0	4H
1	8H

For the single-precision and double-precision variant: is an arrangement specifier, encoded in “sz:Q”:

sz	Q	<T>
0	0	2S
0	1	4S
1	0	RESERVED
1	1	2D

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPRoundInt(element, FPCR[], rounding, exact);

V[d, datasize] = result;
```

FRINTP (scalar)

Floating-point Round to Integral, toward Plus infinity (scalar). This instruction rounds a floating-point value in the SIMD&FP source register to an integral floating-point value of the same size using the Round towards Plus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A floating-point exception can be generated by this instruction. Depending on the settings in *FPCR*, the exception results in either a flag being set in *FPSR*, or a synchronous exception being generated. For more information, see *Floating-point exception traps*.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

## FRSQRTS

Floating-point Reciprocal Square Root Step. This instruction multiplies corresponding floating-point values in the vectors of the two source SIMD&FP registers, subtracts each of the products from 3.0, divides these results by 2.0, places the results into a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exception traps](#).

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: [Scalar half precision](#) , [Scalar single-precision and double-precision](#) , [Vector half precision](#) and [Vector single-precision and double-precision](#)

FSQRT (scalar)

Floating-point Square Root (scalar). This instruction calculates the square root of the value in the SIMD&FP source register and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in *FPCR*, the exception results in either a flag being set in *FPSR*, or a synchronous exception being generated. For more information, see *Floating-point exception traps*.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

INS (element)

Insert vector element from another vector element. This instruction copies the vector element of the source SIMD&FP register to the specified vector element of the destination SIMD&FP register.

This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias MOV (element).

INS <Vd>.<Ts>[<index1>] , <Vn>.<Ts>[<index2>]

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UNDEFINED;

integer dst_index = UInt(imm5<4:size+1>);
integer src_index = UInt(imm4<3:size>);
integer idxdsize = if imm4<3> == '1' then 128 else 64;
// imm4<size-1:0> is IGNORED

integer esize = 8 << size;
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in "imm5":

imm5	<Ts>
x0000	RESERVED
xxxx1	B
xxx10	H
xx100	S
x1000	D

Three registers, register offset (Rm != 11111 && opcode == 0110)

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>
```

Four registers, immediate offset (Rm == 11111 && opcode == 0010)

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>
```

Four registers, register offset (Rm != 11111 && opcode == 0010)

```
LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.

<Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> For the one register, immediate offset variant: is the post-index immediate offset, encoded in "Q":

Q	<imm>
0	#8
1	#16

For the two registers, immediate offset variant: is the post-index immediate offset, encoded in "Q":

Q	<imm>
0	#16
1	#32

For the three registers, immediate offset variant: is the post-index immediate offset, encoded in "Q":

Q	<imm>
0	#24
1	#48

For the four registers, immediate offset variant: is the post-index immediate offset, encoded in "Q":

Q	<imm>
0	#32
1	#64

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

## Shared Decode

```
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer datasize = if Q == '1' then 128 else 64;
integer esize = 8 << UInt(size);
integer elements = datasize DIV esize;

integer rpt;    // number of iterations
integer selem;  // structure elements

case opcode of
  when '0000' rpt = 1; selem = 4;    // LD/ST4 (4 registers)
  when '0010' rpt = 4; selem = 1;    // LD/ST1 (4 registers)
  when '0100' rpt = 1; selem = 3;    // LD/ST3 (3 registers)
  when '0110' rpt = 3; selem = 1;    // LD/ST1 (3 registers)
  when '0111' rpt = 1; selem = 1;    // LD/ST1 (1 register)
  when '1000' rpt = 1; selem = 2;    // LD/ST2 (2 registers)
  when '1010' rpt = 2; selem = 1;    // LD/ST1 (2 registers)
  otherwise UNDEFINED;

// .1D format only permitted with LD1 & ST1
if size:Q == '110' && selem != 1 then UNDEFINED;
```

## Operation

```
CheckFPAdvSIMDEnabled64();

LD1 (single structure)

Load one single-element structure to one lane of one register. This instruction loads a single-element structure from memory and writes the result to the specified lane of the SIMD&FP register without affecting the other bits of the register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

8-bit (opcode == 000)

```
LD1 { <Vt>.B }[<index>], [<Xn|SP>]
```

16-bit (opcode == 010 && size == x0)

```
LD1 { <Vt>.H }[<index>], [<Xn|SP>]
```

32-bit (opcode == 100 && size == 00)

```
LD1 { <Vt>.S }[<index>], [<Xn|SP>]
```

64-bit (opcode == 100 && S == 0 && size == 01)

```
LD1 { <Vt>.D }[<index>], [<Xn|SP>]
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Post-index

**8-bit, immediate offset (Rm == 11111 && opcode == 000)**

```
LD1 { <Vt>.B }[<index>], [<Xn|SP>], #1
```

**8-bit, register offset (Rm != 11111 && opcode == 000)**

```
LD1 { <Vt>.B }[<index>], [<Xn|SP>], <Xm>
```

**16-bit, immediate offset (Rm == 11111 && opcode == 010 && size == x0)**

```
LD1 { <Vt>.H }[<index>], [<Xn|SP>], #2
```

**16-bit, register offset (Rm != 11111 && opcode == 010 && size == x0)**

```
LD1 { <Vt>.H }[<index>], [<Xn|SP>], <Xm>
```

**32-bit, immediate offset (Rm == 11111 && opcode == 100 && size == 00)**

```
LD1 { <Vt>.S }[<index>], [<Xn|SP>], #4
```

**32-bit, register offset (Rm != 11111 && opcode == 100 && size == 00)**

```
LD1 { <Vt>.S }[<index>], [<Xn|SP>], <Xm>
```

**64-bit, immediate offset (Rm == 11111 && opcode == 100 && S == 0 && size == 01)**

```
LD1 { <Vt>.D }[<index>], [<Xn|SP>], #8
```

**64-bit, register offset (Rm != 11111 && opcode == 100 && S == 0 && size == 01)**

```
LD1 { <Vt>.D }[<index>], [<Xn|SP>], <Xm>
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

**Assembler Symbols**

<Vt>	Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
<index>	For the 8-bit variant: is the element index, encoded in "Q:S:size". For the 16-bit variant: is the element index, encoded in "Q:S:size<1>". For the 32-bit variant: is the element index, encoded in "Q:S". For the 64-bit variant: is the element index, encoded in "Q".
<Xn SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

LD1R

Load one single-element structure and Replicate to all lanes (of one register). This instruction loads a single-element structure from memory and replicates the structure to all the lanes of the SIMD&FP register.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [No offset](#) and [Post-index](#)

No offset

```
LD1R { <Vt>.<T> }, [<Xn|SP>]

integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Post-index

Immediate offset (Rm == 11111)

```
LD1R { <Vt>.<T> }, [<Xn|SP>], <imm>
```

Register offset (Rm != 11111)

```
LD1R { <Vt>.<T> }, [<Xn|SP>], <Xm>

integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

- <Vt>

Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- <T>

Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D
- <Xn|SP>

Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in "size":

size	<imm>
00	#1
01	#2
10	#4
11	#8

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

**Shared Decode**

```
integer init_scale = UInt(opcode<2:1>);
integer scale = init_scale;
integer selem = UInt(opcode<0>:R) + 1;
boolean replicate = FALSE;
integer index;

LD2 (multiple structures)

Load multiple 2-element structures to two registers. This instruction loads multiple 2-element structures from memory and writes the result to the two SIMD&FP registers, with de-interleaving.

For an example of de-interleaving, see LD3 (multiple structures).

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

```
LD2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Post-index

Immediate offset (Rm == 11111)

```
LD2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>
```

Register offset (Rm != 11111)

```
LD2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>

LD2R

Load single 2-element structure and Replicate to all lanes of two registers. This instruction loads a 2-element structure from memory and replicates the structure to all the lanes of the two SIMD&FP registers.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [No offset](#) and [Post-index](#)

No offset

```
LD2R { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]

integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Post-index

Immediate offset (Rm == 11111)

```
LD2R { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>
```

Register offset (Rm != 11111)

```
LD2R { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>

integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

- <Vt>

Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- <T>

Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D
- <Vt2>

Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

- <Xn|SP>** Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm>** Is the post-index immediate offset, encoded in "size":
- | size | <imm> |
|------|-------|
| 00   | #2    |
| 01   | #4    |
| 10   | #8    |
| 11   | #16   |
- <Xm>** Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

## Shared Decode

LD3 (multiple structures)

Load multiple 3-element structures to three registers. This instruction loads multiple 3-element structures from memory and writes the result to the three SIMD&FP registers, with de-interleaving. The following figure shows an example of the operation of de-interleaving of a LD3.16 (multiple 3-element structures) instruction:.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

```
LD3 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Post-index

Immediate offset (Rm == 11111)

```
LD3 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>
```

Register offset (Rm != 11111)

```
LD3 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

- <Vt>Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- <T>Is an arrangement specifier, encoded in “size:Q”:

size	Q	<T>

LD3R

Load single 3-element structure and Replicate to all lanes of three registers. This instruction loads a 3-element structure from memory and replicates the structure to all the lanes of the three SIMD&FP registers.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [No offset](#) and [Post-index](#)

No offset

LD3R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Post-index

Immediate offset (Rm == 11111)

LD3R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>

Register offset (Rm != 11111)

```
LD3R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>

integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

- <Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- <T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D
- <Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

- <Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> Is the post-index immediate offset, encoded in "size":
 

size	<imm>
00	#3
01	#6
10	#12
11	#24
- <Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

LD4 (multiple structures)

Load multiple 4-element structures to four registers. This instruction loads multiple 4-element structures from memory and writes the result to the four SIMD&FP registers, with de-interleaving.

For an example of de-interleaving, see LD3 (multiple structures).

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

```
LD4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Post-index

Immediate offset (Rm == 11111)

```
LD4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>
```

Register offset (Rm != 11111)

```
LD4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

- <Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- <T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

- <Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
- <Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
- <Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> Is the post-index immediate offset, encoded in "Q":
 

Q	<imm>
0	#32
1	#64
- <Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

LD4R

Load single 4-element structure and Replicate to all lanes of four registers. This instruction loads a 4-element structure from memory and replicates the structure to all the lanes of the four SIMD&FP registers.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [No offset](#) and [Post-index](#)

No offset

```
LD4R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]

integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Post-index

Immediate offset (Rm == 11111)

```
LD4R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>
```

Register offset (Rm != 11111)

```
LD4R { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>

integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

- <Vt>

Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- <T>

Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	1D
11	1	2D
- <Vt2>

Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

- <Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
- <Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> Is the post-index immediate offset, encoded in "size":
 

size	<imm>
00	#4
01	#8
10	#16
11	#32
- <Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

```

integer init_scale = UInt(opcode<2:1>);
integer scale = init_scale;

LDAP1 (SIMD&FP)

Load-Acquire RCpc one single-element structure to one lane of one register. This instruction loads a single-element structure from memory and writes the result to the specified lane of the SIMD&FP register without affecting the other bits of the register.

The instruction has memory ordering semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release*, except that:

- There is no ordering requirement, separate from the requirements of a Load-AcquirePC or a Store-Release, created by having a Store-Release followed by a Load-AcquirePC instruction.
- The reading of a value written by a Store-Release by a Load-AcquirePC instruction by the same observer does not make the write of the Store-Release globally observed.

This difference in memory ordering is not described in the pseudocode.  
For information about memory accesses, see *Load/Store addressing modes*.  
Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

64-bit  
(FEAT\_LRCPC3)

```
LDAP1 { <Vt>.D }[<index>], [<Xn|SP>]
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

- <Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- <index> Is the element index, encoded in "Q".
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

## Shared Decode

LDNP (SIMD&FP)

Load Pair of SIMD&FP registers, with Non-temporal hint. This instruction loads a pair of SIMD&FP registers from memory, issuing a hint to the memory system that the access is non-temporal. The address that is used for the load is calculated from a base register value and an optional immediate offset.

For information about non-temporal pair instructions, see *Load/Store SIMD and Floating-point Non-temporal pair*. Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

32-bit (opc == 00)

```
LDNP <St1>, <St2>, [<Xn|SP>{, #<imm>}]
```

64-bit (opc == 01)

```
LDNP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]
```

128-bit (opc == 10)

```
LDNP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]
```

// Empty.

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *LDNP (SIMD&FP)*.

Assembler Symbols

- <Dt1>

Is the 64-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Dt2>

Is the 64-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
- <Qt1>

Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Qt2>

Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
- <St1>

Is the 32-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <St2>

Is the 32-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
- <Xn|SP>

Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm>

For the 32-bit variant: is the optional signed immediate byte offset, a multiple of 4 in the range -256 to 252, defaulting to 0 and encoded in the "imm7" field as <imm>/4.  
For the 64-bit variant: is the optional signed immediate byte offset, a multiple of 8 in the range -512 to 504, defaulting to 0 and encoded in the "imm7" field as <imm>/8.  
For the 128-bit variant: is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the "imm7" field as <imm>/16.

## LDR (immediate, SIMD&FP)

Load SIMD&FP Register (immediate offset). This instruction loads an element from memory, and writes the result as a scalar to the SIMD&FP register. The address that is used for the load is calculated from a base register value, a signed immediate offset, and an optional offset that is a multiple of the element size.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 3 classes: [Post-index](#) , [Pre-index](#) and [Unsigned offset](#)

LDR (literal, SIMD&FP)

Load SIMD&FP Register (PC-relative literal). This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from the PC value and an immediate offset.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

opc		0	1	1	1	0	0	imm19																		Rt					

32-bit (opc == 00)

```
LDR <St>, <label>
```

64-bit (opc == 01)

```
LDR <Dt>, <label>
```

128-bit (opc == 10)

```
LDR <Qt>, <label>
```

```
integer t = UInt(Rt);
integer size;
bits(64) offset;

case opc of
  when '00'
    size = 4;
  when '01'
    size = 8;
  when '10'
    size = 16;
  when '11'
    UNDEFINED;

offset = SignExtend(imm19:'00', 64);
```

Assembler Symbols

- <Dt> Is the 64-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
- <Qt> Is the 128-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
- <St> Is the 32-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
- <label> Is the program label from which the data is to be loaded. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.

Operation

```
bits(64) address = PC[] + offset;
bits(size*8) data;

CheckFPEEnabled64();
AccessDescriptor accdesc = CreateAccDescASIMD(MemOp_LOAD, FALSE, FALSE);
data = Mem[address, size, accdesc];
V[t, size*8] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

## LDR (register, SIMD&FP)

Load SIMD&FP Register (register offset). This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from a base register value and an offset register value. The offset can be optionally shifted and extended.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### Assembler Symbols

- <Bt> Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Dt> Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Ht> Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Qt> Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <St> Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <Wm> When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.
- <Xm> When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

<extend> For the 8-bit variant: is the index extend specifier, encoded in “option”:

option	<extend>
010	UXTW
110	SXTW
111	SCTX

For the 128-bit, 16-bit, 32-bit and 64-bit variant: is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in “option”:

option	<extend>
010	UXTW
011	LSL
110	SXTW
111	SCTX

<amount> For the 8-bit variant: is the index shift amount, it must be #0, encoded in "S" as 0 if omitted, or as 1 if present.

For the 16-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#1

For the 32-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#2

For the 64-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#3

For the 128-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#4

MOV (element)

Move vector element to another vector element. This instruction copies the vector element of the source SIMD&FP register to the specified vector element of the destination SIMD&FP register.

This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of [INS \(element\)](#). This means:

- The encodings in this description are named to match the encodings of [INS \(element\)](#).
- The description of [INS \(element\)](#) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

MOV (to general)

Move vector element to general-purpose register. This instruction reads the unsigned integer from the source SIMD&FP register, zero-extends it to form a 32-bit or 64-bit value, and writes the result to the destination general-purpose register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of UMOV. This means:

- The encodings in this description are named to match the encodings of UMOV.
- The description of UMOV gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	Q	0	0	1	1	1	0	0	0	0	x	x	x	0	0	0	0	1	1	1	1	Rn				Rd					
imm5																															

32-bit (Q == 0 && imm5 == xx100)

```
MOV <Wd>, <Vn>.S[<index>]
```

is equivalent to

```
UMOV <Wd>, <Vn>.S[<index>]
```

and is always the preferred disassembly.

64-bit (Q == 1 && imm5 == x1000)

```
MOV <Xd>, <Vn>.D[<index>]
```

is equivalent to

```
UMOV <Xd>, <Vn>.D[<index>]
```

and is always the preferred disassembly.

Assembler Symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <index> For the 32-bit variant: is the element index encoded in "imm5<4:3>".  
For the 64-bit variant: is the element index encoded in "imm5<4>".

Operation

The description of UMOV gives the operational pseudocode for this instruction.

Operational information

- If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

MOV (vector)

Move vector. This instruction copies the vector in the source SIMD&FP register into the destination SIMD&FP register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of ORR (vector, register). This means:

- The encodings in this description are named to match the encodings of ORR (vector, register).
- The description of ORR (vector, register) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	Q	0	0	1	1	1	0	1	0	1	Rm					0	0	0	1	1	1	Rn					Rd				
size																															

MOV <Vd>.<T>, <Vn>.<T>

is equivalent to

ORR <Vd>.<T>, <Vn>.<T>, <Vn>.<T>

and is the preferred disassembly when Rm == Rn.

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in "Q":

Q	<T>
0	8B
1	16B

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

Operation

The description of ORR (vector, register) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

MUL (vector)

Multiply (vector). This instruction multiplies corresponding elements in the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

MUL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if U == '1' && size != '00' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean poly = (U == '1');
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

MVN

Bitwise NOT (vector). This instruction reads each vector element from the source SIMD&FP register, places the inverse of each value into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of [NOT](#). This means:

- The encodings in this description are named to match the encodings of [NOT](#).
- The description of [NOT](#) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ORR (vector, register)

Bitwise inclusive OR (vector, register). This instruction performs a bitwise OR between the two source SIMD&FP registers, and writes the result to the destination SIMD&FP register.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias [MOV \(vector\)](#).

ORR <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler Symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in "Q":
- | Q | <T> |
|---|-----|
| 0 | 8B  |
| 1 | 16B |
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Alias Conditions

Alias	Is preferred when
<a href="#">MOV (vector)</a>	Rm == Rn

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;

result = operand1 OR operand2;

V[d, datasize] = result;
```

Operational information

- If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

PMUL

Polynomial Multiply. This instruction multiplies corresponding elements in the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register.

For information about multiplying polynomials see *Polynomial arithmetic over {0, 1}*.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

PMUL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if U == '1' && size != '00' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean poly = (U == '1');
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B

PMULL, PMULL2

Polynomial Multiply Long. This instruction multiplies corresponding elements in the lower or upper half of the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

For information about multiplying polynomials, see *Polynomial arithmetic over {0, 1}*.

The PMULL instruction extracts each source vector from the lower half of each source register. The PMULL2 instruction extracts each source vector from the upper half of each source register.

The PMULL and PMULL2 variants that operate on 64-bit source elements are defined only when FEAT\_PMULL is implemented.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '01' || size == '10' then UNDEFINED;
if size == '11' && !HaveBit128PMULLExt() then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

Assembler Symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q 2	
0	[absent]
1	[present]

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	RESERVED
10	RESERVED
11	1Q

The '1Q' arrangement is only allocated in an implementation that includes the Cryptographic Extension, and is otherwise RESERVED.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in “size:Q”:

size	Q	<Tb>
00	0	8B
00	1	16B
01	x	RESERVED
10	x	RESERVED
11	0	1D
11	1	2D

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part, datasize];
bits(datasize) operand2 = Vpart[m, part, datasize];
bits(2*datasize) result;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    Elem[result, e, 2*esize] = PolynomialMult(element1, element2);

V[d, 2*datasize] = result;
```

## Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

RADDHN, RADDHN2

Rounding Add returning High Narrow. This instruction adds each vector element in the first source SIMD&FP register to the corresponding vector element in the second source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register.

The results are rounded. For truncated results, see ADDHN.

The RADDHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RADDHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

RADDHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean round = (U == '1');
```

Assembler Symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

RAX1

Rotate and Exclusive-OR rotates each 64-bit element of the 128-bit vector in a source SIMD&FP register left by 1, performs a bitwise exclusive-OR of the resulting 128-bit vector and the vector in another source SIMD&FP register, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when **FEAT\_SHA3** is implemented.

Advanced SIMD  
(FEAT\_SHA3)

RAX1 <Vd>.2D, <Vn>.2D, <Vm>.2D

```
if !HaveSHA3Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);

RSHRN, RSHRN2

Rounding Shift Right Narrow (immediate). This instruction reads each unsigned integer value from the vector in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The results are rounded. For truncated results, see [SHRN](#).

The RSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

RSUBHN, RSUBHN2

Rounding Subtract returning High Narrow. This instruction subtracts each vector element of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register.

The results are rounded. For truncated results, see SUBHN.

The RSUBHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RSUBHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

RSUBHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;

SADDLV

Signed Add Long across Vector. This instruction adds every vector element in the source SIMD&FP register together, and writes the scalar result to the destination SIMD&FP register. The destination scalar is twice as long as the source vector elements. All the values in this instruction are signed integer values.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SADDLV <V><d>, <Vn>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '100' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

Assembler Symbols

<V> Is the destination width specifier, encoded in “size”:

SADDW, SADDW2

Signed Add Wide. This instruction adds vector elements of the first source SIMD&FP register to the corresponding vector elements in the lower or upper half of the second source SIMD&FP register, places the results in a vector, and writes the vector to the SIMD&FP destination register.

The SADDW instruction extracts the second source vector from the lower half of the second source register. The SADDW2 instruction extracts the second source vector from the upper half of the second source register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SADDW{2} <Vd>.<Ta>, <Vn>.<Ta>, <Vm>.<Tb>

SDOT (by element)

Dot Product signed arithmetic (vector, by element). This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register. Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped. In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note

*ID\_AA64ISAR0\_EL1*.DP indicates whether this instruction is supported.

Vector  
(FEAT\_DotProd)

SDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.**4B**[<index>]

    - The values of the NZCV flags.

SHA512H

SHA512 Hash update part 1 takes the values from the three 128-bit source SIMD&FP registers and produces a 128-bit output value that combines the sigma1 and chi functions of two iterations of the SHA512 computation. It returns this value to the destination SIMD&FP register.

This instruction is implemented only when *FEAT\_SHA512* is implemented.

Advanced SIMD

Operational information

- If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

SHA512H2

SHA512 Hash update part 2 takes the values from the three 128-bit source SIMD&FP registers and produces a 128-bit output value that combines the sigma0 and majority functions of two iterations of the SHA512 computation. It returns this value to the destination SIMD&FP register.

This instruction is implemented only when *FEAT\_SHA512* is implemented.

Advanced SIMD

SHL

Shift Left (immediate). This instruction reads each value from a vector, left shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

```
SHL <V><d>, <V><n>, #<shift>

integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = UInt(immh:immb) - esize;
```

Vector

```
SHL <Vd>.<T>, <Vn>.<T>, #<shift>

integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE(asimdimm);
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = UInt(immh:immb) - esize;
```

Assembler Symbols

- <V> Is a width specifier, encoded in “immh”:

SHLL, SHLL2

Shift Left Long (by element size). This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, left shifts each result by the element size, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. The SHLL instruction extracts vector elements from the lower half of the source register. The SHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	Q	1	0	1	1	1	0	size		1	0	0	0	0	1	0	0	1	1	1	0	Rn				Rd					

SHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #<shift>

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = esize;
boolean unsigned = FALSE;    // Or TRUE without change of functionality
```

Assembler Symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q 2	
0	[absent]
1	[present]

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	4S
10	2D
11	RESERVED

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in “size:Q”:

size	Q	<Tb>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	x	RESERVED

<shift> Is the left shift amount, which must be equal to the source element width in bits, encoded in “size”:

size	<shift>
00	8
01	16
10	32
11	RESERVED

## Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part, datasize];
bits(2*datasize) result;
integer element;

for e = 0 to elements-1
    element = Int(Elem[operand, e, esize], unsigned) << shift;
    Elem[result, e, 2*esize] = element<2*esize-1:0>;

V[d, 2*datasize] = result;

```

## Operational information

SHRN, SHRN2

Shift Right Narrow (immediate). This instruction reads each unsigned integer value from the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The results are truncated. For rounded results, see [RSHRN](#).

The RSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
SHRN{2} <Vd>.<Tb>, <Vn>.<Ta>, #<shift>
```

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE(asimdimm);
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = (2 * esize) - UInt(immh:immb);
boolean round = (op == '1');
```

Assembler Symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in “immh:Q”:

## SLI

Shift Left and Insert (immediate). This instruction reads each vector element in the source SIMD&FP register, left shifts each vector element by an immediate value, and inserts the result into the corresponding vector element in the destination SIMD&FP register such that the new zero bits created by the shift are not inserted but retain their existing value. Bits shifted out of the left of each vector element in the source register are lost.

The following figure shows an example of the operation of shift left by 3 for an 8-bit vector element.

Depending on the settings in the [CPACR EL1](#), [CPTR EL2](#), and [CPTR EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

### Scalar

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	1	1	1	1	0	!= 0000			immb			0	1	0	1	0	1	1	Rn				Rd					
immh																															

**SLI** [<V><d>](#), [<V><n>](#), [#<shift>](#)

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = UInt(immh:immb) - esize;
```

### Vector

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	Q	1	0	1	1	1	1	0	!= 0000				immb			0	1	0	1	0	1	Rn				Rd					
immh																															

**SLI** [<Vd>.<T>](#), [<Vn>.<T>](#), [#<shift>](#)

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE(asimdimm);
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = UInt(immh:immb) - esize;
```

Assembler Symbols

<V> Is a width specifier, encoded in “immh”:

immh	<V>
0xxx	RESERVED
1xxx	D

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “immh:Q”:

immh	Q	<T>
0000	x	<a href="#">SEE Advanced SIMD modified immediate</a>
0001	0	8B
0001	1	16B
001x	0	4H
001x	1	8H
01xx	0	2S
01xx	1	4S
1xxx	0	RESERVED
1xxx	1	2D

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<shift> For the scalar variant: is the left shift amount, in the range 0 to 63, encoded in “immh:immb”:

immh	<shift>
0xxx	RESERVED
1xxx	(UInt(immh:immb)-64)

For the vector variant: is the left shift amount, in the range 0 to the element width in bits minus 1, encoded in “immh:immb”:

immh	<shift>
0000	<a href="#">SEE Advanced SIMD modified immediate</a>
0001	(UInt(immh:immb)-8)
001x	(UInt(immh:immb)-16)
01xx	(UInt(immh:immb)-32)
1xxx	(UInt(immh:immb)-64)

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n, datasize];
bits(datasize) operand2 = V[d, datasize];
bits(datasize) result;
bits(esize) mask = LSL(Ones(esize), shift);
bits(esize) shifted;

for e = 0 to elements-1
    shifted = LSL(Elem[operand, e, esize], shift);
    Elem[result, e, esize] = (Elem[operand2, e, esize] AND NOT(mask)) OR shifted;
V[d, datasize] = result;
```

SM3PARTW1

SM3PARTW1 takes three 128-bit vectors from the three source SIMD&FP registers and returns a 128-bit result in the destination SIMD&FP register. The result is obtained by a three-way exclusive-OR of the elements within the input vectors with some fixed rotations, see the Operation pseudocode for more information.

This instruction is implemented only when *FEAT\_SM3* is implemented.

# SM3TT1A

SM3TT1A takes three 128-bit vectors from three source SIMD&FP registers and a 2-bit immediate index value, and returns a 128-bit result in the destination SIMD&FP register. It performs a three-way exclusive-OR of the three 32-bit fields held in the upper three elements of the first source vector, and adds the resulting 32-bit value and the following three other 32-bit values:

- The bottom 32-bit element of the first source vector, Vd, that was used for the three-way exclusive-OR.
- The result of the exclusive-OR of the top 32-bit element of the second source vector, Vn, with a rotation left by 12 of the top 32-bit element of the first source vector.
- A 32-bit element indexed out of the third source vector, Vm.

The result of this addition is returned as the top element of the result. The other elements of the result are taken from elements of the first source vector, with the element returned in bits<63:32> being rotated left by 9.

This instruction is implemented only when **FEAT\_SM3** is implemented.

SM4E

SM4 Encode takes input data as a 128-bit vector from the first source SIMD&FP register, and four iterations of the round key held as the elements of the 128-bit vector in the second source SIMD&FP register. It encrypts the data by four rounds, in accordance with the SM4 standard, returning the 128-bit result to the destination SIMD&FP register. This instruction is implemented only when *FEAT\_SM4* is implemented.

Advanced SIMD  
(FEAT\_SM4)

SMLAL, SMLAL2 (by element)

Signed Multiply-Add Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element in the second source SIMD&FP register, and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are signed integer values.

The SMLAL instruction extracts vector elements from the lower half of the first source register. The SMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR EL1, CPTR EL2, and CPTR EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SMLAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

```
integer idxdsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean sub_op = (o2 == '1');
```

Assembler Symbols

```

## Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

SMLAL, SMLAL2 (vector)

Signed Multiply-Add Long (vector). This instruction multiplies corresponding signed integer values in the lower or upper half of the vectors of the two source SIMD&FP registers, and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The SMLAL instruction extracts each source vector from the lower half of each source register. The SMLAL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR EL1, CPTR EL2, and CPTR EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SMMLA (vector)

Signed 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of signed 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. [ID\\_AA64ISAR1\\_EL1](#).I8MM indicates whether this instruction is supported.

Vector  
(FEAT\_I8MM)

SMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B

```
if !HaveInt8MatMulExt() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);
```

Assembler Symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(128) operand1 = V[n, 128];
bits(128) operand2 = V[m, 128];
bits(128) addend = V[d, 128];

V[d, 128] = MatMulAdd(addend, operand1, operand2, FALSE, FALSE);
```

Operational information

Arm expects that the SMMLA (vector) instruction will deliver a peak integer multiply throughput that is at least as high as can be achieved using two SDOT (vector) instructions, with a goal that it should have significantly higher throughput.

SMOV

Signed Move vector element to general-purpose register. This instruction reads the signed integer from the source SIMD&FP register, sign-extends it to form a 32-bit or 64-bit value, and writes the result to destination general-purpose register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

32-bit (Q == 0)

```
SMOV <Wd>, <Vn>.<Ts>[<index>]
```

SQABS

Signed saturating Absolute value. This instruction reads each vector element from the source SIMD&FP register, puts the absolute value of the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit *FPSR.QC* is set.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: *Scalar* and *Vector*

SQADD

Signed saturating Add. This instruction adds the values of corresponding elements of the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register. If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit *FPSR.QC* is set.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

SQADD <V><d>, <V><n>, <V><m>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
```

Vector

SQADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```

10	1	4S
11	0	RESERVED
11	1	2D

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
integer element1;
integer element2;
integer sum;
boolean sat;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    sum = element1 + element2;
    (Elem[result, e, esize], sat) = SatQ(sum, esize, unsigned);
    if sat then FPSR.QC = '1';

V[d, datasize] = result;
```

SQDMLAL, SQDMLAL2 (by element)

Signed saturating Doubling Multiply-Add Long (by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, and accumulates the final results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit *FPSR.QC* is set.

The *SQDMLAL* instruction extracts vector elements from the lower half of the first source register. The *SQDMLAL2* instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: *Scalar* and *Vector*

## SQDMULH (by element)

Signed saturating Doubling Multiply returning High half (by element). This instruction multiplies each vector element in the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, places the most significant half of the final results into a vector, and writes the vector to the destination SIMD&FP register.

The results are truncated. For rounded results, see [SQRDMULH](#).

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

## SQDMULL, SQDMULL2 (by element)

Signed saturating Doubling Multiply Long (by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, places the final results in a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

The [SQDMULL](#) instruction extracts the first source vector from the lower half of the first source register. The [SQDMULL2](#) instruction extracts the first source vector from the upper half of the first source register.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

SQRDMLAH (by element)

Signed Saturating Rounding Doubling Multiply Accumulate returning High Half (by element). This instruction multiplies the vector elements of the first source SIMD&FP register with the value of a vector element of the second source SIMD&FP register without saturating the multiply results, doubles the results, and accumulates the most significant half of the final results with the vector elements of the destination SIMD&FP register. The results are rounded.

If any of the results overflow, they are saturated. The cumulative saturation bit, [FPSR.QC](#), is set if saturation occurs.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

SQRDMLAH (vector)

Signed Saturating Rounding Doubling Multiply Accumulate returning High Half (vector). This instruction multiplies the vector elements of the first source SIMD&FP register with the corresponding vector elements of the second source SIMD&FP register without saturating the multiply results, doubles the results, and accumulates the most significant half of the final results with the vector elements of the destination SIMD&FP register. The results are rounded. If any of the results overflow, they are saturated. The cumulative saturation bit, [FPSR.QC](#), is set if saturation occurs. Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped. It has encodings from 2 classes: [Scalar](#) and [Vector](#)

SQRDMULH (vector)

Signed saturating Rounding Doubling Multiply returning High half. This instruction multiplies the values of corresponding elements of the two source SIMD&FP registers, doubles the results, places the most significant half of the final results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see SQDMULH.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

SQRSHL

Signed saturating Rounding Shift Left (register). This instruction takes each vector element in the first source SIMD&FP register, shifts it by a value from the least significant byte of the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are rounded. For truncated results, see [SQSHL](#).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

SQRSHL <V><d>, <V><n>, <V><m>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
if S == '0' && size != '11' then UNDEFINED;
```

Vector

SQRSHL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;

boolean sat;

for e = 0 to elements-1
    integer element = Int(Elem[operand1, e, esize], unsigned);
    integer shift = SInt(Elem[operand2, e, esize]<7:0>);
    if shift >= 0 then // left shift
        element = element << shift;
    else // right shift
        shift = -shift;
        element = RShr(element, shift, rounding);

    if saturating then
        (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
        if sat then FPSR.QC = '1';
    else
        Elem[result, e, esize] = element<esize-1:0>;

V[d, datasize] = result;

```

# SQRSHRN, SQRSHRN2

Signed saturating Rounded Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are half as long as the source vector elements. The results are rounded. For truncated results, see [SQSHRN](#).

The `SQRSHRN` instruction writes the vector to the lower half of the destination register and clears the upper half, while the `SQRSHRN2` instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit `FPSR.QC` is set.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

    element = Int(Elem[operand, e, esize], src_unsigned) << shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, dst_unsigned);
    if sat then FPSR.QC = '1';

V[d, datasize] = result;
```

## SQSHRN, SQSHRN2

Signed saturating Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts and truncates each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are half as long as the source vector elements. For rounded results, see [SQRSHRN](#).

The `SQSHRN` instruction writes the vector to the lower half of the destination register and clears the upper half, while the `SQSHRN2` instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit `FPSR.QC` is set.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

SQSUB

Signed saturating Subtract. This instruction subtracts the element values of the second source SIMD&FP register from the corresponding element values of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit *FPSR.QC* is set.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: *Scalar* and *Vector*

Scalar

SQSUB <V><d>, <V><n>, <V><m>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
```

Vector

SQSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>

    diff = element1 - element2;
    (Elem[result, e, esize], sat) = SatQ(diff, esize, unsigned);
    if sat then FPSR.QC = '1';

V[d, datasize] = result;
```

## SQXTN, SQXTN2

Signed saturating extract Narrow. This instruction reads each vector element from the source SIMD&FP register, saturates the value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

The [SQXTN](#) instruction writes the vector to the lower half of the destination register and clears the upper half, while the [SQXTN2](#) instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

### Scalar

SRHADD

Signed Rounding Halving Add. This instruction adds corresponding signed integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see [SHADD](#).

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SRHADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B

    sum = (element1 + element2 + 1) >> 1;
    Elem[result, e, esize] = sum<esize-1:0>;

V[d, datasize] = result;
```

## SRI

Shift Right and Insert (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each vector element by an immediate value, and inserts the result into the corresponding vector element in the destination SIMD&FP register such that the new zero bits created by the shift are not inserted but retain their existing value. Bits shifted out of the right of each vector element of the source register are lost.

The following figure shows an example of the operation of shift right by 3 for an 8-bit vector element.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

SRSHL

Signed Rounding Shift Left (register). This instruction takes each signed integer value in the vector of the first source SIMD&FP register, shifts it by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see [SSHL](#). Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped. It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

SRSHL <v><d>, <v><n>, <v><m>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
if S == '0' && size != '11' then UNDEFINED;
```

Vector

### Operational information

- If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

SSHLL, SSHLL2

Signed Shift Left Long (immediate). This instruction reads each vector element from the source SIMD&FP register, left shifts each vector element by the specified shift amount, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

The SSHLL instruction extracts vector elements from the lower half of the source register. The SSHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR EL1, CPTR EL2, and CPTR EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias SXTL, SXTL2.

```
SSHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #<shift>
```

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE(asimdimh);
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = UInt(immh:immb) - esize;
boolean unsigned = (U == '1');
```

Assembler Symbols

SSHR

Signed Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, places the final result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The results are truncated. For rounded results, see [SRSHR](#).

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

SSHR <V><d>, <V><n>, #<shift>

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Vector

SSHR <Vd>.<T>, <Vn>.<T>, #<shift>

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE(asimdimm);
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

SSUBL, SSUBL2

Signed Subtract Long. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are twice as long as the source vector elements.

The SSUBL instruction extracts each source vector from the lower half of each source register. The SSUBL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
SSUBL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>
```

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler Symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]
1	[present]

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

## ST1 (single structure)

Store a single-element structure from one lane of one register. This instruction stores the specified element of a SIMD&FP register to memory.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [No offset](#) and [Post-index](#)

### No offset

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ST2 (multiple structures)

Store multiple 2-element structures from two registers. This instruction stores multiple 2-element structures from two SIMD&FP registers to memory, with interleaving. Every element of each register is stored.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [No offset](#) and [Post-index](#)

No offset

```
ST2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Post-index

Immediate offset (Rm == 11111)

```
ST2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>
```

Register offset (Rm != 11111)

```
ST2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

- <Xn|SP>

Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm>

Is the post-index immediate offset, encoded in "Q":

Q	<imm>
0	#16
1	#32
- <Xm>

Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

ST3 (single structure)

Store single 3-element structure from one lane of three registers. This instruction stores a 3-element structure to memory from corresponding elements of three SIMD&FP registers.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [No offset](#) and [Post-index](#)

No offset

ST4 (multiple structures)

Store multiple 4-element structures from four registers. This instruction stores multiple 4-element structures to memory from four SIMD&FP registers, with interleaving. Every element of each register is stored.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [No offset](#) and [Post-index](#)

No offset

ST4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Post-index

Immediate offset (Rm == 11111)

ST4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>

Register offset (Rm != 11111)

ST4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

Assembler Symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

- <Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
- <Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> Is the post-index immediate offset, encoded in "Q":
 

Q	<imm>
0	#32
1	#64
- <Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared Decode

## STL1 (SIMD&FP)

Store-Release a single-element structure from one lane of one register. This instruction stores the specified element of a SIMD&FP register to memory.

The instruction also has memory ordering semantics, as described in [Load-Acquire](#), [Load-AcquirePC](#), and [Store-Release](#). For information about memory accesses, see [Load/Store addressing modes](#).

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### 64-bit (FEAT\_LRCPC3)

STL1 { <Vt>.D } [<index>], [<Xn|SP>]

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = wback || n != 31;
```

### Assembler Symbols

- <Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- <index> Is the element index, encoded in "Q".
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

### Shared Decode

```
integer init_scale = UInt(opcode<2:1>);
integer scale = init_scale;
integer selem = UInt(opcode<0>:R) + 1;
boolean replicate = FALSE;
integer index;

case scale of
  when 3
    // load and replicate
    if L == '0' || S == '1' then UNDEFINED;

STLUR (SIMD&FP)

Store-Release SIMD&FP Register (unscaled offset). This instruction stores a single SIMD&FP register to memory. The address that is used for the store is calculated from a base register value and an optional immediate offset. The instruction has memory ordering semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release*. Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

## STNP (SIMD&FP)

Store Pair of SIMD&FP registers, with Non-temporal hint. This instruction stores a pair of SIMD&FP registers to memory, issuing a hint to the memory system that the access is non-temporal. The address used for the store is calculated from an address from a base register value and an immediate offset. For information about non-temporal pair instructions, see [Load/Store SIMD and Floating-point Non-temporal pair](#). Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### 32-bit (opc == 00)

```
STNP <St1>, <St2>, [<Xn|SP>{, #<imm>}]
```

### 64-bit (opc == 01)

```
STNP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]
```

### 128-bit (opc == 10)

```
STNP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]
```

```
// Empty.
```

## Assembler Symbols

- <Dt1> Is the 64-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Dt2> Is the 64-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
- <Qt1> Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Qt2> Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.

STR (register, SIMD&FP)

Store SIMD&FP register (register offset). This instruction stores a single SIMD&FP register to memory. The address that is used for the store is calculated from a base register value and an offset register value. The offset can be optionally shifted and extended.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler Symbols

- <Bt> Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Dt> Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Ht> Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Qt> Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <St> Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <Wm> When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.
- <Xm> When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

<extend> For the 8-bit variant: is the index extend specifier, encoded in “option”:

option	<extend>
010	UXTW
110	SXTW
111	SCTX

For the 128-bit, 16-bit, 32-bit and 64-bit variant: is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in “option”:

option	<extend>
010	UXTW
011	LSL
110	SXTW
111	SCTX

<amount> For the 8-bit variant: is the index shift amount, it must be #0, encoded in "S" as 0 if omitted, or as 1 if present.

For the 16-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#1

For the 32-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#2

For the 64-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#3

For the 128-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in “S”:

S	<amount>
0	#0
1	#4

SUB (vector)

Subtract (vector). This instruction subtracts each vector element in the second source SIMD&FP register from the corresponding vector element in the first source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

SUB <V><d>, <V><n>, <V><m>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size != '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean sub_op = (U == '1');
```

Vector

        Elem[result, e, esize] = element1 - element2;
    else
        Elem[result, e, esize] = element1 + element2;

V[d, datasize] = result;

```

## Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v33.64, AdvSIMD v29.12, pseudocode v2023-06\_rel, sve v2023-06\_rel ; Build timestamp: 2023-07-04T19:42

SUBHN, SUBHN2

Subtract returning High Narrow. This instruction subtracts each vector element in the second source SIMD&FP register from the corresponding vector element in the first source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values.

The results are truncated. For rounded results, see *RSUBHN*.

The SUBHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SUBHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

SUBHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;

SUDOT (by element)

Dot product index form with signed and unsigned integers. This instruction performs the dot product of the four signed 8-bit integer values in each 32-bit element of the first source register with the four unsigned 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination vector.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. [ID\\_AA64ISAR1\\_EL1](#).I8MM indicates whether this instruction is supported.

Vector  
(FEAT\_I8MM)

SUDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.4B[<index>]

```
if !HaveInt8MatMulExt() then UNDEFINED;
boolean op1_unsigned = (US == '1');
boolean op2_unsigned = (US == '0');
integer n = UInt(Rn);
integer m = UInt(M:Rm);
integer d = UInt(Rd);
integer i = UInt(H:L);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 32;
```

Assembler Symbols

- <Vd>

Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Ta>

Is an arrangement specifier, encoded in “Q”:

Q	<Ta>
0	2S
1	4S
- <Vn>

Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb>

Is an arrangement specifier, encoded in “Q”:

Q	<Tb>
0	8B
1	16B
- <Vm>

Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.
- <index>

Is the immediate index of a 32-bit group of four 8-bit values in the range 0 to 3, encoded in the "H:L" fields.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(128) operand2 = V[m, 128];
bits(datasize) operand3 = V[d, datasize];

SUQADD

Signed saturating Accumulate of Unsigned value. This instruction adds the unsigned integer values of the vector elements in the source SIMD&FP register to corresponding signed integer values of the vector elements in the destination SIMD&FP register, and writes the resulting signed integer values to the destination SIMD&FP register. If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit `FPSR.QC` is set.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

SUQADD <V><d>, <V><n>

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 8 << UInt(size);

SXTL, SXTL2

Signed extend Long. This instruction duplicates each vector element in the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values. The SXTL instruction extracts the source vector from the lower half of the source register. The SXTL2 instruction extracts the source vector from the upper half of the source register. Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of SSHLL, SSHLL2. This means:

- The encodings in this description are named to match the encodings of SSHLL, SSHLL2.
- The description of SSHLL, SSHLL2 gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

## Operation

The description of [SSHLL](#), [SSHLL2](#) gives the operational pseudocode for this instruction.

## Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v33.64, AdvSIMD v29.12, pseudocode v2023-06\_rel, sve v2023-06\_rel ; Build timestamp: 2023-07-04T19:42

TBL

Table vector Lookup. This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the result for that lookup is 0. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Two register table (len == 01)

```
TBL <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B }, <Vm>.<Ta>
```

Three register table (len == 10)

```
TBL <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B, <Vn+2>.16B }, <Vm>.<Ta>
```

Four register table (len == 11)

```
TBL <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B, <Vn+2>.16B, <Vn+3>.16B }, <Vm>.<Ta>
```

Single register table (len == 00)

```
TBL <Vd>.<Ta>, { <Vn>.16B }, <Vm>.<Ta>
```

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 8;
integer regs = UInt(len) + 1;
boolean is_tbl = (op == '0');
```

Assembler Symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in "Q":

Q	<Ta>
0	8B
1	16B
- <Vn> For the four register table, three register table and two register table variant: is the name of the first SIMD&FP table register, encoded in the "Rn" field.  
For the single register table variant: is the name of the SIMD&FP table register, encoded in the "Rn" field.
- <Vn+1> Is the name of the second SIMD&FP table register, encoded as "Rn" plus 1 modulo 32.
- <Vn+2> Is the name of the third SIMD&FP table register, encoded as "Rn" plus 2 modulo 32.
- <Vn+3> Is the name of the fourth SIMD&FP table register, encoded as "Rn" plus 3 modulo 32.
- <Vm> Is the name of the SIMD&FP index register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) indices = V[m, datasize];
bits(128*regs) table = Zeros(128 * regs);
bits(datasize) result;
integer index;

// Create table from registers
for i = 0 to regs-1
    table<128*i+127:128*i> = V[n, 128];
    n = (n + 1) MOD 32;

result = if is_tbl then Zeros(datasize) else V[d, datasize];

TBX

Table vector lookup extension. This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the existing value in the vector element of the destination register is left unchanged. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Two register table (len == 01)

```
TBX <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B }, <Vm>.<Ta>
```

Three register table (len == 10)

```
TBX <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B, <Vn+2>.16B }, <Vm>.<Ta>
```

Four register table (len == 11)

```

TRN1

Transpose vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places each result into consecutive elements of a vector, and writes the vector to the destination SIMD&FP register. Vector elements from the first source register are placed into even-numbered elements of the destination vector, starting at zero, while vector elements from the second source register are placed into odd-numbered elements of the destination vector.

Note

By using this instruction with TRN2, a 2 x 2 matrix can be transposed. The following figure shows an example of the operation of TRN1 and TRN2 halfword operations where Q = 0.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

TRN1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
integer pairs = elements DIV 2;
```

Assembler Symbols

UADALP

Unsigned Add and Accumulate Long Pairwise. This instruction adds pairs of adjacent unsigned integer values from the vector in the source SIMD&FP register and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

UADALP <Vd>.<Ta>, <Vn>.<Tb>

```

UADDL, UADDL2

Unsigned Add Long (vector). This instruction adds each vector element in the lower or upper half of the first source SIMD&FP register to the corresponding vector element of the second source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are unsigned integer values.

The UADDL instruction extracts each source vector from the lower half of each source register. The UADDL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

UADDL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

```
integer d = UInt(Rd);

## UCVTF (scalar, fixed-point)

Unsigned fixed-point Convert to Floating-point (scalar). This instruction converts the unsigned value in the 32-bit or 64-bit general-purpose source register to a floating-point value using the rounding mode that is specified by the *FPCR*, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in *FPCR*, the exception results in either a flag being set in *FPSR*, or a synchronous exception being generated. For more information, see *Floating-point exception traps*.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

## UCVTF (vector, fixed-point)

Unsigned fixed-point Convert to Floating-point (vector). This instruction converts each element in a vector from fixed-point to floating-point using the rounding mode that is specified by the [FPCR](#), and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exception traps](#).

Depending on the settings in the [CPACR EL1](#), [CPTR EL2](#), and [CPTR EL3](#) registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

### Scalar

UCVTF (vector, integer)

Unsigned integer Convert to Floating-point (vector). This instruction converts each element in a vector from an unsigned integer value to a floating-point value using the rounding mode that is specified by the *FPCR*, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in *FPCR*, the exception results in either a flag being set in *FPSR*, or a synchronous exception being generated. For more information, see *Floating-point exception traps*.

Depending on the settings in the *CPACR EL1*, *CPTR EL2*, and *CPTR EL3* registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

It has encodings from 4 classes: [Scalar half precision](#) , [Scalar single-precision and double-precision](#) , [Vector half precision](#) and [Vector single-precision and double-precision](#)

UDOT (by element)

Dot Product unsigned arithmetic (vector, by element). This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register. Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped. In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note

ID\_AA64ISAR0\_EL1.DP indicates whether this instruction is supported.

UMLAL, UMLAL2 (by element)

Unsigned Multiply-Add Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLAL instruction extracts vector elements from the lower half of the first source register. The UMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
UMLAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

## UMMLA (vector)

Unsigned 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of unsigned 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. [ID\\_AA64ISAR1\\_EL1](#).I8MM indicates whether this instruction is supported.

### Vector (FEAT\_I8MM)

UMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B

```
if !HaveInt8MatMulExt() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);
```

### Assembler Symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

### Operation

```
CheckFPAdvSIMDEnabled64();
bits(128) operand1 = V[n, 128];
bits(128) operand2 = V[m, 128];
bits(128) addend = V[d, 128];

V[d, 128] = MatMulAdd(addend, operand1, operand2, TRUE, TRUE);
```

### Operational information

Arm expects that the UMMLA (vector) instruction will deliver a peak integer multiply throughput that is at least as high as can be achieved using two UDOT (vector) instructions, with a goal that it should have significantly higher throughput.

UMOV

Unsigned Move vector element to general-purpose register. This instruction reads the unsigned integer from the source SIMD&FP register, zero-extends it to form a 32-bit or 64-bit value, and writes the result to the destination general-purpose register.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias [MOV \(to general\)](#).

32-bit (Q == 0)

```
UMOV <Wd>, <Vn>.<Ts>[<index>]
```

64-bit (Q == 1 && imm5 == x1000)

```
UMOV <Xd>, <Vn>.<Ts>[<index>]
```

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size;
case Q:imm5 of
    when '0xxxx1' size = 0;    // UMOV Wd, Vn.B
    when '0xxx10' size = 1;    // UMOV Wd, Vn.H
    when '0xx100' size = 2;    // UMOV Wd, Vn.S
    when '1x1000' size = 3;    // UMOV Xd, Vn.D
    otherwise UNDEFINED;

integer idxdsize = if imm5<4> == '1' then 128 else 64;
integer index = UInt(imm5<4:size+1>);
integer esize = 8 << size;
integer datasize = if Q == '1' then 64 else 32;
```

Assembler Symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Ts> For the 32-bit variant: is an element size specifier, encoded in "imm5":

imm5	<Ts>
xx000	RESERVED
xxxx1	B
xxx10	H
xx100	S

For the 64-bit variant: is an element size specifier, encoded in "imm5":

imm5	<Ts>
x0000	RESERVED
xxxx1	RESERVED
xxx10	RESERVED
xx100	RESERVED
x1000	D

- <index> For the 32-bit variant: is the element index encoded in "imm5":

imm5	<index>
xx000	RESERVED
xxxx1	imm5<4:1>
xxx10	imm5<4:2>
xx100	imm5<4:3>

For the 64-bit variant: is the element index encoded in "imm5<4>".

## Alias Conditions

Alias	Is preferred when
<a href="#">MOV (to general)</a>	imm5 == 'x1000'
<a href="#">MOV (to general)</a>	imm5 == 'xx100'

## Operation

```

if index == 0 then
    CheckFPEEnabled64();
else
    CheckFPAdvSIMDEnabled64();
bits(idxdsize) operand = V[n, idxdsize];

X[d, datasize] = ZeroExtend(Elem[operand, index, esize], datasize);

```

## Operational information

UMULL, UMULL2 (by element)

Unsigned Multiply Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMULL instruction extracts vector elements from the lower half of the first source register. The UMULL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
UMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]
```

```
integer idxdsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler Symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q	2
0	[absent]

UQADD

Unsigned saturating Add. This instruction adds the values of corresponding elements of the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register. If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

UQADD <V><d>, <V><n>, <V><m>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
```

Vector

UQADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
integer element1;
integer element2;
integer sum;
boolean sat;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    sum = element1 + element2;
    (Elem[result, e, esize], sat) = SatQ(sum, esize, unsigned);
    if sat then FPSR.QC = '1';

V[d, datasize] = result;
```

UQRSHL

Unsigned saturating Rounding Shift Left (register). This instruction takes each vector element of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are rounded. For truncated results, see [UQSHL](#).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

## UQRSHRN, UQRSHRN2

Unsigned saturating Rounded Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see [UQSHRN](#).

The [UQRSHRN](#) instruction writes the vector to the lower half of the destination register and clears the upper half, while the [UQRSHRN2](#) instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

## UQSHL (immediate)

Unsigned saturating Shift Left (immediate). This instruction takes each vector element in the source SIMD&FP register, shifts it by an immediate value, places the results in a vector, and writes the vector to the destination SIMD&FP register. The results are truncated. For rounded results, see [UQRSHL](#).  
If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.  
Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.  
It has encodings from 2 classes: [Scalar](#) and [Vector](#)

### Scalar

    if sat then FPSR.QC = '1';

V[d, datasize] = result;
```

## UQSHL (register)

Unsigned saturating Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts the element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are truncated. For rounded results, see [UQRSHL](#).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

### Scalar

# UQSHRN, UQSHRN2

Unsigned saturating Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see [UQSRSHRN](#).

The UQSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

## Scalar

UQSUB

Unsigned saturating Subtract. This instruction subtracts the element values of the second source SIMD&FP register from the corresponding element values of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit `FPSR.QC` is set.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

UQSUB <V><d>, <V><n>, <V><m>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
```

Vector

UQSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in “size:Q”:

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S

11	1	2D

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n, datasize];
bits(datasize) operand2 = V[m, datasize];
bits(datasize) result;
integer element1;
integer element2;
integer diff;
boolean sat;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    diff = element1 - element2;
    (Elem[result, e, esize], sat) = SatQ(diff, esize, unsigned);
    if sat then FPSR.QC = '1';

V[d, datasize] = result;
```

UQXTN, UQXTN2

Unsigned saturating extract Narrow. This instruction reads each vector element from the source SIMD&FP register, saturates each value to half the original width, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

If saturation occurs, the cumulative saturation bit *FPSR.QC* is set.

The *UQXTN* instruction writes the vector to the lower half of the destination register and clears the upper half, while the *UQXTN2* instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: *Scalar* and *Vector*

Scalar

UQXTN <Vb><d>, <Va><n>

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer part = 0;
integer elements = 1;

size	<Vb>
00	B
01	H
10	S
11	RESERVED

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Va> Is the source width specifier, encoded in “size”:

size	<Va>
00	H
01	S
10	D
11	RESERVED

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand = V[n, 2*datasize];
bits(datasize) result;
bits(2*esize) element;
boolean sat;

for e = 0 to elements-1
    element = Elem[operand, e, 2*esize];
    (Elem[result, e, esize], sat) = SatQ(Int(element, unsigned), esize, unsigned);
    if sat then FPSR.QC = '1';

Vpart[d, part, datasize] = result;
```

URECPE

Unsigned Reciprocal Estimate. This instruction reads each vector element from the source SIMD&FP register, calculates an approximate inverse for the unsigned integer value, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

    element2 = Int(Elem[operand2, e, esize], unsigned);
    sum = (element1 + element2 + 1) >> 1;
    Elem[result, e, esize] = sum<esize-1:0>;

V[d, datasize] = result;
```

# URSHL

Unsigned Rounding Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift.

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

## Scalar

URSHL <V><d>, <V><n>, <V><m>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
if S == '0' && size != '11' then UNDEFINED;
```

## Vector

URSHL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
```

## Assembler Symbols

**<V>** Is a width specifier, encoded in “size”:

size	<V>
0x	RESERVED

    else
        Elem[result, e, esize] = element<esize-1:0>;

V[d, datasize] = result;
```

URSHR

Unsigned Rounding Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see [USHR](#).

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

V[d, datasize] = result;

```

USDOT (by element)

Dot Product index form with unsigned and signed integers. This instruction performs the dot product of the four unsigned 8-bit integer values in each 32-bit element of the first source register with the four signed 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. *ID\_AA64ISAR1\_EL1*.I8MM indicates whether this instruction is supported.

Vector  
(FEAT\_I8MM)

USDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.**4B**[<index>]

```
if !HaveInt8MatMulExt() then UNDEFINED;

### Operational information

- If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

USHLL, USHLL2

Unsigned Shift Left Long (immediate). This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, shifts the unsigned integer value left by the specified number of bits, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The USHLL instruction extracts vector elements from the lower half of the source register. The USHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR EL1, CPTR EL2, and CPTR EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias UXTL, UXTL2.

USHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #<shift>

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE(asimdimh);

USHR

Unsigned Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see [URSHR](#).

Depending on the settings in the [CPACR\\_EL1](#), [CPTR\\_EL2](#), and [CPTR\\_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

USHR <V><d>, <V><n>, #<shift>

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Vector

USHR <Vd>.<T>, <Vn>.<T>, #<shift>

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE(asimdimm);
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Assembler Symbols

<V> Is a width specifier, encoded in “immh”:

immh	<V>
0xxx	RESERVED
1xxx	D

- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in "immh:Q":

    element = RShr(Int(Elem[operand, e, esize], unsigned), shift, round);
    Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;

V[d, datasize] = result;

```

### Operational information

- If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

USMMLA (vector)

Unsigned and signed 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element. From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. *ID\_AA64ISAR1\_EL1*.I8MM indicates whether this instruction is supported.

Vector  
(FEAT\_I8MM)

USMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B

```
if !HaveInt8MatMulExt() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);
```

Assembler Symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(128) operand1 = V[n, 128];
bits(128) operand2 = V[m, 128];
bits(128) addend = V[d, 128];

V[d, 128] = MatMulAdd(addend, operand1, operand2, TRUE, FALSE);
```

Operational information

Arm expects that the USMMLA (vector) instruction will deliver a peak integer multiply throughput that is at least as high as can be achieved using two USDOT (vector) instructions, with a goal that it should have significantly higher throughput.

USQADD

Unsigned saturating Accumulate of Signed value. This instruction adds the signed integer values of the vector elements in the source SIMD&FP register to corresponding unsigned integer values of the vector elements in the destination SIMD&FP register, and accumulates the resulting unsigned integer values with the vector elements of the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit *FPSR.QC* is set.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Scalar](#) and [Vector](#)

Scalar

USQADD <V><d>, <V><n>

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 8 << UInt(size);
integer datasize = esize;

UXTL, UXTL2

Unsigned extend Long. This instruction copies each vector element from the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The UXTL instruction extracts vector elements from the lower half of the source register. The UXTL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR\_EL1, CPTR\_EL2, and CPTR\_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of USHLL, USHLL2. This means:

- The encodings in this description are named to match the encodings of USHLL, USHLL2.
- The description of USHLL, USHLL2 gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

UZP1

Unzip vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

Note

This instruction can be used with UZP2 to de-interleave two vectors.  
The following figure shows an example of the operation of UZP1 and UZP2 with the arrangement specifier 8B.

UZP1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operandl = V[n, datasize];
bits(datasize) operandh = V[m, datasize];
bits(datasize) result;

bits(datasize*2) zipped = operandh:operandl;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[zipped, 2*e+part, esize];

V[d, datasize] = result;
```

UZP2

Unzip vectors (secondary). This instruction reads corresponding odd-numbered vector elements from the two source SIMD&FP registers, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

Note

This instruction can be used with UZP1 to de-interleave two vectors.  
The following figure shows an example of the operation of UZP1 and UZP2 with the arrangement specifier 8B.

UZP2 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
```

Assembler Symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in "size:Q":

size	Q	<T>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	0	RESERVED
11	1	2D

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operandl = V[n, datasize];
bits(datasize) operandh = V[m, datasize];
bits(datasize) result;

bits(datasize*2) zipped = operandh:operandl;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[zipped, 2*e+part, esize];

V[d, datasize] = result;
```

## Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v33.64, AdvSIMD v29.12, pseudocode v2023-06\_rel, sve v2023-06\_rel ; Build timestamp: 2023-07-04T19:42

XAR

Exclusive-OR and Rotate performs a bitwise exclusive-OR of the 128-bit vectors in the two source SIMD&FP registers, rotates each 64-bit element of the resulting 128-bit vector right by the value specified by a 6-bit immediate value, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when **FEAT\_SHA3** is implemented.

Advanced SIMD  
(FEAT\_SHA3)

XAR <Vd>.2D, <Vn>.2D, <Vm>.2D, #<imm6>

```
if !HaveSHA3Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
```

Assembler Symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
- <imm6> Is a rotation right, encoded in "imm6".

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) Vm = V[m, 128];
bits(128) Vn = V[n, 128];
bits(128) tmp;
tmp = Vn EOR Vm;
V[d, 128] = ROR(tmp<127:64>, UInt(imm6)):ROR(tmp<63:0>, UInt(imm6));
```

Operational information

- If PSTATE.DIT is 1:

    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

XTN, XTN2

Extract Narrow. This instruction reads each vector element from the source SIMD&FP register, narrows each value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The `XTN` instruction writes the vector to the lower half of the destination register and clears the upper half, while the `XTN2` instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	Q	0	0	1	1	1	0	size	1	0	0	0	0	1	0	0	1	0	1	0	Rn					Rd					

`XTN{2} <Vd>.<Tb>, <Vn>.<Ta>`

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

Assembler Symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in “Q”:

Q 2	
0	[absent]
1	[present]

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in “size:Q”:

size	Q	<Tb>
00	0	8B
00	1	16B
01	0	4H
01	1	8H
10	0	2S
10	1	4S
11	x	RESERVED

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in “size”:

size	<Ta>
00	8H
01	4S
10	2D
11	RESERVED

## Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand = V[n, 2*datasize];
bits(datasize) result;
bits(2*esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, 2*esize];
    Elem[result, e, esize] = element<esize-1:0>;
Vpart[d, part, datasize] = result;
```

ZIP1

Zip vectors (primary). This instruction reads adjacent vector elements from the lower half of two source SIMD&FP registers as pairs, interleaves the pairs and places them into a vector, and writes the vector to the destination SIMD&FP register. The first pair from the first source register is placed into the two lowest vector elements, with subsequent pairs taken alternately from each source register.

**Note**

This instruction can be used with ZIP2 to interleave two vectors.

The following figure shows an example of the operation of ZIP1 and ZIP2 with the arrangement specifier 8B.

```
ZIP1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
integer pairs = elements DIV 2;
```

Assembler Symbols

## A64 -- SVE Instructions (alphabetic order)

[ABS](#): Absolute value (predicated).

[ADCLB](#): Add with carry long (bottom).

[ADCLT](#): Add with carry long (top).

[ADD \(immediate\)](#): Add immediate (unpredicated).

[ADD \(vectors, predicated\)](#): Add vectors (predicated).

[ADD \(vectors, unpredicated\)](#): Add vectors (unpredicated).

[ADDHNB](#): Add narrow high part (bottom).

[ADDHNT](#): Add narrow high part (top).

[ADDP](#): Add pairwise.

[ADDPL](#): Add multiple of predicate register size to scalar register.

[ADDQV](#): Unsigned add reduction of quadword vector segments.

[ADDVL](#): Add multiple of vector register size to scalar register.

[ADR](#): Compute vector address.

[AESD](#): AES single round decryption.

[AESE](#): AES single round encryption.

[AESIMC](#): AES inverse mix columns.

[AESMC](#): AES mix columns.

[AND \(immediate\)](#): Bitwise AND with immediate (unpredicated).

[AND \(predicates\)](#): Bitwise AND predicates.

[AND \(vectors, predicated\)](#): Bitwise AND vectors (predicated).

[AND \(vectors, unpredicated\)](#): Bitwise AND vectors (unpredicated).

[ANDQV](#): Bitwise AND reduction of quadword vector segments.

[ANDS](#): Bitwise AND predicates, setting the condition flags.

[ANDV](#): Bitwise AND reduction to scalar.

[ASR \(immediate, predicated\)](#): Arithmetic shift right by immediate (predicated).

[ASR \(immediate, unpredicated\)](#): Arithmetic shift right by immediate (unpredicated).

[ASR \(vectors\)](#): Arithmetic shift right by vector (predicated).

[ASR \(wide elements, predicated\)](#): Arithmetic shift right by 64-bit wide elements (predicated).

[ASR \(wide elements, unpredicated\)](#): Arithmetic shift right by 64-bit wide elements (unpredicated).

[ASRD](#): Arithmetic shift right for divide by immediate (predicated).

[ASRR](#): Reversed arithmetic shift right by vector (predicated).

[BCAX](#): Bitwise clear and exclusive OR.

[BDEP](#): Scatter lower bits into positions selected by bitmask.

[BEXT](#): Gather lower bits from positions selected by bitmask.

[BFADD \(predicated\)](#): BFloat16 floating-point add vectors (predicated).

[BFADD \(unpredicated\)](#): BFloat16 floating-point add vectors (unpredicated).

[BFCLAMP](#): BFloat16 floating-point clamp to minimum/maximum number.

[BFCVT](#): Floating-point down convert to BFloat16 format (predicated).

[BFCVTNT](#): Floating-point down convert and narrow to BFloat16 (top, predicated).

[BFDOT \(indexed\)](#): BFloat16 floating-point indexed dot product.

[BFDOT \(vectors\)](#): BFloat16 floating-point dot product.

[BFMAX](#): BFloat16 floating-point maximum (predicated).

[BFMAXNM](#): BFloat16 floating-point maximum number (predicated).

[BFMIN](#): BFloat16 floating-point minimum (predicated).

[BFMINNM](#): BFloat16 floating-point minimum number (predicated).

[BFMLA \(indexed\)](#): BFloat16 floating-point fused multiply-add vectors by indexed elements.

[BFMLA \(vectors\)](#): BFloat16 floating-point fused multiply-add vectors.

[BFMLALB \(indexed\)](#): BFloat16 floating-point multiply-add long to single-precision (bottom, indexed).

[BFMLALB \(vectors\)](#): BFloat16 floating-point multiply-add long to single-precision (bottom).

[BFMLALT \(indexed\)](#): BFloat16 floating-point multiply-add long to single-precision (top, indexed).

[BFMLALT \(vectors\)](#): BFloat16 floating-point multiply-add long to single-precision (top).

[BFMLS \(indexed\)](#): BFloat16 floating-point fused multiply-subtract vectors by indexed elements.

[BFMLS \(vectors\)](#): BFloat16 floating-point fused multiply-subtract vectors.

[BFMLSLB \(indexed\)](#): BFloat16 floating-point multiply-subtract long from single-precision (bottom, indexed).

[BFMLSLB \(vectors\)](#): BFloat16 floating-point multiply-subtract long from single-precision (bottom).

[BFMLSLT \(indexed\)](#): BFloat16 floating-point multiply-subtract long from single-precision (top, indexed).

[BFMLSLT \(vectors\)](#): BFloat16 floating-point multiply-subtract long from single-precision (top).

[BFMMLA](#): BFloat16 floating-point matrix multiply-accumulate into 2×2 matrices.

[BFMUL \(indexed\)](#): BFloat16 floating-point multiply vectors by indexed elements.

[BFMUL \(vectors, predicated\)](#): BFloat16 floating-point multiply vectors (predicated).

[BFMUL \(vectors, unpredicated\)](#): BFloat16 floating-point multiply vectors (unpredicated).

[BFSUB \(predicated\)](#): BFloat16 floating-point subtract vectors (predicated).

[BFSUB \(unpredicated\)](#): BFloat16 floating-point subtract vectors (unpredicated).

[BGRP](#): Group bits to right or left as selected by bitmask.

[BIC \(immediate\)](#): Bitwise clear bits using immediate (unpredicated): an alias of AND (immediate).

[BIC \(predicates\)](#): Bitwise clear predicates.

[BIC \(vectors, predicated\)](#): Bitwise clear vectors (predicated).

[BIC \(vectors, unpredicated\)](#): Bitwise clear vectors (unpredicated).

[BICS](#): Bitwise clear predicates, setting the condition flags.

[BRKA](#): Break after first true condition.

[BRKAS](#): Break after first true condition, setting the condition flags.

[BRKB](#): Break before first true condition.

[BRKBS](#): Break before first true condition, setting the condition flags.

[BRKN](#): Propagate break to next partition.

[BRKNS](#): Propagate break to next partition, setting the condition flags.

[BRKPA](#): Break after first true condition, propagating from previous partition.

[BRKPAS](#): Break after first true condition, propagating from previous partition and setting the condition flags.

[BRKPB](#): Break before first true condition, propagating from previous partition.

[BRKPBS](#): Break before first true condition, propagating from previous partition and setting the condition flags.

[BSL](#): Bitwise select.

[BSL1N](#): Bitwise select with first input inverted.

[BSL2N](#): Bitwise select with second input inverted.

[CADD](#): Complex integer add with rotate.

[CDOT \(indexed\)](#): Complex integer dot product (indexed).

[CDOT \(vectors\)](#): Complex integer dot product.

[CLASTA \(scalar\)](#): Conditionally extract element after last to general-purpose register.

[CLASTA \(SIMD&FP scalar\)](#): Conditionally extract element after last to SIMD&FP scalar register.

[CLASTA \(vectors\)](#): Conditionally extract element after last to vector register.

[CLASTB \(scalar\)](#): Conditionally extract last element to general-purpose register.

[CLASTB \(SIMD&FP scalar\)](#): Conditionally extract last element to SIMD&FP scalar register.

[CLASTB \(vectors\)](#): Conditionally extract last element to vector register.

[CLS](#): Count leading sign bits (predicated).

[CLZ](#): Count leading zero bits (predicated).

[CMLA \(indexed\)](#): Complex integer multiply-add with rotate (indexed).

[CMLA \(vectors\)](#): Complex integer multiply-add with rotate.

[CMP<cc> \(immediate\)](#): Compare vector to immediate.

[CMP<cc> \(vectors\)](#): Compare vectors.

[CMP<cc> \(wide elements\)](#): Compare vector to 64-bit wide elements.

[CMPLE \(vectors\)](#): Compare signed less than or equal to vector, setting the condition flags: an alias of CMP<cc> (vectors).

[CMPLO \(vectors\)](#): Compare unsigned lower than vector, setting the condition flags: an alias of CMP<cc> (vectors).

[CMPLS \(vectors\)](#): Compare unsigned lower or same as vector, setting the condition flags: an alias of CMP<cc> (vectors).

[CMPLT \(vectors\)](#): Compare signed less than vector, setting the condition flags: an alias of CMP<cc> (vectors).

[CNOT](#): Logically invert boolean condition in vector (predicated).

[CNT](#): Count non-zero bits (predicated).

[CNTB, CNTD, CNTH, CNTW](#): Set scalar to multiple of predicate constraint element count.

[CNTP \(predicate as counter\)](#): Set scalar to count from predicate-as-counter.

[CNTP \(predicate\)](#): Set scalar to count of true predicate elements.

[COMPACT](#): Shuffle active elements of vector to the right and fill with zero.

[CPY \(immediate, merging\)](#): Copy signed integer immediate to vector elements (merging).

[CPY \(immediate, zeroing\)](#): Copy signed integer immediate to vector elements (zeroing).

[CPY \(scalar\)](#): Copy general-purpose register to vector elements (predicated).

[CPY \(SIMD&FP scalar\)](#): Copy SIMD&FP scalar register to vector elements (predicated).

[CTERMEQ, CTERMNE](#): Compare and terminate loop.

[DECB, DECD, DECH, DECW \(scalar\)](#): Decrement scalar by multiple of predicate constraint element count.

[DECD, DECH, DECW \(vector\)](#): Decrement vector by multiple of predicate constraint element count.

[DECP \(scalar\)](#): Decrement scalar by count of true predicate elements.

[DECP \(vector\)](#): Decrement vector by count of true predicate elements.

[DUP \(immediate\)](#): Broadcast signed immediate to vector elements (unpredicated).

[DUP \(indexed\)](#): Broadcast indexed element to vector (unpredicated).

[DUP \(scalar\)](#): Broadcast general-purpose register to vector elements (unpredicated).

[DUPM](#): Broadcast logical bitmask immediate to vector (unpredicated).

[DUPQ](#): Broadcast indexed element within each quadword vector segment (unpredicated).

[EON](#): Bitwise exclusive OR with inverted immediate (unpredicated); an alias of EOR (immediate).

[EOR \(immediate\)](#): Bitwise exclusive OR with immediate (unpredicated).

[EOR \(predicates\)](#): Bitwise exclusive OR predicates.

[EOR \(vectors, predicated\)](#): Bitwise exclusive OR vectors (predicated).

[EOR \(vectors, unpredicated\)](#): Bitwise exclusive OR vectors (unpredicated).

[EOR3](#): Bitwise exclusive OR of three vectors.

[EORBT](#): Interleaving exclusive OR (bottom, top).

[EORQV](#): Bitwise exclusive OR reduction of quadword vector segments.

[EORS](#): Bitwise exclusive OR predicates, setting the condition flags.

[EORTB](#): Interleaving exclusive OR (top, bottom).

[EORV](#): Bitwise exclusive OR reduction to scalar.

[EXT](#): Extract vector from pair of vectors.

[EXTQ](#): Extract vector segment from each pair of quadword vector segments.

[FABD](#): Floating-point absolute difference (predicated).

[FABS](#): Floating-point absolute value (predicated).

[FAC<cc>](#): Floating-point absolute compare vectors.

[FACLE](#): Floating-point absolute compare less than or equal: an alias of FAC<cc>.

[FACLT](#): Floating-point absolute compare less than: an alias of FAC<cc>.

[FADD \(immediate\)](#): Floating-point add immediate (predicated).

[FADD \(vectors, predicated\)](#): Floating-point add vector (predicated).

[FADD \(vectors, unpredicated\)](#): Floating-point add vector (unpredicated).

[FADDA](#): Floating-point add strictly-ordered reduction, accumulating in scalar.

[FADDP](#): Floating-point add pairwise.

[FADDQV](#): Floating-point add recursive reduction of quadword vector segments.

[FADDV](#): Floating-point add recursive reduction to scalar.

[FCADD](#): Floating-point complex add with rotate (predicated).

[FCLAMP](#): Floating-point clamp to minimum/maximum number.

[FCM<cc> \(vectors\)](#): Floating-point compare vectors.

[FCM<cc> \(zero\)](#): Floating-point compare vector with zero.

[FCMLA \(indexed\)](#): Floating-point complex multiply-add by indexed values with rotate.

[FCMLA \(vectors\)](#): Floating-point complex multiply-add with rotate (predicated).

[FCMLE \(vectors\)](#): Floating-point compare less than or equal to vector: an alias of FCM<cc> (vectors).

[FCMLT \(vectors\)](#): Floating-point compare less than vector: an alias of FCM<cc> (vectors).

[FCPY](#): Copy 8-bit floating-point immediate to vector elements (predicated).

[FCVT](#): Floating-point convert precision (predicated).

[FCVTLT](#): Floating-point up convert long (top, predicated).

[FCVTNT](#): Floating-point down convert and narrow (top, predicated).

[FCVTX](#): Floating-point down convert, rounding to odd (predicated).

[FCVTXNT](#): Floating-point down convert, rounding to odd (top, predicated).

[FCVTZS](#): Floating-point convert to signed integer, rounding toward zero (predicated).

[FCVTZU](#): Floating-point convert to unsigned integer, rounding toward zero (predicated).

[FDIV](#): Floating-point divide by vector (predicated).

[FDIVR](#): Floating-point reversed divide by vector (predicated).

[FDOT \(indexed\)](#): Half-precision floating-point indexed dot product.

[FDOT \(vectors\)](#): Half-precision floating-point dot product.

[FDUP](#): Broadcast 8-bit floating-point immediate to vector elements (unpredicated).

[FEXPA](#): Floating-point exponential accelerator.

[FLOGB](#): Floating-point base 2 logarithm as integer.

[FMAD](#): Floating-point fused multiply-add vectors (predicated), writing multiplicand [ $Z_{dn} = Z_a + Z_{dn} * Z_m$ ].

[FMAX \(immediate\)](#): Floating-point maximum with immediate (predicated).

[FMAX \(vectors\)](#): Floating-point maximum (predicated).

[FMAXNM \(immediate\)](#): Floating-point maximum number with immediate (predicated).

[FMAXNM \(vectors\)](#): Floating-point maximum number (predicated).

[FMAXNMP](#): Floating-point maximum number pairwise.

[FMAXNMQV](#): Floating-point maximum number recursive reduction of quadword vector segments.

[FMAXNMV](#): Floating-point maximum number recursive reduction to scalar.

[FMAXP](#): Floating-point maximum pairwise.

[FMAXQV](#): Floating-point maximum reduction of quadword vector segments.

[FMAXV](#): Floating-point maximum recursive reduction to scalar.

[FMIN \(immediate\)](#): Floating-point minimum with immediate (predicated).

[FMIN \(vectors\)](#): Floating-point minimum (predicated).

[FMINNM \(immediate\)](#): Floating-point minimum number with immediate (predicated).

[FMINNM \(vectors\)](#): Floating-point minimum number (predicated).

[FMINNMP](#): Floating-point minimum number pairwise.

[FMINNMQV](#): Floating-point minimum number recursive reduction of quadword vector segments.

[FMINNMV](#): Floating-point minimum number recursive reduction to scalar.

[FMINP](#): Floating-point minimum pairwise.

[FMINQV](#): Floating-point minimum recursive reduction of quadword vector segments.

[FMINV](#): Floating-point minimum recursive reduction to scalar.

[FMLA \(indexed\)](#): Floating-point fused multiply-add by indexed elements ( $Z_{da} = Z_{da} + Z_n * Z_m[\text{indexed}]$ ).

[FMLA \(vectors\)](#): Floating-point fused multiply-add vectors (predicated), writing addend [ $Z_{da} = Z_{da} + Z_n * Z_m$ ].

[FMLALB \(indexed\)](#): Half-precision floating-point multiply-add long to single-precision (bottom, indexed).

[FMLALB \(vectors\)](#): Half-precision floating-point multiply-add long to single-precision (bottom).

[FMLALT \(indexed\)](#): Half-precision floating-point multiply-add long to single-precision (top, indexed).

[FMLALT \(vectors\)](#): Half-precision floating-point multiply-add long to single-precision (top).

[FMLS \(indexed\)](#): Floating-point fused multiply-subtract by indexed elements ( $Z_{da} = Z_{da} + -Z_n * Z_m[\text{indexed}]$ ).

[FMLS \(vectors\)](#): Floating-point fused multiply-subtract vectors (predicated), writing addend [ $Z_{da} = Z_{da} + -Z_n * Z_m$ ].

[FMLS LB \(indexed\)](#): Half-precision floating-point multiply-subtract long from single-precision (bottom, indexed).

[FMLS LB \(vectors\)](#): Half-precision floating-point multiply-subtract long from single-precision (bottom).

[FMLS LT \(indexed\)](#): Half-precision floating-point multiply-subtract long from single-precision (top, indexed).

[FMLS LT \(vectors\)](#): Half-precision floating-point multiply-subtract long from single-precision (top).

[FMMLA](#): Floating-point matrix multiply-accumulate.

[FMOV \(immediate, predicated\)](#): Move 8-bit floating-point immediate to vector elements (predicated): an alias of FCPY.

[FMOV \(immediate, unpredicated\)](#): Move 8-bit floating-point immediate to vector elements (unpredicated): an alias of FDUP.

[FMOV \(zero, predicated\)](#): Move floating-point +0.0 to vector elements (predicated): an alias of CPY (immediate, merging).

[FMOV \(zero, unpredicated\)](#): Move floating-point +0.0 to vector elements (unpredicated): an alias of DUP (immediate).

[FMSB](#): Floating-point fused multiply-subtract vectors (predicated), writing multiplicand [ $Z_{dn} = Z_a + -Z_{dn} * Z_m$ ].

[FMUL \(immediate\)](#): Floating-point multiply by immediate (predicated).

[FMUL \(indexed\)](#): Floating-point multiply by indexed elements.

[FMUL \(vectors, predicated\)](#): Floating-point multiply vectors (predicated).

[FMUL \(vectors, unpredicated\)](#): Floating-point multiply vectors (unpredicated).

[FMULX](#): Floating-point multiply-extended vectors (predicated).

[FNEG](#): Floating-point negate (predicated).

[FNMAD](#): Floating-point negated fused multiply-add vectors (predicated), writing multiplicand [ $Z_{dn} = -Z_a + -Z_{dn} * Z_m$ ].

[FNMLA](#): Floating-point negated fused multiply-add vectors (predicated), writing addend [ $Z_{da} = -Z_{da} + -Z_n * Z_m$ ].

[FNMLS](#): Floating-point negated fused multiply-subtract vectors (predicated), writing addend [ $Z_{da} = -Z_{da} + Z_n * Z_m$ ].

[FNMSB](#): Floating-point negated fused multiply-subtract vectors (predicated), writing multiplicand [ $Z_{dn} = -Z_a + Z_{dn} * Z_m$ ].

[FRECPE](#): Floating-point reciprocal estimate (unpredicated).

[FRECPS](#): Floating-point reciprocal step (unpredicated).

[FRECPSX](#): Floating-point reciprocal exponent (predicated).

[FRINT<r>](#): Floating-point round to integral value (predicated).

[FRSQRT](#): Floating-point reciprocal square root estimate (unpredicated).

[FRSQRTS](#): Floating-point reciprocal square root step (unpredicated).

[FSCALE](#): Floating-point adjust exponent by vector (predicated).

[FSQRT](#): Floating-point square root (predicated).

[FSUB \(immediate\)](#): Floating-point subtract immediate (predicated).

[FSUB \(vectors, predicated\)](#): Floating-point subtract vectors (predicated).

[FSUB \(vectors, unpredicated\)](#): Floating-point subtract vectors (unpredicated).

[FSUBR \(immediate\)](#): Floating-point reversed subtract from immediate (predicated).

[FSUBR \(vectors\)](#): Floating-point reversed subtract vectors (predicated).

[FTMAD](#): Floating-point trigonometric multiply-add coefficient.

[FTSMUL](#): Floating-point trigonometric starting value.

[FTSSEL](#): Floating-point trigonometric select coefficient.

[HISTCNT](#): Count matching elements in vector.

[HISTSEG](#): Count matching elements in vector segments.

[INCB, INCD, INCH, INCW \(scalar\)](#): Increment scalar by multiple of predicate constraint element count.

[INCD, INCH, INCW \(vector\)](#): Increment vector by multiple of predicate constraint element count.

[INCP \(scalar\)](#): Increment scalar by count of true predicate elements.

[INCP \(vector\)](#): Increment vector by count of true predicate elements.

[INDEX \(immediate, scalar\)](#): Create index starting from immediate and incremented by general-purpose register.

[INDEX \(immediates\)](#): Create index starting from and incremented by immediate.

[INDEX \(scalar, immediate\)](#): Create index starting from general-purpose register and incremented by immediate.

[INDEX \(scalars\)](#): Create index starting from and incremented by general-purpose register.

[INSR \(scalar\)](#): Insert general-purpose register in shifted vector.

[INSR \(SIMD&FP scalar\)](#): Insert SIMD&FP scalar register in shifted vector.

[LASTA \(scalar\)](#): Extract element after last to general-purpose register.

[LASTA \(SIMD&FP scalar\)](#): Extract element after last to SIMD&FP scalar register.

[LASTB \(scalar\)](#): Extract last element to general-purpose register.

[LASTB \(SIMD&FP scalar\)](#): Extract last element to SIMD&FP scalar register.

[LD1B \(scalar plus immediate, consecutive registers\)](#): Contiguous load of bytes to multiple consecutive vectors (immediate index).

[LD1B \(scalar plus immediate, single register\)](#): Contiguous load unsigned bytes to vector (immediate index).

[LD1B \(scalar plus scalar, consecutive registers\)](#): Contiguous load of bytes to multiple consecutive vectors (scalar index).

[LD1B \(scalar plus scalar, single register\)](#): Contiguous load unsigned bytes to vector (scalar index).

[LD1B \(scalar plus vector\)](#): Gather load unsigned bytes to vector (vector index).

[LD1B \(vector plus immediate\)](#): Gather load unsigned bytes to vector (immediate index).

[LD1D \(scalar plus immediate, consecutive registers\)](#): Contiguous load of doublewords to multiple consecutive vectors (immediate index).

[LD1D \(scalar plus immediate, single register\)](#): Contiguous load unsigned doublewords to vector (immediate index).

[LD1D \(scalar plus scalar, consecutive registers\)](#): Contiguous load of doublewords to multiple consecutive vectors (scalar index).

[LD1D \(scalar plus scalar, single register\)](#): Contiguous load unsigned doublewords to vector (scalar index).

[LD1D \(scalar plus vector\)](#): Gather load doublewords to vector (vector index).

[LD1D \(vector plus immediate\)](#): Gather load doublewords to vector (immediate index).

[LD1H \(scalar plus immediate, consecutive registers\)](#): Contiguous load of halfwords to multiple consecutive vectors (immediate index).

[LD1H \(scalar plus immediate, single register\)](#): Contiguous load unsigned halfwords to vector (immediate index).

[LD1H \(scalar plus scalar, consecutive registers\)](#): Contiguous load of halfwords to multiple consecutive vectors (scalar index).

[LD1H \(scalar plus scalar, single register\)](#): Contiguous load unsigned halfwords to vector (scalar index).

[LD1H \(scalar plus vector\)](#): Gather load unsigned halfwords to vector (vector index).

[LD1H \(vector plus immediate\)](#): Gather load unsigned halfwords to vector (immediate index).

[LD1Q](#): Gather load quadwords.

[LD1RB](#): Load and broadcast unsigned byte to vector.

[LD1RD](#): Load and broadcast doubleword to vector.

[LD1RH](#): Load and broadcast unsigned halfword to vector.

[LD1ROB \(scalar plus immediate\)](#): Contiguous load and replicate thirty-two bytes (immediate index).

[LD1ROB \(scalar plus scalar\)](#): Contiguous load and replicate thirty-two bytes (scalar index).

[LD1ROD \(scalar plus immediate\)](#): Contiguous load and replicate four doublewords (immediate index).

[LD1ROD \(scalar plus scalar\)](#): Contiguous load and replicate four doublewords (scalar index).

[LD1ROH \(scalar plus immediate\)](#): Contiguous load and replicate sixteen halfwords (immediate index).

[LD1ROH \(scalar plus scalar\)](#): Contiguous load and replicate sixteen halfwords (scalar index).

[LD1ROW \(scalar plus immediate\)](#): Contiguous load and replicate eight words (immediate index).

[LD1ROW \(scalar plus scalar\)](#): Contiguous load and replicate eight words (scalar index).

[LD1ROB \(scalar plus immediate\)](#): Contiguous load and replicate sixteen bytes (immediate index).

[LD1ROB \(scalar plus scalar\)](#): Contiguous load and replicate sixteen bytes (scalar index).

[LD1ROD \(scalar plus immediate\)](#): Contiguous load and replicate two doublewords (immediate index).

[LD1ROD \(scalar plus scalar\)](#): Contiguous load and replicate two doublewords (scalar index).

[LD1ROH \(scalar plus immediate\)](#): Contiguous load and replicate eight halfwords (immediate index).

[LD1ROH \(scalar plus scalar\)](#): Contiguous load and replicate eight halfwords (scalar index).

[LD1RQW \(scalar plus immediate\)](#): Contiguous load and replicate four words (immediate index).

[LD1RQW \(scalar plus scalar\)](#): Contiguous load and replicate four words (scalar index).

[LD1RSB](#): Load and broadcast signed byte to vector.

[LD1RSH](#): Load and broadcast signed halfword to vector.

[LD1RSW](#): Load and broadcast signed word to vector.

[LD1RW](#): Load and broadcast unsigned word to vector.

[LD1SB \(scalar plus immediate\)](#): Contiguous load signed bytes to vector (immediate index).

[LD1SB \(scalar plus scalar\)](#): Contiguous load signed bytes to vector (scalar index).

[LD1SB \(scalar plus vector\)](#): Gather load signed bytes to vector (vector index).

[LD1SB \(vector plus immediate\)](#): Gather load signed bytes to vector (immediate index).

[LD1SH \(scalar plus immediate\)](#): Contiguous load signed halfwords to vector (immediate index).

[LD1SH \(scalar plus scalar\)](#): Contiguous load signed halfwords to vector (scalar index).

[LD1SH \(scalar plus vector\)](#): Gather load signed halfwords to vector (vector index).

[LD1SH \(vector plus immediate\)](#): Gather load signed halfwords to vector (immediate index).

[LD1SW \(scalar plus immediate\)](#): Contiguous load signed words to vector (immediate index).

[LD1SW \(scalar plus scalar\)](#): Contiguous load signed words to vector (scalar index).

[LD1SW \(scalar plus vector\)](#): Gather load signed words to vector (vector index).

[LD1SW \(vector plus immediate\)](#): Gather load signed words to vector (immediate index).

[LD1W \(scalar plus immediate, consecutive registers\)](#): Contiguous load of words to multiple consecutive vectors (immediate index).

[LD1W \(scalar plus immediate, single register\)](#): Contiguous load unsigned words to vector (immediate index).

[LD1W \(scalar plus scalar, consecutive registers\)](#): Contiguous load of words to multiple consecutive vectors (scalar index).

[LD1W \(scalar plus scalar, single register\)](#): Contiguous load unsigned words to vector (scalar index).

[LD1W \(scalar plus vector\)](#): Gather load unsigned words to vector (vector index).

[LD1W \(vector plus immediate\)](#): Gather load unsigned words to vector (immediate index).

[LD2B \(scalar plus immediate\)](#): Contiguous load two-byte structures to two vectors (immediate index).

[LD2B \(scalar plus scalar\)](#): Contiguous load two-byte structures to two vectors (scalar index).

[LD2D \(scalar plus immediate\)](#): Contiguous load two-doubleword structures to two vectors (immediate index).

[LD2D \(scalar plus scalar\)](#): Contiguous load two-doubleword structures to two vectors (scalar index).

[LD2H \(scalar plus immediate\)](#): Contiguous load two-halfword structures to two vectors (immediate index).

[LD2H \(scalar plus scalar\)](#): Contiguous load two-halfword structures to two vectors (scalar index).

[LD2Q \(scalar plus immediate\)](#): Contiguous load two-quadword structures to two vectors (immediate index).

[LD2Q \(scalar plus scalar\)](#): Contiguous load two-quadword structures to two vectors (scalar index).

[LD2W \(scalar plus immediate\)](#): Contiguous load two-word structures to two vectors (immediate index).

[LD2W \(scalar plus scalar\)](#): Contiguous load two-word structures to two vectors (scalar index).

[LD3B \(scalar plus immediate\)](#): Contiguous load three-byte structures to three vectors (immediate index).

[LD3B \(scalar plus scalar\)](#): Contiguous load three-byte structures to three vectors (scalar index).

[LD3D \(scalar plus immediate\)](#): Contiguous load three-doubleword structures to three vectors (immediate index).

[LD3D \(scalar plus scalar\)](#): Contiguous load three-doubleword structures to three vectors (scalar index).

[LD3H \(scalar plus immediate\)](#): Contiguous load three-halfword structures to three vectors (immediate index).

[LD3H \(scalar plus scalar\)](#): Contiguous load three-halfword structures to three vectors (scalar index).

[LD3Q \(scalar plus immediate\)](#): Contiguous load three-quadword structures to three vectors (immediate index).

[LD3Q \(scalar plus scalar\)](#): Contiguous load three-quadword structures to three vectors (scalar index).

[LD3W \(scalar plus immediate\)](#): Contiguous load three-word structures to three vectors (immediate index).

[LD3W \(scalar plus scalar\)](#): Contiguous load three-word structures to three vectors (scalar index).

[LD4B \(scalar plus immediate\)](#): Contiguous load four-byte structures to four vectors (immediate index).

[LD4B \(scalar plus scalar\)](#): Contiguous load four-byte structures to four vectors (scalar index).

[LD4D \(scalar plus immediate\)](#): Contiguous load four-doubleword structures to four vectors (immediate index).

[LD4D \(scalar plus scalar\)](#): Contiguous load four-doubleword structures to four vectors (scalar index).

[LD4H \(scalar plus immediate\)](#): Contiguous load four-halfword structures to four vectors (immediate index).

[LD4H \(scalar plus scalar\)](#): Contiguous load four-halfword structures to four vectors (scalar index).

[LD4Q \(scalar plus immediate\)](#): Contiguous load four-quadword structures to four vectors (immediate index).

[LD4Q \(scalar plus scalar\)](#): Contiguous load four-quadword structures to four vectors (scalar index).

[LD4W \(scalar plus immediate\)](#): Contiguous load four-word structures to four vectors (immediate index).

[LD4W \(scalar plus scalar\)](#): Contiguous load four-word structures to four vectors (scalar index).

[LDFF1B \(scalar plus scalar\)](#): Contiguous load first-fault unsigned bytes to vector (scalar index).

[LDFF1B \(scalar plus vector\)](#): Gather load first-fault unsigned bytes to vector (vector index).

[LDFF1B \(vector plus immediate\)](#): Gather load first-fault unsigned bytes to vector (immediate index).

[LDFF1D \(scalar plus scalar\)](#): Contiguous load first-fault doublewords to vector (scalar index).

[LDFF1D \(scalar plus vector\)](#): Gather load first-fault doublewords to vector (vector index).

[LDFF1D \(vector plus immediate\)](#): Gather load first-fault doublewords to vector (immediate index).

[LDFF1H \(scalar plus scalar\)](#): Contiguous load first-fault unsigned halfwords to vector (scalar index).

[LDFF1H \(scalar plus vector\)](#): Gather load first-fault unsigned halfwords to vector (vector index).

[LDFF1H \(vector plus immediate\)](#): Gather load first-fault unsigned halfwords to vector (immediate index).

[LDFF1SB \(scalar plus scalar\)](#): Contiguous load first-fault signed bytes to vector (scalar index).

[LDFF1SB \(scalar plus vector\)](#): Gather load first-fault signed bytes to vector (vector index).

[LDFF1SB \(vector plus immediate\)](#): Gather load first-fault signed bytes to vector (immediate index).

[LDFF1SH \(scalar plus scalar\)](#): Contiguous load first-fault signed halfwords to vector (scalar index).

[LDFF1SH \(scalar plus vector\)](#): Gather load first-fault signed halfwords to vector (vector index).

[LDFF1SH \(vector plus immediate\)](#): Gather load first-fault signed halfwords to vector (immediate index).

[LDFF1SW \(scalar plus scalar\)](#): Contiguous load first-fault signed words to vector (scalar index).

[LDFF1SW \(scalar plus vector\)](#): Gather load first-fault signed words to vector (vector index).

[LDFF1SW \(vector plus immediate\)](#): Gather load first-fault signed words to vector (immediate index).

[LDFF1W \(scalar plus scalar\)](#): Contiguous load first-fault unsigned words to vector (scalar index).

[LDFF1W \(scalar plus vector\)](#): Gather load first-fault unsigned words to vector (vector index).

[LDFF1W \(vector plus immediate\)](#): Gather load first-fault unsigned words to vector (immediate index).

[LDNF1B](#): Contiguous load non-fault unsigned bytes to vector (immediate index).

[LDNF1D](#): Contiguous load non-fault doublewords to vector (immediate index).

[LDNF1H](#): Contiguous load non-fault unsigned halfwords to vector (immediate index).

[LDNF1SB](#): Contiguous load non-fault signed bytes to vector (immediate index).

[LDNF1SH](#): Contiguous load non-fault signed halfwords to vector (immediate index).

[LDNF1SW](#): Contiguous load non-fault signed words to vector (immediate index).

[LDNF1W](#): Contiguous load non-fault unsigned words to vector (immediate index).

[LDNT1B \(scalar plus immediate, consecutive registers\)](#): Contiguous load non-temporal of bytes to multiple consecutive vectors (immediate index).

[LDNT1B \(scalar plus immediate, single register\)](#): Contiguous load non-temporal bytes to vector (immediate index).

[LDNT1B \(scalar plus scalar, consecutive registers\)](#): Contiguous load non-temporal of bytes to multiple consecutive vectors (scalar index).

[LDNT1B \(scalar plus scalar, single register\)](#): Contiguous load non-temporal bytes to vector (scalar index).

[LDNT1B \(vector plus scalar\)](#): Gather load non-temporal unsigned bytes.

[LDNT1D \(scalar plus immediate, consecutive registers\)](#): Contiguous load non-temporal of doublewords to multiple consecutive vectors (immediate index).

[LDNT1D \(scalar plus immediate, single register\)](#): Contiguous load non-temporal doublewords to vector (immediate index).

[LDNT1D \(scalar plus scalar, consecutive registers\)](#): Contiguous load non-temporal of doublewords to multiple consecutive vectors (scalar index).

[LDNT1D \(scalar plus scalar, single register\)](#): Contiguous load non-temporal doublewords to vector (scalar index).

[LDNT1D \(vector plus scalar\)](#): Gather load non-temporal unsigned doublewords.

[LDNT1H \(scalar plus immediate, consecutive registers\)](#): Contiguous load non-temporal of halfwords to multiple consecutive vectors (immediate index).

[LDNT1H \(scalar plus immediate, single register\)](#): Contiguous load non-temporal halfwords to vector (immediate index).

[LDNT1H \(scalar plus scalar, consecutive registers\)](#): Contiguous load non-temporal of halfwords to multiple consecutive vectors (scalar index).

[LDNT1H \(scalar plus scalar, single register\)](#): Contiguous load non-temporal halfwords to vector (scalar index).

[LDNT1H \(vector plus scalar\)](#): Gather load non-temporal unsigned halfwords.

[LDNT1SB](#): Gather load non-temporal signed bytes.

[LDNT1SH](#): Gather load non-temporal signed halfwords.

[LDNT1SW](#): Gather load non-temporal signed words.

[LDNT1W \(scalar plus immediate, consecutive registers\)](#): Contiguous load non-temporal of words to multiple consecutive vectors (immediate index).

[LDNT1W \(scalar plus immediate, single register\)](#): Contiguous load non-temporal words to vector (immediate index).

[LDNT1W \(scalar plus scalar, consecutive registers\)](#): Contiguous load non-temporal of words to multiple consecutive vectors (scalar index).

[LDNT1W \(scalar plus scalar, single register\)](#): Contiguous load non-temporal words to vector (scalar index).

[LDNT1W \(vector plus scalar\)](#): Gather load non-temporal unsigned words.

[LDR \(predicate\)](#): Load predicate register.

[LDR \(vector\)](#): Load vector register.

[LSL \(immediate, predicated\)](#): Logical shift left by immediate (predicated).

[LSL \(immediate, unpredicated\)](#): Logical shift left by immediate (unpredicated).

[LSL \(vectors\)](#): Logical shift left by vector (predicated).

[LSL \(wide elements, predicated\)](#): Logical shift left by 64-bit wide elements (predicated).

[LSL \(wide elements, unpredicated\)](#): Logical shift left by 64-bit wide elements (unpredicated).

[LSLR](#): Reversed logical shift left by vector (predicated).

[LSR \(immediate, predicated\)](#): Logical shift right by immediate (predicated).

[LSR \(immediate, unpredicated\)](#): Logical shift right by immediate (unpredicated).

[LSR \(vectors\)](#): Logical shift right by vector (predicated).

[LSR \(wide elements, predicated\)](#): Logical shift right by 64-bit wide elements (predicated).

[LSR \(wide elements, unpredicated\)](#): Logical shift right by 64-bit wide elements (unpredicated).

[LSRR](#): Reversed logical shift right by vector (predicated).

[MAD](#): Multiply-add vectors (predicated), writing multiplicand [ $Z_{dn} = Z_a + Z_{dn} * Z_m$ ].

[MATCH](#): Detect any matching elements, setting the condition flags.

[MLA \(indexed\)](#): Multiply-add to accumulator (indexed).

[MLA \(vectors\)](#): Multiply-add vectors (predicated), writing addend [ $Z_{da} = Z_{da} + Z_n * Z_m$ ].

[MLS \(indexed\)](#): Multiply-subtract from accumulator (indexed).

[MLS \(vectors\)](#): Multiply-subtract vectors (predicated), writing addend [ $Z_{da} = Z_{da} - Z_n * Z_m$ ].

[MOV](#): Move logical bitmask immediate to vector (unpredicated): an alias of DUPM.

[MOV](#): Move predicate (unpredicated): an alias of ORR (predicates).

[MOV \(immediate, predicated, merging\)](#): Move signed integer immediate to vector elements (merging): an alias of CPY (immediate, merging).

[MOV \(immediate, predicated, zeroing\)](#): Move signed integer immediate to vector elements (zeroing): an alias of CPY (immediate, zeroing).

[MOV \(immediate, unpredicated\)](#): Move signed immediate to vector elements (unpredicated): an alias of DUP (immediate).

[MOV \(predicate, predicated, merging\)](#): Move predicates (merging): an alias of SEL (predicates).

[MOV \(predicate, predicated, zeroing\)](#): Move predicates (zeroing): an alias of AND (predicates).

[MOV \(scalar, predicated\)](#): Move general-purpose register to vector elements (predicated): an alias of CPY (scalar).

[MOV \(scalar, unpredicated\)](#): Move general-purpose register to vector elements (unpredicated): an alias of DUP (scalar).

[MOV \(SIMD&FP scalar, predicated\)](#): Move SIMD&FP scalar register to vector elements (predicated): an alias of CPY (SIMD&FP scalar).

[MOV \(SIMD&FP scalar, unpredicated\)](#): Move indexed element or SIMD&FP scalar to vector (unpredicated): an alias of DUP (indexed).

[MOV \(vector, predicated\)](#): Move vector elements (predicated): an alias of SEL (vectors).

[MOV \(vector, unpredicated\)](#): Move vector register (unpredicated): an alias of ORR (vectors, unpredicated).

[MOVPRFX \(predicated\)](#): Move prefix (predicated).

[MOVPRFX \(unpredicated\)](#): Move prefix (unpredicated).

[MOVS \(predicated\)](#): Move predicates (zeroing), setting the condition flags: an alias of ANDS.

[MOVS \(unpredicated\)](#): Move predicate (unpredicated), setting the condition flags: an alias of ORRS.

[MSB](#): Multiply-subtract vectors (predicated), writing multiplicand [ $Z_{dn} = Z_a - Z_{dn} * Z_m$ ].

[MUL \(immediate\)](#): Multiply by immediate (unpredicated).

[MUL \(indexed\)](#): Multiply (indexed).

[MUL \(vectors, predicated\)](#): Multiply vectors (predicated).

[MUL \(vectors, unpredicated\)](#): Multiply vectors (unpredicated).

[NAND](#): Bitwise NAND predicates.

[NANDS](#): Bitwise NAND predicates, setting the condition flags.

[NBSL](#): Bitwise inverted select.

[NEG](#): Negate (predicated).

[NMATCH](#): Detect no matching elements, setting the condition flags.

[NOR](#): Bitwise NOR predicates.

[NORS](#): Bitwise NOR predicates, setting the condition flags.

[NOT \(predicate\)](#): Bitwise invert predicate: an alias of EOR (predicates).

[NOT \(vector\)](#): Bitwise invert vector (predicated).

[NOTS](#): Bitwise invert predicate, setting the condition flags: an alias of EORS.

[ORN \(immediate\)](#): Bitwise inclusive OR with inverted immediate (unpredicated): an alias of ORR (immediate).

[ORN \(predicates\)](#): Bitwise inclusive OR inverted predicate.

[ORNS](#): Bitwise inclusive OR inverted predicate, setting the condition flags.

[ORQV](#): Bitwise inclusive OR reduction of quadword vector segments.

[ORR \(immediate\)](#): Bitwise inclusive OR with immediate (unpredicated).

[ORR \(predicates\)](#): Bitwise inclusive OR predicates.

[ORR \(vectors, predicated\)](#): Bitwise inclusive OR vectors (predicated).

[ORR \(vectors, unpredicated\)](#): Bitwise inclusive OR vectors (unpredicated).

[ORRS](#): Bitwise inclusive OR predicates, setting the condition flags.

[ORV](#): Bitwise inclusive OR reduction to scalar.

[PEXT \(predicate pair\)](#): Set pair of predicates from predicate-as-counter.

[PEXT \(predicate\)](#): Set predicate from predicate-as-counter.

[PFALSE](#): Set all predicate elements to false.

[PFIRST](#): Set the first active predicate element to true.

[PMOV \(to predicate\)](#): Move predicate from vector.

[PMOV \(to vector\)](#): Move predicate to vector.

[PMUL](#): Polynomial multiply vectors (unpredicated).

[PMULLB](#): Polynomial multiply long (bottom).

[PMULLT](#): Polynomial multiply long (top).

[PNEXT](#): Find next active predicate.

[PRFB \(scalar plus immediate\)](#): Contiguous prefetch bytes (immediate index).

[PRFB \(scalar plus scalar\)](#): Contiguous prefetch bytes (scalar index).

[PRFB \(scalar plus vector\)](#): Gather prefetch bytes (scalar plus vector).

[PRFB \(vector plus immediate\)](#): Gather prefetch bytes (vector plus immediate).

[PRFD \(scalar plus immediate\)](#): Contiguous prefetch doublewords (immediate index).

[PRFD \(scalar plus scalar\)](#): Contiguous prefetch doublewords (scalar index).

[PRFD \(scalar plus vector\)](#): Gather prefetch doublewords (scalar plus vector).

[PRFD \(vector plus immediate\)](#): Gather prefetch doublewords (vector plus immediate).

[PRFH \(scalar plus immediate\)](#): Contiguous prefetch halfwords (immediate index).

[PRFH \(scalar plus scalar\)](#): Contiguous prefetch halfwords (scalar index).

[PRFH \(scalar plus vector\)](#): Gather prefetch halfwords (scalar plus vector).

[PRFH \(vector plus immediate\)](#): Gather prefetch halfwords (vector plus immediate).

[PRFW \(scalar plus immediate\)](#): Contiguous prefetch words (immediate index).

[PRFW \(scalar plus scalar\)](#): Contiguous prefetch words (scalar index).

[PRFW \(scalar plus vector\)](#): Gather prefetch words (scalar plus vector).

[PRFW \(vector plus immediate\)](#): Gather prefetch words (vector plus immediate).

[PSEL](#): Predicate select between predicate register or all-false.

[PTEST](#): Set condition flags for predicate.

[PTRUE \(predicate as counter\)](#): Initialise predicate-as-counter to all active.

[PTRUE \(predicate\)](#): Initialise predicate from named constraint.

[PTRUES](#): Initialise predicate from named constraint and set the condition flags.

[PUNPKHL, PUNPKLO](#): Unpack and widen half of predicate.

[RADDHNB](#): Rounding add narrow high part (bottom).

[RADDHNT](#): Rounding add narrow high part (top).

[RAX1](#): Bitwise rotate left by 1 and exclusive OR.

[RBIT](#): Reverse bits (predicated).

[RDFFR \(predicated\)](#): Return predicate of succesfully loaded elements.

[RDFFR \(unpredicated\)](#): Read the first-fault register.

[RDFFRS](#): Return predicate of succesfully loaded elements, setting the condition flags.

[RDVL](#): Read multiple of vector register size to scalar register.

[REV \(predicate\)](#): Reverse all elements in a predicate.

[REV \(vector\)](#): Reverse all elements in a vector (unpredicated).

[REVB, REVH, REVW](#): Reverse bytes / halfwords / words within elements (predicated).

[REVD](#): Reverse 64-bit doublewords in elements (predicated).

[RSHRNB](#): Rounding shift right narrow by immediate (bottom).

[RSHRNT](#): Rounding shift right narrow by immediate (top).

[RSUBHNB](#): Rounding subtract narrow high part (bottom).

[RSUBHNT](#): Rounding subtract narrow high part (top).

[SABA](#): Signed absolute difference and accumulate.

[SABALB](#): Signed absolute difference and accumulate long (bottom).

[SABALT](#): Signed absolute difference and accumulate long (top).

[SABD](#): Signed absolute difference (predicated).

[SABDLB](#): Signed absolute difference long (bottom).

[SABDLT](#): Signed absolute difference long (top).

[SADALP](#): Signed add and accumulate long pairwise.

[SADDLB](#): Signed add long (bottom).

[SADDLBT](#): Signed add long (bottom + top).

[SADDLT](#): Signed add long (top).

[SADDV](#): Signed add reduction to scalar.

[SADDWB](#): Signed add wide (bottom).

[SADDWT](#): Signed add wide (top).

[SBCLB](#): Subtract with carry long (bottom).

[SBCLT](#): Subtract with carry long (top).

[SCLAMP](#): Signed clamp to minimum/maximum vector.

[SCVTF](#): Signed integer convert to floating-point (predicated).

[SDIV](#): Signed divide (predicated).

[SDIVR](#): Signed reversed divide (predicated).

[SDOT \(2-way, indexed\)](#): Signed integer indexed dot product.

[SDOT \(2-way, vectors\)](#): Signed integer dot product.

[SDOT \(4-way, indexed\)](#): Signed integer indexed dot product.

[SDOT \(4-way, vectors\)](#): Signed integer dot product.

[SEL \(predicates\)](#): Conditionally select elements from two predicates.

[SEL \(vectors\)](#): Conditionally select elements from two vectors.

[SETFFR](#): Initialise the first-fault register to all true.

[SHADD](#): Signed halving addition.

[SHRNB](#): Shift right narrow by immediate (bottom).

[SHRNT](#): Shift right narrow by immediate (top).

[SHSUB](#): Signed halving subtract.

[SHSUBR](#): Signed halving subtract reversed vectors.

[SLI](#): Shift left and insert (immediate).

[SM4E](#): SM4 encryption and decryption.

[SM4EKEY](#): SM4 key updates.

[SMAx \(immediate\)](#): Signed maximum with immediate (unpredicated).

[SMAx \(vectors\)](#): Signed maximum vectors (predicated).

[SMAxP](#): Signed maximum pairwise.

[SMAxQV](#): Signed maximum reduction of quadword vector segments.

[SMAxV](#): Signed maximum reduction to scalar.

[SMIN \(immediate\)](#): Signed minimum with immediate (unpredicated).

[SMIN \(vectors\)](#): Signed minimum vectors (predicated).

[SMINP](#): Signed minimum pairwise.

[SMINQV](#): Signed minimum reduction of quadword vector segments.

[SMINV](#): Signed minimum reduction to scalar.

[SMLALB \(indexed\)](#): Signed multiply-add long to accumulator (bottom, indexed).

[SMLALB \(vectors\)](#): Signed multiply-add long to accumulator (bottom).

[SMLALT \(indexed\)](#): Signed multiply-add long to accumulator (top, indexed).

[SMLALT \(vectors\)](#): Signed multiply-add long to accumulator (top).

[SMLSLB \(indexed\)](#): Signed multiply-subtract long from accumulator (bottom, indexed).

[SMLSLB \(vectors\)](#): Signed multiply-subtract long from accumulator (bottom).

[SMLSLT \(indexed\)](#): Signed multiply-subtract long from accumulator (top, indexed).

[SMLSLT \(vectors\)](#): Signed multiply-subtract long from accumulator (top).

[SMMLA](#): Signed integer matrix multiply-accumulate.

[SMULH \(predicated\)](#): Signed multiply returning high half (predicated).

[SMULH \(unpredicated\)](#): Signed multiply returning high half (unpredicated).

[SMULLB \(indexed\)](#): Signed multiply long (bottom, indexed).

[SMULLB \(vectors\)](#): Signed multiply long (bottom).

[SMULLT \(indexed\)](#): Signed multiply long (top, indexed).

[SMULLT \(vectors\)](#): Signed multiply long (top).

[SPLICE](#): Splice two vectors under predicate control.

[SQABS](#): Signed saturating absolute value.

[SQADD \(immediate\)](#): Signed saturating add immediate (unpredicated).

[SQADD \(vectors, predicated\)](#): Signed saturating addition (predicated).

[SQADD \(vectors, unpredicated\)](#): Signed saturating add vectors (unpredicated).

[SQCADD](#): Saturating complex integer add with rotate.

[SQCVTN](#): Signed saturating extract narrow and interleave.

[SQCVTUN](#): Signed saturating unsigned extract narrow and interleave.

[SQDECB](#): Signed saturating decrement scalar by multiple of 8-bit predicate constraint element count.

[SQDECD \(scalar\)](#): Signed saturating decrement scalar by multiple of 64-bit predicate constraint element count.

[SQDECD \(vector\)](#): Signed saturating decrement vector by multiple of 64-bit predicate constraint element count.

[SQDECH \(scalar\)](#): Signed saturating decrement scalar by multiple of 16-bit predicate constraint element count.

[SQDECH \(vector\)](#): Signed saturating decrement vector by multiple of 16-bit predicate constraint element count.

[SQDECP \(scalar\)](#): Signed saturating decrement scalar by count of true predicate elements.

[SQDECP \(vector\)](#): Signed saturating decrement vector by count of true predicate elements.

[SQDECW \(scalar\)](#): Signed saturating decrement scalar by multiple of 32-bit predicate constraint element count.

[SQDECW \(vector\)](#): Signed saturating decrement vector by multiple of 32-bit predicate constraint element count.

[SQDMLALB \(indexed\)](#): Signed saturating doubling multiply-add long to accumulator (bottom, indexed).

[SQDMLALB \(vectors\)](#): Signed saturating doubling multiply-add long to accumulator (bottom).

[SQDMLALBT](#): Signed saturating doubling multiply-add long to accumulator (bottom × top).

[SQDMLALT \(indexed\)](#): Signed saturating doubling multiply-add long to accumulator (top, indexed).

[SQDMLALT \(vectors\)](#): Signed saturating doubling multiply-add long to accumulator (top).

[SQDMLSLB \(indexed\)](#): Signed saturating doubling multiply-subtract long from accumulator (bottom, indexed).

[SQDMLSLB \(vectors\)](#): Signed saturating doubling multiply-subtract long from accumulator (bottom).

[SQDMLSLBT](#): Signed saturating doubling multiply-subtract long from accumulator (bottom × top).

[SQDMLSLT \(indexed\)](#): Signed saturating doubling multiply-subtract long from accumulator (top, indexed).

[SQDMLSLT \(vectors\)](#): Signed saturating doubling multiply-subtract long from accumulator (top).

[SQDMULH \(indexed\)](#): Signed saturating doubling multiply high (indexed).

[SQDMULH \(vectors\)](#): Signed saturating doubling multiply high (unpredicated).

[SQDMULLB \(indexed\)](#): Signed saturating doubling multiply long (bottom, indexed).

[SQDMULLB \(vectors\)](#): Signed saturating doubling multiply long (bottom).

[SQDMULLT \(indexed\)](#): Signed saturating doubling multiply long (top, indexed).

[SQDMULLT \(vectors\)](#): Signed saturating doubling multiply long (top).

[SQINCB](#): Signed saturating increment scalar by multiple of 8-bit predicate constraint element count.

[SQINCD \(scalar\)](#): Signed saturating increment scalar by multiple of 64-bit predicate constraint element count.

[SQINCD \(vector\)](#): Signed saturating increment vector by multiple of 64-bit predicate constraint element count.

[SQINCH \(scalar\)](#): Signed saturating increment scalar by multiple of 16-bit predicate constraint element count.

[SQINCH \(vector\)](#): Signed saturating increment vector by multiple of 16-bit predicate constraint element count.

[SQINCP \(scalar\)](#): Signed saturating increment scalar by count of true predicate elements.

[SQINCP \(vector\)](#): Signed saturating increment vector by count of true predicate elements.

[SQINCW \(scalar\)](#): Signed saturating increment scalar by multiple of 32-bit predicate constraint element count.

[SQINCW \(vector\)](#): Signed saturating increment vector by multiple of 32-bit predicate constraint element count.

[SQNEG](#): Signed saturating negate.

[SQRDCMLAH \(indexed\)](#): Saturating rounding doubling complex integer multiply-add high with rotate (indexed).

[SQRDCMLAH \(vectors\)](#): Saturating rounding doubling complex integer multiply-add high with rotate.

[SQRDMLAH \(indexed\)](#): Signed saturating rounding doubling multiply-add high to accumulator (indexed).

[SQRDMLAH \(vectors\)](#): Signed saturating rounding doubling multiply-add high to accumulator (unpredicated).

[SQRDMLSH \(indexed\)](#): Signed saturating rounding doubling multiply-subtract high from accumulator (indexed).

[SQRDMLSH \(vectors\)](#): Signed saturating rounding doubling multiply-subtract high from accumulator (unpredicated).

[SQRDMULH \(indexed\)](#): Signed saturating rounding doubling multiply high (indexed).

[SQRDMULH \(vectors\)](#): Signed saturating rounding doubling multiply high (unpredicated).

[SQRSHL](#): Signed saturating rounding shift left by vector (predicated).

[SQRSHLR](#): Signed saturating rounding shift left reversed vectors (predicated).

[SQRSHRN](#): Signed saturating rounding shift right narrow by immediate and interleave.

[SQRSHRNB](#): Signed saturating rounding shift right narrow by immediate (bottom).

[SQRSHRNT](#): Signed saturating rounding shift right narrow by immediate (top).

[SQRSHRUN](#): Signed saturating rounding shift right unsigned narrow by immediate and interleave.

[SQRSHRUNB](#): Signed saturating rounding shift right unsigned narrow by immediate (bottom).

[SQRSHRUNT](#): Signed saturating rounding shift right unsigned narrow by immediate (top).

[SQSHL \(immediate\)](#): Signed saturating shift left by immediate.

[SQSHL \(vectors\)](#): Signed saturating shift left by vector (predicated).

[SQSHLR](#): Signed saturating shift left reversed vectors (predicated).

[SQSHLU](#): Signed saturating shift left unsigned by immediate.

[SQSHRNB](#): Signed saturating shift right narrow by immediate (bottom).

[SQSHRNT](#): Signed saturating shift right narrow by immediate (top).

[SQSHRUNB](#): Signed saturating shift right unsigned narrow by immediate (bottom).

[SQSHRUNT](#): Signed saturating shift right unsigned narrow by immediate (top).

[SQSUB \(immediate\)](#): Signed saturating subtract immediate (unpredicated).

[SQSUB \(vectors, predicated\)](#): Signed saturating subtraction (predicated).

[SQSUB \(vectors, unpredicated\)](#): Signed saturating subtract vectors (unpredicated).

[SQSUBR](#): Signed saturating subtraction reversed vectors (predicated).

[SQXTNB](#): Signed saturating extract narrow (bottom).

[SQXTNT](#): Signed saturating extract narrow (top).

[SQXTUNB](#): Signed saturating unsigned extract narrow (bottom).

[SQXTUNT](#): Signed saturating unsigned extract narrow (top).

[SRHADD](#): Signed rounding halving addition.

[SRI](#): Shift right and insert (immediate).

[SRSHL](#): Signed rounding shift left by vector (predicated).

[SRSHLR](#): Signed rounding shift left reversed vectors (predicated).

[SRSHR](#): Signed rounding shift right by immediate.

[SRSRA](#): Signed rounding shift right and accumulate (immediate).

[SSHLLB](#): Signed shift left long by immediate (bottom).

[SSHLLT](#): Signed shift left long by immediate (top).

[SSRA](#): Signed shift right and accumulate (immediate).

[SSUBLB](#): Signed subtract long (bottom).

[SSUBLBT](#): Signed subtract long (bottom - top).

[SSUBLT](#): Signed subtract long (top).

[SSUBLTB](#): Signed subtract long (top - bottom).

[SSUBWB](#): Signed subtract wide (bottom).

[SSUBWT](#): Signed subtract wide (top).

[ST1B \(scalar plus immediate, consecutive registers\)](#): Contiguous store of bytes from multiple consecutive vectors (immediate index).

[ST1B \(scalar plus immediate, single register\)](#): Contiguous store bytes from vector (immediate index).

[ST1B \(scalar plus scalar, consecutive registers\)](#): Contiguous store of bytes from multiple consecutive vectors (scalar index).

[ST1B \(scalar plus scalar, single register\)](#): Contiguous store bytes from vector (scalar index).

[ST1B \(scalar plus vector\)](#): Scatter store bytes from a vector (vector index).

[ST1B \(vector plus immediate\)](#): Scatter store bytes from a vector (immediate index).

[ST1D \(scalar plus immediate, consecutive registers\)](#): Contiguous store of doublewords from multiple consecutive vectors (immediate index).

[ST1D \(scalar plus immediate, single register\)](#): Contiguous store doublewords from vector (immediate index).

[ST1D \(scalar plus scalar, consecutive registers\)](#): Contiguous store of doublewords from multiple consecutive vectors (scalar index).

[ST1D \(scalar plus scalar, single register\)](#): Contiguous store doublewords from vector (scalar index).

[ST1D \(scalar plus vector\)](#): Scatter store doublewords from a vector (vector index).

[ST1D \(vector plus immediate\)](#): Scatter store doublewords from a vector (immediate index).

[ST1H \(scalar plus immediate, consecutive registers\)](#): Contiguous store of halfwords from multiple consecutive vectors (immediate index).

[ST1H \(scalar plus immediate, single register\)](#): Contiguous store halfwords from vector (immediate index).

[ST1H \(scalar plus scalar, consecutive registers\)](#): Contiguous store of halfwords from multiple consecutive vectors (scalar index).

[ST1H \(scalar plus scalar, single register\)](#): Contiguous store halfwords from vector (scalar index).

[ST1H \(scalar plus vector\)](#): Scatter store halfwords from a vector (vector index).

[ST1H \(vector plus immediate\)](#): Scatter store halfwords from a vector (immediate index).

[ST1Q](#): Scatter store quadwords.

[ST1W \(scalar plus immediate, consecutive registers\)](#): Contiguous store of words from multiple consecutive vectors (immediate index).

[ST1W \(scalar plus immediate, single register\)](#): Contiguous store words from vector (immediate index).

[ST1W \(scalar plus scalar, consecutive registers\)](#): Contiguous store of words from multiple consecutive vectors (scalar index).

[ST1W \(scalar plus scalar, single register\)](#): Contiguous store words from vector (scalar index).

[ST1W \(scalar plus vector\)](#): Scatter store words from a vector (vector index).

[ST1W \(vector plus immediate\)](#): Scatter store words from a vector (immediate index).

[ST2B \(scalar plus immediate\)](#): Contiguous store two-byte structures from two vectors (immediate index).

[ST2B \(scalar plus scalar\)](#): Contiguous store two-byte structures from two vectors (scalar index).

[ST2D \(scalar plus immediate\)](#): Contiguous store two-doubleword structures from two vectors (immediate index).

[ST2D \(scalar plus scalar\)](#): Contiguous store two-doubleword structures from two vectors (scalar index).

[ST2H \(scalar plus immediate\)](#): Contiguous store two-halfword structures from two vectors (immediate index).

[ST2H \(scalar plus scalar\)](#): Contiguous store two-halfword structures from two vectors (scalar index).

[ST2Q \(scalar plus immediate\)](#): Contiguous store two-quadword structures from two vectors (immediate index).

[ST2Q \(scalar plus scalar\)](#): Contiguous store two-quadword structures from two vectors (scalar index).

[ST2W \(scalar plus immediate\)](#): Contiguous store two-word structures from two vectors (immediate index).

[ST2W \(scalar plus scalar\)](#): Contiguous store two-word structures from two vectors (scalar index).

[ST3B \(scalar plus immediate\)](#): Contiguous store three-byte structures from three vectors (immediate index).

[ST3B \(scalar plus scalar\)](#): Contiguous store three-byte structures from three vectors (scalar index).

[ST3D \(scalar plus immediate\)](#): Contiguous store three-doubleword structures from three vectors (immediate index).

[ST3D \(scalar plus scalar\)](#): Contiguous store three-doubleword structures from three vectors (scalar index).

[ST3H \(scalar plus immediate\)](#): Contiguous store three-halfword structures from three vectors (immediate index).

[ST3H \(scalar plus scalar\)](#): Contiguous store three-halfword structures from three vectors (scalar index).

[ST3Q \(scalar plus immediate\)](#): Contiguous store three-quadword structures from three vectors (immediate index).

[ST3Q \(scalar plus scalar\)](#): Contiguous store three-quadword structures from three vectors (scalar index).

[ST3W \(scalar plus immediate\)](#): Contiguous store three-word structures from three vectors (immediate index).

[ST3W \(scalar plus scalar\)](#): Contiguous store three-word structures from three vectors (scalar index).

[ST4B \(scalar plus immediate\)](#): Contiguous store four-byte structures from four vectors (immediate index).

[ST4B \(scalar plus scalar\)](#): Contiguous store four-byte structures from four vectors (scalar index).

[ST4D \(scalar plus immediate\)](#): Contiguous store four-doubleword structures from four vectors (immediate index).

[ST4D \(scalar plus scalar\)](#): Contiguous store four-doubleword structures from four vectors (scalar index).

[ST4H \(scalar plus immediate\)](#): Contiguous store four-halfword structures from four vectors (immediate index).

[ST4H \(scalar plus scalar\)](#): Contiguous store four-halfword structures from four vectors (scalar index).

[ST4Q \(scalar plus immediate\)](#): Contiguous store four-quadword structures from four vectors (immediate index).

[ST4Q \(scalar plus scalar\)](#): Contiguous store four-quadword structures from four vectors (scalar index).

[ST4W \(scalar plus immediate\)](#): Contiguous store four-word structures from four vectors (immediate index).

[ST4W \(scalar plus scalar\)](#): Contiguous store four-word structures from four vectors (scalar index).

[STNT1B \(scalar plus immediate, consecutive registers\)](#): Contiguous store non-temporal of bytes from multiple consecutive vectors (immediate index).

[STNT1B \(scalar plus immediate, single register\)](#): Contiguous store non-temporal bytes from vector (immediate index).

[STNT1B \(scalar plus scalar, consecutive registers\)](#): Contiguous store non-temporal of bytes from multiple consecutive vectors (scalar index).

[STNT1B \(scalar plus scalar, single register\)](#): Contiguous store non-temporal bytes from vector (scalar index).

[STNT1B \(vector plus scalar\)](#): Scatter store non-temporal bytes.

[STNT1D \(scalar plus immediate, consecutive registers\)](#): Contiguous store non-temporal of doublewords from multiple consecutive vectors (immediate index).

[STNT1D \(scalar plus immediate, single register\)](#): Contiguous store non-temporal doublewords from vector (immediate index).

[STNT1D \(scalar plus scalar, consecutive registers\)](#): Contiguous store non-temporal of doublewords from multiple consecutive vectors (scalar index).

[STNT1D \(scalar plus scalar, single register\)](#): Contiguous store non-temporal doublewords from vector (scalar index).

[STNT1D \(vector plus scalar\)](#): Scatter store non-temporal doublewords.

[STNT1H \(scalar plus immediate, consecutive registers\)](#): Contiguous store non-temporal of halfwords from multiple consecutive vectors (immediate index).

[STNT1H \(scalar plus immediate, single register\)](#): Contiguous store non-temporal halfwords from vector (immediate index).

[STNT1H \(scalar plus scalar, consecutive registers\)](#): Contiguous store non-temporal of halfwords from multiple consecutive vectors (scalar index).

[STNT1H \(scalar plus scalar, single register\)](#): Contiguous store non-temporal halfwords from vector (scalar index).

[STNT1H \(vector plus scalar\)](#): Scatter store non-temporal halfwords.

[STNT1W \(scalar plus immediate, consecutive registers\)](#): Contiguous store non-temporal of words from multiple consecutive vectors (immediate index).

[STNT1W \(scalar plus immediate, single register\)](#): Contiguous store non-temporal words from vector (immediate index).

[STNT1W \(scalar plus scalar, consecutive registers\)](#): Contiguous store non-temporal of words from multiple consecutive vectors (scalar index).

[STNT1W \(scalar plus scalar, single register\)](#): Contiguous store non-temporal words from vector (scalar index).

[STNT1W \(vector plus scalar\)](#): Scatter store non-temporal words.

[STR \(predicate\)](#): Store predicate register.

[STR \(vector\)](#): Store vector register.

[SUB \(immediate\)](#): Subtract immediate (unpredicated).

[SUB \(vectors, predicated\)](#): Subtract vectors (predicated).

[SUB \(vectors, unpredicated\)](#): Subtract vectors (unpredicated).

[SUBHNB](#): Subtract narrow high part (bottom).

[SUBHNT](#): Subtract narrow high part (top).

[SUBR \(immediate\)](#): Reversed subtract from immediate (unpredicated).

[SUBR \(vectors\)](#): Reversed subtract vectors (predicated).

[SUDOT](#): Signed by unsigned integer indexed dot product.

[SUNPKHL](#), [SUNPKLO](#): Signed unpack and extend half of vector.

[SUQADD](#): Signed saturating addition of unsigned value.

[SXTB](#), [SXTH](#), [SXTW](#): Signed byte / halfword / word extend (predicated).

[TBL](#): Programmable table lookup in one or two vector table (zeroing).

[TBLQ](#): Programmable table lookup within each quadword vector segment (zeroing).

[TBX](#): Programmable table lookup in single vector table (merging).

[TBXQ](#): Programmable table lookup within each quadword vector segment (merging).

[TRN1](#), [TRN2 \(predicates\)](#): Interleave even or odd elements from two predicates.

[TRN1](#), [TRN2 \(vectors\)](#): Interleave even or odd elements from two vectors.

[UABA](#): Unsigned absolute difference and accumulate.

[UABALB](#): Unsigned absolute difference and accumulate long (bottom).

[UABALT](#): Unsigned absolute difference and accumulate long (top).

[UABD](#): Unsigned absolute difference (predicated).

[UABDLB](#): Unsigned absolute difference long (bottom).

[UABDLT](#): Unsigned absolute difference long (top).

[UADALP](#): Unsigned add and accumulate long pairwise.

[UADDLB](#): Unsigned add long (bottom).

[UADDLT](#): Unsigned add long (top).

[UADDV](#): Unsigned add reduction to scalar.

[UADDWB](#): Unsigned add wide (bottom).

[UADDWT](#): Unsigned add wide (top).

[UCLAMP](#): Unsigned clamp to minimum/maximum vector.

[UCVTF](#): Unsigned integer convert to floating-point (predicated).

[UDIV](#): Unsigned divide (predicated).

[UDIVR](#): Unsigned reversed divide (predicated).

[UDOT \(2-way, indexed\)](#): Unsigned integer indexed dot product.

[UDOT \(2-way, vectors\)](#): Unsigned integer dot product.

[UDOT \(4-way, indexed\)](#): Unsigned integer indexed dot product.

[UDOT \(4-way, vectors\)](#): Unsigned integer dot product.

[UHADD](#): Unsigned halving addition.

[UHSUB](#): Unsigned halving subtract.

[UHSUBR](#): Unsigned halving subtract reversed vectors.

[UMAX \(immediate\)](#): Unsigned maximum with immediate (unpredicated).

[UMAX \(vectors\)](#): Unsigned maximum vectors (predicated).

[UMAXP](#): Unsigned maximum pairwise.

[UMAXQV](#): Unsigned maximum reduction of quadword vector segments.

[UMAXV](#): Unsigned maximum reduction to scalar.

[UMIN \(immediate\)](#): Unsigned minimum with immediate (unpredicated).

[UMIN \(vectors\)](#): Unsigned minimum vectors (predicated).

[UMINP](#): Unsigned minimum pairwise.

[UMINQV](#): Unsigned minimum reduction of quadword vector segments.

[UMINV](#): Unsigned minimum reduction to scalar.

[UMLALB \(indexed\)](#): Unsigned multiply-add long to accumulator (bottom, indexed).

[UMLALB \(vectors\)](#): Unsigned multiply-add long to accumulator (bottom).

[UMLALT \(indexed\)](#): Unsigned multiply-add long to accumulator (top, indexed).

[UMLALT \(vectors\)](#): Unsigned multiply-add long to accumulator (top).

[UMLSLB \(indexed\)](#): Unsigned multiply-subtract long from accumulator (bottom, indexed).

[UMLSLB \(vectors\)](#): Unsigned multiply-subtract long from accumulator (bottom).

[UMLSLT \(indexed\)](#): Unsigned multiply-subtract long from accumulator (top, indexed).

[UMLSLT \(vectors\)](#): Unsigned multiply-subtract long from accumulator (top).

[UMMLA](#): Unsigned integer matrix multiply-accumulate.

[UMULH \(predicated\)](#): Unsigned multiply returning high half (predicated).

[UMULH \(unpredicated\)](#): Unsigned multiply returning high half (unpredicated).

[UMULLB \(indexed\)](#): Unsigned multiply long (bottom, indexed).

[UMULLB \(vectors\)](#): Unsigned multiply long (bottom).

[UMULLT \(indexed\)](#): Unsigned multiply long (top, indexed).

[UMULLT \(vectors\)](#): Unsigned multiply long (top).

[UQADD \(immediate\)](#): Unsigned saturating add immediate (unpredicated).

[UQADD \(vectors, predicated\)](#): Unsigned saturating addition (predicated).

[UQADD \(vectors, unpredicated\)](#): Unsigned saturating add vectors (unpredicated).

[UQCVTN](#): Unsigned saturating extract narrow and interleave.

[UQDECB](#): Unsigned saturating decrement scalar by multiple of 8-bit predicate constraint element count.

[UQDECD \(scalar\)](#): Unsigned saturating decrement scalar by multiple of 64-bit predicate constraint element count.

[UQDECD \(vector\)](#): Unsigned saturating decrement vector by multiple of 64-bit predicate constraint element count.

[UQDECH \(scalar\)](#): Unsigned saturating decrement scalar by multiple of 16-bit predicate constraint element count.

[UQDECH \(vector\)](#): Unsigned saturating decrement vector by multiple of 16-bit predicate constraint element count.

[UQDECP \(scalar\)](#): Unsigned saturating decrement scalar by count of true predicate elements.

[UQDECP \(vector\)](#): Unsigned saturating decrement vector by count of true predicate elements.

[UQDECW \(scalar\)](#): Unsigned saturating decrement scalar by multiple of 32-bit predicate constraint element count.

[UQDECW \(vector\)](#): Unsigned saturating decrement vector by multiple of 32-bit predicate constraint element count.

[UQINCB](#): Unsigned saturating increment scalar by multiple of 8-bit predicate constraint element count.

[UQINCD \(scalar\)](#): Unsigned saturating increment scalar by multiple of 64-bit predicate constraint element count.

[UQINCD \(vector\)](#): Unsigned saturating increment vector by multiple of 64-bit predicate constraint element count.

[UQINCH \(scalar\)](#): Unsigned saturating increment scalar by multiple of 16-bit predicate constraint element count.

[UQINCH \(vector\)](#): Unsigned saturating increment vector by multiple of 16-bit predicate constraint element count.

[UQINCP \(scalar\)](#): Unsigned saturating increment scalar by count of true predicate elements.

[UQINCP \(vector\)](#): Unsigned saturating increment vector by count of true predicate elements.

[UQINCW \(scalar\)](#): Unsigned saturating increment scalar by multiple of 32-bit predicate constraint element count.

[UQINCW \(vector\)](#): Unsigned saturating increment vector by multiple of 32-bit predicate constraint element count.

[UQRSHL](#): Unsigned saturating rounding shift left by vector (predicated).

[UQRSHLR](#): Unsigned saturating rounding shift left reversed vectors (predicated).

[UQRSHRN](#): Unsigned saturating rounding shift right narrow by immediate and interleave.

[UQRSHRNB](#): Unsigned saturating rounding shift right narrow by immediate (bottom).

[UQRSHRNT](#): Unsigned saturating rounding shift right narrow by immediate (top).

[UQSHL \(immediate\)](#): Unsigned saturating shift left by immediate.

[UQSHL \(vectors\)](#): Unsigned saturating shift left by vector (predicated).

[UQSHLR](#): Unsigned saturating shift left reversed vectors (predicated).

[UQSHRNB](#): Unsigned saturating shift right narrow by immediate (bottom).

[UQSHRNT](#): Unsigned saturating shift right narrow by immediate (top).

[UQSUB \(immediate\)](#): Unsigned saturating subtract immediate (unpredicated).

[UQSUB \(vectors, predicated\)](#): Unsigned saturating subtraction (predicated).

[UQSUB \(vectors, unpredicated\)](#): Unsigned saturating subtract vectors (unpredicated).

[UQSUBR](#): Unsigned saturating subtraction reversed vectors (predicated).

[UQXTNB](#): Unsigned saturating extract narrow (bottom).

[UQXTNT](#): Unsigned saturating extract narrow (top).

[URECPE](#): Unsigned reciprocal estimate (predicated).

[URHADD](#): Unsigned rounding halving addition.

[URSHL](#): Unsigned rounding shift left by vector (predicated).

[URSHLR](#): Unsigned rounding shift left reversed vectors (predicated).

[URSHR](#): Unsigned rounding shift right by immediate.

[URSQRTE](#): Unsigned reciprocal square root estimate (predicated).

[URSRA](#): Unsigned rounding shift right and accumulate (immediate).

[USDOT \(indexed\)](#): Unsigned by signed integer indexed dot product.

[USDOT \(vectors\)](#): Unsigned by signed integer dot product.

[USHLLB](#): Unsigned shift left long by immediate (bottom).

[USHLLT](#): Unsigned shift left long by immediate (top).

[USMMLA](#): Unsigned by signed integer matrix multiply-accumulate.

[USQADD](#): Unsigned saturating addition of signed value.

[USRA](#): Unsigned shift right and accumulate (immediate).

[USUBLB](#): Unsigned subtract long (bottom).

[USUBLT](#): Unsigned subtract long (top).

[USUBWB](#): Unsigned subtract wide (bottom).

[USUBWT](#): Unsigned subtract wide (top).

[UUNPKHI](#), [UUNPKLO](#): Unsigned unpack and extend half of vector.

[UXTB](#), [UXTH](#), [UXTW](#): Unsigned byte / halfword / word extend (predicated).

[UZP1](#), [UZP2 \(predicates\)](#): Concatenate even or odd elements from two predicates.

[UZP1](#), [UZP2 \(vectors\)](#): Concatenate even or odd elements from two vectors.

[UZPO1](#): Concatenate even elements within each pair of quadword vector segments.

[UZPO2](#): Concatenate odd elements within each pair of quadword vector segments.

[WHILEGE \(predicate as counter\)](#): While decrementing signed scalar greater than or equal to scalar (predicate-as-counter).

[WHILEGE \(predicate pair\)](#): While decrementing signed scalar greater than or equal to scalar (pair of predicates).

[WHILEGE \(predicate\)](#): While decrementing signed scalar greater than or equal to scalar.

[WHILEGT \(predicate as counter\)](#): While decrementing signed scalar greater than scalar (predicate-as-counter).

[WHILEGT \(predicate pair\)](#): While decrementing signed scalar greater than scalar (pair of predicates).

[WHILEGT \(predicate\)](#): While decrementing signed scalar greater than scalar.

[WHILEHI \(predicate as counter\)](#): While decrementing unsigned scalar higher than scalar (predicate-as-counter).

[WHILEHI \(predicate pair\)](#): While decrementing unsigned scalar higher than scalar (pair of predicates).

[WHILEHI \(predicate\)](#): While decrementing unsigned scalar higher than scalar.

[WHILEHS \(predicate as counter\)](#): While decrementing unsigned scalar higher or same as scalar (predicate-as-counter).

[WHILEHS \(predicate pair\)](#): While decrementing unsigned scalar higher or same as scalar (pair of predicates).

[WHILEHS \(predicate\)](#): While decrementing unsigned scalar higher or same as scalar.

[WHILELE \(predicate as counter\)](#): While incrementing signed scalar less than or equal to scalar (predicate-as-counter).

[WHILELE \(predicate pair\)](#): While incrementing signed scalar less than or equal to scalar (pair of predicates).

[WHILELE \(predicate\)](#): While incrementing signed scalar less than or equal to scalar.

[WHILELO \(predicate as counter\)](#): While incrementing unsigned scalar lower than scalar (predicate-as-counter).

[WHILELO \(predicate pair\)](#): While incrementing unsigned scalar lower than scalar (pair of predicates).

[WHILELO \(predicate\)](#): While incrementing unsigned scalar lower than scalar.

[WHILELS \(predicate as counter\)](#): While incrementing unsigned scalar lower or same as scalar (predicate-as-counter).

[WHILELS \(predicate pair\)](#): While incrementing unsigned scalar lower or same as scalar (pair of predicates).

[WHILELS \(predicate\)](#): While incrementing unsigned scalar lower or same as scalar.

[WHILELT \(predicate as counter\)](#): While incrementing signed scalar less than scalar (predicate-as-counter).

[WHILELT \(predicate pair\)](#): While incrementing signed scalar less than scalar (pair of predicates).

[WHILELT \(predicate\)](#): While incrementing signed scalar less than scalar.

[WHILERW](#): While free of read-after-write conflicts.

[WHILEWR](#): While free of write-after-read/write conflicts.

[WRFFR](#): Write the first-fault register.

[XAR](#): Bitwise exclusive OR and rotate right by immediate.

[ZIP1, ZIP2 \(predicates\)](#): Interleave elements from two half predicates.

[ZIP1, ZIP2 \(vectors\)](#): Interleave elements from two half vectors.

[ZIPQ1](#): Interleave elements from low halves of each pair of quadword vector segments.

[ZIPQ2](#): Interleave elements from high halves of each pair of quadword vector segments.

ABS

Absolute value (predicated)

Compute the absolute value of the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	size	0	1	0	1	1	0	1	0	1	Pg													

ABS <Zd>.<T>, <Pg>/M, <Zn>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);

ADD (immediate)

Add immediate (unpredicated)

Add an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	0	0	1	0	1	size	1	0	0	0	0	0	1	1	sh	imm8								Zdn					

ADD <Zdn>.<T>, <Zdn>.<T>, #<imm>{, <shift>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer imm = UInt(imm8);
if sh == '1' then imm = imm << 8;
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

sh	<shift>
0	LSL #0
1	LSL #8

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    Elem[result, e, esize] = element1 + imm;

Z[dn, VL] = result;
```

ADDPL

Add multiple of predicate register size to scalar register

Add the current predicate register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer and place the result in the 64-bit destination general-purpose register or current stack pointer.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	0	1	1					Rn		0	1	0	1	0										Rd

```
ADDPL <Xd|SP>, <Xn|SP>, #<imm>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer n = UInt(Rn);
integer d = UInt(Rd);
integer imm = SInt(imm6);
```

Assembler Symbols

- <Xd|SP> Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- <Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- <imm> Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
bits(64) operand1 = if n == 31 then SP[] else X[n, 64];
bits(64) result = operand1 + (imm * (PL DIV 8));

if d == 31 then
    SP[] = result;
else
    X[d, 64] = result;
```

Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

ADDQV

Unsigned add reduction of quadword vector segments

Unsigned addition of the same element numbers from each 128-bit source vector segment, placing each result into the corresponding element number of the 128-bit SIMD&FP destination register. Inactive elements in the source vector are treated as zero.

SVE2  
(FEAT\_SVE2p1)

```
ADDQV <Vd>.<T>, <Pg>, <Zn>.<Tb>
```

```
if !HaveSVE2p1() && !HaveSME2p1() then UNDEFINED;
constant integer esize = 8 << UInt(size);

  - The values of the NZCV flags.

## ADR

Compute vector address

Optionally sign or zero-extend the least significant 32-bits of each element from a vector of offsets or indices in the second source vector, scale each index by 2, 4 or 8, add to a vector of base addresses from the first source vector, and place the resulting addresses in the destination vector. This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 3 classes: [Packed offsets](#) , [Unpacked 32-bit signed offsets](#) and [Unpacked 32-bit unsigned offsets](#)

### Packed offsets

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ADR <Zd>.<T>, [<Zn>.<T>, <Zm>.<T>{, <mod> <amount>}]

```
if !HaveSVE() then UNDEFINED;
constant integer esize = 32 << UInt(sz);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
constant integer osize = esize;
boolean unsigned = TRUE;
integer mbytes = 1 << UInt(msz);
```

### Unpacked 32-bit signed offsets

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	0	0	1			Zm			1	0	1	0	msz				Zn					Zd		

ADR <Zd>.D, [<Zn>.D, <Zm>.D, SXTW{ <amount>}]

```
if !HaveSVE() then UNDEFINED;
constant integer esize = 64;
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
constant integer osize = 32;
boolean unsigned = FALSE;
integer mbytes = 1 << UInt(msz);
```

### Unpacked 32-bit unsigned offsets

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	0	1	1			Zm			1	0	1	0	msz				Zn					Zd		

ADR <Zd>.D, [<Zn>.D, <Zm>.D, UXTW{ <amount>}]

```
if !HaveSVE() then UNDEFINED;
constant integer esize = 64;
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
constant integer osize = 32;
boolean unsigned = TRUE;
integer mbytes = 1 << UInt(msz);
```

Assembler Symbols

- <Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
- <T> Is the size specifier, encoded in "sz":

sz	<T>
0	S
1	D

- <Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.
- <Zm> Is the name of the offset scalable vector register, encoded in the "Zm" field.
- <mod> Is the index extend and shift specifier, encoded in "msz":

msz	<mod>
00	[absent]
x1	LSL
10	LSL

- <amount> Is the index shift amount, encoded in "msz":

msz	<amount>
00	[absent]
01	#1
10	#2
11	#3

Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) base = Z[n, VL];
bits(VL) offs = Z[m, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) addr = Elem[base, e, esize];
    integer offset = Int(Elem[offs, e, esize]<osize-1:0>, unsigned);
    Elem[result, e, esize] = addr + (offset * mbytes);

Z[d, VL] = result;
```

Operational information

- If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

AESD

AES single round decryption

The `AESD` instruction reads a 16-byte state array from each 128-bit segment of the first source vector, together with a round key from the corresponding 128-bit segment of the second source vector. Each state array undergoes a single round of the `ADDROUNDKEY()`, `INVSUBBYTES()` and `INVSHIFTRROWS()` transformations in accordance with the AES standard. Each updated state array is destructively placed in the corresponding segment of the first source vector. This instruction is unpredicated.

`ID_AA64ZFR0_EL1.AES` indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless `FEAT_SME_FA64` is implemented and enabled.

SVE2  
(FEAT\_SVE\_AES)

```
AESD <Zdn>.B, <Zdn>.B, <Zm>.B
```

```
if !HaveSVE() || !HaveSVE2AES() then UNDEFINED;
integer m = UInt(Zm);
integer dn = UInt(Zdn);
```

Assembler Symbols

- <Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- <Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer segments = VL DIV 128;
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;

result = operand1 EOR operand2;
for s = 0 to segments-1
    Elem[result, s, 128] = AESInvSubBytes(AESInvShiftRows(Elem[result, s, 128]));

Z[dn, VL] = result;
```

Operational information

- If `PSTATE.DIT` is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

AESE

AES single round encryption

The `AESE` instruction reads a 16-byte state array from each 128-bit segment of the first source vector together with a round key from the corresponding 128-bit segment of the second source vector. Each state array undergoes a single round of the `ADDROUNDKEY()`, `SUBBYTES()` and `SHIFTRROWS()` transformations in accordance with the AES standard. Each updated state array is destructively placed in the corresponding segment of the first source vector. This instruction is unpredicated.

`ID_AA64ZFR0_EL1.AES` indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless `FEAT_SME_FA64` is implemented and enabled.

SVE2  
(FEAT\_SVE\_AES)

```
AESE <Zdn>.B, <Zdn>.B, <Zm>.B
```

```
if !HaveSVE() || !HaveSVE2AES() then UNDEFINED;
integer m = UInt(Zm);
integer dn = UInt(Zdn);
```

Assembler Symbols

- <Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- <Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer segments = VL DIV 128;
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;

result = operand1 EOR operand2;
for s = 0 to segments-1
    Elem[result, s, 128] = AESSubBytes(AESShiftRows(Elem[result, s, 128]));

Z[dn, VL] = result;
```

Operational information

- If `PSTATE.DIT` is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

AESIMC

AES inverse mix columns

The AESIMC instruction reads a 16-byte state array from each 128-bit segment of the source register, and performs a single round of the INVMIXCOLUMNS() transformation on each state array in accordance with the AES standard. Each updated state array is destructively placed in the corresponding segment of the first source vector. This instruction is unpredicated.

ID\_AA64ZFR0\_EL1.AES indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

SVE2
(FEAT\_SVE\_AES)

AESIMC <Zdn>.B, <Zdn>.B

```
if !HaveSVE() || !HaveSVE2AES() then UNDEFINED;
integer dn = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer segments = VL DIV 128;
bits(VL) operand = Z[dn, VL];
bits(VL) result;

for s = 0 to segments-1
    Elem[result, s, 128] = AESInvMixColumns(Elem[operand, s, 128]);

Z[dn, VL] = result;
```

Operational information

- If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

AESMC

AES mix columns

The AESMC instruction reads a 16-byte state array from each 128-bit segment of the source register, and performs a single round of the MIXCOLUMNS() transformation on each state array in accordance with the AES standard. Each updated state array is destructively placed in the corresponding segment of the first source vector. This instruction is unpredicated.

ID\_AA64ZFR0\_EL1.AES indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

SVE2  
(FEAT\_SVE\_AES)

AESMC <Zdn>.B, <Zdn>.B

```
if !HaveSVE() || !HaveSVE2AES() then UNDEFINED;
integer dn = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer segments = VL DIV 128;
bits(VL) operand = Z[dn, VL];
bits(VL) result;

for s = 0 to segments-1
    Elem[result, s, 128] = AESMixColumns(Elem[operand, s, 128]);

Z[dn, VL] = result;
```

Operational information

- If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

AND (immediate)

Bitwise AND with immediate (unpredicated)

Bitwise AND an immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This instruction is used by the pseudo-instruction [BIC \(immediate\)](#).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	1	1	0	0	0	0	0	imm13														Zdn			

AND <Zdn>.<T>, <Zdn>.<T>, #<const>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer dn = UInt(Zdn);
bits(64) imm;
(imm, -) = DecodeBitMasks(imm13<12>, imm13<5:0>, imm13<11:6>, TRUE, 64);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "imm13<12>:imm13<5:0>":

imm13<12>	imm13<5:0>	<T>
0	0xxxxxx	S
0	10xxxxx	H
0	110xxxx	B
0	1110xxx	B
0	11110xx	B
0	1111110	RESERVED
0	1111111	RESERVED
1	xxxxxxx	D

<const> Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV 64;
bits(VL) operand = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(64) element1 = Elem[operand, e, 64];
    Elem[result, e, 64] = element1 AND imm;

Z[dn, VL] = result;
```

Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:

AND (predicates)

Bitwise AND predicates

Bitwise AND active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

This instruction is used by the alias [MOV \(predicate, predicated, zeroing\)](#).

```
AND <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = FALSE;
```

Assembler Symbols

- <Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- <Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- <Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.
- <Pm> Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Alias Conditions

Alias	Is preferred when
<a href="#">MOV (predicate, predicated, zeroing)</a>	S == '0' && Pn == Pm

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(PL) operand1 = P[n, PL];
bits(PL) operand2 = P[m, PL];
bits(PL) result;
constant integer psize = esize DIV 8;

for e = 0 to elements-1
    bit element1 = PredicateElement(operand1, e, esize);
    bit element2 = PredicateElement(operand2, e, esize);
    if ActivePredicateElement(mask, e, esize) then
        Elem[result, e, psize] = ZeroExtend(element1 AND element2, psize);
    else
        Elem[result, e, psize] = ZeroExtend('0', psize);

if setflags then
    PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[d, PL] = result;
```

## Operational information

ANDS

Bitwise AND predicates, setting the condition flags

Bitwise AND active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is used by the alias [MOVS \(predicated\)](#).

ANDS <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;

Arithmetic shift right by 64-bit wide elements (unpredicated)

Shift right, preserving the sign bit, all elements of the first source vector by corresponding overlapping 64-bit elements of the second source vector and place the first in the corresponding elements of the destination vector. The shift amount is a vector of unsigned 64-bit doubleword elements in which all bits are significant, and not used modulo the destination element size. This instruction is unpredicated.

ASR <Zd>.<T>, <Zn>.<T>, <Zm>.<D>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '11' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	RESERVED

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];

ASRD

Arithmetic shift right for divide by immediate (predicated)

Shift right by immediate, preserving the sign bit, each active element of the source vector, and destructively place the results in the corresponding elements of the source vector. The result rounds toward zero as in a signed division. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. Inactive elements in the destination vector register remain unmodified.

ASRD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, #<const>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
bits(4) tsize = tszh:tszl;
if tsize == '0000' then UNDEFINED;
constant integer esize = 8 << HighestSetBit(tsize);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer shift = (2 * esize) - UInt(tsize:imm3);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "tszh:tszl":

        Elem[result, e, 16] = BFAdd(element1, element2, FPCR[]);
    else
        Elem[result, e, 16] = element1;

Z[dn, VL] = result;
```

## Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

BFADD (unpredicated)

BFloat16 floating-point add vectors (unpredicated)

Add all BFloat16 elements of the second source vector to corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector.

This instruction follows SVE2.1 non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

ID\_AA64ZFR0\_EL1.B16B16 indicates whether this instruction is implemented.

SVE2
(FEAT\_SVE\_B16B16)

BFADD <Zd>.H, <Zn>.H, <Zm>.H

```
if (!HaveSVE2() && !HaveSME2()) || !IsFeatureImplemented(FEAT_SVE_B16B16) then UNDEFINED;
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

Assembler Symbols

- <Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
- <Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.
- <Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV 16;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(16) element1 = Elem[operand1, e, 16];
    bits(16) element2 = Elem[operand2, e, 16];
    Elem[result, e, 16] = BFAdd(element1, element2, FPCR[]);

Z[d, VL] = result;
```

BFCLAMP

BFloat16 floating-point clamp to minimum/maximum number

Clamp each BFloat16 element in the destination vector to between the BFloat16 minimum value in the corresponding element of the first source vector and the BFloat16 maximum value in the corresponding element of the second source vector and destructively place the clamped results in the corresponding elements of the destination vector. Regardless of the value of FPCR.AH, the behavior is as follows for each minimum number and maximum number operation:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is Default NaN.

This instruction follows SVE2.1 non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

ID\_AA64ZFR0\_EL1.B16B16 indicates whether this instruction is implemented.

SVE2
(FEAT\_SVE\_B16B16)

- <Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV 32;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, 32) then Z[n, VL] else Zeros(VL);
bits(VL) result = Z[d, VL];

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, 32) then
        bits(32) element = Elem[operand, e, 32];
        Elem[result, 2*e+1, 16] = FPConvertBF(element, FPCR[]);

Z[d, VL] = result;
```

BFDOT (indexed)

BFloat16 floating-point indexed dot product

This instruction delimits the source vectors into pairs of BFloat16 elements. The BFloat16 pairs within the second source vector are specified using an immediate index which selects the same BFloat16 pair position within each 128-bit vector segment. The index range is from 0 to 3.

If FEAT\_EBF16 is not implemented or FPCR.EBF is 0, this instruction:

- Performs an unfused sum-of-products of each pair of adjacent BFloat16 elements in the first source vector with the specified pair of elements in the second vector. The intermediate single-precision products are rounded before they are summed, and the intermediate sum is rounded before accumulation into the single-precision destination element that overlaps with the corresponding pair of BFloat16 elements in the first source vector.
- Uses the non-IEEE 754 Round-to-Odd rounding mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
- Flushes denormalized inputs and results to zero, as if FPCR.{FZ, FIZ} is {1, 1}.
- Disables alternative floating point behaviors, as if FPCR.AH is 0.

If FEAT\_EBF16 is implemented and FPCR.EBF is 1, then this instruction:

- Performs a fused sum-of-products of each pair of adjacent BFloat16 elements in the first source vector with the specified pair of elements in the second vector. The intermediate single-precision products are not rounded before they are summed, but the intermediate sum is rounded before accumulation into the single-precision destination element that overlaps with the corresponding pair of BFloat16 elements in the first source vector.
- Follows all other floating-point behaviors that apply to single-precision arithmetic, as governed by FPCR.RMode, FPCR.FZ, FPCR.AH, and FPCR.FIZ.

Irrespective of FEAT\_EBF16 and FPCR.EBF, this instruction:

- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.
- Generates only the default NaN, as if FPCR.DN is 1.

This instruction is unpredicated.

ID\_AA64ZFR0\_EL1.BF16 indicates whether this instruction is implemented.

# BFMAX

BFloat16 floating-point maximum (predicated)

Determine the maximum of active BFloat16 elements of the second source vector and corresponding BFloat16 elements of the first source vector and destructively place the results in the corresponding elements of the first source vector.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either element is a NaN, the result is a quiet NaN.
- When FPCR.DN is 1, if either element is a NaN, the result is Default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both elements are zeros, regardless of the sign of either zero, the result is the second element.
- If either element is a NaN, regardless of the value of FPCR.DN, the result is the second element.

Inactive elements in the destination vector register remain unmodified.

This instruction follows SVE2.1 non-widening BFloat16 numerical behaviors.

ID\_AA64ZFR0\_EL1.B16B16 indicates whether this instruction is implemented.

## BFMLA (indexed)

BFloat16 floating-point fused multiply-add vectors by indexed elements

Multiply all BFloat16 elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added without intermediate rounding to the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

This instruction follows SVE2.1 non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

ID\_AA64ZFR0\_EL1.B16B16 indicates whether this instruction is implemented.

## BFMLA (vectors)

BFloat16 floating-point fused multiply-add vectors

Multiply the corresponding active BFloat16 elements of the first and second source vectors and add to elements of the third source (addend) vector without intermediate rounding. Destructively place the results in the destination and third source (addend) vector. Inactive elements in the destination vector register remain unmodified.

This instruction follows SVE2.1 non-widening BFloat16 numerical behaviors.

ID\_AA64ZFR0\_EL1.B16B16 indicates whether this instruction is implemented.

### SVE2 (FEAT\_SVE\_B16B16)

## BFMLS (indexed)

BFloat16 floating-point fused multiply-subtract vectors by indexed elements

Multiply all BFloat16 elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively subtracted without intermediate rounding from the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

This instruction follows SVE2.1 non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

ID\_AA64ZFR0\_EL1.B16B16 indicates whether this instruction is implemented.

- <Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

### Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV 32;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) operand3 = Z[da, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(16) element1 = Elem[operand1, 2 * e + 0, 16];
    bits(16) element2 = Elem[operand2, 2 * e + 0, 16];
    bits(32) element3 = Elem[operand3, e, 32];
    if op1_neg then element1 = BFNeg(element1);
    Elem[result, e, 32] = BFMulAddH(element3, element1, element2, FPCR[]);

Z[da, VL] = result;
```

### Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

## BFMLSLT (indexed)

BFloat16 floating-point multiply-subtract long from single-precision (top, indexed)

This BFloat16 floating-point multiply-subtract long instruction widens the odd-numbered BFloat16 elements in the first source vector and the indexed element from the corresponding 128-bit segment in the second source vector to single-precision format and then destructively multiplies and subtracts these values without intermediate rounding from the single-precision elements of the destination vector that overlap with the corresponding BFloat16 elements in the first source vector. This instruction is unpredicated.

### SVE2 (FEAT\_SVE2p1)

**BFMLSLT** <Zda>.S, <Zn>.H, <Zm>.H[<imm>]

```
if !HaveSME2() && !HaveSVE2p1() then UNDEFINED;
integer n = UInt(Zn);
integer m = UInt(Zm);

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

BFMMLA

BFloat16 floating-point matrix multiply-accumulate into 2x2 matrices

If FEAT\_EBF16 is not implemented or FPCR.EBF is 0, this instruction:

- Performs two unfused sums-of-products within each two pairs of adjacent BFloat16 elements while multiplying the 2x4 matrix of BFloat16 values held in each 128-bit segment of the first source vector by the 4x2 matrix of BFloat16 values in the corresponding segment of the second source vector. The intermediate single-precision products are rounded before they are summed and the intermediate sum is rounded before accumulation into the 2x2 single-precision matrix in the corresponding segment of the destination vector. This is equivalent to accumulating two 2-way unfused dot products per destination element.
- Uses the non-IEEE 754 Round-to-Odd rounding mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
- Flushes denormalized inputs and results to zero, as if FPCR.{FZ, FIZ} is {1, 1}.
- Disables alternative floating point behaviors, as if FPCR.AH is 0.

If FEAT\_EBF16 is implemented and FPCR.EBF is 1, then this instruction:

- Performs two fused sums-of-products within each two pairs of adjacent BFloat16 elements while multiplying the 2x4 matrix of BFloat16 values held in each 128-bit segment of the first source vector by the 4x2 matrix of BFloat16 values in the corresponding segment of the second source vector. The intermediate single-precision products are not rounded before they are summed, but the intermediate sum is rounded before accumulation into the 2x2 single-precision matrix in the corresponding segment of the destination vector. This is equivalent to accumulating two 2-way fused dot products per destination element.
- Follows all other floating-point behaviors that apply to single-precision arithmetic, as governed by FPCR.RMode, FPCR.FZ, FPCR.AH, and FPCR.FIZ.

Irrespective of FEAT\_EBF16 and FPCR.EBF, this instruction:

- Does not modify the cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC, and IOC).
- Disables trapped floating-point exceptions, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE, and IOE) are all zero.
- Generates only the default NaN, as if FPCR.DN is 1.

This instruction is unpredicated and vector length agnostic.

ID\_AA64ZFR0\_EL1.BF16 indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

SVE
(FEAT\_BF16)

BFMUL (indexed)

BFloat16 floating-point multiply vectors by indexed elements

Multiply all BFloat16 elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment and place the results in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

This instruction follows SVE2.1 non-widening BFloat16 numerical behaviors.

This instruction is unpredicated.

ID\_AA64ZFR0\_EL1.B16B16 indicates whether this instruction is implemented.

SVE2
(FEAT\_SVE\_B16B16)

Table with 32 columns (31 to 0) and 2 rows. Row 1 contains bit positions. Row 2 contains fields: 0, 1, 1, 0, 0, 1, 0, 0, 0, i3h, 1, i3l, Zm, 0, 0, 1, 0, 1, 0, Zn, Zd.

## Operation

The description of [AND \(immediate\)](#) gives the operational pseudocode for this instruction.

## Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

## BIC (predicates)

Bitwise clear predicates

Bitwise AND inverted active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

```

Operational information

If FEAT\_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the NZCV condition flags written by this instruction might be significantly delayed.

# BRKPA

Break after first true condition, propagating from previous partition

If the last active element of the first source predicate is false then set the destination predicate to all-false. Otherwise sets destination predicate elements up to and including the first active and true source element to true, then sets subsequent elements to false. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

BRKPA <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer g = UInt(Pg);

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

CADD

Complex integer add with rotate

Add the real and imaginary components of the integral complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by  $\pm j$  beforehand. Destructively place the results in the corresponding elements of the first source vector. This instruction is unpredicated.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	1	0	1	size	0	0	0	0	0	0	0	1	1	0	1	1	rot	Zm				Zdn					

CADD <Zdn>.<T>, <Zdn>.<T>, <Zm>.<T>, <const>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Zm);
integer dn = UInt(Zdn);
boolean sub_i = (rot == '0');
boolean sub_r = (rot == '1');
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

<const> Is the const specifier, encoded in "rot":

rot	<const>
0	#90
1	#270

## Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer pairs = VL DIV (2 * esize);
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;

for p = 0 to pairs-1
    integer acc_r = SInt(Elem[operand1, 2 * p + 0, esize]);
    integer acc_i = SInt(Elem[operand1, 2 * p + 1, esize]);
    integer elt2_r = SInt(Elem[operand2, 2 * p + 0, esize]);
    integer elt2_i = SInt(Elem[operand2, 2 * p + 1, esize]);
    if sub_i then

## CDOT (indexed)

### Complex integer dot product (indexed)

The complex integer dot product instructions delimit the source vectors into pairs of 8-bit or 16-bit signed integer complex numbers. Within each pair, the complex numbers in the first source vector are multiplied by the corresponding complex numbers in the second source vector and the resulting wide real or wide imaginary part of the product is accumulated into a 32-bit or 64-bit destination vector element which overlaps all four of the elements that comprise a pair of complex number values in the first source vector.

As a result each instruction implicitly deinterleaves the real and imaginary components of their complex number inputs, so that the destination vector accumulates 4×wide real sums or 4×wide imaginary sums. The complex numbers in the second source vector are rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, by performing the following transformations prior to the dot product operations:

- If the rotation is #0, the imaginary parts of the complex numbers in the second source vector are negated. The destination vector therefore accumulates the real parts of a complex dot product.
- If the rotation is #90, the real and imaginary parts of the complex numbers the second source vector are swapped. The destination vector therefore accumulates the imaginary parts of a complex dot product.
- If the rotation is #180, there is no transformation. The destination vector therefore accumulates the real parts of a complex conjugate dot product.
- If the rotation is #270, the real parts of the complex numbers in the second source vector are negated and then swapped with the imaginary parts. The destination vector therefore accumulates the imaginary parts of a complex conjugate dot product.

The indexed form of these instructions select a single pair of complex numbers within each 128-bit segment of the second source vector as the multiplier for all pairs of complex numbers within the corresponding 128-bit segment of the first source vector. The complex number pairs within the second source vector are specified using an immediate index which selects the same complex number pair position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex number pairs per 128-bit segment, encoded in 1 or 2 bits depending on the size of the complex number pair.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

It has encodings from 2 classes: [32-bit](#) and [64-bit](#)

CDOT (vectors)

Complex integer dot product

The complex integer dot product instructions delimit the source vectors into pairs of 8-bit or 16-bit signed integer complex numbers. Within each pair, the complex numbers in the first source vector are multiplied by the corresponding complex numbers in the second source vector and the resulting wide real or wide imaginary part of the product is accumulated into a 32-bit or 64-bit destination vector element which overlaps all four of the elements that comprise a pair of complex number values in the first source vector.

As a result each instruction implicitly deinterleaves the real and imaginary components of their complex number inputs, so that the destination vector accumulates 4×wide real sums or 4×wide imaginary sums.

The complex numbers in the second source vector are rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, by performing the following transformations prior to the dot product operations:

- If the rotation is #0, the imaginary parts of the complex numbers in the second source vector are negated. The destination vector therefore accumulates the real parts of a complex dot product.
- If the rotation is #90, the real and imaginary parts of the complex numbers the second source vector are swapped. The destination vector therefore accumulates the imaginary parts of a complex dot product.
- If the rotation is #180, there is no transformation. The destination vector therefore accumulates the real parts of a complex conjugate dot product.
- If the rotation is #270, the real parts of the complex numbers in the second source vector are negated and then swapped with the imaginary parts. The destination vector therefore accumulates the imaginary parts of a complex conjugate dot product.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(VL) result = Z[d, VL];

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        bits(esome) element = Elem[operand, e, esize];
        Elem[result, e, esize] = CountLeadingZeroBits(element)<esome-1:0>;

Z[d, VL] = result;
```

Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a `MOVPRFX` instruction. The `MOVPRFX` instruction must conform to all of the following requirements, otherwise the behavior of the `MOVPRFX` and this instruction is UNPREDICTABLE:

- The `MOVPRFX` instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The `MOVPRFX` instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

## CMLA (indexed)

### Complex integer multiply-add with rotate (indexed)

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the integral numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then add the products to the corresponding components of the complex numbers in the addend vector. Destructively place the results in the corresponding elements of the addend vector. This instruction is unpredicated.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

It has encodings from 2 classes: [16-bit](#) and [32-bit](#)

### 16-bit

P[d, PL] = result;
```

### Operational information

- If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:
- The execution time of this instruction is independent of:

- The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
- The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

If FEAT\_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register or NZCV condition flags written by this instruction might be significantly delayed.

CMP<cc> (wide elements)

Compare vector to 64-bit wide elements

Compare active integer elements in the first source vector with overlapping 64-bit doubleword elements in the second source vector, and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

<cc>	Comparison
EQ	equal
GE	signed greater than or equal
GT	signed greater than
HI	unsigned higher than
HS	unsigned higher than or same
LE	signed less than or equal
LO	unsigned lower than
LS	unsigned lower than or same
LT	signed less than
NE	not equal

ne																															

CMPLS <Pd>.<T>, <Pg>/z, <Zm>.<T>, <Zn>.<T>

is equivalent to

CMPHS <Pd>.<T>, <Pg>/z, <Zn>.<T>, <Zm>.<T>

Assembler Symbols

- <Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- <Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.
- <Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.
- <T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

Operation

The description of [CMP<cc> \(vectors\)](#) gives the operational pseudocode for this instruction.

Operational information

- If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    - The values of the NZCV flags.
- If FEAT\_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the predicate register or NZCV condition flags written by this instruction might be significantly delayed.

CMPLT (vectors)

Compare signed less than vector, setting the condition flags

Compare active signed integer elements in the first source vector being less than corresponding signed elements in the second source vector, and place the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This is a pseudo-instruction of [CMP<cc> \(vectors\)](#). This means:

- The encodings in this description are named to match the encodings of [CMP<cc> \(vectors\)](#).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of [CMP<cc> \(vectors\)](#) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

## CNTB, CNTD, CNTH, CNTW

Set scalar to multiple of predicate constraint element count

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then places the result in the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: [Byte](#) , [Doubleword](#) , [Halfword](#) and [Word](#)

### Byte

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	0	0	1	0	imm4				1	1	1	0	0	0	pattern					Rd				

size<1>size<0>

CNTB <Xd>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer d = UInt(Rd);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```

### Doubleword

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	1	1	1	0	imm4				1	1	1	0	0	0	pattern					Rd				

size<1>size<0>

CNTD <Xd>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 64;
integer d = UInt(Rd);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```

### Halfword

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	0	1	1	0	imm4				1	1	1	0	0	0	pattern					Rd				

size<1>size<0>

CNTH <Xd>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer d = UInt(Rd);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```

Word

CNTW <Xd>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer d = UInt(Rd);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```

Assembler Symbols

- <Xd> Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.
- <pattern> Is the optional pattern specifier, defaulting to ALL, encoded in "pattern":

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
101x1	#uimm5
10110	#uimm5
1x0x1	#uimm5
1x010	#uimm5
1xx00	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

- <imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
X[d, 64] = (count * imm)<63:0>;
```

Operational information

- If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

CNTP (predicate as counter)

Set scalar to count from predicate-as-counter

Counts the number of true elements in the source predicate and places the scalar result in the destination general-purpose register.

SVE2  
(FEAT\_SVE2p1)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	0	0	1	0	1	size	1	0	0	0	0	0	1	0	0	0	0	vl	1	PNn				Rd					

CNTP <Xd>, <PNn>.<T>, <vl>

```
if !HaveSME2() && !HaveSVE2p1() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(PNn);
integer d = UInt(Rd);
constant integer width = 2 << UInt(vl);
```

Assembler Symbols

- <Xd> Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.
- <PNn> Is the name of the first source scalable predicate register, with predicate-as-counter encoding, encoded in the "PNn" field.
- <T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

- <vl> Is the vl specifier, encoded in "vl":

vl	<vl>
0	VLx2
1	VLx4

Operation

```
if HaveSVE2p1() then CheckSVEEnabled(); else CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) pred = P[n, PL];
bits(PL*4) mask = CounterToPredicate(pred<15:0>, PL*4);
bits(64) sum = Zeros(64);
constant integer limit = elements * width;

for e = 0 to limit-1
  if ActivePredicateElement(mask, e, esize) then
    sum = sum + 1;
X[d, 64] = sum;
```

Operational information

- If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:

- The values of the data supplied in any of its registers.
- The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v33.64, AdvSIMD v29.12, pseudocode v2023-06\_rel, sve v2023-06\_rel ; Build timestamp: 2023-07-04T19:42

CNTP (predicate)

Set scalar to count of true predicate elements

Counts the number of active and true elements in the source predicate and places the scalar result in the destination general-purpose register. Inactive predicate elements are not counted.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	0	0	1	0	1	size	1	0	0	0	0	0	1	0			Pg		0			Pn					Rd		

CNTP <Xd>, <Pg>, <Pn>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Pn);
integer d = UInt(Rd);
```

Assembler Symbols

- <Xd> Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.
- <Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- <Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.
- <T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(PL) operand = P[n, PL];
bits(64) sum = Zeros(64);

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) && ActivePredicateElement(operand, e, esize) then
        sum = sum + 1;
X[d, 64] = sum;
```

Operational information

- If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    - The values of the NZCV flags.

If FEAT\_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.

COMPACT

Shuffle active elements of vector to the right and fill with zero

Read the active elements from the source vector and pack them into the lowest-numbered elements of the destination vector. Then set any remaining elements of the destination vector to zero.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	1	size	1	0	0	0	0	1	1	0	0	Pg				Zn				Zd					

COMPACT <Zd>.<T>, <Pg>, <Zn>.<T>

```
if !HaveSVE() then UNDEFINED;
if size IN {'0x'} then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size<0>":

size<0>	<T>
0	S
1	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(VL) result = Zeros(VL);
integer x = 0;

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        bits(esize) element = Elem[operand1, e, esize];
        Elem[result, x, esize] = element;
        x = x + 1;

Z[d, VL] = result;
```

CPY (immediate, merging)

Copy signed integer immediate to vector elements (merging)

Copy a signed integer immediate to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<simm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the alias [MOV \(immediate, predicated, merging\)](#).

This instruction is used by the pseudo-instruction [FMOV \(zero, predicated\)](#).

CPY <Zd>.<T>, <Pg>/M, #<imm>{, <shift>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer d = UInt(Zd);
boolean merging = TRUE;
integer imm = SInt(imm8);
if sh == '1' then imm = imm << 8;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

sh	<shift>
0	LSL #0
1	LSL #8

Alias Conditions

Alias	Is preferred when
<a href="#">FMOV (zero, predicated)</a>	Never
<a href="#">MOV (immediate, predicated, merging)</a>	Unconditionally

## Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) dest = Z[d, VL];
bits(VL) result;

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        Elem[result, e, esize] = imm<esize-1:0>;
    elsif merging then
        Elem[result, e, esize] = Elem[dest, e, esize];
    else
        Elem[result, e, esize] = Zeros(esize);

Z[d, VL] = result;
```

## Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Internal version only: isa v33.64, AdvSIMD v29.12, pseudocode v2023-06\_rel, sve v2023-06\_rel ; Build timestamp: 2023-07-04T19:42

CPY (immediate, zeroing)

Copy signed integer immediate to vector elements (zeroing)

Copy a signed integer immediate to each active element in the destination vector. Inactive elements in the destination vector register are set to zero.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the alias [MOV\(immediate, predicated, zeroing\)](#).

CPY <Zd>.<T>, <Pg>/z, #<imm>{, <shift>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer d = UInt(Zd);
boolean merging = FALSE;
integer imm = SInt(imm8);
if sh == '1' then imm = imm << 8;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

sh	<shift>
0	LSL #0
1	LSL #8

## Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) dest = Z[d, VL];
bits(VL) result;

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        Elem[result, e, esize] = imm<esize-1:0>;
    elsif merging then
        Elem[result, e, esize] = Elem[dest, e, esize];
    else
        Elem[result, e, esize] = Zeros(esize);

Z[d, VL] = result;
```

CTERMEQ, CTERMNE

Compare and terminate loop

Detect termination conditions in serialized vector loops. Tests whether the comparison between the scalar source operands holds true and if not tests the state of the !LAST condition flag (C) which indicates whether the previous flag-setting predicate instruction selected the last element of the vector partition.  
The Z and C condition flags are preserved by this instruction. The N and V condition flags are set as a pair to generate one of the following conditions for a subsequent conditional instruction:

Condition	N	V	Meaning
GE	0	0	Continue loop (compare failed and last element not selected)
LT	0	1	Terminate loop (last element selected)
LT	1	0	Terminate loop (compare succeeded)
GE	1	1	Never generated

The scalar source operands are 32-bit or 64-bit general-purpose registers of the same size.  
It has encodings from 2 classes: [Equal](#) and [Not equal](#)

Equal

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## DECB, DECD, DECH, DECW (scalar)

Decrement scalar by multiple of predicate constraint element count

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: [Byte](#) , [Doubleword](#) , [Halfword](#) and [Word](#)

### Byte

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1x010	#uimm5
1xx00	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

- <imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
constant integer VL = CurrentVL;
bits(64) operand1 = X[dn, 64];

X[dn, 64] = operand1 - (count * imm);
```

Operational information

- If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

## DECD, DECH, DECW (vector)

Decrement vector by multiple of predicate constraint element count

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement all destination vector elements.

The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 3 classes: [Doubleword](#) , [Halfword](#) and [Word](#)

### Doubleword

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```

### Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
101x1	#uimm5
10110	#uimm5
1x0x1	#uimm5
1x010	#uimm5
1xx00	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    Elem[result, e, esize] = Elem[operand1, e, esize] - (count * imm);

Z[dn, VL] = result;
```

Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

DECP (scalar)

Decrement scalar by count of true predicate elements

Counts the number of true elements in the source predicate and then uses the result to decrement the scalar destination.

DECP <Xdn>, <Pm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
```

Assembler Symbols

- <Xdn>Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
- <Pm>Is the name of the source scalable predicate register, encoded in the "Pm" field.
- <T>Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(64) operand1 = X[dn, 64];
bits(PL) operand2 = P[m, PL];
integer count = 0;

for e = 0 to elements-1
    if ActivePredicateElement(operand2, e, esize) then
        count = count + 1;

X[dn, 64] = operand1 - count;
```

Operational information

If FEAT\_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.

DECP (vector)

Decrement vector by count of true predicate elements

Counts the number of true elements in the source predicate and then uses the result to decrement all destination vector elements.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

```
DECP <Zdn>.<T>, <Pm>.<T>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(PL) operand2 = P[m, PL];
bits(VL) result;
integer count = 0;

for e = 0 to elements-1
    if ActivePredicateElement(operand2, e, esize) then
        count = count + 1;

for e = 0 to elements-1
    Elem[result, e, esize] = Elem[operand1, e, esize] - count;

Z[dn, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Internal version only: isa v33.64, AdvSIMD v29.12, pseudocode v2023-06\_rel, sve v2023-06\_rel ; Build timestamp: 2023-07-04T19:42

DUP (immediate)

Broadcast signed immediate to vector elements (unpredicated)

Unconditionally broadcast the signed integer immediate into each element of the destination vector. This instruction is unpredicated.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the alias [MOV \(immediate, unpredicated\)](#).

This instruction is used by the pseudo-instruction [FMOV \(zero, unpredicated\)](#).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	0	0	1	0	1	size	1	1	1	0	0	0	1	1	sh	imm8								Zd					

DUP <Zd>.<T>, #<imm>{, <shift>}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer d = UInt(Zd);
integer imm = SInt(imm8);
if sh == '1' then imm = imm << 8;
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

sh	<shift>
0	LSL #0
1	LSL #8

Alias Conditions

Alias	Is preferred when
<a href="#">FMOV (zero, unpredicated)</a>	Never
<a href="#">MOV (immediate, unpredicated)</a>	Unconditionally

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
bits(VL) result = Replicate(imm<esize-1:0>, VL DIV esize);
Z[d, VL] = result;
```

## Operational information

EON

Bitwise exclusive OR with inverted immediate (unpredicated)

Bitwise exclusive OR an inverted immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of [EOR \(immediate\)](#). This means:

- The encodings in this description are named to match the encodings of [EOR \(immediate\)](#).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of [EOR \(immediate\)](#) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	1	0	1	0	0	0	0	imm13														Zdn			

EON <Zdn>.<T>, <Zdn>.<T>, #<const>

is equivalent to

EOR <Zdn>.<T>, <Zdn>.<T>, #(-<const> - 1)

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "imm13<12>:imm13<5:0>":

imm13<12>	imm13<5:0>	<T>
0	0xxxxx	S
0	10xxxx	H
0	110xxx	B
0	1110xx	B
0	11110x	B
0	111110	RESERVED
0	111111	RESERVED
1	xxxxxx	D

<const> Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.

Operation

The description of [EOR \(immediate\)](#) gives the operational pseudocode for this instruction.

Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:

- The execution time of this instruction is independent of:

EOR (vectors, predicated)

Bitwise exclusive OR vectors (predicated)

Bitwise exclusive OR active elements of the second source vector with corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	size	0	1	1	0	0	1	0	0	0	Pg	Zm				Zdn								

EOR <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = if AnyActiveElement(mask, esize) then Z[m, VL] else Zeros(VL);
bits(VL) result;

for e = 0 to elements-1

EORS

Bitwise exclusive OR predicates, setting the condition flags

Bitwise exclusive OR active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is used by the alias [NOTS](#).

```
EORS <Pd>.B, <Pg>/Z, <Pn>.B, <Pm>.B
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = TRUE;
```

Assembler Symbols

- <Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- <Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- <Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.
- <Pm> Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Alias Conditions

Alias	Is preferred when
<a href="#">NOTS</a>	Pm == Pg

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(PL) operand1 = P[n, PL];
bits(PL) operand2 = P[m, PL];
bits(PL) result;
constant integer psize = esize DIV 8;

for e = 0 to elements-1
    bit element1 = PredicateElement(operand1, e, esize);
    bit element2 = PredicateElement(operand2, e, esize);
    if ActivePredicateElement(mask, e, esize) then
        Elem[result, e, psize] = ZeroExtend(element1 EOR element2, psize);
    else
        Elem[result, e, psize] = ZeroExtend('0', psize);

if setflags then
    PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[d, PL] = result;
```

## Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

EXT

Extract vector from pair of vectors

Copy the indexed byte up to the last byte of the first source vector to the bottom of the result vector, then fill the remainder of the result starting from the first byte of the second source vector. The result is placed destructively in the destination and first source vector, or constructively in the destination vector. This instruction is unpredicated. An index that is greater than or equal to the vector length in bytes is treated as zero, resulting in the first source vector being copied to the result unchanged.

The Destructive encoding of this instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE: The MOVPRFX instruction must be unpredicated. The MOVPRFX instruction must specify the same destination register as this instruction. The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

It has encodings from 2 classes: [Constructive](#) and [Destructive](#)

Constructive

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

# EXTQ

Extract vector segment from each pair of quadword vector segments

For each 128-bit vector segment of the result, copy the indexed byte up to and including the last byte of the corresponding first source vector segment to the bottom of the result segment, then fill the remainder of the result segment starting from the first byte of the corresponding second source vector segment. The result segments are destructively placed in the corresponding first source vector segment. This instruction is unpredicated.

## SVE2 (FEAT\_SVE2p1)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EXTQ <Zdn>.B, <Zdn>.B, <Zm>.B, #<imm>

```
if !HaveSVE2p1() && !HaveSME2p1() then UNDEFINED;
integer dn = UInt(Zdn);
integer m = UInt(Zm);
constant integer position = UInt(imm4) << 3;
```

### Assembler Symbols

- <Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- <Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.
- <imm> Is the unsigned immediate operand, in the range 0 to 15, encoded in the "imm4" field.

### Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer segments = VL DIV 128;
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;

for s = 0 to segments-1
    bits(256) concat = Elem[operand2, s, 128] : Elem[operand1, s, 128];
    Elem[result, s, 128] = concat<position+127:position>;

Z[dn, VL] = result;
```

### Operational information

- If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FABD

Floating-point absolute difference (predicated)

Compute the absolute difference of active floating-point elements of the second source vector and corresponding floating-point elements of the first source vector and destructively place the result in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	0	0	1	0	1	size	0	0	1	0	0	0	1	0	0	Pg	Zm				Zdn								

FABD <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);
```

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = if AnyActiveElement(mask, esize) then Z[m, VL] else Zeros(VL);
bits(VL) result;

for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
  if ActivePredicateElement(mask, e, esize) then
    bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPAbs(FPSub(element1, element2, FPCR[]));
  else
    Elem[result, e, esize] = element1;

Z[dn, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.

- The `MOVPRFX` instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

<T> Is the size specifier, encoded in "size":

size	<T>
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPAdd(element1, element2, FPCR[]);

Z[d, VL] = result;
```

FADDA

Floating-point add strictly-ordered reduction, accumulating in scalar

Floating-point add a SIMD&FP scalar source and all active lanes of the vector source and place the result destructively in the SIMD&FP scalar source register. Vector elements are processed strictly in order from low to high, with the scalar source providing the initial value. Inactive elements in the source vector are ignored. This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

V[d, esize] = ReducePredicated(ReduceOp_FADD, operand, mask, identity);
```

FCADD

Floating-point complex add with rotate (predicated)

Add the real and imaginary components of the active floating-point complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by  $\pm j$  beforehand. Destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

FCLAMP

Floating-point clamp to minimum/maximum number

Clamp each floating-point element in the destination vector to between the floating-point minimum value in the corresponding element of the first source vector and the floating-point maximum value in the corresponding element of the second source vector and destructively place the clamped results in the corresponding elements of the destination vector.

Regardless of the value of FPCR.AH, the behavior is as follows for each mininum number and maximum number operation:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the result is the numeric value.
- When FPCR.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a quiet NaN.
- When FPCR.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is Default NaN.

This instruction is unpredicated.

## FCMLA (indexed)

Floating-point complex multiply-add by indexed values with rotate

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the floating-point complex numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then destructively add the products to the corresponding components of the complex numbers in the addend and destination vector, without intermediate rounding.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

The complex numbers within the second source vector are specified using an immediate index which selects the same complex number position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex numbers per 128-bit segment, encoded in 1 to 2 bits depending on the size of the complex number. This instruction is unpredicated.

It has encodings from 2 classes: [Half-precision](#) and [Single-precision](#)

### Half-precision

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

11	D

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<const> Is a floating-point immediate value expressible as  $\pm n \div 16 \times 2^r$ , where n and r are integers such that  $16 \leq n \leq 31$  and  $-3 \leq r \leq 4$ , i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) result = Z[d, VL];

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        Elem[result, e, esize] = imm;

Z[d, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

## FCVT

Floating-point convert precision (predicated)

Convert the size and precision of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Since the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

It has encodings from 6 classes: [Half-precision to single-precision](#) , [Half-precision to double-precision](#) , [Single-precision to half-precision](#) , [Single-precision to double-precision](#) , [Double-precision to half-precision](#) and [Double-precision to single-precision](#)

Z[d, VL] = result;
```

FCVTX

Floating-point down convert, rounding to odd (predicated)

Convert active double-precision floating-point elements from the source vector to single-precision, rounding to Odd, and place the results in the even-numbered 32-bit elements of the destination vector, while setting the odd-numbered elements to zero. Inactive elements in the destination vector register remain unmodified.

Rounding to Odd (aka Von Neumann rounding) permits a two-step conversion from double-precision to half-precision without incurring intermediate rounding errors.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Z[d, VL] = result;
```

FCVTZS

Floating-point convert to signed integer, rounding toward zero (predicated)

Convert to the signed integer nearer to zero from each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are sign-extended to fill each destination element.

It has encodings from 7 classes: [Half-precision to 16-bit](#) , [Half-precision to 32-bit](#) , [Half-precision to 64-bit](#) , [Single-precision to 32-bit](#) , [Single-precision to 64-bit](#) , [Double-precision to 32-bit](#) and [Double-precision to 64-bit](#)

## FDOT (indexed)

Half-precision floating-point indexed dot product

This instruction computes the fused sum-of-products of a pair of half-precision floating-point values held in each 32-bit element of the first source vector and a pair of half-precision floating-point values in an indexed 32-bit element of the second source vector, without intermediate rounding, and then destructively adds the single-precision sum-of-products to the corresponding single-precision element of the destination vector.

The half-precision floating-point pairs within the second source vector are specified using an immediate index which selects the same pair position within each 128-bit vector segment. The index range is from 0 to 3.

This instruction is unpredicated.

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FDUP

Broadcast 8-bit floating-point immediate to vector elements (unpredicated)

Unconditionally broadcast the floating-point immediate into each element of the destination vector. This instruction is unpredicated.

This instruction is used by the alias [FMOV \(immediate, unpredicated\)](#).

FDUP <Zd>.<T>, #<const>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer d = UInt(Zd);
bits(esize) imm = VFPEExpandImm(imm8, esize);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	RESERVED
01	H
10	S
11	D

<const> Is a floating-point immediate value expressible as  $\pm n \div 16 \times 2^r$ , where n and r are integers such that  $16 \leq n \leq 31$  and  $-3 \leq r \leq 4$ , i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
bits(VL) result;

for e = 0 to elements-1
    Elem[result, e, esize] = imm;

Z[d, VL] = result;
```

FEXPA

Floating-point exponential accelerator

The FEXPA instruction accelerates the polynomial series calculation of the EXP(x) function.

The double-precision variant copies the low 52 bits of an entry from a hard-wired table of 64-bit coefficients, indexed by the low 6 bits of each element of the source vector, and prepends to that the next 11 bits of the source element (src<16:6>), setting the sign bit to zero.

The single-precision variant copies the low 23 bits of an entry from hard-wired table of 32-bit coefficients, indexed by the low 6 bits of each element of the source vector, and prepends to that the next 8 bits of the source element (src<13:6>), setting the sign bit to zero.

The half-precision variant copies the low 10 bits of an entry from hard-wired table of 16-bit coefficients, indexed by the low 5 bits of each element of the source vector, and prepends to that the next 5 bits of the source element (src<9:5>), setting the sign bit to zero.

A coefficient table entry with index m holds the floating-point value 2<sup>(m/64)</sup>, or for the half-precision variant 2<sup>(m/32)</sup>. This instruction is unpredicated.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand = Z[n, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPExpA(element);

Z[d, VL] = result;
```

FLOGB

Floating-point base 2 logarithm as integer

This instruction returns the signed integer base 2 logarithm of each floating-point input element |x| after normalization.

This is the unbiased exponent of x used in the representation of the floating-point value, such that, for positive x,  $x = \text{significand} \times 2^{\text{exponent}}$ .

The integer results are placed in elements of the destination vector which have the same width (ESIZE) as the floating-point input elements:

- If x is normal, the result is the base 2 logarithm of x.
- If x is subnormal, the result corresponds to the normalized representation.
- If x is infinite, the result is  $2^{(\text{esize}-1)}-1$ .
- If x is  $\pm 0.0$  or NaN, the result is  $-2^{(\text{esize}-1)}$ .

Inactive elements in the destination vector register remain unmodified.

FLOGB <Zd>.<T>, <Pg>/M, <Zn>.<T>

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;

FMAX (immediate)

Floating-point maximum with immediate (predicated)

Determine the maximum of an immediate and each active floating-point element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate may take the value +0.0 or +1.0 only.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if the element is a NaN, the result is a quiet NaN.
- When FPCR.DN is 1, if the element is a NaN, the result is Default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both the element and the immediate are zeros, regardless of the sign of either zero, the result is the immediate.
- If the element is a NaN, regardless of the value of FPCR.DN, the result is the immediate.

Inactive elements in the destination vector register remain unmodified.

FMAXNM (immediate)

Floating-point maximum number with immediate (predicated)

Determine the maximum number value of an immediate and each active floating-point element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate may take the value +0.0 or +1.0 only.

Regardless of the value of FPCR.AH, the behavior is as follows:

- Negative zero compares less than positive zero.
- If the element is a quiet NaN, the result is the immediate value.
- When FPCR.DN is 0, if the element is a signaling NaN, the result is a quiet NaN.
- When FPCR.DN is 1, if the element is a signaling NaN, the result is Default NaN.

Inactive elements in the destination vector register remain unmodified.

00	RESERVED
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
bits(PL) mask = P[g, PL];
bits(VL) operand = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(esize) identity = FPInfinity('1', esize);

V[d, esize] = ReducePredicated(ReduceOp_FMAX, operand, mask, identity);
```

FMIN (immediate)

Floating-point minimum with immediate (predicated)

Determine the minimum of an immediate and each active floating-point element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate may take the value +0.0 or +1.0 only.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if the element is a NaN, the result is a quiet NaN.
- When FPCR.DN is 1, if the element is a NaN, the result is Default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both the element and the immediate are zeros, regardless of the sign of either zero, the result is the immediate.
- If the element is a NaN, regardless of the value of FPCR.DN, the result is the immediate.

Inactive elements in the destination vector register remain unmodified.

FMINQV

Floating-point minimum recursive reduction of quadword vector segments

Floating-point minimum of the same element numbers from each 128-bit source vector segment using a recursive pairwise reduction, placing each result into the corresponding element number of the 128-bit SIMD&FP destination register. Inactive elements in the source vector are treated as +Infinity.

When FPCR.AH is 0, the behavior is as follows:

- Negative zero compares less than positive zero.
- When FPCR.DN is 0, if either value is a NaN, the result is a quiet NaN.
- When FPCR.DN is 1, if either value is a NaN, the result is Default NaN.

When FPCR.AH is 1, the behavior is as follows:

- If both values are zeros, regardless of the sign of either zero, the result is the second value.
- If either value is a NaN, regardless of the value of FPCR.DN, the result is the second value.

V[d, esize] = ReducePredicated(ReduceOp_FMIN, operand, mask, identity);
```

## FMLA (indexed)

Floating-point fused multiply-add by indexed elements ( $Zda = Zda + Zn * Zm[indexed]$ )

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added without intermediate rounding to the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: [Half-precision](#) , [Single-precision](#) and [Double-precision](#)

### Half-precision

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

# FMLALT (vectors)

Half-precision floating-point multiply-add long to single-precision (top)

This half-precision floating-point multiply-add long instruction widens the odd-numbered half-precision elements in the first source vector and the corresponding elements in the second source vector to single-precision format and then destructively multiplies and adds these values without intermediate rounding to the single-precision elements of the destination vector that overlap with the corresponding half-precision elements in the source vectors. This instruction is unpredicated.

FMLALT <Zda>.S, <Zn>.H, <Zm>.H

```
if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
boolean opl_neg = FALSE;
```

## Assembler Symbols

- <Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
- <Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.
- <Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

## Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) operand3 = Z[da, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(esize DIV 2) element1 = Elem[operand1, 2 * e + 1, esize DIV 2];
    bits(esize DIV 2) element2 = Elem[operand2, 2 * e + 1, esize DIV 2];
    bits(esize) element3 = Elem[operand3, e, esize];
    if opl_neg then element1 = FPNeg(element1);
    Elem[result, e, esize] = FPMulAddH(element3, element1, element2, FPCR[]);

Z[da, VL] = result;
```

## Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

## FMLS (indexed)

Floating-point fused multiply-subtract by indexed elements ( $Zda = Zda + -Zn * Zm[\text{indexed}]$ )

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively subtracted without intermediate rounding from the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: [Half-precision](#) , [Single-precision](#) and [Double-precision](#)

### Half-precision

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

integer index = UInt(il);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
boolean op1_neg = TRUE;
boolean op3_neg = FALSE;
```

## Assembler Symbols

<Zda>	Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	For the half-precision and single-precision variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.  For the double-precision variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<imm>	For the half-precision variant: is the immediate index, in the range 0 to 7, encoded in the "i3h:i3l" fields.  For the single-precision variant: is the immediate index, in the range 0 to 3, encoded in the "i2" field.  For the double-precision variant: is the immediate index, in the range 0 to 1, encoded in the "i1" field.

## Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
constant integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result = Z[da, VL];

for e = 0 to elements-1
    integer segmentbase = e - (e MOD eltspersegment);
    integer s = segmentbase + index;
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, s, esize];
    bits(esize) element3 = Elem[result, e, esize];
    if op1_neg then element1 = FPNeg(element1);
    if op3_neg then element3 = FPNeg(element3);
    Elem[result, e, esize] = FPMulAdd(element3, element1, element2, FPCR[]);

Z[da, VL] = result;
```

## Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FMLS (vectors)

Floating-point fused multiply-subtract vectors (predicated), writing addend [Zda = Zda + -Zn \* Zm]

Multiply the corresponding active floating-point elements of the first and second source vectors and subtract from elements of the third source (addend) vector without intermediate rounding. Destructively place the results in the destination and third source (addend) vector. Inactive elements in the destination vector register remain unmodified.

```
FMLS <Zda>.<T>, <Pg>/M, <Zn>.<T>, <Zm>.<T>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
boolean op1_neg = TRUE;
boolean op3_neg = FALSE;
```

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in "size":

size	<T>
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = if AnyActiveElement(mask, esize) then Z[n, VL] else Zeros(VL);
bits(VL) operand2 = if AnyActiveElement(mask, esize) then Z[m, VL] else Zeros(VL);
bits(VL) operand3 = Z[da, VL];
bits(VL) result;

for e = 0 to elements-1
  if ActivePredicateElement(mask, e, esize) then
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    bits(esize) element3 = Elem[operand3, e, esize];

    if op1_neg then element1 = FPNeg(element1);
    if op3_neg then element3 = FPNeg(element3);
    Elem[result, e, esize] = FPMulAdd(element3, element1, element2, FPCR[]);
  else
    Elem[result, e, esize] = Elem[operand3, e, esize];

Z[da, VL] = result;
```

## Operational information

This instruction might be immediately preceded in program order by a `MOVPRFX` instruction. The `MOVPRFX` instruction must conform to all of the following requirements, otherwise the behavior of the `MOVPRFX` and this instruction is UNPREDICTABLE:

- The `MOVPRFX` instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The `MOVPRFX` instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

# FMMLA

Floating-point matrix multiply-accumulate

The floating-point matrix multiply-accumulate instruction supports single-precision and double-precision data types in a 2×2 matrix contained in segments of 128 or 256 bits, respectively. It multiplies the 2×2 matrix in each segment of the first source vector by the 2×2 matrix in the corresponding segment of the second source vector. The resulting 2×2 matrix product is then destructively added to the matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing a 2-way dot product per destination element. This instruction is unpredicated. The single-precision variant is vector length agnostic. The double-precision variant requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits are set to zero.

ID\_AA64ZFR0\_EL1.F32MM indicates whether the single-precision variant is implemented.

ID\_AA64ZFR0\_EL1.F64MM indicates whether the double-precision variant is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 2 classes: [32-bit element](#) and [64-bit element](#)

## 32-bit element

# FMUL (indexed)

Floating-point multiply by indexed elements

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The results are placed in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: [Half-precision](#) , [Single-precision](#) and [Double-precision](#)

## Half-precision

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

FMUL (vectors, unpredicated)

Floating-point multiply vectors (unpredicated)

Multiply all elements of the first source vector by corresponding floating-point elements of the second source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

```
FMUL <Zd>.<T>, <Zn>.<T>, <Zm>.<T>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

size	<T>
01	H
10	S
11	D

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPMul(element1, element2, FPCR[]);

Z[d, VL] = result;
```

FMULX

Floating-point multiply-extended vectors (predicated)

Multiply active floating-point elements of the first source vector by corresponding floating-point elements of the second source vector except that  $\infty \times 0.0$  gives 2.0 instead of NaN, and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

The instruction can be used with FRECPX to safely convert arbitrary elements in mathematical vector space to UNIT VECTORS or DIRECTION VECTORS with length 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

    Elem[result, e, esize] = FPRecipEstimate(element, FPCR[]);

Z[d, VL] = result;
```

FRECPS

Floating-point reciprocal step (unpredicated)

Multiply corresponding floating-point elements of the first and second source vectors, subtract the products from 2.0 without intermediate rounding and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

This instruction can be used to perform a single Newton-Raphson iteration for calculating the reciprocal of a vector of floating-point values.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

        bits(esize) element = Elem[operand, e, esize];
        Elem[result, e, esize] = FPRoundInt(element, FPCR[], rounding, exact);

Z[d, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FRSQRTE

Floating-point reciprocal square root estimate (unpredicated)

Find the approximate reciprocal square root of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<T> Is the size specifier, encoded in "size":

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand = Z[n, VL];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPRSqrtEstimate(element, FPCR[]);

Z[d, VL] = result;
```

FRSQRTS

Floating-point reciprocal square root step (unpredicated)

Multiply corresponding floating-point elements of the first and second source vectors, subtract the products from 3.0 and divide the results by 2.0 without any intermediate rounding and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.  
This instruction can be used to perform a single Newton-Raphson iteration for calculating the reciprocal square root of a vector of floating-point values.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

integer m = UInt(Zm);
```

### Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

### Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = if AnyActiveElement(mask, esize) then Z[m, VL] else Zeros(VL);
bits(VL) result;

for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
  if ActivePredicateElement(mask, e, esize) then
    bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPSub(element2, element1, FPCR[]);
  else
    Elem[result, e, esize] = element1;

Z[dn, VL] = result;
```

### Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.

- The `MOVPRFX` instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FTMAD

Floating-point trigonometric multiply-add coefficient

The FTMAD instruction calculates the series terms for either SIN(x) or COS(x), where the argument x has been adjusted to be in the range  $-\pi/4 < x \leq \pi/4$ .

To calculate the series terms of SIN(x) and COS(x) the initial source operands of FTMAD should be zero in the first source vector and  $x^2$  in the second source vector. The FTMAD instruction is then executed eight times to calculate the sum of eight series terms, which gives a result of sufficient precision.

The FTMAD instruction multiplies each element of the first source vector by the absolute value of the corresponding element of the second source vector and performs a fused addition of each product with a value obtained from a table of hard-wired coefficients, and places the results destructively in the first source vector.

The coefficients are different for SIN(x) and COS(x), and are selected by a combination of the sign bit in the second source element and an immediate index in the range 0 to 7.

FTSMUL

Floating-point trigonometric starting value

The FTSMUL instruction calculates the initial value for the FTMAD instruction. The instruction squares each element in the first source vector and then sets the sign bit to a copy of bit 0 of the corresponding element in the second source register, and places the results in the destination vector. This instruction is unpredicated.

To compute SIN(x) or COS(x) the instruction is executed with elements of the first source vector set to x, adjusted to be in the range  $-\pi/4 < x \leq \pi/4$ .

The elements of the second source vector hold the corresponding value of the quadrant Q number as an integer not a floating-point value. The value Q satisfies the relationship  $(2q-1) \times \pi/4 < x \leq (2q+1) \times \pi/4$ .

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

Z[d, VL] = result;
```

FTSSEL

Floating-point trigonometric select coefficient

The FTSSEL instruction selects the coefficient for the final multiplication in the polynomial series approximation. The instruction places the value 1.0 or a copy of the first source vector element in the destination element, depending on bit 0 of the quadrant number Q held in the corresponding element of the second source vector. The sign bit of the destination element is copied from bit 1 of the corresponding value of Q. This instruction is unpredicated. To compute SIN(x) or COS(x) the instruction is executed with elements of the first source vector set to x, adjusted to be in the range  $-\pi/4 < x \leq \pi/4$ . The elements of the second source vector hold the corresponding value of the quadrant Q number as an integer not a floating-point value. The value Q satisfies the relationship  $(2q-1) \times \pi/4 < x \leq (2q+1) \times \pi/4$ . This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

Z[d, VL] = result;
```

## INCB, INCD, INCH, INCW (scalar)

Increment scalar by multiple of predicate constraint element count

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: [Byte](#) , [Doubleword](#) , [Halfword](#) and [Word](#)

11101	MUL4
11110	MUL3
11111	ALL

- <imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
constant integer VL = CurrentVL;
bits(64) operand1 = X[dn, 64];

X[dn, 64] = operand1 + (count * imm);
```

Operational information

- If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

## INCD, INCH, INCW (vector)

Increment vector by multiple of predicate constraint element count

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements.

The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 3 classes: [Doubleword](#) , [Halfword](#) and [Word](#)

### Doubleword

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	1	1	1	1	imm4				1	1	0	0	0	0	0	pattern				Zdn				
size<1>size<0>																					D										

```
INCD <Zdn>.D{, <pattern>{, MUL #<imm>}}
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 64;
integer dn = UInt(Zdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```

### Halfword

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	0	1	1	1	imm4				1	1	0	0	0	0	0	pattern					Zdn			
size<1>size<0>																					D										

```
INCH <Zdn>.H{, <pattern>{, MUL #<imm>}}
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer dn = UInt(Zdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```

### Word

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	0	0	1	0	1	1	imm4				1	1	0	0	0	0	0	pattern					Zdn

```
INCW <Zdn>.S{, <pattern>{, MUL #<imm>}}
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer dn = UInt(Zdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```

### Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<pattern> Is the optional pattern specifier, defaulting to ALL, encoded in “pattern”:

pattern	<pattern>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
101x1	#uimm5
10110	#uimm5
1x0x1	#uimm5
1x010	#uimm5
1xx00	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn, VL];
bits(VL) result;

for e = 0 to elements-1
    Elem[result, e, esize] = Elem[operand1, e, esize] + (count * imm);

Z[dn, VL] = result;
```

Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

INCP (scalar)

Increment scalar by count of true predicate elements

Counts the number of true elements in the source predicate and then uses the result to increment the scalar destination.

INCP <Xdn>, <Pm>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
```

Assembler Symbols

- <Xdn>Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
- <Pm>Is the name of the source scalable predicate register, encoded in the "Pm" field.
- <T>Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(64) operand1 = X[dn, 64];
bits(PL) operand2 = P[m, PL];
integer count = 0;

for e = 0 to elements-1
    if ActivePredicateElement(operand2, e, esize) then
        count = count + 1;

X[dn, 64] = operand1 + count;
```

Operational information

If FEAT\_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.

INCP (vector)

Increment vector by count of true predicate elements

Counts the number of true elements in the source predicate and then uses the result to increment all destination vector elements.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

```
INCP <Zdn>.<T>, <Pm>.<T>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if size == '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Zdn);
```

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	RESERVED
01	H
10	S
11	D

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn, VL];
bits(PL) operand2 = P[m, PL];
bits(VL) result;
integer count = 0;

for e = 0 to elements-1
    if ActivePredicateElement(operand2, e, esize) then
        count = count + 1;

for e = 0 to elements-1
    Elem[result, e, esize] = Elem[operand1, e, esize] + count;

Z[dn, VL] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

INDEX (immediate, scalar)

Create index starting from immediate and incremented by general-purpose register

Populates the destination vector by setting the first element to the first signed immediate integer operand and monotonically incrementing the value by the second signed scalar integer operand for each subsequent element. The scalar source operand is a general-purpose register in which only the least significant bits corresponding to the vector element size are used and any remaining bits are ignored. This instruction is unpredicated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

INDEX <Zd>.<T>, #<imm>, <R><m>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer m = UInt(Rm);
integer d = UInt(Zd);
integer imm = SInt(imm5);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

<imm> Is the signed immediate operand, in the range -16 to 15, encoded in the "imm5" field.

<R> Is a width specifier, encoded in "size":

size	<R>
01	W
x0	W
11	X

<m> Is the number [0-30] of the source general-purpose register or the name ZR (31), encoded in the "Rm" field.

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(esize) operand2 = X[m, esize];
integer element2 = SInt(operand2);
bits(VL) result;

for e = 0 to elements-1
    integer index = imm + e * element2;
    Elem[result, e, esize] = index<size-1:0>;

Z[d, VL] = result;
```

Operational information

- If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1:
- The execution time of this instruction is independent of:

LASTA (scalar)

Extract element after last to general-purpose register

If there is an active element then extract the element after the last active element modulo the number of elements from the final source vector register. If there are no active elements, extract element zero. Then zero-extend and place the extracted element in the destination general-purpose register.

```
LASTA <R><d>, <Pg>, <Zn>.<T>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
constant integer rsize = if esize < 64 then 32 else 64;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Rd);
boolean isBefore = FALSE;
```

Assembler Symbols

<R> Is a width specifier, encoded in “size”:

size	<R>
01	W
x0	W
11	X

<d> Is the number [0-30] of the destination general-purpose register or the name ZR (31), encoded in the "Rd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

## Operation

```
CheckSVEEnabled();  
constant integer VL = CurrentVL;  
constant integer PL = VL DIV 8;  
constant integer elements = VL DIV esize;  
bits(PL) mask = P[g, PL];  
bits(VL) operand = Z[n, VL];  
bits(rsize) result;  
integer last = LastActiveElement(mask, esize);  
  
if isBefore then  
    if last < 0 then last = elements - 1;  
else  
    last = last + 1;  
    if last >= elements then last = 0;  
result = ZeroExtend(Elem[operand, last, esize], rsize);  
  
X[d, rsize] = result;
```

## Operational information

If FEAT\_SME is implemented and the PE is in Streaming SVE mode, then any subsequent instruction which is dependent on the general-purpose register written by this instruction might be significantly delayed.

LASTA (SIMD&FP scalar)

Extract element after last to SIMD&FP scalar register

If there is an active element then extract the element after the last active element modulo the number of elements from the final source vector register. If there are no active elements, extract element zero. Then place the extracted element in the destination SIMD&FP scalar register.

```
LASTA <V><d>, <Pg>, <Zn>.<T>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Vd);
boolean isBefore = FALSE;
```

Assembler Symbols

<V> Is a width specifier, encoded in "size":

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in "size":

size	<T>
00	B
01	H
10	S
11	D

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = Z[n, VL];
integer last = LastActiveElement(mask, esize);

if isBefore then
    if last < 0 then last = elements - 1;
else
    last = last + 1;
    if last >= elements then last = 0;
V[d, esize] = Elem[operand, last, esize];
```

LASTB (scalar)

Extract last element to general-purpose register

If there is an active element then extract the last active element from the final source vector register. If there are no active elements, extract the highest-numbered element. Then zero-extend and place the extracted element in the destination general-purpose register.

```
LASTB <R><d>, <Pg>, <Zn>.<T>
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
constant integer rsize = if esize < 64 then 32 else 64;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Rd);
boolean isBefore = TRUE;
```

Assembler Symbols

## LASTB (SIMD&FP scalar)

Extract last element to SIMD&FP scalar register

If there is an active element then extract the last active element from the final source vector register. If there are no active elements, extract the highest-numbered element. Then place the extracted element in the destination SIMD&FP register.

LASTB <V><d>, <Pg>, <Zn>.<T>

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Vd);
boolean isBefore = TRUE;
```

### Assembler Symbols

<V> Is a width specifier, encoded in “size”:

size	<V>
00	B
01	H
10	S
11	D

<d> Is the number [0-31] of the destination SIMD&FP register, encoded in the "Vd" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

### Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) operand = Z[n, VL];
integer last = LastActiveElement(mask, esize);

if isBefore then
    if last < 0 then last = elements - 1;
else
    last = last + 1;
    if last >= elements then last = 0;
V[d, esize] = Elem[operand, last, esize];
```

## LD1B (scalar plus immediate, consecutive registers)

Contiguous load of bytes to multiple consecutive vectors (immediate index)

Contiguous load of unsigned bytes to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: [Two registers](#) and [Four registers](#)

### Two registers

(FEAT\_SVE2p1)

LD1B { <Zt1>.B-<Zt2>.B }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSME2() && !HaveSVE2p1() then UNDEFINED;
integer n = UInt(Rn);
integer g = UInt('1':PNg);
constant integer nreg = 2;
integer t = UInt(Zt:'0');
constant integer esize = 8;
integer offset = SInt(imm4);
```

### Four registers

(FEAT\_SVE2p1)

LD1B { <Zt1>.B-<Zt4>.B }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSME2() && !HaveSVE2p1() then UNDEFINED;
integer n = UInt(Rn);
integer g = UInt('1':PNg);
constant integer nreg = 4;
integer t = UInt(Zt:'00');
constant integer esize = 8;
integer offset = SInt(imm4);
```

### Assembler Symbols

- <Zt1> For the two registers variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2.
- For the four registers variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
- <Zt4> Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.
- <Zt2> Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
- <PNg> Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded in the "PNg" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> For the two registers variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded in the "imm4" field.

For the four registers variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded in the "imm4" field.

## Operation

```
if HaveSVE2p1() then CheckSVEEnabled(); else CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
constant integer mbytes = esize DIV 8;
bits(64) base;
bits(PL) pred = P[g, PL];
bits(PL * nreg) mask = CounterToPredicate(pred<15:0>, PL * nreg);
array [0..3] of bits(VL) values;
boolean contiguous = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = n != 31;
AccessDescriptor accdesc = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous, tagchecked);

if !AnyActiveElement(mask, esize) then
    if n == 31 && ConstrainUnpredictableBool(Unpredictable_CHECKSPNONEACTIVE) then
        CheckSPAlignment();
    else
        if n == 31 then CheckSPAlignment();
        base = if n == 31 then SP[] else X[n, 64];

for r = 0 to nreg-1
    for e = 0 to elements-1
        if ActivePredicateElement(mask, r * elements + e, esize) then
            bits(64) addr = base + (offset * nreg * elements + r * elements + e) * mbytes;
            Elem[values[r], e, esize] = Mem[addr, mbytes, accdesc];
        else
            Elem[values[r], e, esize] = Zeros(esize);

for r = 0 to nreg-1
    Z[t+r, VL] = values[r];
```

## Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored when its governing predicate register contains the same value for each execution.

## LD1B (scalar plus vector)

Gather load unsigned bytes to vector (vector index)

Gather load of unsigned bytes to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign or zero-extended from 32 to 64 bits. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector. This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 3 classes: [32-bit unpacked unscaled offset](#) , [32-bit unscaled offset](#) and [64-bit unscaled offset](#)

### 32-bit unpacked unscaled offset

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## LD1B (vector plus immediate)

Gather load unsigned bytes to vector (immediate index)

Gather load of unsigned bytes to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 2 classes: [32-bit element](#) and [64-bit element](#)

### 32-bit element

LD1B { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 32;
constant integer msize = 8;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

### 64-bit element

LD1B { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 8;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

### Assembler Symbols

- <Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.
- <imm> Is the optional unsigned immediate byte offset, in the range 0 to 31, defaulting to 0, encoded in the "imm5" field.

## Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) base;
bits(VL) result;

## LD1D (scalar plus immediate, consecutive registers)

Contiguous load of doublewords to multiple consecutive vectors (immediate index)

Contiguous load of unsigned doublewords to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: [Two registers](#) and [Four registers](#)

### Two registers

(FEAT\_SVE2p1)

LD1D { <Zt1>.D-<Zt2>.D }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSME2() && !HaveSVE2p1() then UNDEFINED;
integer n = UInt(Rn);
integer g = UInt('1':PNg);
constant integer nreg = 2;
integer t = UInt(Zt:'0');
constant integer esize = 64;
integer offset = SInt(imm4);
```

### Four registers

(FEAT\_SVE2p1)

LD1D { <Zt1>.D-<Zt4>.D }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSME2() && !HaveSVE2p1() then UNDEFINED;
integer n = UInt(Rn);
integer g = UInt('1':PNg);
constant integer nreg = 4;
integer t = UInt(Zt:'00');
constant integer esize = 64;
integer offset = SInt(imm4);
```

### Assembler Symbols

- <Zt1> For the two registers variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2.  
For the four registers variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
- <Zt4> Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.
- <Zt2> Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
- <PNg> Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded in the "PNg" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> For the two registers variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded in the "imm4" field.

For the four registers variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded in the "imm4" field.

## Operation

```
if HaveSVE2p1() then CheckSVEEnabled(); else CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
constant integer mbytes = esize DIV 8;
bits(64) base;

## LD1D (scalar plus vector)

Gather load doublewords to vector (vector index)

Gather load of doublewords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 8. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 4 classes: [32-bit unpacked scaled offset](#) , [32-bit unpacked unscaled offset](#) , [64-bit scaled offset](#) and [64-bit unscaled offset](#)

### 32-bit unpacked scaled offset

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## LD1D (vector plus immediate)

Gather load doublewords to vector (immediate index)

Gather load of doublewords to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 8 in the range 0 to 248. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

**LD1D** { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 64;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

### Assembler Symbols

- <Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.
- <imm> Is the optional unsigned immediate byte offset, a multiple of 8 in the range 0 to 248, defaulting to 0, encoded in the "imm5" field.

### Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) base;
bits(VL) result;
bits(msize) data;
constant integer mbytes = msize DIV 8;
boolean contiguous = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = TRUE;
AccessDescriptor accdesc = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous, tagchecked);

if AnyActiveElement(mask, esize) then
    base = Z[n, VL];

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        bits(64) addr = ZeroExtend(Elem[base, e, esize], 64) + offset * mbytes;
        data = Mem[addr, mbytes, accdesc];
        Elem[result, e, esize] = Extend(data, esize, unsigned);
    else
        Elem[result, e, esize] = Zeros(esize);

Z[t, VL] = result;
```

## Operational information

## LD1H (scalar plus immediate, consecutive registers)

Contiguous load of halfwords to multiple consecutive vectors (immediate index)

Contiguous load of unsigned halfwords to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: [Two registers](#) and [Four registers](#)

### Two registers

(FEAT\_SVE2p1)

LD1H { <Zt1>.H-<Zt2>.H }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSME2() && !HaveSVE2p1() then UNDEFINED;
integer n = UInt(Rn);
integer g = UInt('1':PNg);
constant integer nreg = 2;
integer t = UInt(Zt:'0');
constant integer esize = 16;
integer offset = SInt(imm4);
```

### Four registers

(FEAT\_SVE2p1)

LD1H { <Zt1>.H-<Zt4>.H }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSME2() && !HaveSVE2p1() then UNDEFINED;
integer n = UInt(Rn);
integer g = UInt('1':PNg);
constant integer nreg = 4;
integer t = UInt(Zt:'00');
constant integer esize = 16;
integer offset = SInt(imm4);
```

### Assembler Symbols

- <Zt1> For the two registers variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2.
- For the four registers variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
- <Zt4> Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.
- <Zt2> Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
- <PNg> Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded in the "PNg" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> For the two registers variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded in the "imm4" field.

For the four registers variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded in the "imm4" field.

## Operation

```
if HaveSVE2p1() then CheckSVEEnabled(); else CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
constant integer mbytes = esize DIV 8;

## LD1H (scalar plus scalar, single register)

Contiguous load unsigned halfwords to vector (scalar index)

Contiguous load of unsigned halfwords to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 2 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: [16-bit element](#) , [32-bit element](#) and [64-bit element](#)

### 16-bit element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## LD1H (scalar plus vector)

Gather load unsigned halfwords to vector (vector index)

Gather load of unsigned halfwords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 6 classes: [32-bit scaled offset](#) , [32-bit unpacked scaled offset](#) , [32-bit unpacked unscaled offset](#) , [32-bit unscaled offset](#) , [64-bit scaled offset](#) and [64-bit unscaled offset](#)

### 32-bit scaled offset

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## LD1RB

Load and broadcast unsigned byte to vector

Load a single unsigned byte from a memory address generated by a 64-bit scalar base address plus an immediate offset which is in the range 0 to 63.

Broadcast the loaded data into all active elements of the destination vector, setting the inactive elements to zero. If all elements are inactive then the instruction will not perform a read from Device memory or cause a data abort.

It has encodings from 4 classes: [8-bit element](#) , [16-bit element](#) , [32-bit element](#) and [64-bit element](#)

### 8-bit element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

```

## Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored when its governing predicate register contains the same value for each execution.

LD1RD

Load and broadcast doubleword to vector

Load a single doubleword from a memory address generated by a 64-bit scalar base address plus an immediate offset which is a multiple of 8 in the range 0 to 504.

Broadcast the loaded data into all active elements of the destination vector, setting the inactive elements to zero. If all elements are inactive then the instruction will not perform a read from Device memory or cause a data abort.

```
LD1RD { <Zt>.D }, <Pg>/z, [<Xn|SP>{, #<imm>}]
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 64;
boolean unsigned = TRUE;
integer offset = UInt(imm6);
```

Assembler Symbols

- <Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> Is the optional unsigned immediate byte offset, a multiple of 8 in the range 0 to 504, defaulting to 0, encoded in the "imm6" field.

LD1ROB (scalar plus immediate)

Contiguous load and replicate thirty-two bytes (immediate index)

Load thirty-two contiguous bytes to elements of a 256-bit (octaword) vector from the memory address generated by a 64-bit scalar base address and immediate index that is a multiple of 32 in the range -256 to +224 added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero.

The resulting 256-bit vector is then replicated to fill the destination vector. The instruction requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits in the destination vector are set to zero.

Only the first thirty-two predicate elements are used and higher numbered predicate elements are ignored.

ID\_AA64ZFR0\_EL1.F64MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

LD1ROH (scalar plus scalar)

Contiguous load and replicate sixteen halfwords (scalar index)

Load sixteen contiguous halfwords to elements of a 256-bit (octaword) vector from the memory address generated by a 64-bit scalar base address and scalar index which is multiplied by 2 and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero.

The resulting 256-bit vector is then replicated to fill the destination vector. The instruction requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits in the destination vector are set to zero.

Only the first sixteen predicate elements are used and higher numbered predicate elements are ignored.

ID\_AA64ZFR0\_EL1.F64MM indicates whether this instruction is implemented.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

LD1ROW (scalar plus immediate)

Contiguous load and replicate eight words (immediate index)

Load eight contiguous words to elements of a 256-bit (octaword) vector from the memory address generated by a 64-bit scalar base address and immediate index that is a multiple of 32 in the range -256 to +224 added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero.

The resulting 256-bit vector is then replicated to fill the destination vector. The instruction requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits in the destination vector are set to zero.

Only the first eight predicate elements are used and higher numbered predicate elements are ignored.

LD1RQH (scalar plus scalar)

Contiguous load and replicate eight halfwords (scalar index)

Load eight contiguous halfwords to elements of a short, 128-bit (quadword) vector from the memory address generated by a 64-bit scalar base address and scalar index which is multiplied by 2 and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero. The resulting short vector is then replicated to fill the long destination vector. Only the first eight predicate elements are used and higher numbered predicate elements are ignored.

```
LD1RQH { <Zt>.H }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #1]
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if Rm == '11111' then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer g = UInt(Pg);
constant integer esize = 16;
```

Assembler Symbols

- <Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.

## Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = 128 DIV esize;
bits(64) base;
bits(PL) mask = P[g, PL]; // low 16 bits only
bits(64) offset;
bits(128) result;
constant integer mbytes = esize DIV 8;
boolean contiguous = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = TRUE;
AccessDescriptor accdesc = CreateAccDescSVE(MemOp\_LOAD, nontemporal, contiguous, tagchecked);

## LD1RQW (scalar plus immediate)

Contiguous load and replicate four words (immediate index)

Load four contiguous words to elements of a short, 128-bit (quadword) vector from the memory address generated by a 64-bit scalar base address and immediate index that is a multiple of 16 in the range -128 to +112 added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero. The resulting short vector is then replicated to fill the long destination vector. Only the first four predicate elements are used and higher numbered predicate elements are ignored.

```
LD1RQW { <Zt>.S }, <Pg>/Z, [<Xn|SP>{, #<imm>}]
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer g = UInt(Pg);
constant integer esize = 32;
integer offset = SInt(imm4);
```

### Assembler Symbols

- <Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> Is the optional signed immediate byte offset, a multiple of 16 in the range -128 to 112, defaulting to 0, encoded in the "imm4" field.

### Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = 128 DIV esize;
bits(64) base;
bits(PL) mask = P[g, PL]; // low 16 bits only
bits(128) result;
constant integer mbytes = esize DIV 8;
boolean contiguous = TRUE;
boolean nontemporal = FALSE;
boolean tagchecked = n != 31;
AccessDescriptor accdesc = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous, tagchecked);

if !AnyActiveElement(mask, esize) then
    if n == 31 && ConstrainUnpredictableBool(Unpredictable_CHECKSPNONEACTIVE) then
        CheckSPAlignment();
    else
        if n == 31 then CheckSPAlignment();
        base = if n == 31 then SP[] else X[n, 64];

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        bits(64) addr = base + (offset * 16) + (e * mbytes);
        Elem[result, e, esize] = Mem[addr, mbytes, accdesc];
    else
        Elem[result, e, esize] = Zeros(esize);

Z[t, VL] = Replicate(result, VL DIV 128);
```

## LD1RSB

Load and broadcast signed byte to vector

Load a single signed byte from a memory address generated by a 64-bit scalar base address plus an immediate offset which is in the range 0 to 63.

Broadcast the loaded data into all active elements of the destination vector, setting the inactive elements to zero. If all elements are inactive then the instruction will not perform a read from Device memory or cause a data abort.

It has encodings from 3 classes: [16-bit element](#) , [32-bit element](#) and [64-bit element](#)

### 16-bit element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	0	0	0	1	0	1	1	1	imm6						1	1	0	Pg			Rn				Zt					
dtypeh<1>dtypeh<0>																dtytel<1>dtytel<0>															

**LD1RSB** { **<Zt>.H** }, **<Pg>/Z**, [ **<Xn|SP>**{, #**<imm>**} ]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer g = UInt(Pg);
constant integer esize = 16;
constant integer msize = 8;
boolean unsigned = FALSE;
integer offset = UInt(imm6);
```

### 32-bit element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	0	0	0	1	0	1	1	1	imm6						1	0	1	Pg			Rn				Zt					
dtypeh<1>dtypeh<0>																dtytel<1>dtytel<0>															

**LD1RSB** { **<Zt>.S** }, **<Pg>/Z**, [ **<Xn|SP>**{, #**<imm>**} ]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer g = UInt(Pg);
constant integer esize = 32;
constant integer msize = 8;
boolean unsigned = FALSE;
integer offset = UInt(imm6);
```

### 64-bit element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1 0 0 0 0 1 0							1	1	1	imm6						1	0	0	Pg			Rn				Zt

## LD1SB (scalar plus immediate)

Contiguous load signed bytes to vector (immediate index)

Contiguous load of signed bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: [16-bit element](#) , [32-bit element](#) and [64-bit element](#)

### 16-bit element

## LD1SB (scalar plus vector)

Gather load signed bytes to vector (vector index)

Gather load of signed bytes to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign or zero-extended from 32 to 64 bits. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector. This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 3 classes: [32-bit unpacked unscaled offset](#) , [32-bit unscaled offset](#) and [64-bit unscaled offset](#)

### 32-bit unpacked unscaled offset

LD1SH (scalar plus vector)

Gather load signed halfwords to vector (vector index)

Gather load of signed halfwords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 6 classes: [32-bit scaled offset](#) , [32-bit unpacked scaled offset](#) , [32-bit unpacked unscaled offset](#) , [32-bit unscaled offset](#) , [64-bit scaled offset](#) and [64-bit unscaled offset](#)

32-bit scaled offset

```
LD1SH { <Zt>.S }, <Pg>/Z, [<Xn|SP>, <Zm>.S, <mod> #1]
```

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer g = UInt(Pg);
constant integer esize = 32;
constant integer msize = 16;
constant integer offs_size = 32;
boolean unsigned = FALSE;
boolean offs_unsigned = xs == '0';
integer scale = 1;
```

32-bit unpacked scaled offset

```
LD1SH { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #1]
```

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);

- <Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.
- <imm> Is the optional unsigned immediate byte offset, a multiple of 4 in the range 0 to 124, defaulting to 0, encoded in the "imm5" field.

### Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) base;
bits(VL) result;
bits(msize) data;
constant integer mbytes = msize DIV 8;
boolean contiguous = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = TRUE;
AccessDescriptor accdesc = CreateAccDescSVE(MemOp_LOAD, nontemporal, contiguous, tagchecked);

if AnyActiveElement(mask, esize) then
    base = Z[n, VL];

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        bits(64) addr = ZeroExtend(Elem[base, e, esize], 64) + offset * mbytes;
        data = Mem[addr, mbytes, accdesc];
        Elem[result, e, esize] = Extend(data, esize, unsigned);
    else
        Elem[result, e, esize] = Zeros(esize);

Z[t, VL] = result;
```

## Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored when its governing predicate register contains the same value for each execution.

## LD1W (scalar plus immediate, consecutive registers)

Contiguous load of words to multiple consecutive vectors (immediate index)

Contiguous load of unsigned words to elements of two or four consecutive vector registers from the memory address generated by a 64-bit scalar base and immediate index which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: [Two registers](#) and [Four registers](#)

### Two registers

(FEAT\_SVE2p1)

LD1W { <Zt1>.S-<Zt2>.S }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSME2() && !HaveSVE2p1() then UNDEFINED;
integer n = UInt(Rn);
integer g = UInt('1':PNg);
constant integer nreg = 2;
integer t = UInt(Zt:'0');
constant integer esize = 32;
integer offset = SInt(imm4);
```

### Four registers

(FEAT\_SVE2p1)

LD1W { <Zt1>.S-<Zt4>.S }, <PNg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSME2() && !HaveSVE2p1() then UNDEFINED;
integer n = UInt(Rn);
integer g = UInt('1':PNg);
constant integer nreg = 4;
integer t = UInt(Zt:'00');
constant integer esize = 32;
integer offset = SInt(imm4);
```

### Assembler Symbols

- <Zt1> For the two registers variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2.  
For the four registers variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.
- <Zt4> Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.
- <Zt2> Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.
- <PNg> Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded in the "PNg" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> For the two registers variant: is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded in the "imm4" field.

For the four registers variant: is the optional signed immediate vector offset, a multiple of 4 in the range -32 to 28, defaulting to 0, encoded in the "imm4" field.

## Operation

```
if HaveSVE2p1() then CheckSVEEnabled(); else CheckStreamingSVEEnabled();

## LD1W (scalar plus vector)

Gather load unsigned words to vector (vector index)

Gather load of unsigned words to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 6 classes: [32-bit scaled offset](#) , [32-bit unpacked scaled offset](#) , [32-bit unpacked unscaled offset](#) , [32-bit unscaled offset](#) , [64-bit scaled offset](#) and [64-bit unscaled offset](#)

LD1W (vector plus immediate)

Gather load unsigned words to vector (immediate index)

Gather load of unsigned words to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.  
This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 2 classes: [32-bit element](#) and [64-bit element](#)

32-bit element

```
LD1W { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]
```

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 32;
constant integer msize = 32;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

64-bit element

```
LD1W { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]
```

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 32;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

Assembler Symbols

- <Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.
- <imm> Is the optional unsigned immediate byte offset, a multiple of 4 in the range 0 to 124, defaulting to 0, encoded in the "imm5" field.

## Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) base;
bits(VL) result;
bits(msize) data;
constant integer mbytes = msize DIV 8;
boolean contiguous = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = TRUE;
AccessDescriptor accdesc = CreateAccDescSVE(MemOp\_LOAD, nontemporal, contiguous, tagchecked);

if AnyActiveElement(mask, esize) then
    base = Z[n, VL];

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        bits(64) addr = ZeroExtend(Elem[base, e, esize], 64) + offset * mbytes;
        data = Mem[addr, mbytes, accdesc];
        Elem[result, e, esize] = Extend(data, esize, unsigned);
    else
        Elem[result, e, esize] = Zeros(esize);

Z[t, VL] = result;
```

## Operational information

LD2B (scalar plus immediate)

Contiguous load two-byte structures to two vectors (immediate index)

Contiguous load two-byte structures, each to the same element number in two vector registers from the memory address generated by a 64-bit scalar base and an immediate index which is a multiple of 2 in the range -16 to 14 that is multiplied by the vector's in-memory size, irrespective of predication,

Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive bytes in memory which make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the two destination vector registers.

```
LD2B { <Zt1>.B, <Zt2>.B }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer g = UInt(Pg);
constant integer esize = 8;
integer offset = SInt(imm4);
constant integer nreg = 2;
```

Assembler Symbols

- <Zt1> Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
- <Zt2> Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> Is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded in the "imm4" field.

## Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;

## LD2Q (scalar plus immediate)

Contiguous load two-quadword structures to two vectors (immediate index)

Contiguous load two-quadword structures, each to the same element number in two vector registers from the memory address generated by a 64-bit scalar base and an immediate index which is a multiple of 2 in the range -16 to 14 that is multiplied by the vector's in-memory size, irrespective of predication,  
Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive quadwords in memory which make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the two destination vector registers.

### SVE2 (FEAT\_SVE2p1)

LD2Q { <Zt1>.Q, <Zt2>.Q }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]

```
if !HaveSVE2p1() && !HaveSME2p1() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer g = UInt(Pg);
constant integer esize = 128;
integer offset = SInt(imm4);
constant integer nreg = 2;
```

### Assembler Symbols

- <Zt1> Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
- <Zt2> Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> Is the optional signed immediate vector offset, a multiple of 2 in the range -16 to 14, defaulting to 0, encoded in the "imm4" field.

## Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(64) base;

## LD3D (scalar plus scalar)

Contiguous load three-doubleword structures to three vectors (scalar index)

Contiguous load three-doubleword structures, each to the same element number in three vector registers from the memory address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option) and added to the base address. After each structure access the index value is incremented by three. The index register is not updated by the instruction.

Each predicate element applies to the same element number in each of the three vector registers, or equivalently to the three consecutive doublewords in memory which make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the three destination vector registers.

LD3D { <Zt1>.D, <Zt2>.D, <Zt3>.D }, <Pg>/Z, [<Xn|SP>, <Xm>, LSL #3]

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
if Rm == '11111' then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer nreg = 3;
```

### Assembler Symbols

- <Zt1> Is the name of the first scalable vector register to be transferred, encoded in the "Zt" field.
- <Zt2> Is the name of the second scalable vector register to be transferred, encoded as "Zt" plus 1 modulo 32.
- <Zt3> Is the name of the third scalable vector register to be transferred, encoded as "Zt" plus 2 modulo 32.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.

## Operation

LD4B (scalar plus immediate)

Contiguous load four-byte structures to four vectors (immediate index)

Contiguous load four-byte structures, each to the same element number in four vector registers from the memory address generated by a 64-bit scalar base and an immediate index which is a multiple of 4 in the range -32 to 28 that is multiplied by the vector's in-memory size, irrespective of predication,

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive bytes in memory which make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the four destination vector registers.

```
LD4B { <Zt1>.B, <Zt2>.B, <Zt3>.B, <Zt4>.B }, <Pg>/Z, [<Xn|SP>{, #<imm>, MUL VL}]
```

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer g = UInt(Pg);
constant integer esize = 8;
integer offset = SInt(imm4);
constant integer nreg = 4;
```

Assembler Symbols

LD4Q (scalar plus immediate)

Contiguous load four-quadword structures to four vectors (immediate index)

Contiguous load four-quadword structures, each to the same element number in four vector registers from the memory address generated by a 64-bit scalar base and an immediate index which is a multiple of 4 in the range -32 to 28 that is multiplied by the vector's in-memory size, irrespective of predication, Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive quadwords in memory which make up each structure. Inactive elements will not cause a read from Device memory or signal a fault, and the corresponding element is set to zero in each of the four destination vector registers.

## LDFF1B (scalar plus vector)

Gather load first-fault unsigned bytes to vector (vector index)

Gather load with first-faulting behavior of unsigned bytes to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign or zero-extended from 32 to 64 bits. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 3 classes: [32-bit unpacked unscaled offset](#) , [32-bit unscaled offset](#) and [64-bit unscaled offset](#)

### 32-bit unpacked unscaled offset

LDFF1B (vector plus immediate)

Gather load first-fault unsigned bytes to vector (immediate index)

Gather load with first-faulting behavior of unsigned bytes to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector. This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 2 classes: [32-bit element](#) and [64-bit element](#)

32-bit element

```
LDFF1B { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]
```

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 32;
constant integer msize = 8;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

64-bit element

```
LDFF1B { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]
```

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 8;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

Assembler Symbols

- <Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.
- <imm> Is the optional unsigned immediate byte offset, in the range 0 to 31, defaulting to 0, encoded in the "imm5" field.

LDF1H (vector plus immediate)

Gather load first-fault unsigned halfwords to vector (immediate index)

Gather load with first-faulting behavior of unsigned halfwords to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 2 in the range 0 to 62. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector. This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

LDF1H { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 32;
constant integer msize = 16;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

64-bit element

LDF1H { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 16;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

Assembler Symbols

- <Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.
- <imm> Is the optional unsigned immediate byte offset, a multiple of 2 in the range 0 to 62, defaulting to 0, encoded in the "imm5" field.

## LDFF1SB (scalar plus scalar)

Contiguous load first-fault signed bytes to vector (scalar index)

Contiguous load with first-faulting behavior of signed bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 3 classes: [16-bit element](#) , [32-bit element](#) and [64-bit element](#)

# LDF1SB (vector plus immediate)

Gather load first-fault signed bytes to vector (immediate index)

Gather load with first-faulting behavior of signed bytes to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 2 classes: [32-bit element](#) and [64-bit element](#)

## 32-bit element

## LDFF1SH (scalar plus vector)

Gather load first-fault signed halfwords to vector (vector index)

Gather load with first-faulting behavior of signed halfwords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 6 classes: [32-bit scaled offset](#) , [32-bit unpacked scaled offset](#) , [32-bit unpacked unscaled offset](#) , [32-bit unscaled offset](#) , [64-bit scaled offset](#) and [64-bit unscaled offset](#)

**LDFF1SW (scalar plus scalar)**

Contiguous load first-fault signed words to vector (scalar index)

Contiguous load with first-faulting behavior of signed words to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 4 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

```
LDFF1SW { <Zt>.D }, <Pg>/Z, [<Xn|SP>{, <Xm>, LSL #2}]

## LDF1SW (scalar plus vector)

Gather load first-fault signed words to vector (vector index)

Gather load with first-faulting behavior of signed words to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 4 classes: [32-bit unpacked scaled offset](#) , [32-bit unpacked unscaled offset](#) , [64-bit scaled offset](#) and [64-bit unscaled offset](#)

### 32-bit unpacked scaled offset

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	0	0	0	1	0	1	0	xs	1	Zm					0	0	1	Pg				Rn				Zt				
																U ff															

**LDF1SW** { <Zt>.D }, <Pg>/Z, [<Xn|SP>, <Zm>.D, <mod> #2]

```
if !HaveSVE() then UNDEFINED;

LDFF1SW (vector plus immediate)

Gather load first-fault signed words to vector (immediate index)

Gather load with first-faulting behavior of signed words to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector. This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

```
LDFF1SW { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]
```

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 32;
boolean unsigned = FALSE;
integer offset = UInt(imm5);
```

Assembler Symbols

- <Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.
- <imm> Is the optional unsigned immediate byte offset, a multiple of 4 in the range 0 to 124, defaulting to 0, encoded in the "imm5" field.
