

# Intel® Processor Identification and the CPUID Instruction

**Application Note 485**

---

*January 2011*

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER, AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT. Intel products are not intended for use in medical, life saving, life sustaining, critical control or safety systems, or in nuclear facility applications.

Intel may make changes to specifications and product descriptions at any time, without notice.

Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined." Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them.

Intel processors may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

† Hyper-Threading Technology requires a computer system with an Intel® processor supporting Hyper-Threading Technology and an HT Technology enabled chipset, BIOS and operating system. Performance will vary depending on the specific hardware and software you use. See [http://www.intel.com/products/ht/hyperthreading\\_more.htm](http://www.intel.com/products/ht/hyperthreading_more.htm) for more information including details on which processors support HT Technology.

Contact your local Intel sales office or your distributor to obtain the latest specifications and before placing your product order.

Copies of documents which have an order number and are referenced in this document, or other Intel literature may be obtained by calling 1-800-548-4725 or by visiting Intel's website at <http://www.intel.com>.

Intel, Pentium, Pentium M, Celeron, Celeron M, Intel NetBurst, Intel Xeon, Pentium II Xeon, Pentium III Xeon, Intel SpeedStep, OverDrive, MMX, Intel486, Intel386, IntelDX2, Core Solo, Core Duo, Core 2 Duo, Atom, Core i7 and the Intel logo are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

## Revision History

Revision	Description	Date
-001	Original release.	May 1993
-002	Modified Table 3-3 Intel486™ and Pentium® Processor Signatures.	October 1993
-003	Updated to accommodate new processor versions. Program examples modified for ease of use, section added discussing BIOS recognition for OverDrive® processors and feature flag information updated.	September 1994
-004	Updated with Pentium Pro and OverDrive processors information. Modified, Table 3-2, and Table 3-3. Inserted Table 3-5. Feature Flag Values Reported in the ECX Register. Inserted Sections 3.4. and 3.5.	December 1995
-005	Added Figure 2-1 and Figure 3-2. Added Footnotes 1 and 2. Added Assembly code example in Section 4. Modified Tables 3, 5 and 7. Added two bullets in Section 5.0. Modified CPUID3B.ASM and cpuid3b.C programs to determine if processor features MMX™ technology. Modified Figure 6.0.	November 1996
-006	Modified Table 3. Added reserved for future member of P6 family of processors entry. Modified table header to reflect Pentium II processor family. Modified Table 5. Added SEP bit definition. Added Section 3.5. Added Section 3.7 and Table 9. Corrected references of P6 family to reflect correct usage. Modified CPUID3A.ASM, CPUID3Ab.asm and CPUID3.C example code sections to check for SEP feature bit and to check for, and identify, the Pentium II processor. Added additional disclaimer related to designers and errata.CPUID3A.ASM	March 1997
-007	Modified Table 2. Added Pentium II processor, model 5 entry. Modified existing Pentium II processor entry to read "Pentium II processor, model 3". Modified Table 5. Added additional feature bits, PAT and FXSR. Modified Table 7. Added entries 44h and 45h. Removed the note "Do not assume a value of 1 in a feature flag indicates that a given feature is present. For future feature flags, a value of 1 may indicate that the specific feature is not present" in section 4.0. Modified CPUID3B.ASM and CPUID3.C example code section to check for, and identify, the Pentium II processor, model 5. Modified existing Pentium II processor code to print Pentium II processor, model 3.	January 1998
-008	Added note to identify Intel® Celeron® processor, model 5 in section 3.2. Modified Table 2. Added Celeron processor and Pentium® OverDrive® processor with MMX™ technology entry. Modified Table 5. Added additional feature bit, PSE-36. Modified CPUID3B.ASM and CPUID3.C example code to check for, and identify, the Celeron processor.	April 1998
-009	Added note to identify Pentium II Xeon® processor in section 3.2. Modified Table 2. Added Pentium II Xeon processor entry. Modified CPUID3B.ASM and CPUID3.C example code to check for, and identify, the Pentium II Xeon processor.	June 1998
-010	No Changes	
-011	Modified Table 2. Added Celeron processor, model 6 entry. Modified CPUID3B.ASM and CPUID3.C example code to check for, and identify, the Celeron processor, model 6.	December 1998
-012	Modified Figure 1 to add the reserved information for the Intel386 processors. Modified Figure 2. Added the Processor serial number information returned when the CPUID instruction is executed with EAX=3. Modified Table 1. Added the Processor serial number parameter. Modified Table 2. Added the Pentium III processor and Pentium III Xeon processor. Added Section 4 "Processor serial number". Modified CPUID3A.ASM, CPUID3B.ASM and CPUID3.C example code to check for and identify the Pentium III processor and the Pentium III Xeon processor.	December 98
-013	Modified Figure 2. Added the Brand ID information returned when the CPUID instruction is executed with EAX=1. Added section 5 "Brand ID". Added Table 10 that shows the defined Brand ID values. Modified CPUID3A.ASM, CPUID3B.ASM and CPUID3.C example code to check for and identify the Pentium III processor, model 8 and the Pentium III Xeon processor, model 8.	October 1999
-014	Modified Table 4. Added Celeron processor, model 8.	March 2000
-015	Modified Table 4. Added Pentium III Xeon processor, model A. Added the 8-way set associative 1M, and 8-way set associative 2M cache descriptor entries.	May 2000

Revision	Description	Date
-016	<p>Revised Figure 2 to include the Extended Family and Extended Model when CPUID is executed with EAX=1.</p> <p>Added section 6 which describes the Brand String.</p> <p>Added section 10 Alternate Method of Detecting Features and sample code.</p> <p>Added the Pentium 4 processor signature to Table 4.</p> <p>Added new feature flags (SSE2, SS and TM) to Table 5.</p> <p>Added new cache descriptors to Table 3-7.</p> <p>Removed Pentium Pro cache descriptor example.</p>	November 2000
-017	<p>Modified Figure 2 to include additional features reported by the Pentium 4 processors.</p> <p>Modified to include additional Cache and TLB descriptors defined by the Intel NetBurst® microarchitecture.</p> <p>Added Section 9 and program Example 5 which describes how to detect if a processor supports the DAZ feature.</p> <p>Added Section 10 and program Example 6 which describes a method of calculating the actual operating frequency of the processor.</p>	February 2001
-018	<p>Changed the second 66h cache descriptor in Table 7 to 68h.</p> <p>Added the 83h cache descriptor to Table 7.</p> <p>Added the Pentium III processor, model B, processor signature and the Intel Xeon processor, processor signature to Table 4.</p> <p>Modified Table 4 to include the extended family and extended model fields.</p> <p>Modified Table 1 to include the information returned by the extended CPUID functions.</p>	June 2001
-019	<p>Changed to use registered trademark for Intel® Celeron® throughout entire document.</p> <p>Modified Table 5-1 to include new Brand ID values supported by the Intel® processors with Intel NetBurst® microarchitecture.</p> <p>Added Hyper-Threading Technology Flag to Table 3-4 and Logical Processor Count to Figure 3-1.</p> <p>Modified CPUID3B.ASM and CPUID3.C example code to check for and identify Intel® processors based on the updated Brand ID values contained in Table 5-1.</p>	January 2002
-020	<p>Modified Table 3-7 to include new Cache Descriptor values supported by the Intel processors with Intel NetBurst microarchitecture.</p> <p>Modified Table 5-1 to include new Brand ID values supported by the Intel processors with Intel NetBurst microarchitecture.</p> <p>Modified CPUID3B.ASM and CPUID3.C example code to check for and identify Intel® processors based on the updated Brand ID values contained in Table 5-1.</p>	March 2002
-021	<p>Modified Table 3-3 to include additional processors that return a processor signature with a value in the family code equal to 0Fh.</p> <p>Modified Table 3-7 to include new Cache Descriptor values supported by various Intel processors.</p> <p>Modified Table 5-1 to include new Brand ID values supported by the Intel processors with Intel NetBurst microarchitecture.</p> <p>Modified CPUID3B.ASM and CPUID3.C example code to check for and identify Intel processors based on the updated Brand ID values contained in Table 5-1.</p>	May 2002
-022	<p>Modified Table 3-7 with correct Cache Descriptor descriptions.</p> <p>Modified Table 3-4 with new feature flags returned in EDX.</p> <p>Added Table 3-5. Feature Flag Values Reported in the ECX Register the feature flags returned in ECX.</p> <p>Modified Table 3-3, broke out the processors with family 'F' by model numbers.</p>	November 2002
-023	<p>Modified Table 3-3, added the Intel® Pentium® M processor.</p> <p>Modified Table 3-4 with new feature flags returned in EDX.</p> <p>Modified Table 3-5. Feature Flag Values Reported in the ECX Register the feature flags returned in ECX.</p> <p>Modified Table 3-7 with correct Cache Descriptor descriptions.</p>	March 2003
-024	Corrected feature flag definitions in Table 3-5. Feature Flag Values Reported in the ECX Register for bits 7 and 8.	November 2003

Revision	Description	Date
-025	<p>Modified Table 1 to add Deterministic Cache Parameters function (CPUID executed with EAX=4), MONITOR/MWAIT function (CPUID instruction is executed with EAX=5), Extended L2 Cache Features function (CPUID executed with EAX=80000006), Extended Addresses Sizes function (CPUID is executed with EAX=80000008).</p> <p>Modified Table 1 and Table 5 to reinforce no PSN on Pentium® 4 family processors.</p> <p>Modified, added the Intel® Pentium® 4 processor and Intel® Celeron® processor on 90nm process.</p> <p>Modified Table 3-5. Feature Flag Values Reported in the ECX Register to add new feature flags returned in ECX.</p> <p>Modified Table 3-7 to include new Cache Descriptor values supported by various Intel processors.</p> <p>Modified Table 5-1 to include new Brand ID values supported by the Intel processors with Intel NetBurst microarchitecture.</p> <p>Modified CPUID3B.ASM and CPUID3.C example code to check for and identify Intel processors based on the updated Brand ID values contained in Table 5-1.</p> <p>Modified features.cpp, CPUID3.C, and CPUID3A.ASM to check for and identify new feature flags based on the updated values in Table 3-5. Feature Flag Values Reported in the ECX Register.</p>	January 2004
-026	<p>Corrected the name of the feature flag returned in EDX[31] (PBE) when the CPUID instruction is executed with EAX set to a 1.</p> <p>Modified Table 3-15 to indicate CPUID function 80000001h now returns extended feature flags in the EAX register.</p> <p>Added the Intel® Pentium® M processor (family 6, model D) to Table 3-3.</p> <p>Added section 3.2.2.</p> <p>Modified Table 3-5. Feature Flag Values Reported in the ECX Register to add new feature flags returned in ECX.</p> <p>Modified Table 3-5. Feature Flag Values Reported in the ECX Register to include new Cache Descriptor values supported by various Intel processors.</p> <p>Modified Table 5-1 to include new Brand ID values supported by the Intel processors with P6 family microarchitecture.</p> <p>Modified CPUID3B.ASM and CPUID3.C example code to check for and identify Intel processors based on the updated Brand ID values contained in Table 5-1.</p> <p>Modified features.cpp, CPUID3.C, and CPUID3A.ASM to check for and identify new feature flags based on the updated values in Table 3-5. Feature Flag Values Reported in the ECX Register.</p>	May 2004
-027	Corrected the register used for Extended Feature Flags in Section 3.2.2	July 2004
-028	<p>Corrected bit field definitions for CPUID functions 80000001h and 80000006h.</p> <p>Added processor names for family 'F', model '4' to Table 3-3.</p> <p>Updated Table 3-5. Feature Flag Values Reported in the ECX Register to include the feature flag definition (ECX[13]) for the CMPXCHG16B instruction.</p> <p>Updated Table 3-15 to include extended feature flag definitions for (EDX[11]) SYSCALL / SYSRET and (EDX[20]) Execute Disable bit.</p> <p>Updated Example 1 to extract CPUID extended function information.</p> <p>Updated Example 2 and Example 3 to detect and display extended features identified by CPUID function 80000001h.</p>	February 2005
-029	Modified Table 3-7 to include new Cache Descriptor values supported by various Intel processors.	March 2005
-030	<p>Corrected Table 3-16. Extended Feature Flag Values Reported in the ECX Register.</p> <p>Added CPUID function 6, Power management Feature to Table 3-1.</p> <p>Updated Table 3-5 to include the feature flag definition (EDX[30]) for IA64 capabilities.</p> <p>Updated Table 3-10 to include new Cache Descriptor values supported by Intel Pentium 4 processors.</p> <p>Modified CPUID3B.ASM and CPUID3.C example code to check for IA64 capabilities, CMPXCHG16B, LAHF/SAHF instructions.</p>	January 2006
-031	<p>Update Intel® EM64T portions with new naming convention for Intel® 64 Instruction Set Architecture.</p> <p>Added section Composing the Family, Model and Stepping (FMS) values</p> <p>Added section Extended CPUID Functions</p> <p>Updated Table 3-4 to include the Intel Core 2 Duo processor family.</p> <p>Updated Table 3-6 to include the feature flag definitions for VMX, SSSE3 and DCA.</p> <p>Updated Table 3-10 to include new Cache Descriptor values supported by Intel Core 2 Duo processor.</p> <p>Update CPUFREQ.ASM with alternate method to determine frequency without using TSC.</p>	September 2006

Revision	Description	Date
-032	Updated Table 3-10 to correct Cache Descriptor description. Updated trademarks for various processors. Added the Architectural Performance Monitor Features (Function Ah) section. Updated the supported processors in Table 3-3. Updated the feature flags reported by function 1 and reported in ECX, see Table 3-5. Updated the CPUID3A.ASM, CPUID3B.ASM and CPUID3.C sample code Removed the Alternate Method of Detecting Features chapter and sample code.	December 2007
-033	Intel® Atom™ and Intel® Core™ i7 processors added to text and examples Updated <a href="#">Table 5-3</a> to include Intel Atom and Intel Core i7 processors Updated ECX and EDX feature flag definitions in <a href="#">Table 5-4</a> and <a href="#">Table 5-5</a> Updated cache and TLB descriptor values in <a href="#">Table 5-7</a> Updated <a href="#">Table 5-8</a> to feature Intel Core i7 processor Updated <a href="#">Section 5.1.3.1</a> and <a href="#">Table 5-8</a> to include Intel Core i7 processor Modified <a href="#">Table 5-10</a> to include new C-state definitions Updated <a href="#">Table 5-11</a> to include Intel® Turbo Boost Technology Added <a href="#">Section 5.1.13, "Reserved (Function 0Ch)"</a> Combined Chapter 8: Usage Program Examples with Chapter 11: Program Examples into one chapter: Chapter 10: Program Examples	November 2008
-034	Updated Table 3-3 processor signatures Corrected Intel® Core™ i7 processor Model No. data in Table 3-3 Updated Table 3-7 cache descriptor decode values Modified CPUID3A.ASM, CPUID3B.ASM and CPUID3.C: - Added detection of additional feature flags - Updated text output Minor updates to DAZDETCT.ASM & CPUFREQ.ASM	March 2009
-035	Modified CPUID3A.ASM, CPUID3B.ASM and CPUID3.C: - Redesigned code so features are in tables for easier maintenance - Added CPUID Feature Flags per Software Developer Manual Vol 2A June 2009 - Added output for CPUID Function 04h, 05h, 0Ah, 0Bh, 0Dh. Modified FREQUENC.ASM, and added CPUFREQ.C: - Updated frequency code with APERF and MPERF MSR calculations	July 2009
-036	Corrected CPUID Function 04h text to specify EAX[31:26] is APIC IDs reserved for the package.	August 2009
-037	Added Chapter 1.2 Reference Documents Updated Table 3-3 processor signatures Updated Table 3-7 Cache and TLB Descriptor Decode values Updated Table 3-11 Digital Thermal Sensor and Power Management Parameters Added Table 3-19 and Table 3-20 Processor Extended State Enumeration sub-leaves Updated Table 3-22 Extended Feature Flags Reported in EDX Register Modified CPUID3B.ASM, CPUID3B.ASM and CPUID3.C: - Added CPUID Feature Flags per Software Developer Manual Vol 2A January 2011 - Added output for CPUID Function 00h, 01h, 04h, 06h, 09h, 80000006h, 80000008h.	January 2011

§

# 1 Introduction

As the Intel® Architecture evolves with the addition of new generations and models of processors (8086, 8088, Intel286, Intel386™, Intel486™, Pentium® processors, Pentium® OverDrive® processors, Pentium® processors with MMX™ technology, Pentium® OverDrive® processors with MMX™ technology, Pentium® Pro processors, Pentium® II processors, Pentium® II Xeon® processors, Pentium® II Overdrive® processors, Intel® Celeron® processors, Mobile Intel® Celeron® processors, Intel® Celeron® D processors, Intel® Celeron® M processors, Pentium® III processors, Mobile Intel® Pentium® III processor - M, Pentium® III Xeon® processors, Pentium® 4 processors, Mobile Intel® Pentium® 4 processor – M, Intel® Pentium® M processor, Intel® Pentium® D processor, Pentium® processor Extreme Edition, Intel® Pentium® dual-core processor, Intel® Pentium® dual-core mobile processor, Intel® Core™ Solo processor, Intel® Core™ Duo processor, Intel® Core™ Duo mobile processor, Intel® Core™2 Duo processor, Intel® Core™2 Duo mobile processor, Intel® Core™2 Quad processor, Intel® Core™2 Extreme processor, Intel® Core™2 Extreme mobile processor, Intel® Xeon® processors, Intel® Xeon® processor MP, Intel® Atom™ processor, Intel® Core™ i7 processor, Intel® Core™ i3 processor, Intel® Core™ i5 processor, Intel® Core™ i7 Mobile processor, Intel® Core™ i5 Mobile processor), it is essential that Intel provide an increasingly sophisticated means with which software can identify the features available on each processor. This identification mechanism has evolved in conjunction with the Intel Architecture as follows:

1. Originally, Intel published code sequences that could detect minor implementation or architectural differences to identify processor generations.
2. With the advent of the Intel386 processor, Intel implemented processor signature identification that provided the processor family, model, and stepping numbers to software, but only upon reset.
3. As the Intel Architecture evolved, Intel extended the processor signature identification into the CPUID instruction. The CPUID instruction not only provides the processor signature, but also provides information about the features supported by and implemented on the Intel processor.

This evolution of processor identification was necessary because, as the Intel Architecture proliferates, the computing market must be able to tune processor functionality across processor generations and models with differing sets of features. Anticipating that this trend will continue with future processor generations, the Intel Architecture implementation of the CPUID instruction is extensible.

This application note explains how to use the CPUID instruction in software applications, BIOS implementations, and various processor tools. By taking advantage of the CPUID instruction, software developers can create software applications and tools that can execute compatibly across the widest range of Intel processor generations and models, past, present, and future.

## 1.1 Update Support

Intel processor signature and feature bits information can be obtained from the developer's manual, programmer's reference manual and appropriate processor documentation. In addition, updated versions of the programming examples included in this application note are available through your Intel representative, or visit Intel's website at <http://developer.intel.com/>.

## 1.2 Reference Documents

Document	Document Location
<i>Intel® 64 and IA-32 Architectures Software Developer's Manual</i>	<a href="http://www.intel.com/products/processor/manuals/index.htm">http://www.intel.com/products/processor/manuals/index.htm</a>
<i>Intel® AVX home</i>	<a href="http://software.intel.com/en-us/avx/">http://software.intel.com/en-us/avx/</a>

## 2 Usage Guidelines

---

This document presents Intel-recommended feature-detection methods. Software should not try to identify features by exploiting programming tricks, undocumented features, or otherwise deviating from the guidelines presented in this application note.

The following guidelines are intended to help programmers maintain the widest range of compatibility for their software.

- Do not depend on the absence of an invalid opcode trap on the CPUID opcode to detect the CPUID instruction. Do not depend on the absence of an invalid opcode trap on the PUSHFD opcode to detect a 32-bit processor. Test the ID flag, as described in Section 2 and shown in Section 7.
- Do not assume that a given family or model has any specific feature. For example, do not assume the family value 5 (Pentium processor) means there is a floating-point unit on-chip. Use the feature flags for this determination.
- Do not assume processors with higher family or model numbers have all the features of a processor with a lower family or model number. For example, a processor with a family value of 6 (P6 family processor) may not necessarily have all the features of a processor with a family value of 5.
- Do not assume that the features in the OverDrive processors are the same as those in the OEM version of the processor. Internal caches and instruction execution might vary.
- Do not use undocumented features of a processor to identify steppings or features. For example, the Intel386 processor A-step had bit instructions that were withdrawn with the B-step. Some software attempted to execute these instructions and depended on the invalid-opcode exception as a signal that it was not running on the A-step part. The software failed to work correctly when the Intel486 processor used the same opcodes for different instructions. The software should have used the stepping information in the processor signature.
- Test feature flags individually and do not make assumptions about undefined bits. For example, it would be a mistake to test the FPU bit by comparing the feature register to a binary 1 with a compare instruction.
- Do not assume the clock of a given family or model runs at a specific frequency, and do not write processor speed-dependent code, such as timing loops. For instance, an OverDrive Processor could operate at a higher internal frequency and still report the same family and/or model. Instead, use a combination of the system's timers to measure elapsed time and the Time-Stamp Counter (TSC) to measure processor core clocks to allow direct calibration of the processor core. See Section 10 and Example 6 for details.
- Processor model-specific registers may differ among processors, including in various models of the Pentium processor. Do not use these registers unless identified for the installed processor. This is particularly important for systems upgradeable with an OverDrive processor. Only use Model Specific registers that are defined in the BIOS writers guide for that processor.
- Do not rely on the result of the CPUID algorithm when executed in virtual 8086 mode.
- Do not assume any ordering of model and/or stepping numbers. They are assigned arbitrarily.

- Do not assume processor serial number is a unique number without further qualifiers.
- Display processor serial number as 6 groups of 4 hex nibbles (for example, XXXX-XXXX-XXXX-XXXX-XXXX where X represents a hex digit).
- Display alpha hex characters as capital letters.
- A zero in the lower 64 bits of the processor serial number indicate the processor serial number is invalid, not supported, or disabled on this processor.

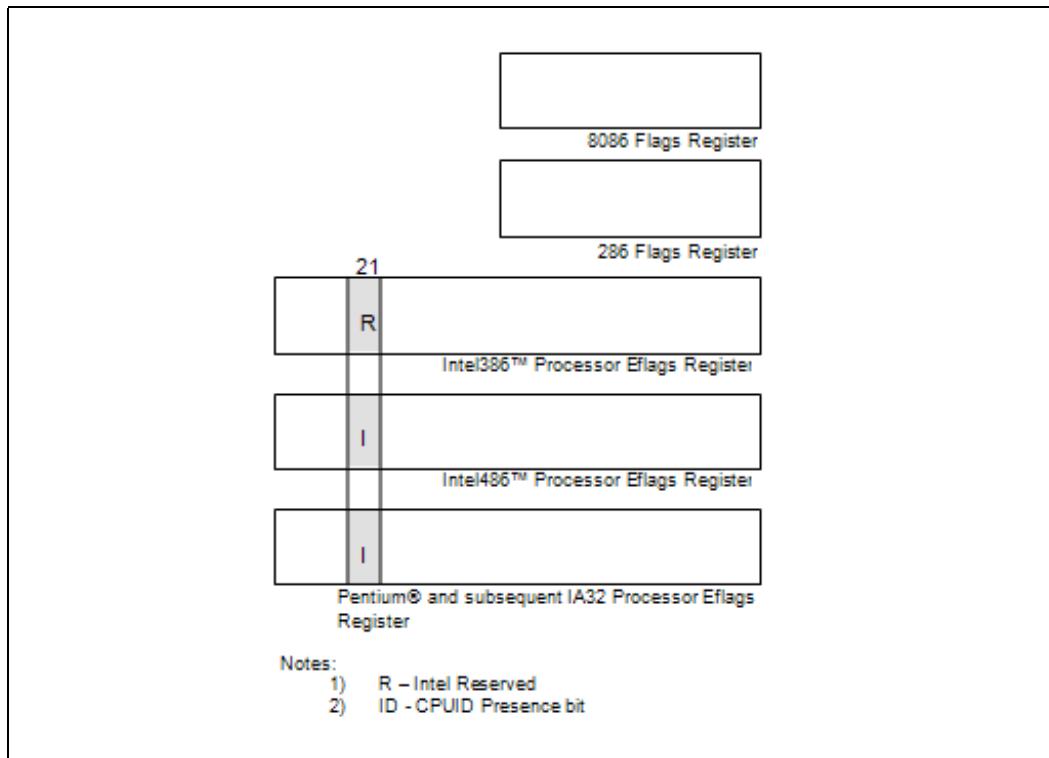

§

## 3 Detecting the CPUID Instruction

The Intel486 family and subsequent Intel processors provide a straightforward method for determining whether the processor's internal architecture is able to execute the CPUID instruction. This method uses the ID flag in bit 21 of the EFLAGS register. If software can change the value of this flag, the CPUID instruction is executable<sup>1</sup> (see Figure 3-1).

**Figure 3-1. Flag Register Evolution**

The POPF, POPFD, PUSHF, and PUSHFD instructions are used to access the flags in EFLAGS register. The program examples at the end of this application note show how to use the PUSHFD instruction to read and the POPFD instruction to change the value of the ID flag.

§

---

1. Only in some Intel486™ and succeeding processors. Bit 21 in the Intel386™ processor's Eflag register cannot be changed by software, and the Intel386 processor cannot execute the CPUID instruction. Execution of CPUID on a processor that does not support this instruction will result in an invalid opcode exception.

## 4 Proper Identification Sequence

---

To identify the processor using the CPUID instructions, software should follow the following steps.

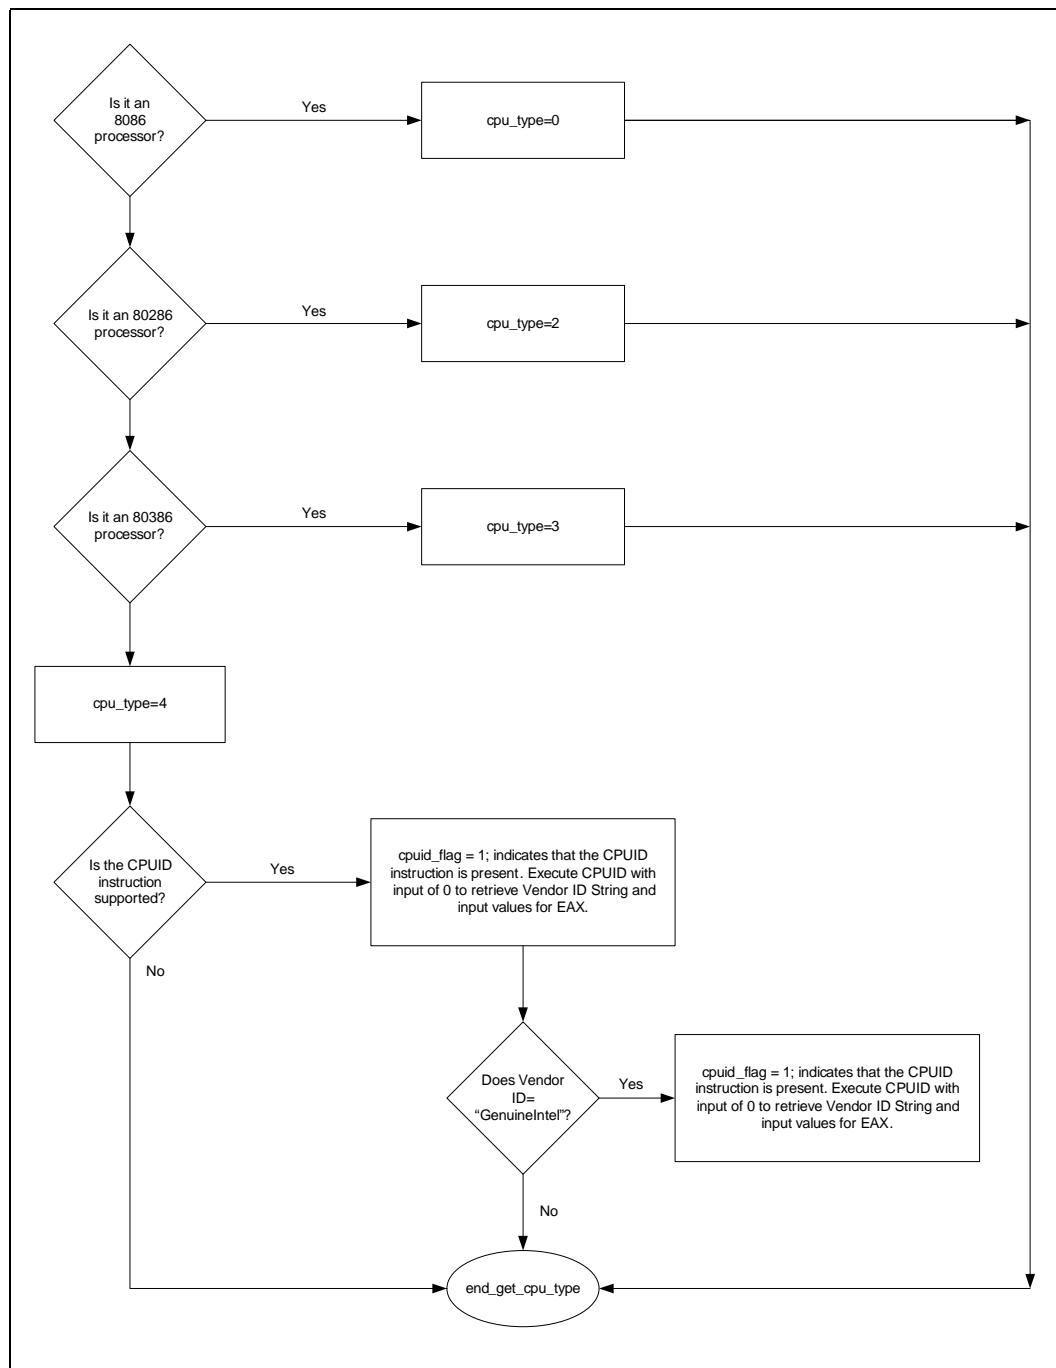

1. Determine if the CPUID instruction is supported by modifying the ID flag in the EFLAGS register. If the ID flag cannot be modified, the processor cannot be identified using the CPUID instruction.
2. Execute the CPUID instruction with EAX equal to 80000000h. CPUID function 80000000h is used to determine if Brand String is supported. If the CPUID function 80000000h returns a value in EAX greater than or equal to 80000004h the Brand String feature is supported and software should use CPUID functions 80000002h through 80000004h to identify the processor.
3. If the Brand String feature is not supported, execute CPUID with EAX equal to 1. CPUID function 1 returns the processor signature in the EAX register, and the Brand ID in the EBX register bits 0 through 7. If the EBX register bits 0 through 7 contain a non-zero value, the Brand ID is supported. Software should scan the list of Brand IDs (see [Table 7-1](#)) to identify the processor.
4. If the Brand ID feature is not supported, software should use the processor signature (see [Table 5-2](#) and [Table 5-3](#)) in conjunction with the cache descriptors (see [Section 5.1.3](#)) to identify the processor.

The CPUID3A.ASM program example demonstrates the correct use of the CPUID instruction. It also shows how to identify earlier processor generations that do not implement the Brand String, Brand ID, processor signature or CPUID instruction (see [Figure 4-1](#)). This program example contains the following two procedures:

- get\_cpu\_type identifies the processor type. [Figure 4-1](#) illustrates the flow of this procedure.
- get\_fpu\_type determines the type of floating-point unit (FPU) or math coprocessor (MCP).

This assembly language program example is suitable for inclusion in a run-time library, or as system calls in operating systems.

**Figure 4-1. Flow of Processor get\_cpu\_type Procedure**

**S**

## 5 Output of the CPUID Instruction

---

The CPUID instruction supports two sets of functions. The first set returns basic processor information; the second set returns extended processor information.

[Figure 5-1](#) summarizes the basic processor information output by the CPUID instruction. The output from the CPUID instruction is fully dependent upon the contents of the EAX register. This means that, by placing different values in the EAX register and then executing CPUID, the CPUID instruction will perform a specific function dependent upon whatever value is resident in the EAX register. In order to determine the highest acceptable value for the EAX register input and CPUID functions that return the basic processor information, the program should set the EAX register parameter value to "0" and then execute the CPUID instruction as follows:

```
MOV EAX, 00h  
CPUID
```

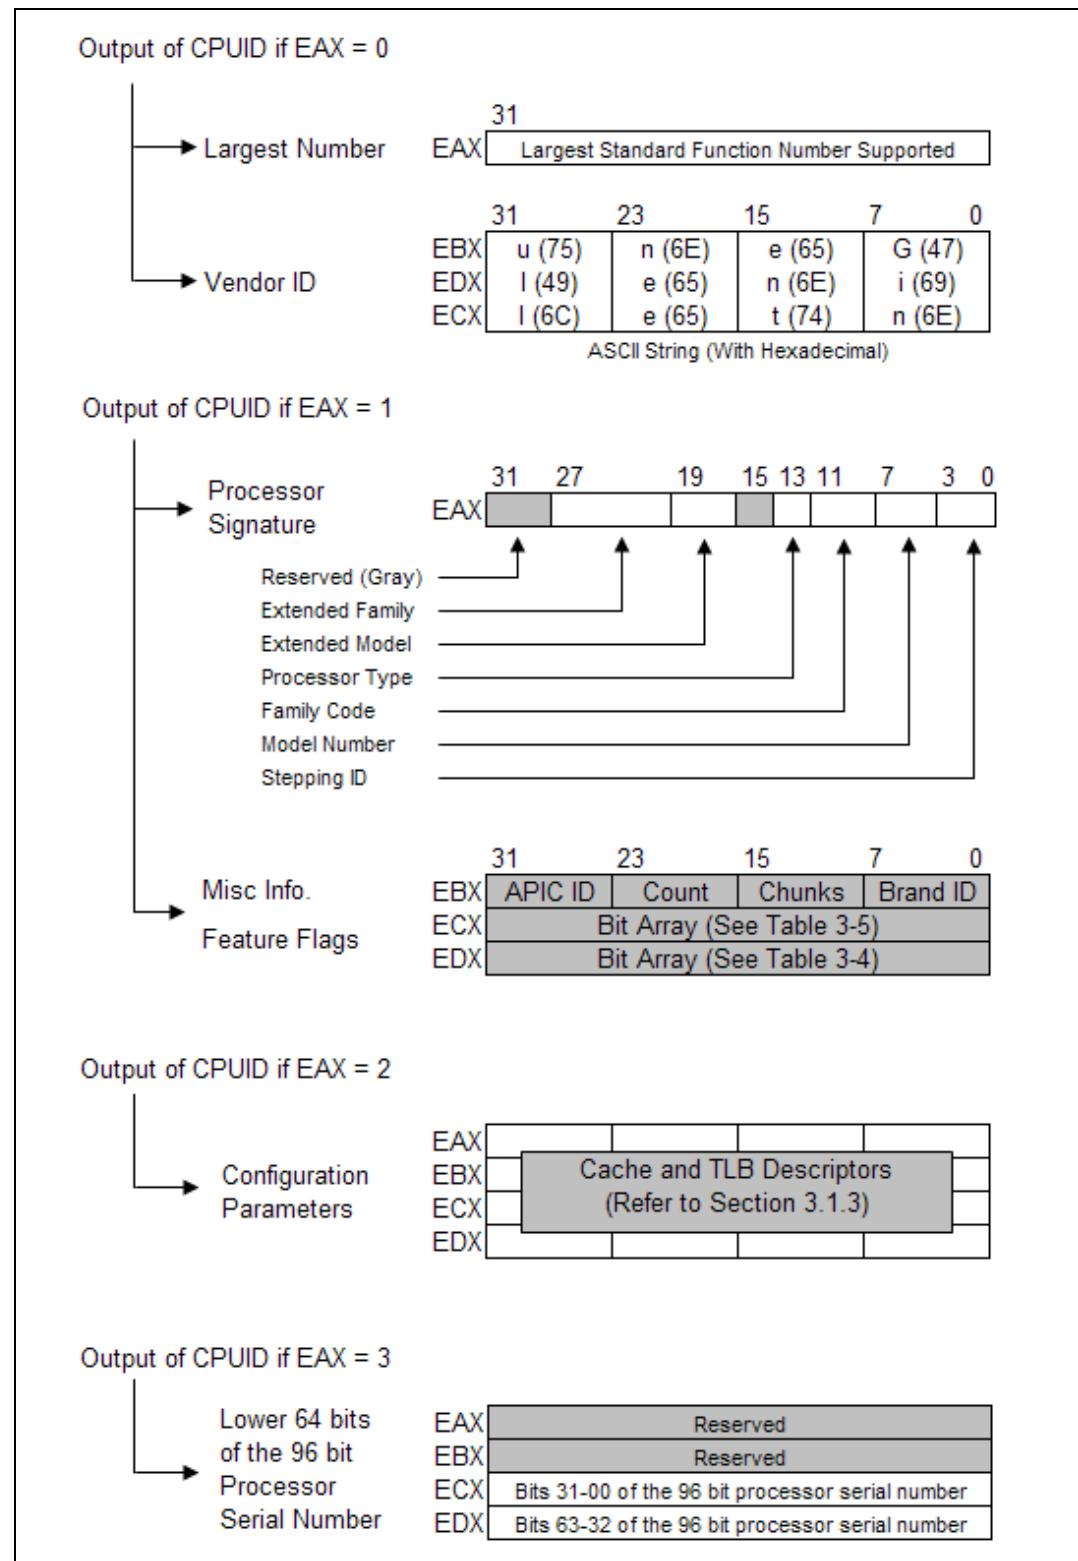

After the execution of the CPUID instruction, a return value will be present in the EAX register. Always use an EAX parameter value that is equal to or greater than zero and less than or equal to this highest EAX "returned" value.

In order to determine the highest acceptable value for the EAX register input and CPUID functions that return the extended processor information, the program should set the EAX register parameter value to "80000000h" and then execute the CPUID instruction as follows:

```
MOV EAX, 80000000h  
CPUID
```

After the execution of the CPUID instruction, a return value will be present in the EAX register. Always use an EAX parameter value that is equal to or greater than 80000000h and less than or equal to this highest EAX "returned" value. On current and future IA-32 processors, bit 31 in the EAX register will be clear when CPUID is executed with an input parameter greater than the highest value for either set of functions, and when the extended functions are not supported. All other bit values returned by the processor in response to a CPUID instruction with EAX set to a value higher than appropriate for that processor are model specific and should not be relied upon.

Figure 5-1. CPUID Instruction Outputs

## 5.1 Standard CPUID Functions

### 5.1.1 Vendor-ID and Largest Standard Function (Function 0)

In addition to returning the largest standard function number in the EAX register, the Intel Vendor-ID string can be verified at the same time. If the EAX register contains an input value of 0, the CPUID instruction also returns the vendor identification string in the EBX, EDX, and ECX registers (see [Figure 5-1](#)). These registers contain the ASCII string:

**GenuineIntel**

While any imitator of the Intel Architecture can provide the CPUID instruction, no imitator can legitimately claim that its part is a genuine Intel part. The presence of the "GenuineIntel" string is an assurance that the CPUID instruction and the processor signature are implemented as described in this document. If the "GenuineIntel" string is not returned after execution of the CPUID instruction, do not rely upon the information described in this document to interpret the information returned by the CPUID instruction.

### 5.1.2 Feature Information (Function 01h)

#### 5.1.2.1 Processor Signature

Beginning with the Intel486 processor family, the EDX register contains the processor identification signature after RESET (see [Figure 5-2](#)). **The processor identification signature is a 32-bit value.** The processor signature is composed from eight different bit fields. The fields in gray represent reserved bits, and should be masked out when utilizing the processor signature. The remaining six fields form the processor identification signature.

**Figure 5-2. EDX Register After RESET**

EDX =	31	28	27	20	19	16	15	14	13	12	11	8	7	4	3	0
				Extended Family	Extended Model		Type	Family Code		Model Number		Stepping ID				

Processors that implement the CPUID instruction also return the 32-bit processor identification signature after reset. However, the CPUID instruction gives you the flexibility of checking the processor signature at any time. [Figure 5-2](#) shows the format of the 32-bit processor signature for the Intel486 and subsequent Intel processors. Note that the EDX processor signature value after reset is equivalent to the processor signature output value in the EAX register in [Figure 5-1](#). [Table 5-3](#) below shows the values returned in the EAX register currently defined for these processors.

The extended family, bit positions 20 through 27 are used in conjunction with the family code, specified in bit positions 8 through 11, to indicate whether the processor belongs to the Intel386, Intel486, Pentium, Pentium Pro or Pentium 4 family of processors. P6 family processors include all processors based on the Pentium Pro processor architecture and have an extended family equal to 00h and a family code equal to 06h. Pentium 4 family processors include all processors based on the Intel NetBurst® microarchitecture and have an extended family equal to 00h and a family code equal to 0Fh.

The extended model specified in bit positions 16 through 19, in conjunction with the model number specified in bits 4 though 7 are used to identify the model of the processor within the processor's family. The stepping ID in bits 0 through 3 indicates the revision number of that model.

The processor type values returned in bits 12 and 13 of the EAX register are specified in [Table 5-1](#) below. These values indicate whether the processor is an original OEM processor, an OverDrive processor, or a dual processor (capable of being used in a dual processor system).

**Table 5-1. Processor Type (Bit Positions 13 and 12)**

Value	Description
00	Original OEM Processor
01	OverDrive Processor
10	Dual Processor

The Pentium II processor, model 5, the Pentium II Xeon processor, model 5, and the Celeron processor, model 5 share the same extended family, family code, extended model and model number. To differentiate between the processors, software should check the cache descriptor values through executing CPUID instruction with EAX = 2. If no L2 cache is returned, the processor is identified as an Intel® Celeron® processor, model 5. If 1-MB or 2-MB L2 cache size is reported, the processor is the Pentium II Xeon processor otherwise it is a Pentium II processor, model 5 or a Pentium II Xeon processor with 512-KB L2 cache.

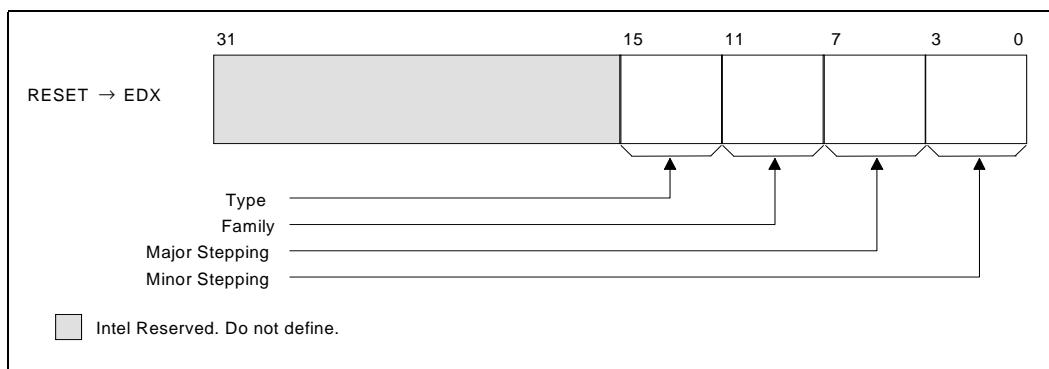

The Pentium III processor, model 7, and the Pentium III Xeon processor, model 7, share the same extended family, family code, extended model and model number. To differentiate between the processors, software should check the cache descriptor values through executing CPUID instruction with EAX = 2. If 1M or 2M L2 cache size is reported, the processor is the Pentium III Xeon processor otherwise it is a Pentium III processor or a Pentium III Xeon processor with 512 KB L2 cache.

The processor brand for the Pentium III processor, model 8, the Pentium III Xeon processor, model 8, and the Celeron processor, model 8, can be determined by using the Brand ID values returned by the CPUID instruction when executed with EAX equal to 01h. Further information regarding Brand ID and Brand String is detailed in [Chapter 7](#) of this document.

Older versions of Intel486 SX, Intel486 DX and IntelDX2™ processors do not support the CPUID instruction, and return the processor signature only at reset.<sup>1</sup> Refer to [Table 5-3](#) to determine which processors support the CPUID instruction.

[Figure 5-3](#) shows the format of the processor signature for Intel386 processors. The Intel386 processor signature is different from the signature of other processors. [Table 5-2](#) provides the processor signatures of Intel386™ processors.

1. All Intel486 SL-enhanced and Write-Back enhanced processors are capable of executing the CPUID instruction. See [Table 5-3](#).

00000000	0010	00	0110	1111	xxxx (2)	Intel Xeon processor MP. All processors are manufactured using the 32 nm process.
00000000	0010	00	0110	1100	xxxx (2)	Intel Core i7 processor and Intel Xeon processor. All processors are manufactured using the 32 nm process.
00000000	0010	00	0110	0101	xxxx (2)	Intel Core i3 processor and Intel Core i5/i7 Mobile processor. All processors are manufactured using the 32 nm process.
00000000	0010	00	0110	1010	xxxx (2)	Intel Core i7 processor. All processors are manufactured using the 32 nm process.

**Notes:**

1. This processor does not implement the CPUID instruction.
2. Refer to the Intel486™ documentation, the Pentium® Processor Specification Update (Document Number 242480), the Pentium® Pro Processor Specification Update (Document Number 242689), the Pentium® II Processor Specification Update (Document Number 243337), the Pentium® II Xeon Processor Specification Update (Document Number 243776), the Intel® Celeron® Processor Specification Update (Document Number 243748), the Pentium® III Processor Specification Update (Document Number 244453), the Pentium® III Xeon® Processor Specification Update (Document Number 244460), the Pentium® 4 Processor Specification Update (Document Number 249199), the Intel® Xeon® Processor Specification Update (Document Number 249678) or the Intel® Xeon® Processor MP Specification Update (Document Number 290741) for the latest list of stepping numbers.
3. Stepping 3 implements the CPUID instruction.
4. The definition of the type field for the OverDrive processor is 01h. An erratum on the Pentium OverDrive processor will always return 00h as the type.
5. To differentiate between the Pentium II processor, model 5, Pentium II Xeon processor and the Celeron processor, model 5, software should check the cache descriptor values through executing CPUID instruction with EAX = 2. If no L2 cache is returned, the processor is identified as an Celeron processor, model 5. If 1M or 2M L2 cache size is reported, the processor is the Pentium II Xeon processor otherwise it is a Pentium II processor, model 5 or a Pentium II Xeon processor with 512-KB L2 cache size.

6. To differentiate between the Pentium III processor, model 7 and the Pentium III Xeon processor, model 7, software should check the cache descriptor values through executing CPUID instruction with EAX = 2. If 1M or 2M L2 cache size is reported, the processor is the Pentium III Xeon processor otherwise it is a Pentium III processor or a Pentium III Xeon processor with 512-KB L2 cache size.
7. To differentiate between the Pentium III processor, model 8 and the Pentium III Xeon processor, model 8, software should check the Brand ID values through executing CPUID instruction with EAX = 1.
8. To differentiate between the processors with the same processor Vendor ID, software should execute the Brand String functions and parse the Brand String.

### 5.1.2.2 Composing the Family, Model and Stepping (FMS) values

The processor family is an 8-bit value obtained by adding the Extended Family field of the processor signature returned by CPUID Function 1 with the Family field.

#### Equation 5-1.Calculated Family Value

$$\begin{aligned} F &= \text{Extended Family} + \text{Family} \\ F &= \text{CPUID}(1).\text{EAX}[27:20] + \text{CPUID}(1).\text{EAX}[11:8] \end{aligned}$$

The processor model is an 8-bit value obtained by shifting left 4 the Extended Model field of the processor signature returned by CPUID Function 1 then adding the Model field.

#### Equation 5-2.Calculated Model Value

$$\begin{aligned} M &= (\text{Extended Model} \ll 4) + \text{Model} \\ M &= (\text{CPUID}(1).\text{EAX}[19:16] \ll 4) + \text{CPUID}(1).\text{EAX}[7:4] \end{aligned}$$

The processor stepping is a 4-bit value obtained by copying the *Stepping* field of the processor signature returned by CPUID function 1.

#### Equation 5-3.Calculated Stepping Value

$$\begin{aligned} S &= \text{Stepping} \\ S &= \text{CPUID}(1).\text{EAX}[3:0] \end{aligned}$$

#### Recommendations for Testing Compliance

New and existing software should be inspected to ensure code always uses:

1. The full 32-bit value when comparing processor signatures;
2. The full 12-bit value when comparing processor families, the full 8-bit value when comparing processor models; and
3. The 4-bit value when comparing processor steppings.

### 5.1.2.3 Feature Flags

When the EAX register contains a value of 1, the CPUID instruction (in addition to loading the processor signature in the EAX register) loads the EDX and ECX register with the feature flags. The feature flags (when a Flag = 1) indicate what features the processor supports. [Table 5-4](#) and [Table 5-5](#) detail the currently-defined feature flag values.

For future processors, refer to the programmer's reference manual, user's manual, or the appropriate documentation for the latest feature flag values.

Use the feature flags in applications to determine which processor features are supported. By using the CPUID feature flags to determine processor features, software can detect and avoid incompatibilities introduced by the addition or removal of processor features.

Table 5-4. Feature Flags Reported in the ECX Register (Sheet 1 of 2)

Bit	Name	Description when Flag = 1	Comments
0	SSE3	Streaming SIMD Extensions 3	The processor supports the Streaming SIMD Extensions 3 instructions.
1	PCLMULQDQ	PCLMULQDQ Instruction	The processor supports PCLMULQDQ instruction.
2	DTES64	64-Bit Debug Store	Indicates that the processor has the ability to write a history of the 64-bit branch to and from addresses into a memory buffer.
3	MONITOR	MONITOR/MWAIT	The processor supports the MONITOR and MWAIT instructions.
4	DS-CPL	CPL Qualified Debug Store	The processor supports the extensions to the Debug Store feature to allow for branch message storage qualified by CPL.
5	VMX	Virtual Machine Extensions	The processor supports Intel® Virtualization Technology
6	SMX	Safer Mode Extensions	The processor supports Intel® Trusted Execution Technology
7	EIST	Enhanced Intel SpeedStep® Technology	The processor supports Enhanced Intel SpeedStep® Technology and implements the IA32_PERF_STS and IA32_PERF_CTL registers.
8	TM2	Thermal Monitor 2	The processor implements the Thermal Monitor 2 thermal control circuit (TCC).
9	SSSE3	Supplemental Streaming SIMD Extensions 3	The processor supports the Supplemental Streaming SIMD Extensions 3 instructions.
10	CNXT-ID	L1 Context ID	The L1 data cache mode can be set to either adaptive mode or shared mode by the BIOS.
11		<b>Reserved</b>	Do not count on the value.
12	FMA	Fused Multiply Add	The processor supports FMA extensions using YMM state.
13	CX16	CMPXCHG16B	The processor supports the CMPXCHG16B instruction.
14	xTPR	xTPR Update Control	The processor supports the ability to disable sending Task Priority messages. When this feature flag is set, Task Priority messages may be disabled. Bit 23 (Echo TPR disable) in the IA32_MISC_ENABLE MSR controls the sending of Task Priority messages.
15	PDCM	Perfmon and Debug Capability	The processor supports the Performance Capabilities MSR. IA32_PERF_CAPABILITIES register is MSR 345h.
16		<b>Reserved</b>	Do not count on the value.
17	PCID	Process Context Identifiers	The processor supports PCIDs and that software may set CR4.PCIDE to 1.
18	DCA	Direct Cache Access	The processor supports the ability to prefetch data from a memory mapped device.
19	SSE4.1	Streaming SIMD Extensions 4.1	The processor supports the Streaming SIMD Extensions 4.1 instructions.
20	SSE4.2	Streaming SIMD Extensions 4.2	The processor supports the Streaming SIMD Extensions 4.2 instructions.
21	x2APIC	Extended xAPIC Support	The processor supports x2APIC feature.
22	MOVBE	MOVBE Instruction	The processor supports MOVBE instruction.
23	POPCNT	POPCNT Instruction	The processor supports the POPCNT instruction.
24	TSC-DEADLINE	Time Stamp Counter Deadline	The processor's local APIC timer supports one-shot operation using a TSC deadline value.

**Table 5-4. Feature Flags Reported in the ECX Register (Sheet 2 of 2)**

<b>Bit</b>	<b>Name</b>	<b>Description when Flag = 1</b>	<b>Comments</b>
25	AES	AES Instruction Extensions	The processor supports the AES instruction extensions.
26	XSAVE	XSAVE/XRSTOR States	The processor supports the XSAVE/XRSTOR processor extended states feature, the XSETBV/XGETBV instructions, and the XFEATURE_ENABLED_MASK register (XCRO)
27	OSXSAVE	OS-Enabled Extended State Management	A value of 1 indicates that the OS has enabled XSETBV/XGETBV instructions to access the XFEATURE_ENABLED_MASK register (XCRO), and support for processor extended state management using XSAVE/XRSTOR.
28	AVX	Advanced Vector Extensions	The processor supports the AVX instruction extensions.
30:29		<b>Reserved</b>	Do not count on the value.
31		Not Used	Always returns 0.

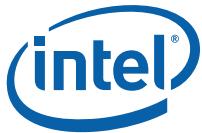

Table 5-5. Feature Flags Reported in the EDX Register (Sheet 1 of 2)

Bit	Name	Description when Flag = 1	Comments
0	FPU	Floating-point Unit On-Chip	The processor contains an FPU that supports the Intel387 floating-point instruction set.
1	VME	Virtual Mode Extension	The processor supports extensions to virtual-8086 mode.
2	DE	Debugging Extension	The processor supports I/O breakpoints, including the CR4.DE bit for enabling debug extensions and optional trapping of access to the DR4 and DR5 registers.
3	PSE	Page Size Extension	The processor supports 4-MB pages.
4	TSC	Time Stamp Counter	The RDTSCL instruction is supported including the CR4.TSD bit for access/privilege control.
5	MSR	Model Specific Registers	Model Specific Registers are implemented with the RDMSR, WRMSR instructions
6	PAE	Physical Address Extension	Physical addresses greater than 32 bits are supported.
7	MCE	Machine-Check Exception	Machine-Check Exception, INT18, and the CR4.MCE enable bit are supported.
8	CX8	CMPXCHG8 Instruction	The compare and exchange 8-bytes instruction is supported.
9	APIC	On-chip APIC Hardware	The processor contains a software-accessible local APIC.
10		<b>Reserved</b>	Do not count on the value.
11	SEP	Fast System Call	Indicates whether the processor supports the Fast System Call instructions, SYSENTER and SYSEXIT. NOTE: Refer to Section 5.1.2.4 for further information regarding SYSENTER/SYSEXIT feature and SEP feature bit.
12	MTRR	Memory Type Range Registers	The processor supports the Memory Type Range Registers specifically the MTRR_CAP register.
13	PGE	Page Global Enable	The global bit in the page directory entries (PDEs) and page table entries (PTEs) is supported, indicating TLB entries that are common to different processes and need not be flushed. The CR4.PGE bit controls this feature.
14	MCA	Machine-Check Architecture	The Machine-Check Architecture is supported, specifically the MCG_CAP register.
15	CMOV	Conditional Move Instruction	The processor supports CMOVcc, and if the FPU feature flag (bit 0) is also set, supports the FCMOVCC and FCOMI instructions.
16	PAT	Page Attribute Table	Indicates whether the processor supports the Page Attribute Table. This feature augments the Memory Type Range Registers (MTRRs), allowing an operating system to specify attributes of memory on 4K granularity through a linear address.
17	PSE-36	36-bit Page Size Extension	Indicates whether the processor supports 4-MB pages that are capable of addressing physical memory beyond 4-GB. This feature indicates that the upper four bits of the physical address of the 4-MB page is encoded by bits 13-16 of the page directory entry.
18	PSN	Processor serial number is present and enabled	The processor supports the 96-bit processor serial number feature, and the feature is enabled. Note: The Pentium 4 and subsequent processor families do not support this feature.
19	CLFSH	CLFLUSH Instruction	Indicates that the processor supports the CLFLUSH instruction.

**Table 5-5. Feature Flags Reported in the EDX Register (Sheet 2 of 2)**

Bit	Name	Description when Flag = 1	Comments
20		<b>Reserved</b>	Do not count on the value.
21	DS	Debug Store	Indicates that the processor supports the ability to write debug information into a memory resident buffer. This feature is used by the branch trace store (BTS) and precise event-based sampling (PEBS) facilities.
22	ACPI	Thermal Monitor and Software Controlled Clock Facilities	The processor implements internal MSRs that allow processor temperature to be monitored and processor performance to be modulated in predefined duty cycles under software control.
23	MMX	MMX technology	The processor supports the MMX technology instruction set extensions to Intel Architecture.
24	FXSR	FXSAVE and FXSTOR Instructions	The FXSAVE and FXRSTOR instructions are supported for fast save and restore of the floating point context. Presence of this bit also indicates that CR4.OSFXSR is available for an operating system to indicate that it supports the FXSAVE and FXRSTOR instructions.
25	SSE	Streaming SIMD Extensions	The processor supports the Streaming SIMD Extensions to the Intel Architecture.
26	SSE2	Streaming SIMD Extensions 2	Indicates the processor supports the Streaming SIMD Extensions 2 Instructions.
27	SS	Self-Snoop	The processor supports the management of conflicting memory types by performing a snoop of its own cache structure for transactions issued to the bus.
28	HTT	Multi-Threading	<p>The physical processor package is capable of supporting more than one logical processor.</p> <p>This field does not indicate that Hyper-Threading Technology or Core Multi-Processing (CMP) has been enabled for this specific processor. To determine if Hyper-Threading Technology or CMP is supported, compare value returned in EBX[23:16] after executing CPUID with EAX=1. If the resulting value is &gt; 1, then the processor supports Multi-Threading.</p> <pre> IF (CPUID(1).EBX[23:16] &gt; 1) {     Multi-Threading = TRUE } ELSE {     Multi-Threading = FALSE } </pre>
29	TM	Thermal Monitor	The processor implements the Thermal Monitor automatic thermal control circuitry (TCC).
30		<b>Reserved</b>	Do not count on the value.
31	PBE	Pending Break Enable	The processor supports the use of the FERR#/PBE# pin when the processor is in the stop-clock state (STPCLK# is asserted) to signal the processor that an interrupt is pending and that the processor should return to normal operation to handle the interrupt. Bit 10 (PBE enable) in the IA32_MISC_ENABLE MSR enables this capability.

#### 5.1.2.4

#### SYSENTER/SYSEXIT – SEP Features Bit

The SYSENTER Present (SEP) Feature bit (returned in EDX bit 11 after execution of CPUID Function 1) indicates support for SYSENTER/SYSEXIT instructions. An operating system that detects the presence of the SEP Feature bit must also qualify the processor family and model to ensure that the SYSENTER/SYSEXIT instructions are actually present:

```
IF (CPUID SEP Feature bit is set, i.e. CPUID (1).EDX[11] == 1)
{
    IF ((Processor Signature & 0xFFFFFFF) < 0x00000633)
        Fast System Call is NOT supported
    ELSE
        Fast System Call is supported
}
```

The Pentium Pro processor (Model = 1) returns a set SEP CPUID feature bit, but should not be used by software.

### 5.1.3 Cache Descriptors (Function 02h)

When the EAX register contains a value of 2, the CPUID instruction loads the EAX, EBX, ECX and EDX registers with descriptors that indicate the processor's cache and TLB characteristics. The lower 8 bits of the EAX register (AL) contain a value that identifies the number of times the CPUID must be executed in order to obtain a complete image of the processor's caching systems. For example, the Intel® Core™ i7 processor returns a value of 01h in the lower 8 bits of the EAX register to indicate that the CPUID instruction need only be executed once (with EAX = 2) to obtain a complete image of the processor configuration.

The remainder of the EAX register, the EBX, ECX and EDX registers, contain the cache and Translation Lookaside Buffer (TLB) descriptors. [Table 5-6](#) shows that when bit 31 in a given register is zero, that register contains valid 8-bit descriptors. To decode descriptors, move sequentially from the most significant byte of the register down through the least significant byte of the register. Assuming bit 31 is 0, then that register contains valid cache or TLB descriptors in bits 24 through 31, bits 16 through 23, bits 8 through 15 and bits 0 through 7. Software must compare the value contained in each of the descriptor bit fields with the values found in [Table 5-7](#) to determine the cache and TLB features of a processor.

[Table 5-7](#) lists the current cache and TLB descriptor values and their respective characteristics. This list will be extended in the future as necessary. Between models and steppings of processors the cache and TLB information may change bit field locations, therefore it is important that software not assume fixed locations when parsing the cache and TLB descriptors.

**Table 5-6. Descriptor Formats**

Register bit 31	Descriptor Type	Description
1	Reserved	Reserved for future use.
0	8-bit descriptors	Descriptors point to a parameter table to identify cache characteristics. The descriptor is null if it has a 0 value.

**Table 5-7. Cache and TLB Descriptor Decode Values (Sheet 1 of 4)**

Value	Type	Cache or TLB Descriptor Description
00h	General	Null Descriptor, this byte contains no information
01h	TLB	Instruction TLB: 4-KB Pages, 4-way set associative, 32 entries
02h	TLB	Instruction TLB: 4-MB Pages, fully associative, 2 entries
03h	TLB	Data TLB: 4-KB Pages, 4-way set associative, 64 entries
04h	TLB	Data TLB: 4-MB Pages, 4-way set associative, 8 entries
05h	TLB	Data TLB: 4-MB Pages, 4-way set associative, 32 entries

**Table 5-7. Cache and TLB Descriptor Decode Values (Sheet 2 of 4)**

<b>Value</b>	<b>Type</b>	<b>Cache or TLB Descriptor Description</b>
06h	Cache	1st-level instruction cache: 8-KB, 4-way set associative, 32-byte line size
08h	Cache	1st-level instruction cache: 16-KB, 4-way set associative, 32-byte line size
09h	Cache	1st-level Instruction Cache: 32-KB, 4-way set associative, 64-byte line size
0Ah	Cache	1st-level data cache: 8-KB, 2-way set associative, 32-byte line size
0Bh	TLB	Instruction TLB: 4-MB pages, 4-way set associative, 4 entries
0Ch	Cache	1st-level data cache: 16-KB, 4-way set associative, 32-byte line size
0Dh	Cache	1st-level Data Cache: 16-KB, 4-way set associative, 64-byte line size, ECC
0Eh	Cache	1st-level Data Cache: 24-KB, 6-way set associative, 64-byte line size, ECC
21h	Cache	2nd-level cache: 256-KB, 8-way set associative, 64-byte line size
22h	Cache	3rd-level cache: 512-KB, 4-way set associative, sectored cache, 64-byte line size
23h	Cache	3rd-level cache: 1-MB, 8-way set associative, sectored cache, 64-byte line size
25h	Cache	3rd-level cache: 2-MB, 8-way set associative, sectored cache, 64-byte line size
29h	Cache	3rd-level cache: 4-MB, 8-way set associative, sectored cache, 64-byte line size
2Ch	Cache	1st-level data cache: 32-KB, 8-way set associative, 64-byte line size
30h	Cache	1st-level instruction cache: 32-KB, 8-way set associative, 64-byte line size
40h	Cache	No 2nd-level cache or, if processor contains a valid 2nd-level cache, no 3rd-level cache
41h	Cache	2nd-level cache: 128-KB, 4-way set associative, 32-byte line size
42h	Cache	2nd-level cache: 256-KB, 4-way set associative, 32-byte line size
43h	Cache	2nd-level cache: 512-KB, 4-way set associative, 32-byte line size
44h	Cache	2nd-level cache: 1-MB, 4-way set associative, 32-byte line size
45h	Cache	2nd-level cache: 2-MB, 4-way set associative, 32-byte line size
46h	Cache	3rd-level cache: 4-MB, 4-way set associative, 64-byte line size
47h	Cache	3rd-level cache: 8-MB, 8-way set associative, 64-byte line size
48h	Cache	2nd-level cache: 3-MB, 12-way set associative, 64-byte line size, unified on-die
49h	Cache	3rd-level cache: 4-MB, 16-way set associative, 64-byte line size (Intel Xeon processor MP, Family 0Fh, Model 06h) 2nd-level cache: 4-MB, 16-way set associative, 64-byte line size
4Ah	Cache	3rd-level cache: 6-MB, 12-way set associative, 64-byte line size
4Bh	Cache	3rd-level cache: 8-MB, 16-way set associative, 64-byte line size
4Ch	Cache	3rd-level cache: 12-MB, 12-way set associative, 64-byte line size
4Dh	Cache	3rd-level cache: 16-MB, 16-way set associative, 64-byte line size
4Eh	Cache	2nd-level cache: 6-MB, 24-way set associative, 64-byte line size
4Fh	TLB	Instruction TLB: 4-KB pages, 32 entries
50h	TLB	Instruction TLB: 4-KB, 2-MB or 4-MB pages, fully associative, 64 entries
51h	TLB	Instruction TLB: 4-KB, 2-MB or 4-MB pages, fully associative, 128 entries
52h	TLB	Instruction TLB: 4-KB, 2-MB or 4-MB pages, fully associative, 256 entries
55h	TLB	Instruction TLB: 2-MB or 4-MB pages, fully associative, 7 entries
56h	TLB	L1 Data TLB: 4-MB pages, 4-way set associative, 16 entries
57h	TLB	L1 Data TLB: 4-KB pages, 4-way set associative, 16 entries
59h	TLB	Data TLB0: 4-KB pages, fully associative, 16 entries
5Ah	TLB	Data TLB0: 2-MB or 4-MB pages, 4-way associative, 32 entries
5Bh	TLB	Data TLB: 4-KB or 4-MB pages, fully associative, 64 entries

Table 5-7. Cache and TLB Descriptor Decode Values (Sheet 3 of 4)

Value	Type	Cache or TLB Descriptor Description
5Ch	TLB	Data TLB: 4-KB or 4-MB pages, fully associative, 128 entries
5Dh	TLB	Data TLB: 4-KB or 4-MB pages, fully associative, 256 entries
60h	Cache	1st-level data cache: 16-KB, 8-way set associative, sectored cache, 64-byte line size
66h	Cache	1st-level data cache: 8-KB, 4-way set associative, sectored cache, 64-byte line size
67h	Cache	1st-level data cache: 16-KB, 4-way set associative, sectored cache, 64-byte line size
68h	Cache	1st-level data cache: 32-KB, 4 way set associative, sectored cache, 64-byte line size
70h	Cache	Trace cache: 12K-uops, 8-way set associative
71h	Cache	Trace cache: 16K-uops, 8-way set associative
72h	Cache	Trace cache: 32K-uops, 8-way set associative
76h	TLB	2nd-level cache: 1-MB, 4-way set associative, 64-byte line size
78h	Cache	2nd-level cache: 1-MB, 4-way set associative, 64-byte line size
79h	Cache	2nd-level cache: 128-KB, 8-way set associative, sectored cache, 64-byte line size
7Ah	Cache	2nd-level cache: 256-KB, 8-way set associative, sectored cache, 64-byte line size
7Bh	Cache	2nd-level cache: 512-KB, 8-way set associative, sectored cache, 64-byte line size
7Ch	Cache	2nd-level cache: 1-MB, 8-way set associative, sectored cache, 64-byte line size
7Dh	Cache	2nd-level cache: 2-MB, 8-way set associative, 64-byte line size
7Fh	Cache	2nd-level cache: 512-KB, 2-way set associative, 64-byte line size
80h	Cache	2nd-level cache: 512-KB, 8-way set associative, 64-byte line size
82h	Cache	2nd-level cache: 256-KB, 8-way set associative, 32-byte line size
83h	Cache	2nd-level cache: 512-KB, 8-way set associative, 32-byte line size
84h	Cache	2nd-level cache: 1-MB, 8-way set associative, 32-byte line size
85h	Cache	2nd-level cache: 2-MB, 8-way set associative, 32-byte line size
86h	Cache	2nd-level cache: 512-KB, 4-way set associative, 64-byte line size
87h	Cache	2nd-level cache: 1-MB, 8-way set associative, 64-byte line size
B0h	TLB	Instruction TLB: 4-KB Pages, 4-way set associative, 128 entries
B1h	TLB	Instruction TLB: 2-MB pages, 4-way, 8 entries or 4M pages, 4-way, 4 entries
B2h	TLB	Instruction TLB: 4-KB pages, 4-way set associative, 64 entries
B3h	TLB	Data TLB: 4-KB Pages, 4-way set associative, 128 entries
B4h	TLB	Data TLB: 4-KB Pages, 4-way set associative, 256 entries
BAh	TLB	Data TLB: 4-KB Pages, 4-way set associative, 64 entries
C0h	TLB	Data TLB: 4-KB or 4-MB Pages, 4-way set associative, 8 entries
CAh	STLB	Shared 2nd-level TLB: 4 KB pages, 4-way set associative, 512 entries
D0h	Cache	3rd-level cache: 512-kB, 4-way set associative, 64-byte line size
D1h	Cache	3rd-level cache: 1-MB, 4-way set associative, 64-byte line size
D2h	Cache	3rd-level cache: 2-MB, 4-way set associative, 64-byte line size
D6h	Cache	3rd-level cache: 1-MB, 8-way set associative, 64-byte line size
D7h	Cache	3rd-level cache: 2-MB, 8-way set associative, 64-byte line size
D8h	Cache	3rd-level cache: 4-MB, 8-way set associative, 64-byte line size
DCh	Cache	3rd-level cache: 1.5-MB, 12-way set associative, 64-byte line size
DDh	Cache	3rd-level cache: 3-MB, 12-way set associative, 64-byte line size
DEh	Cache	3rd-level cache: 6-MB, 12-way set associative, 64-byte line size
E2h	Cache	3rd-level cache: 2-MB, 16-way set associative, 64-byte line size

**Table 5-7. Cache and TLB Descriptor Decode Values (Sheet 4 of 4)**

Value	Type	Cache or TLB Descriptor Description
E3h	Cache	3rd-level cache: 4-MB, 16-way set associative, 64-byte line size
E4h	Cache	3rd-level cache: 8-MB, 16-way set associative, 64-byte line size
EAh	Cache	3rd-level cache: 12-MB, 24-way set associative, 64-byte line size
EBh	Cache	3rd-level cache: 18-MB, 24-way set associative, 64-byte line size
ECh	Cache	3rd-level cache: 24-MB, 24-way set associative, 64-byte line size
F0h	Prefetch	64-byte Prefetching
F1h	Prefetch	128-byte Prefetching
FFh	General	CPUID Leaf 2 does not report cache descriptor information; use CPUID Leaf 4 to query cache parameters

**5.1.3.1****Intel® Core™ i7 Processor, Model 1Ah Output Example**

The Core i7 processor, model 1Ah returns the values shown in Table 5-8. Since the value of AL=1, it is valid to interpret the remainder of the registers. Table 5-8 also shows the MSB (bit 31) of all the registers are 0 which indicates that each register contains valid 8-bit descriptor.

**Table 5-8. Intel® Core™ i7 Processor, Model 1Ah with 8-MB L3 Cache CPUID (EAX=2)**

	31	23	15	7	0
EAX	55h	03h	5Ah	01h	
EBX	00h	F0h	B2h	E4h	
ECX	00h	00h	00h	00h	
EDX	09h	CAh	21h	2Ch	

The register values in Table 5-8 show that this Core i7 processor has the following cache and TLB characteristics:

- (55h) Instruction TLB: 2-MB or 4-MB pages, fully associative, 7 entries
- (03h) Data TLB: 4-KB Pages, 4-way set associative, 64 entries
- (5Ah) Data TLB0: 2-MB or 4-MB pages, 4-way associative, 32 entries
- (01h) Instruction TLB: 4-KB Pages, 4-way set associative, 32 entries
- (F0h) 64-byte Prefetching
- (B2h) Instruction TLB: 4-KB pages, 4-way set associative, 64 entries
- (E4h) 8-MB L3 Cache, 16-way set associative, 64-byte line size
- (09h) 1st-level Instruction Cache: 32-KB, 4-way set associative, 64-byte line size
- (CAh) Shared 2nd-level TLB: 4-KB pages, 4-way set associative, 512 entries
- (21h) 256KB L2 (MLC), 8-way set associative, 64-byte line size
- (2Ch) 1st-level data cache: 32-KB, 8-way set associative, 64-byte line size

**5.1.4****Processor Serial Number (Function 03h)**

Processor serial number (PSN) is available in Pentium III processor only. The value in this register is reserved in the Pentium 4 processor or later. On all models, use the PSN flag (returned using CPUID) to check for PSN support before accessing the feature. Refer to Section 6 for more details.

## 5.1.5

## Deterministic Cache Parameters (Function 04h)

When EAX is initialized to a value of 4, the CPUID instruction returns deterministic cache information in the EAX, EBX, ECX and EDX registers. This function requires ECX be initialized with an index which indicates which cache to return information about. The OS is expected to call this function (CPUID.4) with ECX = 0, 1, 2, until EAX[4:0] == 0, indicating no more caches. The order in which the caches are returned is not specified and may change at Intel's discretion.

**Note:**

The BIOS will use this function to determine the number of APIC IDs reserved for a specific physical processor package. To do this the BIOS must initially set the EAX register to 4 and the ECX register to 0 prior to executing the CPUID instruction. EAX[31:16] will contain the value.

**Table 5-9.**

**Deterministic Cache Parameters**

Register Bits	Description
EAX[31:26]	Number of APIC IDs reserved for the package; this value is not the number of threads implemented for the package. Encoded with a "plus 1" encoding. Add one to the value in this register field.
EAX[25:14]	Maximum number of threads sharing this cache. Encoded with a "plus 1" encoding. Add one to the value in this register field.
EAX[13:10]	<b>Reserved</b>
EAX[9]	Fully Associative Cache
EAX[8]	Self Initializing cache level
EAX[7:5]	Cache Level (Starts at 1)
EAX[4:0]	Cache Type 0 = Null, no more caches 1 = Data Cache 2 = Instruction Cache 3 = Unified Cache 4-31 = Reserved
EBX[31:22]	Ways of Associativity Encoded with a "plus 1" encoding. Add one to the value in this register field.
EBX[21:12]	Physical Line partitions Encoded with a "plus 1" encoding. Add one to the value in this register field.
EBX[11:0]	System Coherency Line Size Encoded with a "plus 1" encoding. Add one to the value in this register field.
ECX[31:0]	Number of Sets Encoded with a "plus 1" encoding. Add one to the value in this register field.
EDX[31:3]	<b>Reserved</b>
EDX[2]	Complex Cache Indexing A value of '0' means that the cache is Direct Mapped. A value of '1' means that the cache uses a complex function to index the cache.
EDX[1]	Cache is inclusive to lower cache levels. A value of '0' means that WBINVD/INVD from any thread sharing this cache acts upon all lower caches for threads sharing this cache. A value of '1' means that WBINVD/INVD is not guaranteed to act upon lower level caches of non-originating threads sharing this cache.
EDX[0]	WBINVD/INVD behavior on lower level caches. A value of '0' means WBINVD/INVD from any thread sharing this cache acts upon all lower level caches for threads sharing this cache; A value of '1' means WBINVD/INVD is not guaranteed to act upon lower level caches of non-originating threads.

#### Equation 5-4.Calculating the Cache Size

$$\begin{aligned}\text{Cache Size in Bytes} &= (\text{Ways} + 1) \times (\text{Partitions} + 1) \times (\text{Line Size} + 1) \times (\text{Sets} + 1) \\ &= (\text{EBX}[31:22] + 1) \times (\text{EBX}[21:12] + 1) \times (\text{EBX}[11:0] + 1) \times (\text{ECX} + 1)\end{aligned}$$

##### 5.1.5.1 Cache Sharing Among Cores and Threads

The multi-core and threads fields give information about cache sharing. By comparing the following three numbers:

1. Number of logical processors per physical processor package (CPUID.1.EBX[23:16])
2. Number of APIC IDs reserved per package (CPUID.4.EAX[31:26] + 1)
3. Total number of threads serviced by this cache (CPUID.4.EAX[25:14] + 1)

Software can determine whether this cache is shared between cores, or specific to one core, or even specific to one thread or a subset of threads. This feature is very important with regard to logical processors since it is a means of differentiating a Hyper-Threading technology processor from a multi-core processor or a multi-core processor with Hyper-Threading Technology. Note that the sharing information was not available using the cache descriptors returned by CPUID function 2. Refer to section 7.10.3 of the *Intel® 64 and IA-32 Software Developer's Manual, Volume 3A: System Programming Guide*.

**Note:** More information can be found in the Architecture Processor Topology Enumeration White Paper at <http://software.intel.com/en-us/articles/intel-64-architecture-processor-topology-enumeration/>

#### 5.1.6 MONITOR / MWAIT Parameters (Function 05h)

When EAX is initialized to a value of 5, the CPUID instruction returns MONITOR / MWAIT parameters in the EAX, EBX, ECX and EDX registers if the MONITOR and MWAIT instructions are supported by the processor.

Table 5-10. MONITOR / MWAIT Parameters

Register Bits	Description
EAX[31:16]	<b>Reserved</b>
EAX[15:0]	Smallest monitor line size in bytes
EBX[31:16]	<b>Reserved</b>
EBX[15:0]	Largest monitor line size in bytes
ECX[31:2]	<b>Reserved</b>
ECX[1]	Support for treating interrupts as break-events for MWAIT.
ECX[0]	MONITOR / MWAIT Extensions supported
EDX[31:20]	<b>Reserved</b>
EDX[19:16]	Number of C7 sub-states supported using MONITOR / MWAIT* Number of C4 sub-states supported using MONITOR / MWAIT†
EDX[15:12]	Number of C6 sub-states supported using MONITOR / MWAIT‡ Number of C3 sub-states supported using MONITOR / MWAIT§
EDX[11:8]	Number of C2 sub-states supported using MONITOR / MWAIT**
EDX[7:4]	Number of C1 sub-states supported using MONITOR / MWAIT
EDX[3:0]	Number of C0 sub-states supported using MONITOR / MWAIT

**Notes:**

\* EDX[19:16] C7 sub-states supported on Core i7 and subsequent processors

† EDX[19:16] C4 sub-states supported on processors prior to the Core i7 generation

‡ EDX[15:12] C6 sub-states supported on Core i7 and subsequent processors

\*\* EDX[11:8] C2 sub-states supported on processors prior to the Core i7 generation

### 5.1.7 Digital Thermal Sensor and Power Management Parameters (Function 06h)

When EAX is initialized to a value of 6, the CPUID instruction returns Digital Thermal Sensor and Power Management parameters in the EAX, EBX, ECX and EDX registers.

**Table 5-11. Digital Sensor and Power Management Parameters**

Register Bits	Description
EAX[31:7]	<b>Reserved</b>
EAX[6]	Package Thermal Management (PTM) capability
EAX[5]	Extended Clock Modulation Duty (ECMD) capability
EAX[4]	Power Limit Notification (PLN) capability
EAX[3]	<b>Reserved</b>
EAX[2]	Always Running APIC Timer (ARAT) capability
EAX[1]	Intel® Turbo Boost Technology capability
EAX[0]	Digital Thermal Sensor (DTS) capability
EBX[31:4]	<b>Reserved</b>
EBX[3:0]	Number of Interrupt Thresholds
ECX[31:4]	<b>Reserved</b>
ECX[3]	Performance-Energy Bias capability (presence of IA32_ENERGY_PERF_BIAS MSR)
ECX[2:1]	<b>Reserved</b>
ECX[0]	Hardware Coordination Feedback capability (presence of IA32_APERF, IA32_MPREF MSRs)
EDX[31:0]	<b>Reserved</b>

### 5.1.8 Reserved (Function 07h)

This function is reserved.

### 5.1.9 Reserved (Function 08h)

This function is reserved.

### 5.1.10 Direct Cache Access (DCA) Parameters (Function 09h)

When EAX is initialized to a value of 9, the CPUID instruction returns DCA information in the EAX, EBX, ECX and EDX registers.

**Table 5-12. DCA Parameters**

Register Bits	Description
EAX[31:0]	Value of PLATFORM_DCA_CAP MSR Bits [31:0] (Offset 1F8h)
EBX[31:0]	<b>Reserved</b>
ECX[31:0]	<b>Reserved</b>
EDX[31:0]	<b>Reserved</b>

### 5.1.11 Architectural Performance Monitor Features (Function 0Ah)

When CPUID executes with EAX set to 0Ah, the processor returns information about support for architectural performance monitoring capabilities. Architectural performance monitoring is supported if the version ID is greater than Pn 0. See [Table 5-13](#) below.

For each version of architectural performance monitoring capability, software must enumerate this leaf to discover the programming facilities and the architectural performance events available in the processor. The details are described in Chapter 18, "Debugging and Performance Monitoring," in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B*.

**Table 5-13. Performance Monitor Features**

Register Bits	Description
EAX[31:24]	Number of arch events supported per logical processor
EAX[23:16]	Number of bits per programmable counter (width)
EAX[15:8]	Number of counters per logical processor
EAX[7:0]	Architectural PerfMon Version
EBX[31:7]	<b>Reserved</b>
EBX[6]	Branch Mispredicts Retired; 0 = supported
EBX[5]	Branch Instructions Retired; 0 = supported
EBX[4]	Last Level Cache Misses; 0 = supported
EBX[3]	Last Level Cache References; 0 = supported
EBX[2]	Reference Cycles; 0 = supported
EBX[1]	Instructions Retired; 0 = supported
EBX[0]	Core Cycles; 0 = supported
ECX[31:0]	<b>Reserved</b>
EDX[31:13]	<b>Reserved</b>
EDX[12:5]	Number of Bits in the Fixed Counters (width)
EDX[4:0]	Number of Fixed Counters

### 5.1.12 x2APIC Features / Processor Topology (Function 0Bh)

When EAX is initialized to a value of 0Bh, the CPUID instruction returns core/logical processor topology information in EAX, EBX, ECX, and EDX registers. This function requires ECX be initialized with an index which indicates which core or logical processor level to return information about. The BIOS or OS is expected to call this function (CPUID.EAX=0Bh) with ECX = 0 (Thread), 1 (Core), 2..n (Package), until EAX=0 and EBX=0, indicating no more levels. The order in which the processor topology levels are returned is specific since each level reports some cumulative data and thus some information is dependent on information retrieved from a previous level.

**Table 5-14. Core / Logical Processor Topology Overview (Sheet 1 of 2)**

Register Bits	Description
EAX[31:5]	<b>Reserved</b>
EAX[4:0]	Number of bits to shift right APIC ID to get next level APIC ID. Note: All logical processors with same topology ID map to same core or package at this level.
EBX[31:16]	<b>Reserved</b>

**Table 5-14. Core / Logical Processor Topology Overview (Sheet 2 of 2)**

Register Bits	Description
EBX[15:0]	Number of factory-configured logical processors at this level. This value does NOT change based on Intel HT Technology disable and core disables.
ECX[31:16]	<b>Reserved</b>
ECX[15:8]	Level Type (0=Invalid, 1=Thread, 2=Core, 3-255=Reserved)
ECX[7:0]	Level Number (same as ECX input)
EDX[31:0]	Extended APIC ID -- Lower 8 bits identical to the legacy APIC ID

BIOS is expected to iterate through the core / logical processor hierarchy using CPUID Function Bh with ECX using input values from 0-N. In turn, the CPUID function Bh provides topology information in terms of levels. Level 0 is lowest level (reserved for thread), level 1 is core, and the last level is package. All logical processors with same topology ID map to same core/package at this level.

BIOS enumeration occurs via iterative CPUID calls with input of level numbers in ECX starting from 0 and incrementing by 1. BIOS should continue until EAX = EBX = 0 returned indicating no more levels are available (refer to [Table 5-17](#)). CPUID Function Bh with ECX=0 provides topology information for the thread level (refer to [Table 5-15](#)). And CPUID Function Bh with ECX=1 provides topology information for the Core level (refer to [Table 5-16](#)). Note that at each level, all logical processors with same topology ID map to same core or package which is specified for that level.

**Note:** More information can be found in the Architecture Processor Topology Enumeration White Paper at <http://software.intel.com/en-us/articles/intel-64-architecture-processor-topology-enumeration/>

**Table 5-15. Thread Level Processor Topology (CPUID Function 0Bh with ECX=0)**

Register Bits	Description	Value with ECX=0 as Input
EAX[31:5]	<b>Reserved</b>	
EAX[4:0]	Number of bits to shift right APIC ID to get next level APIC ID. Note: All logical processors with same topology ID map to same core at this level.	1
EBX[31:16]	<b>Reserved</b>	
EBX[15:0]	Number of factory-configured logical processors at this level. This value does NOT change based on Intel HT Technology disable and core disables.	1-2 (see Note 1)
ECX[31:16]	<b>Reserved</b>	
ECX[15:8]	Level Type (0=Invalid, 1=Thread, 2=Core)	1
ECX[7:0]	Level Number (same as ECX input)	0
EDX[31:0]	Extended APIC ID -- Lower 8 bits identical to the legacy APIC ID	Varies

**Note:**

1. One logical processor per core if Intel HT Technology is factory-configured as disabled and two logical processors per core if Intel HT Technology is factory-configured as enabled.

**Table 5-16. Core Level Processor Topology (CPUID Function 0Bh with ECX=1)**

Register Bits	Description	Value with ECX=1 as Input
EAX[31:5]	<b>Reserved</b>	
EAX[4:0]	Number of bits to shift right APIC ID to get next level APIC ID. Note: All logical processors with same topology ID map to same package at this level.	4 5 – Nehalem-EX
EBX[31:16]	<b>Reserved</b>	
EBX[15:0]	Number of factory-configured logical processors at this level. This value does NOT change based on Intel HT Technology disable and core disables.	1-8 (see Note 1)
ECX[31:16]	<b>Reserved</b>	
ECX[15:8]	Level Type (0=Invalid, 1=Thread, 2=Core)	2
ECX[7:0]	Level Number (same as ECX input)	1
EDX[31:0]	Extended APIC ID -- Lower 8 bits identical to the legacy APIC ID	Varies

**Note:**

- One logical processor per core if Intel HT Technology is factory-configured as disabled and two logical processors per core if Intel HT Technology is factory-configured as enabled.

**Table 5-17. Core Level Processor Topology (CPUID Function 0Bh with ECX>=2)**

Register Bits	Description	Value with ECX>=2 as Input
EAX[31:5]	<b>Reserved</b>	
EAX[4:0]	Number of bits to shift right APIC ID to get next level APIC ID. Note: All logical processors with same topology ID map to same package at this level.	0 (see Note 1)
EBX[31:16]	<b>Reserved</b>	
EBX[15:0]	Number of factory-configured logical processors at this level. This value does NOT change based on Intel HT Technology disable and core disables.	0 (see Note 1)
ECX[31:16]	<b>Reserved</b>	
ECX[15:8]	Level Type (0=Invalid, 1=Thread, 2=Core)	0
ECX[7:0]	Level Number (same as ECX input)	Varies (same as ECX input value)
EDX[31:0]	Extended APIC ID -- Lower 8 bits identical to the legacy APIC ID	Varies

**Note:**

- One logical processor per core if Intel HT Technology is factory-configured as disabled and two logical processors per core if Intel HT Technology is factory-configured as enabled.

**5.1.13 Reserved (Function 0Ch)**

This function is reserved.

**5.1.14 XSAVE Features (Function 0Dh)**

When EAX is initialized to a value of 0Dh and ECX is initialized to a value of 0 (EAX=0Dh AND ECX =0h), the CPUID instruction returns the Processor Extended State Enumeration in the EAX, EBX, ECX and EDX registers.

**Note:** An initial value greater than '0' in ECX is invalid, therefore, EAX/EBX/ECX/EDX return 0.

**Table 5-18. Processor Extended State Enumeration (CPUID Function 0Dh with ECX=0)**

Register Bits	Description
EAX[31:0]	Reports the valid bit fields of the lower 32 bits of the XFEATURE_ENABLED_MASK register (XCRO). If a bit is 0, the corresponding bit field in XCRO is reserved.
EBX[31:0]	Maximum size (bytes) required by enabled features in XFEATURE_ENABLED_MASK (XCRO). May be different than ECX when features at the end of the save area are not enabled.
ECX[31:0]	Maximum size (bytes) of the XSAVE/XRSTOR save area required by all supported features in the processor, i.e all the valid bit fields in XFEATURE_ENABLED_MASK. This includes the size needed for the XSAVE.HEADER.
EDX[31:0]	Reports the valid bit fields of the upper 32 bits of the XFEATURE_ENABLED_MASK register (XCRO). If a bit is 0, the corresponding bit field in XCRO is reserved.

**Table 5-19. Processor Extended State Enumeration (CPUID Function 0Dh with ECX=1)**

Register Bits	Description
EAX[31:0]	<b>Reserved</b>
EBX[31:0]	<b>Reserved</b>
ECX[31:0]	<b>Reserved</b>
EDX[31:0]	<b>Reserved</b>

**Table 5-20. Processor Extended State Enumeration (CPUID Function 0Dh with ECX>1)**

Register Bits	Description
EAX[31:0]	The size in bytes of the save area for an extended state feature associated with a valid sub-leaf index, $n$ . Each valid sub-leaf index maps to a valid bit in the XFEATURE_ENABLED_MASK register (XCRO) starting at bit position 2. This field reports 0 if the sub-leaf index, $n$ , is invalid.
EBX[31:0]	The offset in bytes of the save area from the beginning of the XSAVE/XRSTOR area. This field reports 0 if the sub-leaf index, $n$ , is invalid.
ECX[31:0]	<b>Reserved</b>
EDX[31:0]	<b>Reserved</b>

## 5.2 Extended CPUID Functions

### 5.2.1 Largest Extended Function # (Function 80000000h)

When EAX is initialized to a value of 80000000h, the CPUID instruction returns the largest extended function number supported by the processor in register EAX.

**Table 5-21. Largest Extended Function**

Register Bits	Description
EAX[31:0]	Largest extended function number supported
EBX[31:0]	<b>Reserved</b>
ECX[31:0]	<b>Reserved</b>
EDX[31:0]	<b>Reserved</b>

## 5.2.2

### Extended Feature Bits (Function 80000001h)

When the EAX register contains a value of 80000001h, the CPUID instruction loads the EDX register with the extended feature flags. The feature flags (when a Flag = 1) indicate what extended features the processor supports. Table 5-22 lists the currently defined extended feature flag values.

For future processors, refer to the programmer's reference manual, user's manual, or the appropriate documentation for the latest extended feature flag values.

**Note:**

By using CPUID feature flags to determine processor features, software can detect and avoid incompatibilities introduced by the addition or removal of processor features.

**Table 5-22. Extended Feature Flags Reported in the ECX Register**

Bit	Name	Description when Flag = 1	Comments
31:1		<b>Reserved</b>	Do not count on the value
0	LAHF	LAHF / SAHF	A value of 1 indicates the LAHF and SAHF instructions are available when the IA-32e mode is enabled and the processor is operating in the 64-bit sub-mode.

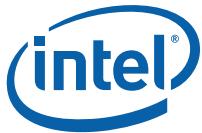

**Table 5-23. Extended Feature Flags Reported in the EDX Register**

Bit	Name	Description when Flag = 1	Comments
31:30		<b>Reserved</b>	Do not count on the value.
29	Intel® 64	Intel® 64 Instruction Set Architecture	The processor supports Intel® 64 Architecture extensions to the IA-32 Architecture. For additional information refer to <a href="http://developer.intel.com/technology/architecture-silicon/intel64/index.htm">http://developer.intel.com/technology/architecture-silicon/intel64/index.htm</a>
28		<b>Reserved</b>	Do not count on the value.
27	RDTSCP	RDTSCP and IA32_TSC_AUX	The processor supports RDTSCP and IA32_TSC_AUX.
26	1 GB Pages	1 GB Pages	The processor supports 1-GB pages.
25:21		<b>Reserved</b>	Do not count on the value.
20	XD Bit	Execution Disable Bit	The processor supports the XD Bit when PAE mode paging is enabled.
19:12		<b>Reserved</b>	Do not count on the value.
11	SYSCALL	SYSCALL/SYSRET	The processor supports the SYSCALL and SYSRET instructions.
10:0		<b>Reserved</b>	Do not count on the value.

## 5.2.3

### Processor Brand String (Function 80000002h, 80000003h, 80000004h)

Functions 80000002h, 80000003h, and 80000004h each return up to 16 ASCII bytes of the processor name in the EAX, EBX, ECX, and EDX registers. The processor name is constructed by concatenating each 16-byte ASCII string returned by the three functions. The processor name is right justified with leading space characters. It is returned in little-endian format and NULL terminated. The processor name can be a maximum of 48 bytes including the NULL terminator character. In addition to the processor name, these functions return the maximum supported speed of the processor in ASCII.

### 5.2.3.1 Building the Processor Brand String

BIOS must reserve enough space in a byte array to concatenate the three 16 byte ASCII strings that comprise the processor name. BIOS must execute each function in sequence. After sequentially executing each CPUID Brand String function, BIOS must concatenate EAX, EBX, ECX, and EDX to create the resulting Processor Brand String.

#### Example 5-1.BUILDING THE PROCESSOR BRAND STRING

---

```
Processor_Name    DB 48 dup(0)

        MOV     EAX, 80000000h
        CPUID
        CMP     EAX, 80000004h          ; Check if extended
                                         ; functions are
                                         ; supported
        JB     Not_Supported

        MOV     EAX, 80000002h
        MOV     DI, OFFSET Processor_Name
        CPUID           ; Get the first 16
                         ; bytes of the
                         ; processor name

        CALL   Save_String
        MOV     EAX, 80000003h
        CPUID           ; Get the second 16
                         ; bytes of the
                         ; processor name

        CALL   Save_String
        MOV     EAX, 80000004h
        CPUID           ; Get the last 16
                         ; bytes of the
                         ; processor name

        CALL   Save_String

Not_Supported
RET

Save_String:
        MOV     Dword Ptr[DI],EAX
        MOV     Dword Ptr [DI+4],EBX
        MOV     Dword Ptr [DI+8],ECX
        MOV     Dword Ptr [DI+12],EDX
        ADD    DI, 16
RET
```

---

### 5.2.3.2 Displaying the Processor Brand String

The processor name may be a right justified string padded with leading space characters. When displaying the processor name string, the display software must skip the leading space characters and discontinue printing characters when the NULL character is encountered.

### Example 5-2. Displaying the Processor Brand String

---

```

CLD
MOV    SI, OFFSET Processor_Name
                                ; Point SI to the
                                ; name string

Spaces:
LODSB
CMP    AL, ' '
                ; Skip leading space chars
JE Spaces
CMP    AL, 0
                ; Exit if NULL byte
                ; encountered
JE Done

Display_Char:
CALL Display_Character
                ; Put a char on the
                ; output device
LODSB
CMP    AL, 0
                ; Exit if NULL byte
                ; encountered
JNE Display_Char

Done:

```

---

#### 5.2.4 Reserved (Function 80000005h)

This function is reserved.

#### 5.2.5 Extended L2 Cache Features (Function 80000006h)

Functions 80000006h returns details of the L2 cache in the ECX register. The details returned are the line size, associativity, and the cache size described in 1024-byte units (see Table 5-4).

**Figure 5-4. L2 Cache Details**

Register Bits	Description
EAX[31:0]	<b>Reserved</b>
EBX[31:0]	<b>Reserved</b>
ECX[31:16]	L2 Cache size described in 1-KB units.
ECX[15:12]	L2 Cache Associativity Encodings 00h Disabled 01h Direct mapped 02h 2-Way 04h 4-Way 06h 8-Way 08h 16-Way 0Fh Fully associative
ECX[11:8]	<b>Reserved</b>
ECX[7:0]	L2 Cache Line Size in bytes.
EDX[31:0]	<b>Reserved</b>

## 5.2.6 Advanced Power Management (Function 80000007h)

In the Core i7 and future processor generations, the TSC will continue to run in the deepest C-states. Therefore, the TSC will run at a constant rate in all ACPI P-, C-, and T-states. Support for this feature is indicated by CPUID.(EAX=80000007h):EDX[8]. On processors with invariant TSC support, the OS may use the TSC for wall clock timer services (instead of ACPI or HPET timers). TSC reads are much more efficient and do not incur the overhead associated with a ring transition or access to a platform resource.

**Table 5-24. Power Management Details**

Register Bits	Description
EAX[31:0]	<b>Reserved</b>
EBX[31:0]	<b>Reserved</b>
ECX[31:0]	<b>Reserved</b>
EDX[31:9]	<b>Reserved</b>
EDX[8]	TSC Invariance (1 = Available, 0 = Not available) TSC will run at a constant rate in all ACPI P-states, C-states and T-states.
EDX[7:0]	<b>Reserved</b>

## 5.2.7 Virtual and Physical Address Sizes (Function 80000008h)

On the Core Solo, Core Duo, Core2 Duo processor families, when EAX is initialized to a value of 80000008h, the CPUID instruction will return the supported virtual and physical address sizes in EAX. Values in other general registers are reserved. This information is useful for BIOS to determine processor support for Intel® 64 Instruction Set Architecture (Intel® 64).

If this function is supported, the Physical Address Size returned in EAX[7:0] should be used to determine the number of bits to configure MTRRn\_PhyMask values with. Software must determine the MTRR PhyMask for each execution thread based on this function and not assume all execution threads in a platform have the same number of physical address bits.

**Table 5-25. Virtual and Physical Address Size Definitions**

Register Bits	Description
EAX[31:16]	<b>Reserved</b>
EAX[15:8]	Virtual Address Size: Number of address bits supported by the processor for a virtual address.
EAX[7:0]	Physical Address Size: Number of address bits supported by the processor for a physical address.
EBX[31:0]	<b>Reserved</b>
ECX[31:0]	<b>Reserved</b>
EDX[31:0]	<b>Reserved</b>

§

# 6

# Processor Serial Number

---

The processor serial number extends the concept of processor identification. Processor serial number is a 96-bit number accessible through the CPUID instruction. Processor serial number can be used by applications to identify a processor, and by extension, its system.

The processor serial number creates a software accessible identity for an individual processor. The processor serial number, combined with other qualifiers, could be applied to user identification. Applications include membership authentication, data backup/restore protection, removable storage data protection, managed access to files, or to confirm document exchange between appropriate users.

Processor serial number is another tool for use in asset management, product tracking, remote systems load and configuration, or to aid in boot-up configuration. In the case of system service, processor serial number could be used to differentiate users during help desk access, or track error reporting. Processor serial number provides an identifier for the processor, but should not be assumed to be unique in itself. There are potential modes in which erroneous processor serial numbers may be reported. For example, in the event a processor is operated outside its recommended operating specifications, (for example, voltage, frequency, and so forth) the processor serial number may not be correctly read from the processor. Improper BIOS or software operations could yield an inaccurate processor serial number. These events could lead to possible erroneous or duplicate processor serial numbers being reported. System manufacturers can strengthen the robustness of the feature by including redundancy features, or other fault tolerant methods.

Processor serial number used as a qualifier for another independent number could be used to create an electrically accessible number that is likely to be distinct. Processor serial number is one building block useful for the purpose of enabling the trusted, connected PC.

## 6.1

## Presence of Processor Serial Number

To determine if the processor serial number feature is supported, the program should set the EAX register parameter value to "1" and then execute the CPUID instruction as follows:

```
MOV EAX, 01H  
CPUID
```

After execution of the CPUID instruction, the ECX and EDX register contains the Feature Flags. If the PSN Feature Flags, (EDX register, bit 18) equals "1", the processor serial number feature is supported, and enabled. **If the PSN Feature Flags equals "0", the processor serial number feature is either not supported, or disabled in a Pentium III processor.**

## 6.2 Forming the 96-bit Processor Serial Number

The 96-bit processor serial number is the concatenation of three 32-bit entities.

To access the most significant 32-bits of the processor serial number the program should set the EAX register parameter value to "1" and then execute the CPUID instruction as follows:

```
MOV EAX, 01H  
CPUID
```

After execution of the CPUID instruction, the EAX register contains the Processor Signature. The Processor Signature comprises the most significant 32-bits of the processor serial number. The value in EAX should be saved prior to gathering the remaining 64-bits of the processor serial number.

To access the remaining 64-bits of the processor serial number the program should set the EAX register parameter value to "3" and then execute the CPUID instruction as follows:

```
MOV EAX, 03H  
CPUID
```

After execution of the CPUID instruction, the EDX register contains the middle 32-bits, and the ECX register contains the least significant 32-bits of the processor serial number. Software may then concatenate the saved Processor Signature, EDX, and ECX before returning the complete 96-bit processor serial number.

Processor serial number should be displayed as 6 groups of 4 hex nibbles (for example, XXXX-XXXX-XXXX-XXXX-XXXX-XXXX where X represents a hex digit). Alpha hex characters should be displayed as capital letters.

§

# 7

# Brand ID and Brand String

## 7.1 Brand ID

Beginning with the Pentium III processors, model 8, the Pentium III Xeon processors, model 8, and Celeron processor, model 8, the concept of processor identification is further extended with the addition of Brand ID. Brand ID is an 8-bit number accessible through the CPUID instruction. Brand ID may be used by applications to assist in identifying the processor.

Processors that implement the Brand ID feature return the Brand ID in bits 7 through 0 of the EBX register when the CPUID instruction is executed with EAX=1 (see [Table 7-1](#)). Processors that do not support the feature return a value of 0 in EBX bits 7 through 0.

To differentiate previous models of the Pentium II processor, Pentium II Xeon processor, Celeron processor, Pentium III processor and Pentium III Xeon processor, application software relied on the L2 cache descriptors. In certain cases, the results were ambiguous. For example, software could not accurately differentiate a Pentium II processor from a Pentium II Xeon processor with a 512-KB L2 cache. Brand ID eliminates this ambiguity by providing a software-accessible value unique to each processor brand. [Table 7-1](#) shows the values defined for each processor.

**Table 7-1. Brand ID (EAX=1) Return Values in EBX (Bits 7 through 9) (Sheet 1 of 2)**

Value	Description
00h	<b>Unsupported</b>
01h	Intel® Celeron® processor
02h	Intel® Pentium® III processor
03h	Intel® Pentium® III Xeon® processor If processor signature = 000006B1h, then Intel® Celeron® processor
04h	Intel® Pentium® III processor
06h	Mobile Intel® Pentium® III processor-M
07h	Mobile Intel® Celeron® processor
08h	Intel® Pentium® 4 processor
09h	Intel® Pentium® 4 processor
0Ah	Intel® Celeron® Processor
0Bh	Intel® Xeon® processor If processor signature = 00000F13h, then Intel® Xeon® processor MP
0Ch	Intel® Xeon® processor MP
0Eh	Mobile Intel® Pentium® 4 processor-M If processor signature = 00000F13h, then Intel® Xeon® processor
0Fh	Mobile Intel® Celeron® processor
11h	Mobile Genuine Intel® processor
12h	Intel® Celeron® M processor
13h	Mobile Intel® Celeron® processor
14h	Intel® Celeron® Processor
15h	Mobile Genuine Intel® processor

**Table 7-1. Brand ID (EAX=1) Return Values in EBX (Bits 7 through 9) (Sheet 2 of 2)**

Value	Description
16h	Intel® Pentium® M processor
17h	Mobile Intel® Celeron® processor
All other values	<b>Reserved</b>

## 7.2 Brand String

The Brand string is an extension to the CPUID instruction implemented in some Intel IA-32 processors, including the Pentium 4 processor. Using the brand string feature, future IA-32 architecture based processors will return their ASCII brand identification string and maximum operating frequency via an extended CPUID instruction. Note that the frequency returned is the maximum operating frequency that the processor has been qualified for and not the current operating frequency of the processor.

When CPUID is executed with EAX set to the values listed in [Table 7-2](#), the processor will return an ASCII brand string in the general-purpose registers as detailed in this document.

The brand/frequency string is defined to be 48 characters long, 47 bytes will contain characters and the 48th byte is defined to be NULL (0). A processor may return less than the 47 ASCII characters as long as the string is null terminated and the processor returns valid data when CPUID is executed with EAX = 80000002h, 80000003h and 80000004h.

To determine if the brand string is supported on a processor, software must follow the steps below:

1. Execute the CPUID instruction with EAX=80000000h
2. If ((returned value in EAX) > 80000000h) then the processor supports the extended CPUID functions and EAX contains the largest extended function supported.
3. The processor brand string feature is supported if EAX >= 80000004h

**Table 7-2. Processor Brand String Feature**

EAX Input Value	Function	Return Value
80000000h	Largest Extended Function Supported	EAX=Largest supported extended function number, EBX = ECX = EDX = Reserved
80000001h	Extended Processor Signature and Extended Feature Bits	EDX and ECX contain Extended Feature Flags EAX = EBX = Reserved
80000002h	Processor Brand String	EAX, EBX, ECX, EDX contain ASCII brand string
80000003h	Processor Brand String	EAX, EBX, ECX, EDX contain ASCII brand string
80000004h	Processor Brand String	EAX, EBX, ECX, EDX contain ASCII brand string

## 8

# Denormals Are Zero

---

With the introduction of the SSE2 extensions, some Intel Architecture processors have the ability to convert SSE and SSE2 source operand denormal numbers to zero. This feature is referred to as Denormals-Are-Zero (DAZ). The DAZ mode is not compatible with IEEE Standard 754. The DAZ mode is provided to improve processor performance for applications such as streaming media processing, where rounding a denormal operand to zero does not appreciably affect the quality of the processed data.

Some processor steppings support SSE2 but do not support the DAZ mode. To determine if a processor supports the DAZ mode, software must perform the following steps:

1. Execute the CPUID instruction with an input value of EAX=0 and ensure the vendor-ID string returned is "GenuineIntel".
2. Execute the CPUID instruction with EAX=1. This will load the EDX register with the feature flags.
3. Ensure that the FXSR feature flag (EDX bit 24) is set. This indicates the processor supports the FXSAVE and FXRSTOR instructions.
4. Ensure that the SSE feature flag (EDX bit 25) or the SSE2 feature flag (EDX bit 26) is set. This indicates that the processor supports at least one of the SSE/SSE2 instruction sets and its MXCSR control register.
5. Zero a 16-byte aligned, 512-byte area of memory. This is necessary since some implementations of FXSAVE do not modify reserved areas within the image.
6. Execute an FXSAVE into the cleared area.
7. Bytes 28-31 of the FXSAVE image are defined to contain the MXCSR\_MASK. If this value is 0, then the processor's MXCSR\_MASK is 0xFFBF, otherwise MXCSR\_MASK is the value of this dword.
8. If bit 6 of the MXCSR\_MASK is set, then DAZ is supported.

After completing this algorithm, if DAZ is supported, software can enable DAZ mode by setting bit 6 in the MXCSR register save area and executing the FXRSTOR instruction. Alternately software can enable DAZ mode by setting bit 6 in the MXCSR by executing the LDMXCSR instruction. Refer to the chapter titled "Programming with the Streaming SIMD Extensions (SSE)" in the Intel Architecture Software Developer's Manual volume 1: Basic Architecture.

The x86 Assembly language program DAZTECT.ASM (see [Detecting Denormals-Are-Zero Support](#)) demonstrates this DAZ detection algorithm.

## S

Denormals Are Zero

## 9 Operating Frequency

---

With the introduction of the Time-Stamp Counter, it is possible for software operating in real mode or protected mode with ring 0 privilege to calculate the actual operating frequency of the processor. To calculate the operating frequency, the software needs a reference period. The reference period can be a periodic interrupt, or another timer that is based on time, and not based on a system clock. Software needs to read the Time-Stamp Counter (TSC) at the beginning and ending of the reference period. Software can read the TSC by executing the RDTSC instruction, or by setting the ECX register to 10h and executing the RDMSR instruction. Both instructions copy the current 64-bit TSC into the EDX:EAX register pair.

To determine the operating frequency of the processor, software performs the following steps. The assembly language program FREQUENC.ASM (see [Frequency Detection Procedure](#)) demonstrates the use of the frequency detection algorithm.

1. Execute the CPUID instruction with an input value of EAX=0 and ensure the vendor-ID string returned is "GenuineIntel".
2. Execute the CPUID instruction with EAX=1 to load the EDX register with the feature flags.
3. Ensure that the TSC feature flag (EDX bit 4) is set. This indicates the processor supports the Time-Stamp Counter and RDTSC instruction.
4. Read the TSC at the beginning of the reference period.
5. Read the TSC at the end of the reference period.
6. Compute the TSC delta from the beginning and ending of the reference period.
7. Compute the actual frequency by dividing the TSC delta by the reference period.

Actual frequency = (Ending TSC value – Beginning TSC value) / reference period.

**Note:**

**The measured accuracy is dependent on the accuracy of the reference period. A longer reference period produces a more accurate result. In addition, repeating the calculation multiple times may also improve accuracy.**

Intel processors that support the IA32\_MPFR (CO maximum frequency clock count) register improve on the ability to calculate the CO state frequency by providing a resetable free running counter. To use the IA32\_MPFR register to determine frequency, software should clear the register by a write of '0' while the core is in a CO state. Subsequently, at the end of a reference period read the IA32\_MPFR register. The actual frequency is calculated by dividing the IA32\_MPFR register value by the reference period.

1. Execute the CPUID instruction with an input value of EAX=0 and ensure the vendor-ID string returned is "GenuineIntel".
2. Execute the CPUID instruction with EAX=1 to load the EAX register with the Processor Signature value.
3. Ensure that the processor belongs to the Intel Core 2 Duo processor family. This indicates the processor supports the Maximum Frequency Clock Count.
4. Clear the IA32\_MPFR register at the beginning of the reference period.
5. Read the IA32\_MPFR register at the end of the reference period.

6. Compute the actual frequency by dividing the IA32\_MPFR delta by the reference period.

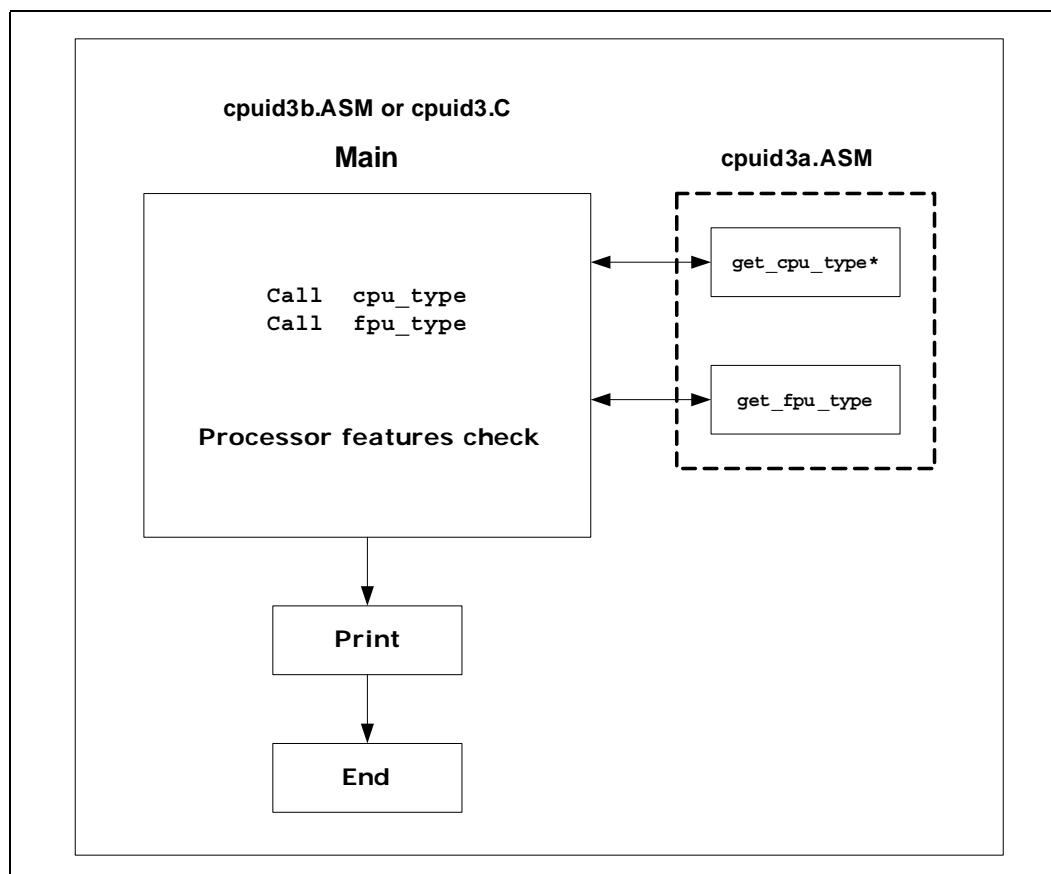

Actual frequency = Ending IA32\_MPFR value / reference period

§

# 10 Program Examples

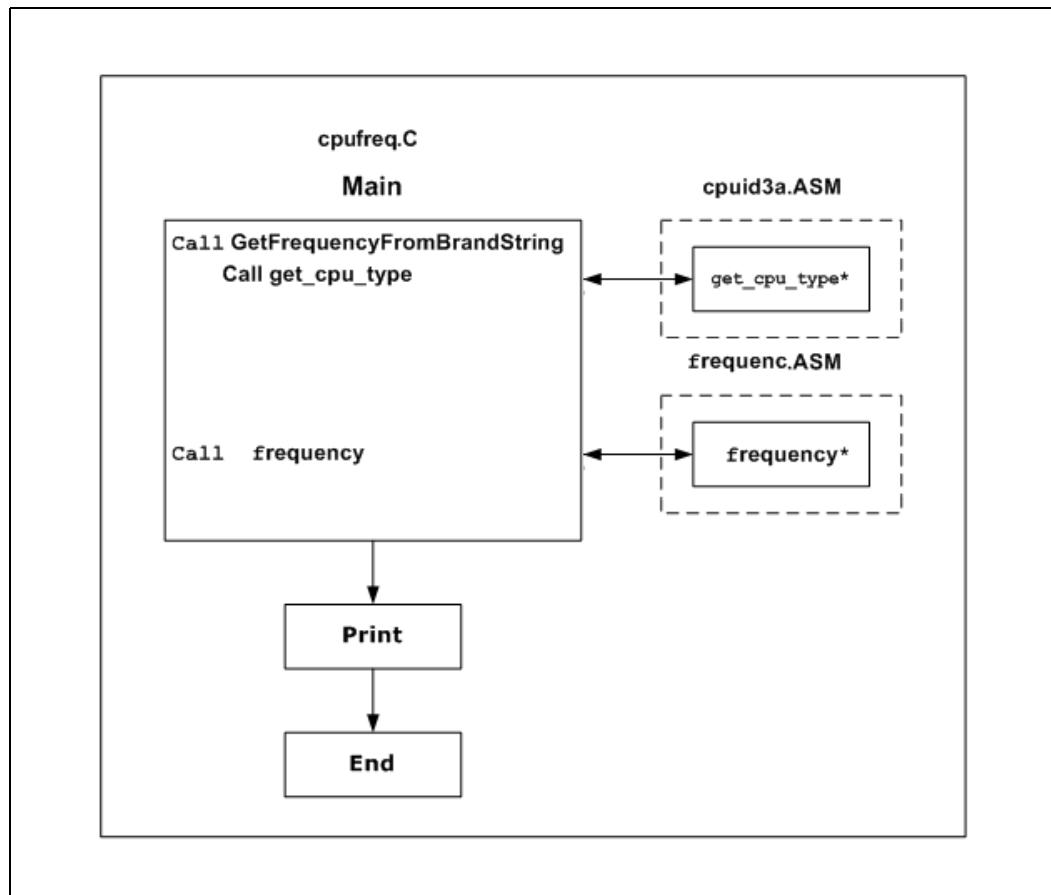

As noted in [Chapter 7](#), the CPUID3A.ASM program shows how software forms the brand string; the code is shown in [Example 10-1](#). The CPUID3B.ASM and CPUID3.C programs demonstrate applications that call get\_cpu\_type and get\_fpu\_type procedures, interpret the returned information, and display the information in the DOS environment; this code is shown in [Example 10-2](#) and [Example 10-3](#). CPUID3A.ASM and CPUID3B.ASM are written in x86 Assembly language, and CPUID3.C is written in C language. [Figure 10-1](#) presents an overview of the relationship between the three programs.

**Figure 10-1. Flow of Processor Identification Extraction Procedure**

The CPUFREQ.C program demonstrates an application that calls get\_cpu\_type and frequency to calculate the processor frequency; this code is shown in [Example 10-6](#). The FREQUENC.ASM program shows how software calculates frequency from the Time Stamp Counter and Brand String; this code is shown in [Example 10-5](#). CPUID3A.ASM and FREQUENC.ASM are written in x86 Assembly language, and CPUFREQ.C is written in C language. [Figure 10-2](#) presents an overview of the relationship between the three programs.

**Figure 10-2. Flow of Processor Frequency Calculation Procedure**

; responsibility for any errors which may appear in this
; program nor any responsibility to update it.
;
;*****
;
; This program contains three parts:
; Part 1: Identifies processor type in the variable
;          _cpu_type:
;
; Part 2: Identifies FPU type in the variable
;          _fpu_type:
;
; Part 3: Prints out the appropriate messages. This part is
;          specific to the DOS environment and uses the DOS
;          system calls to print out the messages.
;
;*****
;
; This program has been compiled with Microsoft Macro Assembler
; 6.15. If this code is compiled with no options specified and
; linked with CPUID3A.ASM, it's assumed to correctly identify
; the current Intel 8086/8088, 80286, 80386, 80486, Pentium(R),
; Pentium(R) Pro, Pentium(R) II, Pentium(R) II Xeon(R),
; Pentium(R) II OverDrive(R), Intel(R) Celeron(R),
; Pentium(R) III, Pentium(R) III Xeon(R), Pentium(R) 4, Intel(R)
; Xeon(R) DP and MP, Intel(R) Core(TM), Intel(R) Core(TM) 2,
; Intel(R) Core(TM) i7, and Intel(R) Atom(TM) processors when
; executed in real-address mode.
;
; NOTE: This code is written using 16-bit Segments.
;        This module is the application; CPUID3A.ASM is linked as
;        a support module.

; The purpose of this code is to identify the processor and
; coprocessor that is currently in the system. The program
; first determines the processor type. Then it determines
; whether a coprocessor exists in the system. If a
; coprocessor or integrated coprocessor exists, the program
; identifies the coprocessor type. The program then prints
; the processor and floating point processors present and type.

### Example 10-4.Detecting Denormals-Are-Zero Support

```

; Filename: DAZDTECT.ASM
; Copyright (c) Intel Corporation 2001-2011
;
; This program has been developed by Intel Corporation. Intel
; has various intellectual property rights which it may assert
; under certain circumstances, such as if another
; manufacturer's processor mis-identifies itself as being
; "GenuineIntel" when the CPUID instruction is executed.
;
; Intel specifically disclaims all warranties, express or
; implied, and all liability, including consequential and other
; indirect damages, for the use of this program, including
; liability for infringement of any proprietary rights,
; and including the warranties of merchantability and fitness
; for a particular purpose. Intel does not assume any
; responsibility for any errors which may appear in this program
; nor any responsibility to update it.
;
; This example assumes the system has booted DOS.
; This program runs in real mode.
;
;*****
;
; This program performs the following steps to determine if the
; processor supports the SSE/SSE2 DAZ mode.
;
; Step 1. Execute the CPUID instruction with an input value of EAX=0 and
;         ensure the vendor-ID string returned is "GenuineIntel".
;
; Step 2. Execute the CPUID instruction with EAX=1. This will load the
;         EDX register with the feature flags.
;
; Step 3. Ensure that the FXSR feature flag (EDX bit 24) is set. This
;         indicates the processor supports the FXSAVE and FXRSTOR
;         instructions.
;
; Step 4. Ensure that the SSE feature flag (EDX bit 25) or the SSE2 feature
;         flag (EDX bit 26) is set. This indicates that the processor supports
;         at least one of the SSE/SSE2 instruction sets and its MXCSR control
;         register.
;
; Step 5. Zero a 16-byte aligned, 512-byte area of memory.
;         This is necessary since some implementations of FXSAVE do not
;         modify reserved areas within the image.
;
; Step 6. Execute an FXSAVE into the cleared area.
;
; Step 7. Bytes 28-31 of the FXSAVE image are defined to contain the
;         MXCSR_MASK. If this value is 0, then the processor's MXCSR_MASK
;         is 0xFFBF, otherwise MXCSR_MASK is the value of this dword.
;
; Step 8. If bit 6 of the MXCSR_MASK is set, then DAZ is supported.
;

; responsibility for any errors which may appear in this program
; nor any responsibility to update it.
;
;*****
;
; This program performs the following steps to determine the
; processor frequency.
;
; Step 1. Execute the CPUID instruction with EAX=0 and ensure
;         the Vendor ID string returned is "GenuineIntel".
; Step 2. Execute the CPUID instruction with EAX=1 to load EDX
;         with the feature flags.
; Step 3. Ensure that the TSC feature flag (EDX bit 4) is set.
;         This indicates the processor supports the Time Stamp
;         Counter and RDTSC instruction.
; Step 4. Verify that CPUID with EAX=6 is supported by checking
;         the maximum CPUID input returned with EAX=0 in EAX.
; Step 5. Execute the CPUID instruction with EAX=6 to load ECX
;         with the feature flags.
; Step 6. Ensure that the MPERF/APERF feature flag (ECX bit 0)
;         is set. This indicates the processor supports the
;         MPERF and APERF MSRs.
; Step 7. Zero the MPERF and APERF MSRs.
; Step 8. Read the TSC at the start of the reference period.
; Step 9. Read the MPERF and APERF MSRs at the end of the
;         reference period.
; Step 10. Read the TSC at the end of the reference period.
; Step 11. Compute the TSC delta from the start and end of the
;         reference period.
; Step 12. Compute the actual frequency by dividing the TSC
;         delta by the reference period.
; Step 13. Compute the MPERF and APERF frequency.
; Step 14. Compute the MPERF and APERF percentage frequency.
;
