Outstanding requests[1]	OUTSTANDING	38	(R/W) Counts weighted cycles of outstanding offcore requests of the request type specified in bits 15:0, from the time the XQ receives the request and any response is received. Bits 37:16 must be set to 0. This bit is only available in MSR_OFFCORE_RESP0.

NOTES:

1. See Section 18.5.2.3, "Average Offcore Request Latency Measurement" for details on how to use this bit to extract average latency.

To specify a complete offcore response filter, software must properly program bits in the request and response type fields. A valid request type must have at least one bit set in the non-reserved bits of 15:0. A valid response type must be a non-zero value of the following expression:

[ANY 'OR' (L2 Hit)] 'XOR' (Snoop Info Bits) 'XOR' (Avg Latency)

18.5.3.3 Average Offcore Request Latency Measurement

In Goldmont microarchitecture, measurement of average latency of offcore transaction requests is the same as described in Section 18.5.2.3.

18.5.4 Performance Monitoring for Goldmont Plus Microarchitecture

Intel Atom processors based on the Goldmont Plus microarchitecture report architectural performance monitoring versionID = 4 and support non-architectural monitoring capabilities described in this section.

Architectural performance monitoring version 4 capabilities are described in Section 18.2.4.

Goldmont Plus performance monitoring capabilities are similar to Goldmont capabilities. The differences are in specific events and in which counters support PEBS. Goldmont Plus introduces the ability for fixed performance monitoring counters to generate PEBS records.

Goldmont Plus will set the AnyThread deprecation CPUID bit (CPUID.0AH:EDX[15]) to indicate that the Any-Thread bits in IA32_PERFEVTSELx and IA32_FIXED_CTR_CTRL have no effect.

The core PMU's capability is similar to that of the Goldmont microarchitecture described in Section 18.6.3, with some differences and enhancements summarized in Table 18-60.

Table 18-60. Core PMU Comparison Between the Goldmont Plus and Goldmont Microarchitectures

Box	Goldmont Plus Microarchitecture	Goldmont Microarchitecture	Comment
# of Fixed counters per core	3	3	No change.
# of general-purpose counters per core	4	4	No change.
Counter width (R,W)	R:48, W: 32/48	R:48, W: 32/48	No change.
Architectural Performance Monitoring version ID	4	4	No change.
Processor Event Based Sampling (PEBS) Events	All General-Purpose and Fixed counters. Each General-Purpose counter supports all events (precise and non-precise).	General-Purpose Counter 0 only. Supports all events (precise and non-precise). Precise events are listed in Table 18-56.	Goldmont Plus supports PEBS on all counters.
PEBS record format encoding	0011b	0011b	No change.

18.5.4.1 Extended PEBS

The Extended PEBS feature, introduced in Goldmont Plus microarchitecture, supports PEBS (Processor Event Based Sampling) on a fixed-function performance counters as well as all four general purpose counters (PMC0-3). PEBS can be enabled for the four general purpose counters using PEBS_EN_PMCi bits of IA32_PEBS_ENABLE (i = 0, 1, 2, 3). PEBS can be enabled for the 3 fixed function counters using the PEBS_EN_FIXEDi bits of IA32_PEBS_ENABLE (I = 0, 1, 2).

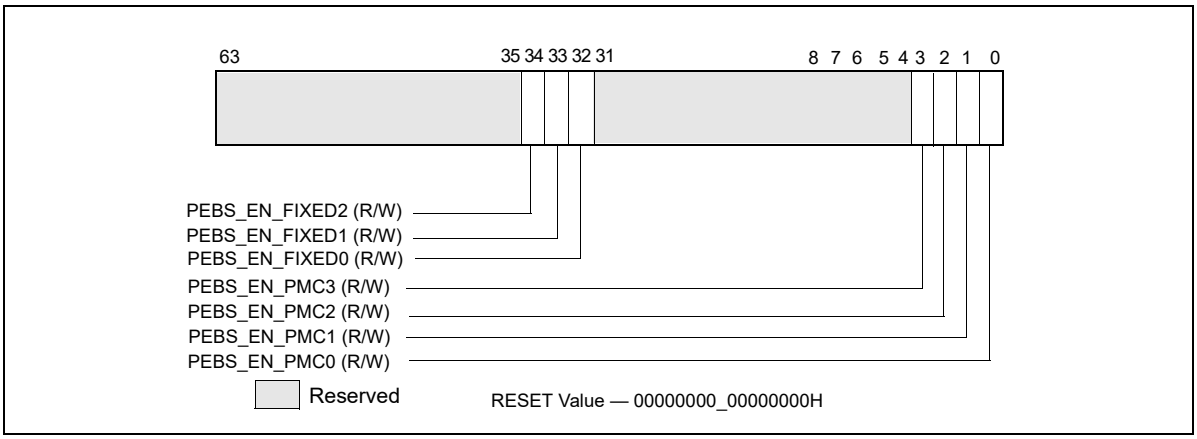

Figure 18-39. Layout of IA32_PEBS_ENABLE MSR

Similar to Goldmont microarchitecture, Goldmont Plus microarchitecture processors can generate PEBS record events on both precise as well as non-precise events.

A PEBS record due to a precise event will be generated after an instruction that causes the event when the counter has already overflowed. A PEBS record due to a non-precise event will occur at the next opportunity after the counter has overflowed, including immediately after an overflow is set by an MSR write.

IA32_FIXED_CTR0 counts instructions retired and is a precise event. IA32_FIXED_CTR1 counts unhalted core cycles and is a non-precise event. IA32_FIXED_CTR2 counts unhalted reference cycles and is a non-precise event.

The Applicable Counter field at offset 90H of the PEBS record indicates which counters caused the PEBS record to be generated. It is in the same format as the enable bits for each counter in IA32_PEBS_ENABLE. As an example,

an Applicable Counter field with bits 2 and 32 set would indicate that both general purpose counter 2 and fixed function counter 0 generated the PEBS record.

- To properly use PEBS for the additional counters, software will need to set up the counter reset values in PEBS portion of the DS_BUFFER_MANAGEMENT_AREA data structure that is indicated by the IA32_DS_AREA register. The layout of the DS_BUFFER_MANAGEMENT_AREA for Goldmont Plus is shown in Figure 18-40. When a counter generates a PEBS records, the appropriate counter reset values will be loaded into that counter. In the above example where general purpose counter 2 and fixed function counter 0 generated the PEBS record, general purpose counter 2 would be reloaded with the value contained in PEBS GP Counter 2 Reset (offset 50H) and fixed function counter 0 would be reloaded with the value contained in PEBS Fixed Counter 0 Reset (offset 80H).

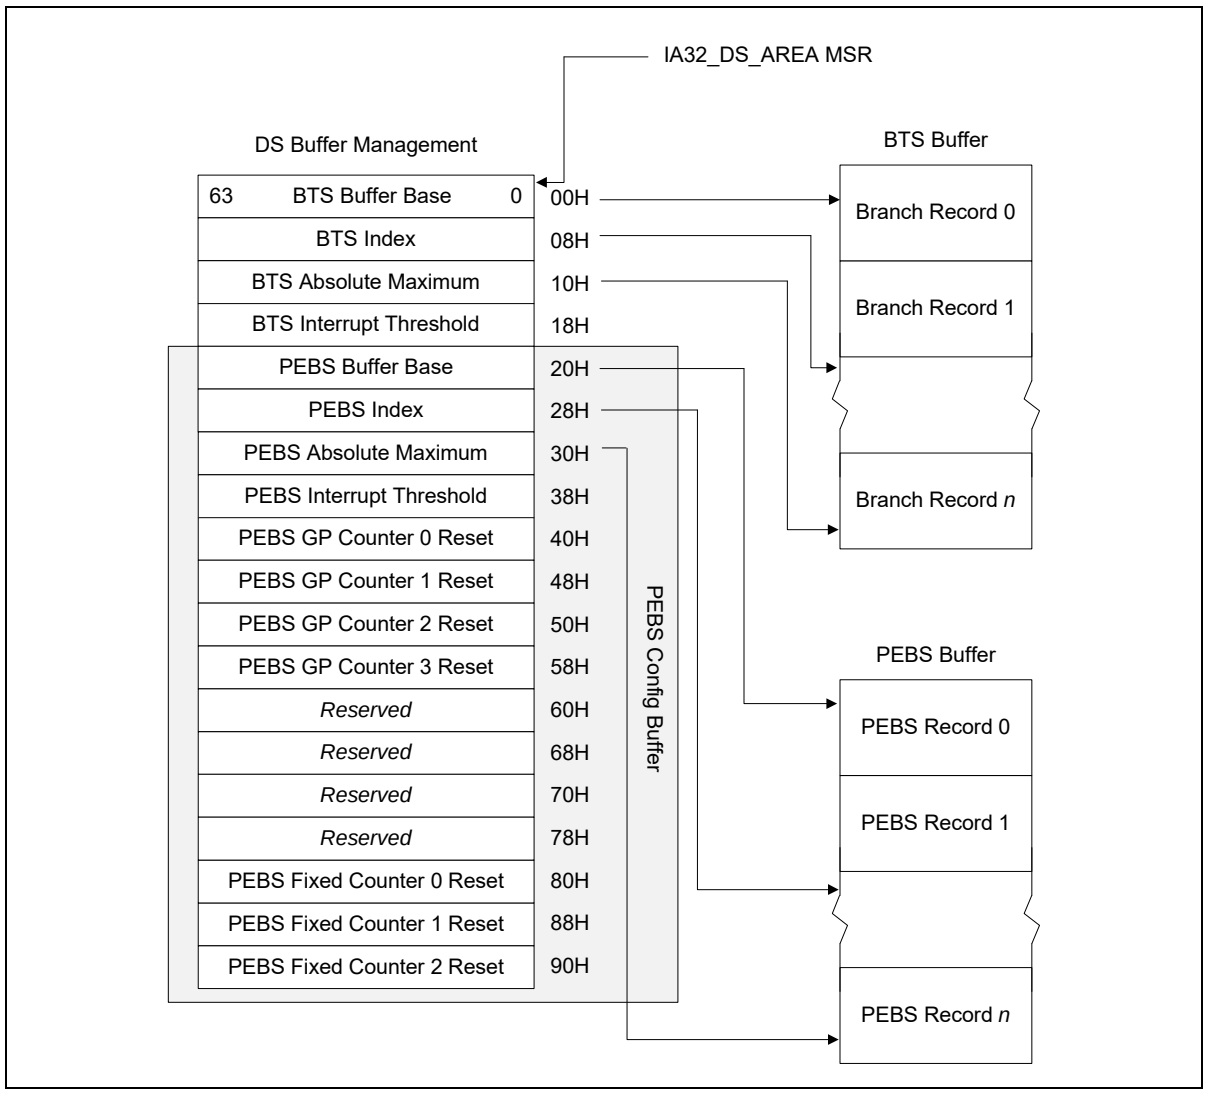

Figure 18-40. PEBS Programming Environment

18.5.4.2 Reduced Skid PEBS

Goldmont Plus microarchitecture processors supports the Reduced Skid PEBS feature described in Section 18.5.3.1.2 on the IA32_PMC0 counter. Although Goldmont Plus adds support for generating PEBS records for precise events on the other general-purpose and fixed-function performance counters, those counters do not support the Reduced Skid PEBS feature.

18.6 PERFORMANCE MONITORING (LEGACY INTEL PROCESSORS)

18.6.1 Performance Monitoring (Intel® Core™ Solo and Intel® Core™ Duo Processors)

In Intel Core Solo and Intel Core Duo processors, non-architectural performance monitoring events are programmed using the same facilities (see Figure 18-1) used for architectural performance events.

Non-architectural performance events use event select values that are model-specific. Event mask (Umask) values are also specific to event logic units. Some microarchitectural conditions detectable by a Umask value may have specificity related to processor topology (see Section 8.6, "Detecting Hardware Multi-Threading Support and Topology," in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*). As a result, the unit mask field (for example, IA32_PERFEVTSELx[bits 15:8]) may contain sub-fields that specify topology information of processor cores.

The sub-field layout within the Umask field may support two-bit encoding that qualifies the relationship between a microarchitectural condition and the originating core. This data is shown in Table 18-61. The two-bit encoding for core-specificity is only supported for a subset of Umask values (see Chapter 19, "Performance Monitoring Events") and for Intel Core Duo processors. Such events are referred to as core-specific events.

Table 18-61. Core Specificity Encoding within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit 15:14 Encoding	**Description**
11B	All cores
10B	Reserved
01B	This core
00B	Reserved

Some microarchitectural conditions allow detection specificity only at the boundary of physical processors. Some bus events belong to this category, providing specificity between the originating physical processor (a bus agent) versus other agents on the bus. Sub-field encoding for agent specificity is shown in Table 18-62.

Table 18-62. Agent Specificity Encoding within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit 13 Encoding	**Description**
0	This agent
1	Include all agents

Some microarchitectural conditions are detectable only from the originating core. In such cases, unit mask does not support core-specificity or agent-specificity encodings. These are referred to as core-only conditions.

Some microarchitectural conditions allow detection specificity that includes or excludes the action of hardware prefetches. A two-bit encoding may be supported to qualify hardware prefetch actions. Typically, this applies only to some L2 or bus events. The sub-field encoding for hardware prefetch qualification is shown in Table 18-63.

Table 18-63. HW Prefetch Qualification Encoding within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit 13:12 Encoding	**Description**
11B	All inclusive
10B	Reserved
01B	Hardware prefetch only
00B	Exclude hardware prefetch

Some performance events may (a) support none of the three event-specific qualification encodings (b) may support core-specificity and agent specificity simultaneously (c) or may support core-specificity and hardware prefetch qualification simultaneously. Agent-specificity and hardware prefetch qualification are mutually exclusive.

In addition, some L2 events permit qualifications that distinguish cache coherent states. The sub-field definition for cache coherency state qualification is shown in Table 18-64. If no bits in the MESI qualification sub-field are set for an event that requires setting MESI qualification bits, the event count will not increment.

Table 18-64. MESI Qualification Definitions within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit Position 11:8	**Description**
Bit 11	Counts modified state
Bit 10	Counts exclusive state
Bit 9	Counts shared state
Bit 8	Counts Invalid state

18.6.2 Performance Monitoring (Processors Based on Intel® Core™ Microarchitecture)

In addition to architectural performance monitoring, processors based on the Intel Core microarchitecture support non-architectural performance monitoring events.

Architectural performance events can be collected using general-purpose performance counters. Non-architectural performance events can be collected using general-purpose performance counters (coupled with two IA32_PERFEVTSELx MSRs for detailed event configurations), or fixed-function performance counters (see Section 18.6.2.1). IA32_PERFEVTSELx MSRs are architectural; their layout is shown in Figure 18-1. Starting with Intel Core 2 processor T 7700, fixed-function performance counters and associated counter control and status MSR becomes part of architectural performance monitoring version 2 facilities (see also Section 18.2.2).

Non-architectural performance events in processors based on Intel Core microarchitecture use event select values that are model-specific. Valid event mask (Umask) bits are listed in Chapter 19. The UMASK field may contain sub-fields identical to those listed in Table 18-61, Table 18-62, Table 18-63, and Table 18-64. One or more of these sub-fields may apply to specific events on an event-by-event basis. Details are listed in Table 19-25 in Chapter 19, "Performance Monitoring Events."

In addition, the UMASK filed may also contain a sub-field that allows detection specificity related to snoop responses. Bits of the snoop response qualification sub-field are defined in Table 18-65.

Table 18-65. Bus Snoop Qualification Definitions within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit Position 11:8	**Description**
Bit 11	HITM response
Bit 10	Reserved

Table 18-65. Bus Snoop Qualification Definitions within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit Position 11:8	**Description**
Bit 9	HIT response
Bit 8	CLEAN response

There are also non-architectural events that support qualification of different types of snoop operation. The corresponding bit field for snoop type qualification are listed in Table 18-66.

Table 18-66. Snoop Type Qualification Definitions within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit Position 9:8	**Description**
Bit 9	CMP2I snoops
Bit 8	CMP2S snoops

No more than one sub-field of MESI, snoop response, and snoop type qualification sub-fields can be supported in a performance event.

NOTE

Software must write known values to the performance counters prior to enabling the counters. The content of general-purpose counters and fixed-function counters are undefined after INIT or RESET.

18.6.2.1 Fixed-function Performance Counters

Processors based on Intel Core microarchitecture provide three fixed-function performance counters. Bits beyond the width of the fixed counter are reserved and must be written as zeros. Model-specific fixed-function performance counters on processors that support Architectural Perfmon version 1 are 40 bits wide.

Each of the fixed-function counter is dedicated to count a pre-defined performance monitoring events. See Table 18-2 for details of the PMC addresses and what these events count.

Programming the fixed-function performance counters does not involve any of the IA32_PERFEVTSELx MSRs, and does not require specifying any event masks. Instead, the MSR MSR_PERF_FIXED_CTR_CTRL provides multiple sets of 4-bit fields; each 4-bit field controls the operation of a fixed-function performance counter (PMC). See Figures 18-41. Two sub-fields are defined for each control. See Figure 18-41; bit fields are:

- **Enable field (low 2 bits in each 4-bit control) —** When bit 0 is set, performance counting is enabled in the corresponding fixed-function performance counter to increment when the target condition associated with the architecture performance event occurs at ring 0.

  When bit 1 is set, performance counting is enabled in the corresponding fixed-function performance counter to increment when the target condition associated with the architecture performance event occurs at ring greater than 0.

  Writing 0 to both bits stops the performance counter. Writing 11B causes the counter to increment irrespective of privilege levels.

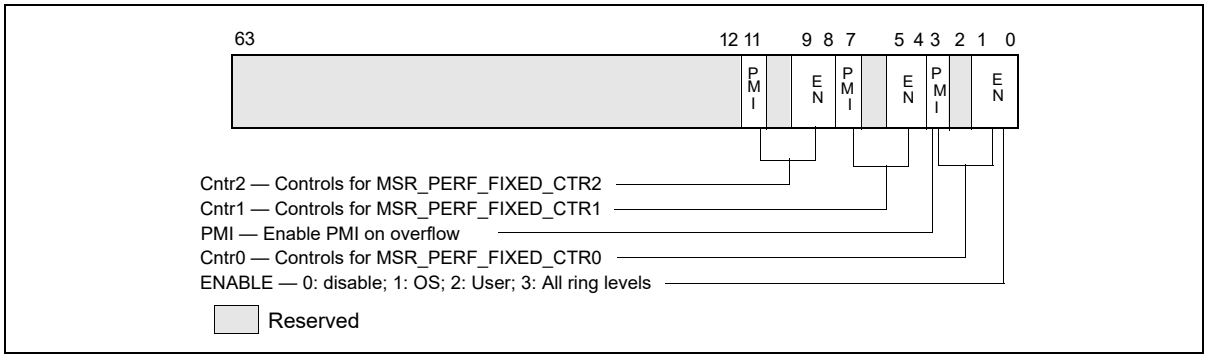

Figure 18-41. Layout of MSR_PERF_FIXED_CTR_CTRL MSR

- **PMI field (fourth bit in each 4-bit control)** — When set, the logical processor generates an exception through its local APIC on overflow condition of the respective fixed-function counter.

18.6.2.2 Global Counter Control Facilities

Processors based on Intel Core microarchitecture provides simplified performance counter control that simplifies the most frequent operations in programming performance events, i.e. enabling/disabling event counting and checking the status of counter overflows. This is done by the following three MSRs:

- MSR_PERF_GLOBAL_CTRL enables/disables event counting for all or any combination of fixed-function PMCs (MSR_PERF_FIXED_CTRx) or general-purpose PMCs via a single WRMSR.
- MSR_PERF_GLOBAL_STATUS allows software to query counter overflow conditions on any combination of fixed-function PMCs (MSR_PERF_FIXED_CTRx) or general-purpose PMCs via a single RDMSR.
- MSR_PERF_GLOBAL_OVF_CTRL allows software to clear counter overflow conditions on any combination of fixed-function PMCs (MSR_PERF_FIXED_CTRx) or general-purpose PMCs via a single WRMSR.

MSR_PERF_GLOBAL_CTRL MSR provides single-bit controls to enable counting in each performance counter (see Figure 18-42). Each enable bit in MSR_PERF_GLOBAL_CTRL is AND'ed with the enable bits for all privilege levels in the respective IA32_PERFEVTSELx or MSR_PERF_FIXED_CTR_CTRL MSRs to start/stop the counting of respective counters. Counting is enabled if the AND'ed results is true; counting is disabled when the result is false.

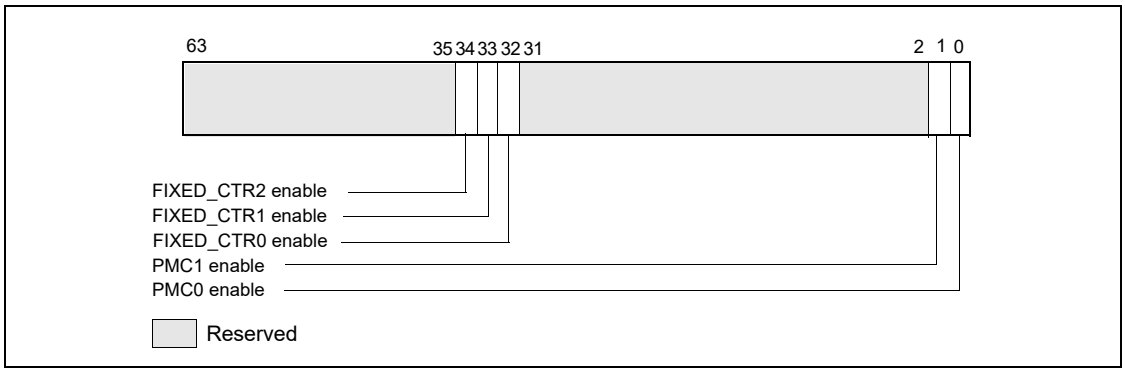

Figure 18-42. Layout of MSR_PERF_GLOBAL_CTRL MSR

MSR_PERF_GLOBAL_STATUS MSR provides single-bit status used by software to query the overflow condition of each performance counter. MSR_PERF_GLOBAL_STATUS[bit 62] indicates overflow conditions of the DS area data buffer. MSR_PERF_GLOBAL_STATUS[bit 63] provides a CondChgd bit to indicate changes to the state of performance monitoring hardware (see Figure 18-43). A value of 1 in bits 34:32, 1, 0 indicates an overflow condition has

occurred in the associated counter.

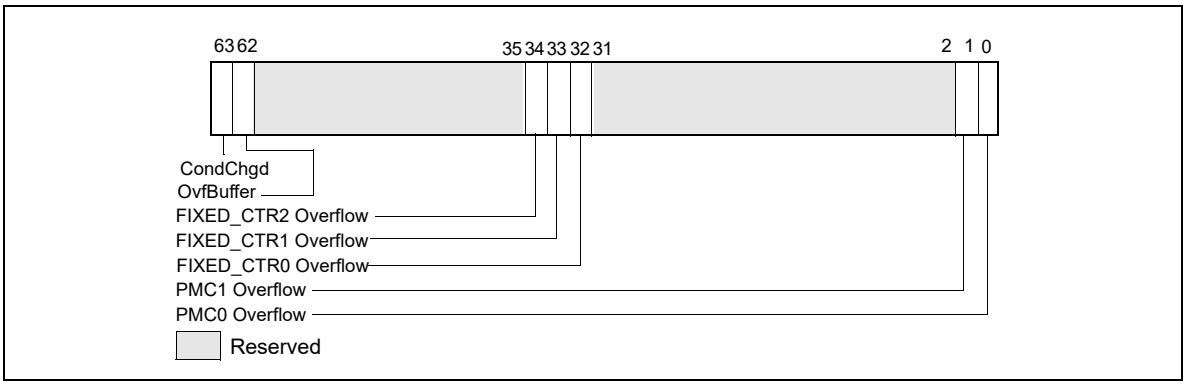

Figure 18-43. Layout of MSR_PERF_GLOBAL_STATUS MSR

When a performance counter is configured for PEBS, an overflow condition in the counter will arm PEBS. On the subsequent event following overflow, the processor will generate a PEBS event. On a PEBS event, the processor will perform bounds checks based on the parameters defined in the DS Save Area (see Section 17.4.9). Upon successful bounds checks, the processor will store the data record in the defined buffer area, clear the counter overflow status, and reload the counter. If the bounds checks fail, the PEBS will be skipped entirely. In the event that the PEBS buffer fills up, the processor will set the OvfBuffer bit in MSR_PERF_GLOBAL_STATUS.

MSR_PERF_GLOBAL_OVF_CTL MSR allows software to clear overflow the indicators for general-purpose or fixed-function counters via a single WRMSR (see Figure 18-44). Clear overflow indications when:

- Setting up new values in the event select and/or UMASK field for counting or interrupt-based event sampling.
- Reloading counter values to continue collecting next sample.
- Disabling event counting or interrupt-based event sampling.

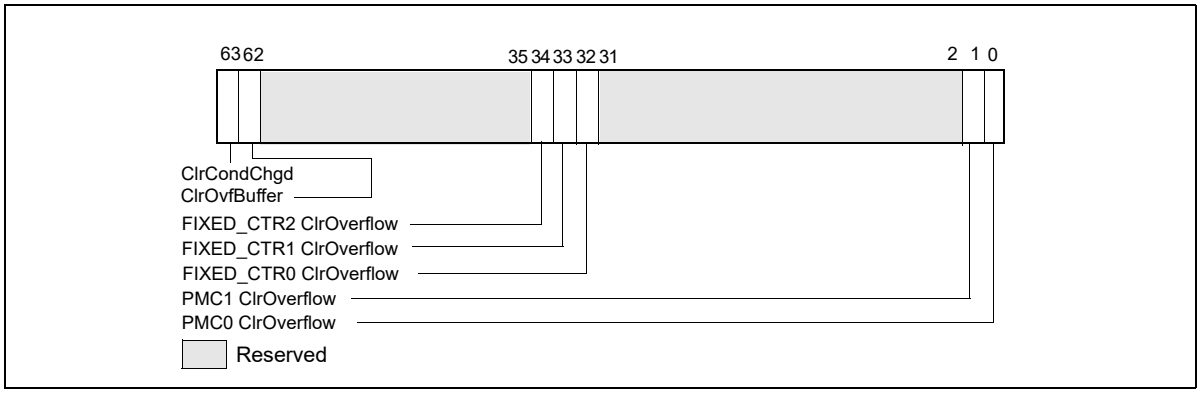

Figure 18-44. Layout of MSR_PERF_GLOBAL_OVF_CTRL MSR

18.6.2.3 At-Retirement Events

Many non-architectural performance events are impacted by the speculative nature of out-of-order execution. A subset of non-architectural performance events on processors based on Intel Core microarchitecture are enhanced with a tagging mechanism (similar to that found in Intel NetBurst® microarchitecture) that exclude contributions that arise from speculative execution. The at-retirement events available in processors based on Intel Core micro-architecture does not require special MSR programming control (see Section 18.6.3.6, "At-Retirement Counting"), but is limited to IA32_PMC0. See Table 18-67 for a list of events available to processors based on Intel Core micro-architecture.

Table 18-67. At-Retirement Performance Events for Intel Core Microarchitecture

Event Name	UMask	Event Select
ITLB_MISS_RETIRED	00H	C9H
MEM_LOAD_RETIRED.L1D_MISS	01H	CBH
MEM_LOAD_RETIRED.L1D_LINE_MISS	02H	CBH
MEM_LOAD_RETIRED.L2_MISS	04H	CBH
MEM_LOAD_RETIRED.L2_LINE_MISS	08H	CBH
MEM_LOAD_RETIRED.DTLB_MISS	10H	CBH

18.6.2.4 Processor Event Based Sampling (PEBS)

Processors based on Intel Core microarchitecture also support processor event based sampling (PEBS). This feature was introduced by processors based on Intel NetBurst microarchitecture.

PEBS uses a debug store mechanism and a performance monitoring interrupt to store a set of architectural state information for the processor. The information provides architectural state of the instruction executed after the instruction that caused the event (See Section 18.6.2.4.2 and Section 17.4.9).

In cases where the same instruction causes BTS and PEBS to be activated, PEBS is processed before BTS are processed. The PMI request is held until the processor completes processing of PEBS and BTS.

For processors based on Intel Core microarchitecture, precise events that can be used with PEBS are listed in Table 18-68. The procedure for detecting availability of PEBS is the same as described in Section 18.6.3.8.1.

Table 18-68. PEBS Performance Events for Intel Core Microarchitecture

Event Name	UMask	Event Select
INSTR_RETIRED.ANY_P	00H	C0H
X87_OPS_RETIRED.ANY	FEH	C1H
BR_INST_RETIRED.MISPRED	00H	C5H
SIMD_INST_RETIRED.ANY	1FH	C7H
MEM_LOAD_RETIRED.L1D_MISS	01H	CBH
MEM_LOAD_RETIRED.L1D_LINE_MISS	02H	CBH
MEM_LOAD_RETIRED.L2_MISS	04H	CBH
MEM_LOAD_RETIRED.L2_LINE_MISS	08H	CBH
MEM_LOAD_RETIRED.DTLB_MISS	10H	CBH

18.6.2.4.1 Setting up the PEBS Buffer

For processors based on Intel Core microarchitecture, PEBS is available using IA32_PMC0 only. Use the following procedure to set up the processor and IA32_PMC0 counter for PEBS:

1. Set up the precise event buffering facilities. Place values in the precise event buffer base, precise event index, precise event absolute maximum, precise event interrupt threshold, and precise event counter reset fields of the DS buffer management area. In processors based on Intel Core microarchitecture, PEBS records consist of 64-bit address entries. See Figure 17-8 to set up the precise event records buffer in memory.
2. Enable PEBS. Set the Enable PEBS on PMC0 flag (bit 0) in IA32_PEBS_ENABLE MSR.
3. Set up the IA32_PMC0 performance counter and IA32_PERFEVTSEL0 for an event listed in Table 18-68.

18.6.2.4.2 PEBS Record Format

The PEBS record format may be extended across different processor implementations. The IA32_PERF_CAPABILITES MSR defines a mechanism for software to handle the evolution of PEBS record format in processors that support architectural performance monitoring with version id equals 2 or higher. The bit fields of

IA32_PERF_CAPABILITES are defined in Table 2-2 of Chapter 2, "Model-Specific Registers (MSRs)" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4*. The relevant bit fields that governs PEBS are:

- PEBSTrap [bit 6]: When set, PEBS recording is trap-like. After the PEBS-enabled counter has overflowed, PEBS record is recorded for the next PEBS-able event at the completion of the sampled instruction causing the PEBS event. When clear, PEBS recording is fault-like. The PEBS record is recorded before the sampled instruction causing the PEBS event.
- PEBSSaveArchRegs [bit 7]: When set, PEBS will save architectural register and state information according to the encoded value of the PEBSRecordFormat field. When clear, only the return instruction pointer and flags are recorded. On processors based on Intel Core microarchitecture, this bit is always 1
- PEBSRecordFormat [bits 11:8]: Valid encodings are:
  - 0000B: Only general-purpose registers, instruction pointer and RFLAGS registers are saved in each PEBS record (seeSection 18.6.3.8).
  - 0001B: PEBS record includes additional information of IA32_PERF_GLOBAL_STATUS and load latency data. (seeSection 18.3.1.1.1).
  - 0010B: PEBS record includes additional information of IA32_PERF_GLOBAL_STATUS, load latency data, and TSX tuning information. (seeSection 18.3.6.2).
  - 0011B: PEBS record includes additional information of load latency data, TSX tuning information, TSC data, and the applicable counter field replaces IA32_PERF_GLOBAL_STATUS at offset 90H. (see Section 18.3.8.1.1).

18.6.2.4.3 Writing a PEBS Interrupt Service Routine

The PEBS facilities share the same interrupt vector and interrupt service routine (called the DS ISR) with the Interrupt-based event sampling and BTS facilities. To handle PEBS interrupts, PEBS handler code must be included in the DS ISR. See Section 17.4.9.1, "64 Bit Format of the DS Save Area," for guidelines when writing the DS ISR.

The service routine can query MSR_PERF_GLOBAL_STATUS to determine which counter(s) caused of overflow condition. The service routine should clear overflow indicator by writing to MSR_PERF_GLOBAL_OVF_CTL.

A comparison of the sequence of requirements to program PEBS for processors based on Intel Core and Intel NetBurst microarchitectures is listed in Table 18-69.

Table 18-69. Requirements to Program PEBS

	For Processors based on Intel Core microarchitecture	For Processors based on Intel NetBurst microarchitecture
Verify PEBS support of processor/OS.	▪ IA32_MISC_ENABLE.EMON_AVAILABE (bit 7) is set. ▪ IA32_MISC_ENABLE.PEBS_UNAVAILABE (bit 12) is clear.	
Ensure counters are in disabled.	On initial set up or changing event configurations, write MSR_PERF_GLOBAL_CTRL MSR (38FH) with 0. On subsequent entries: ▪ Clear all counters if "Counter Freeze on PMI" is not enabled. ▪ If IA32_DebugCTL.Freeze is enabled, counters are automatically disabled. Counters MUST be stopped before writing.[1]	Optional
Disable PEBS.	Clear ENABLE PMC0 bit in IA32_PEBS_ENABLE MSR (3F1H).	Optional
Check overflow conditions.	Check MSR_PERF_GLOBAL_STATUS MSR (38EH) handle any overflow conditions.	Check OVF flag of each CCCR for overflow condition
Clear overflow status.	Clear MSR_PERF_GLOBAL_STATUS MSR (38EH) using IA32_PERF_GLOBAL_OVF_CTRL MSR (390H).	Clear OVF flag of each CCCR.
Write "sample-after" values.	Configure the counter(s) with the sample after value.	

Table 18-69. Requirements to Program PEBS (Contd.)

	For Processors based on Intel Core microarchitecture	For Processors based on Intel NetBurst microarchitecture
Configure specific counter configuration MSR.	▪ Set local enable bit 22 - 1. ▪ Do NOT set local counter PMI/INT bit, bit 20 - 0. ▪ Event programmed must be PEBS capable.	▪ Set appropriate OVF_PMI bits - 1. ▪ Only CCCR for MSR_IQ_COUNTER4 support PEBS.
Allocate buffer for PEBS states.	Allocate a buffer in memory for the precise information.	
Program the IA32_DS_AREA MSR.	Program the IA32_DS_AREA MSR.	
Configure the PEBS buffer management records.	Configure the PEBS buffer management records in the DS buffer management area.	
Configure/Enable PEBS.	Set Enable PMC0 bit in IA32_PEBS_ENABLE MSR (3F1H).	Configure MSR_PEBS_ENABLE, MSR_PEBS_MATRIX_VERT and MSR_PEBS_MATRIX_HORZ as needed.
Enable counters.	Set Enable bits in MSR_PERF_GLOBAL_CTRL MSR (38FH).	Set each CCCR enable bit 12 - 1.

NOTES:

1. Counters read while enabled are not guaranteed to be precise with event counts that occur in timing proximity to the RDMSR.

18.6.2.4.4 Re-configuring PEBS Facilities

When software needs to reconfigure PEBS facilities, it should allow a quiescent period between stopping the prior event counting and setting up a new PEBS event. The quiescent period is to allow any latent residual PEBS records to complete its capture at their previously specified buffer address (provided by IA32_DS_AREA).

18.6.3 Performance Monitoring (Processors Based on Intel NetBurst® Microarchitecture)

The performance monitoring mechanism provided in processors based on Intel NetBurst microarchitecture is different from that provided in the P6 family and Pentium processors. While the general concept of selecting, filtering, counting, and reading performance events through the WRMSR, RDMSR, and RDPMC instructions is unchanged, the setup mechanism and MSR layouts are incompatible with the P6 family and Pentium processor mechanisms. Also, the RDPMC instruction has been extended to support faster reading of counters and to read all performance counters available in processors based on Intel NetBurst microarchitecture.

The event monitoring mechanism consists of the following facilities:

- The IA32_MISC_ENABLE MSR, which indicates the availability in an Intel 64 or IA-32 processor of the performance monitoring and processor event-based sampling (PEBS) facilities.
- Event selection control (ESCR) MSRs for selecting events to be monitored with specific performance counters. The number available differs by family and model (43 to 45).
- 18 performance counter MSRs for counting events.
- 18 counter configuration control (CCCR) MSRs, with one CCCR associated with each performance counter. CCCRs sets up an associated performance counter for a specific method of counting.
- A debug store (DS) save area in memory for storing PEBS records.
- The IA32_DS_AREA MSR, which establishes the location of the DS save area.
- The debug store (DS) feature flag (bit 21) returned by the CPUID instruction, which indicates the availability of the DS mechanism.
- The MSR_PEBS_ENABLE MSR, which enables the PEBS facilities and replay tagging used in at-retirement event counting.
- A set of predefined events and event metrics that simplify the setting up of the performance counters to count specific events.

Table 18-70 lists the performance counters and their associated CCCRs, along with the ESCRs that select events to be counted for each performance counter. Predefined event metrics and events are listed in Chapter 19, "Perfor-

mance Monitoring Events."

Table 18-70. Performance Counter MSRs and Associated CCCR and ESCR MSRs (Processors Based on Intel NetBurst Microarchitecture)

NOTES:

1. MSR_IQ_ESCR0 and MSR_IQ_ESCR1 are available only on early processor builds (family 0FH, models 01H-02H). These MSRs are not available on later versions.

The types of events that can be counted with these performance monitoring facilities are divided into two classes: non-retirement events and at-retirement events.

- Non-retirement events (see Table 19-31) are events that occur any time during instruction execution (such as bus transactions or cache transactions).
- At-retirement events (see Table 19-32) are events that are counted at the retirement stage of instruction execution, which allows finer granularity in counting events and capturing machine state.

  The at-retirement counting mechanism includes facilities for tagging μops that have encountered a particular performance event during instruction execution. Tagging allows events to be sorted between those that occurred on an execution path that resulted in architectural state being committed at retirement as well as events that occurred on an execution path where the results were eventually cancelled and never committed to architectural state (such as, the execution of a mispredicted branch).

The Pentium 4 and Intel Xeon processor performance monitoring facilities support the three usage models described below. The first two models can be used to count both non-retirement and at-retirement events; the third model is used to count a subset of at-retirement events:

- **Event counting —** A performance counter is configured to count one or more types of events. While the counter is counting, software reads the counter at selected intervals to determine the number of events that have been counted between the intervals.
- **Interrupt-based event sampling —** A performance counter is configured to count one or more types of events and to generate an interrupt when it overflows. To trigger an overflow, the counter is preset to a modulus value that will cause the counter to overflow after a specific number of events have been counted.

  When the counter overflows, the processor generates a performance monitoring interrupt (PMI). The interrupt service routine for the PMI then records the return instruction pointer (RIP), resets the modulus, and restarts the counter. Code performance can be analyzed by examining the distribution of RIPs with a tool like the VTune™ Performance Analyzer.
- **Processor event-based sampling (PEBS) —** In PEBS, the processor writes a record of the architectural state of the processor to a memory buffer after the counter overflows. The records of architectural state provide additional information for use in performance tuning. Processor-based event sampling can be used to count only a subset of at-retirement events. PEBS captures more precise processor state information compared to interrupt based event sampling, because the latter need to use the interrupt service routine to re-construct the architectural states of processor.

The following sections describe the MSRs and data structures used for performance monitoring in the Pentium 4 and Intel Xeon processors.

18.6.3.1 ESCR MSRs

The 45 ESCR MSRs (see Table 18-70) allow software to select specific events to be countered. Each ESCR is usually associated with a pair of performance counters (see Table 18-70) and each performance counter has several ESCRs associated with it (allowing the events counted to be selected from a variety of events).

Figure 18-45 shows the layout of an ESCR MSR. The functions of the flags and fields are:

- **USR flag, bit 2 —** When set, events are counted when the processor is operating at a current privilege level (CPL) of 1, 2, or 3. These privilege levels are generally used by application code and unprotected operating system code.
- **OS flag, bit 3 —** When set, events are counted when the processor is operating at CPL of 0. This privilege level is generally reserved for protected operating system code. (When both the OS and USR flags are set, events are counted at all privilege levels.)

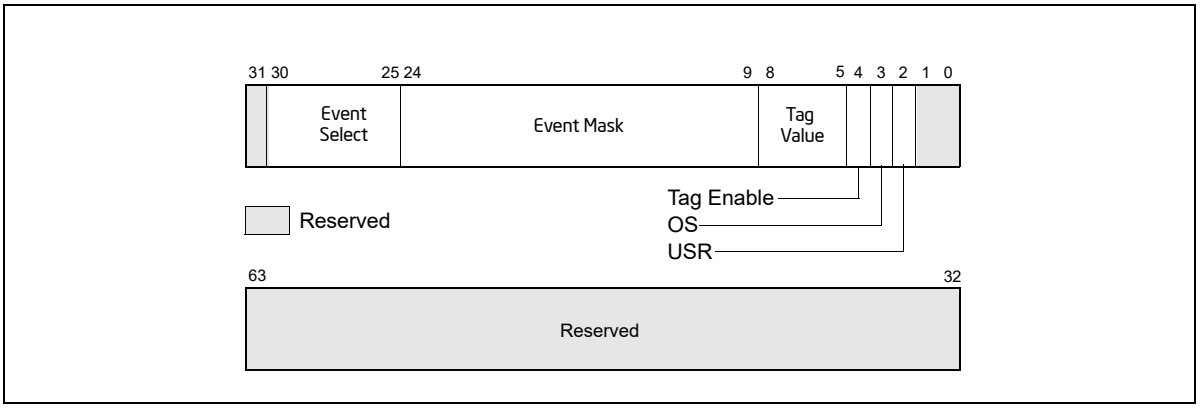

Figure 18-45. Event Selection Control Register (ESCR) for Pentium 4 and Intel Xeon Processors without Intel HT Technology Support

- **Tag enable, bit 4 —** When set, enables tagging of μops to assist in at-retirement event counting; when clear, disables tagging. See Section 18.6.3.6, "At-Retirement Counting."
- **Tag value field, bits 5 through 8 —** Selects a tag value to associate with a μop to assist in at-retirement event counting.
- **Event mask field, bits 9 through 24 —** Selects events to be counted from the event class selected with the event select field.
- **Event select field, bits 25 through 30) —** Selects a class of events to be counted. The events within this class that are counted are selected with the event mask field.

When setting up an ESCR, the event select field is used to select a specific class of events to count, such as retired branches. The event mask field is then used to select one or more of the specific events within the class to be counted. For example, when counting retired branches, four different events can be counted: branch not taken predicted, branch not taken mispredicted, branch taken predicted, and branch taken mispredicted. The OS and USR flags allow counts to be enabled for events that occur when operating system code and/or application code are being executed. If neither the OS nor USR flag is set, no events will be counted.

The ESCRs are initialized to all 0s on reset. The flags and fields of an ESCR are configured by writing to the ESCR using the WRMSR instruction. Table 18-70 gives the addresses of the ESCR MSRs.

Writing to an ESCR MSR does not enable counting with its associated performance counter; it only selects the event or events to be counted. The CCCR for the selected performance counter must also be configured. Configuration of the CCCR includes selecting the ESCR and enabling the counter.

18.6.3.2 Performance Counters

The performance counters in conjunction with the counter configuration control registers (CCCRs) are used for filtering and counting the events selected by the ESCRs. Processors based on Intel NetBurst microarchitecture provide 18 performance counters organized into 9 pairs. A pair of performance counters is associated with a particular subset of events and ESCR's (see Table 18-70). The counter pairs are partitioned into four groups:

- The BPU group, includes two performance counter pairs:
  - MSR_BPU_COUNTER0 and MSR_BPU_COUNTER1.
  - MSR_BPU_COUNTER2 and MSR_BPU_COUNTER3.
- The MS group, includes two performance counter pairs:
  - MSR_MS_COUNTER0 and MSR_MS_COUNTER1.
  - MSR_MS_COUNTER2 and MSR_MS_COUNTER3.
- The FLAME group, includes two performance counter pairs:
  - MSR_FLAME_COUNTER0 and MSR_FLAME_COUNTER1.

  - MSR_FLAME_COUNTER2 and MSR_FLAME_COUNTER3.
- The IQ group, includes three performance counter pairs:
  - MSR_IQ_COUNTER0 and MSR_IQ_COUNTER1.
  - MSR_IQ_COUNTER2 and MSR_IQ_COUNTER3.
  - MSR_IQ_COUNTER4 and MSR_IQ_COUNTER5.

The MSR_IQ_COUNTER4 counter in the IQ group provides support for the PEBS.

Alternate counters in each group can be cascaded: the first counter in one pair can start the first counter in the second pair and vice versa. A similar cascading is possible for the second counters in each pair. For example, within the BPU group of counters, MSR_BPU_COUNTER0 can start MSR_BPU_COUNTER2 and vice versa, and MSR_BPU_COUNTER1 can start MSR_BPU_COUNTER3 and vice versa (see Section 18.6.3.5.6, "Cascading Counters"). The cascade flag in the CCCR register for the performance counter enables the cascading of counters.

Each performance counter is 40-bits wide (see Figure 18-46). The RDPMC instruction is intended to allow reading of either the full counter-width (40-bits) or the low 32-bits of the counter. Reading the low 32-bits is faster than reading the full counter width and is appropriate in situations where the count is small enough to be contained in 32 bits.

The RDPMC instruction can be used by programs or procedures running at any privilege level and in virtual-8086 mode to read these counters. The PCE flag in control register CR4 (bit 8) allows the use of this instruction to be restricted to only programs and procedures running at privilege level 0.

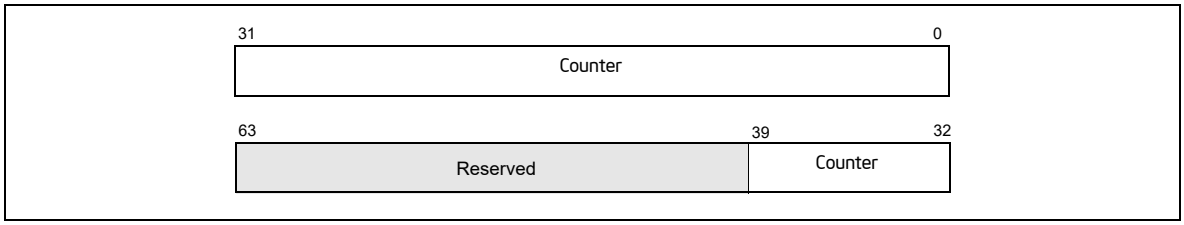

Figure 18-46. Performance Counter (Pentium 4 and Intel Xeon Processors)

The RDPMC instruction is not serializing or ordered with other instructions. Thus, it does not necessarily wait until all previous instructions have been executed before reading the counter. Similarly, subsequent instructions may begin execution before the RDPMC instruction operation is performed.

Only the operating system, executing at privilege level 0, can directly manipulate the performance counters, using the RDMSR and WRMSR instructions. A secure operating system would clear the PCE flag during system initialization to disable direct user access to the performance-monitoring counters, but provide a user-accessible programming interface that emulates the RDPMC instruction.

Some uses of the performance counters require the counters to be preset before counting begins (that is, before the counter is enabled). This can be accomplished by writing to the counter using the WRMSR instruction. To set a counter to a specified number of counts before overflow, enter a 2s complement negative integer in the counter. The counter will then count from the preset value up to -1 and overflow. Writing to a performance counter in a Pentium 4 or Intel Xeon processor with the WRMSR instruction causes all 40 bits of the counter to be written.

18.6.3.3 CCCR MSRs

Each of the 18 performance counters has one CCCR MSR associated with it (see Table 18-70). The CCCRs control the filtering and counting of events as well as interrupt generation. Figure 18-47 shows the layout of an CCCR MSR. The functions of the flags and fields are as follows:

- **Enable flag, bit 12 —** When set, enables counting; when clear, the counter is disabled. This flag is cleared on reset.
- **ESCR select field, bits 13 through 15 —** Identifies the ESCR to be used to select events to be counted with the counter associated with the CCCR.

- **Compare flag, bit 18 —** When set, enables filtering of the event count; when clear, disables filtering. The filtering method is selected with the threshold, complement, and edge flags.
- **Complement flag, bit 19 —** Selects how the incoming event count is compared with the threshold value. When set, event counts that are less than or equal to the threshold value result in a single count being delivered to the performance counter; when clear, counts greater than the threshold value result in a count being delivered to the performance counter (see Section 18.6.3.5.2, "Filtering Events"). The complement flag is not active unless the compare flag is set.
- **Threshold field, bits 20 through 23 —** Selects the threshold value to be used for comparisons. The processor examines this field only when the compare flag is set, and uses the complement flag setting to determine the type of threshold comparison to be made. The useful range of values that can be entered in this field depend on the type of event being counted (see Section 18.6.3.5.2, "Filtering Events").
- **Edge flag, bit 24 —** When set, enables rising edge (false-to-true) edge detection of the threshold comparison output for filtering event counts; when clear, rising edge detection is disabled. This flag is active only when the compare flag is set.

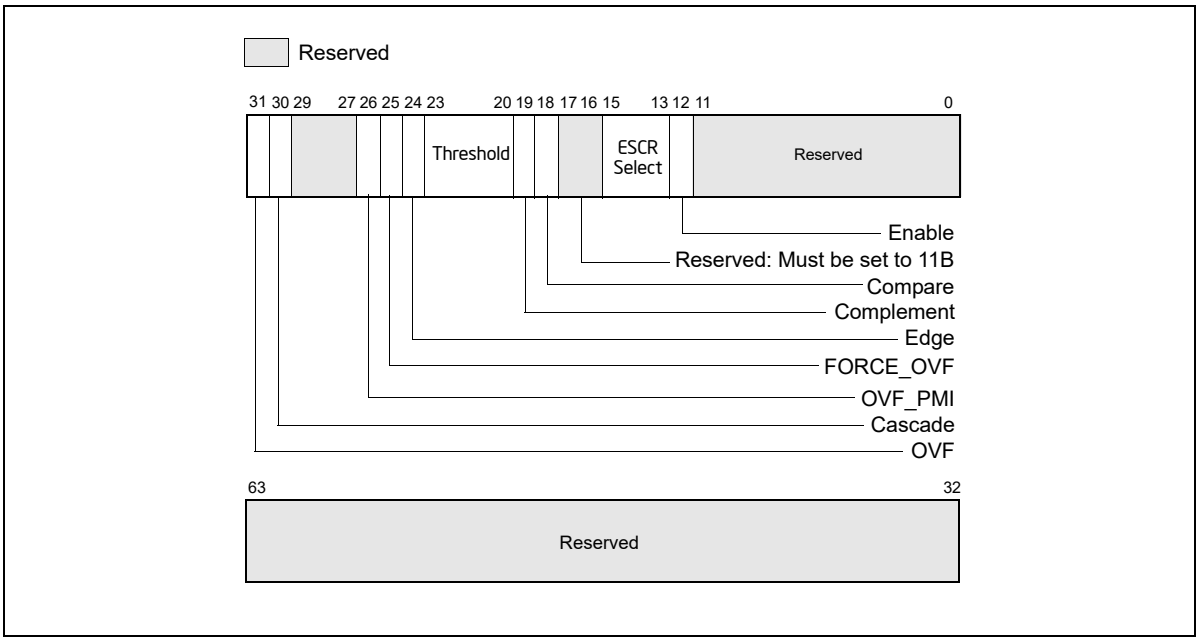

Figure 18-47. Counter Configuration Control Register (CCCR)

- **FORCE_OVF flag, bit 25 —** When set, forces a counter overflow on every counter increment; when clear, overflow only occurs when the counter actually overflows.
- **OVF_PMI flag, bit 26 —** When set, causes a performance monitor interrupt (PMI) to be generated when the counter overflows occurs; when clear, disables PMI generation. Note that the PMI is generated on the next event count after the counter has overflowed.
- **Cascade flag, bit 30 —** When set, enables counting on one counter of a counter pair when its alternate counter in the other the counter pair in the same counter group overflows (see Section 18.6.3.2, "Performance Counters," for further details); when clear, disables cascading of counters.
- **OVF flag, bit 31 —** Indicates that the counter has overflowed when set. This flag is a sticky flag that must be explicitly cleared by software.

The CCCRs are initialized to all 0s on reset.

The events that an enabled performance counter actually counts are selected and filtered by the following flags and fields in the ESCR and CCCR registers and in the qualification order given:

1. The event select and event mask fields in the ESCR select a class of events to be counted and one or more event types within the class, respectively.

2. The OS and USR flags in the ESCR selected the privilege levels at which events will be counted.
3. The ESCR select field of the CCCR selects the ESCR. Since each counter has several ESCRs associated with it, one ESCR must be chosen to select the classes of events that may be counted.
4. The compare and complement flags and the threshold field of the CCCR select an optional threshold to be used in qualifying an event count.
5. The edge flag in the CCCR allows events to be counted only on rising-edge transitions.

The qualification order in the above list implies that the filtered output of one "stage" forms the input for the next. For instance, events filtered using the privilege level flags can be further qualified by the compare and complement flags and the threshold field, and an event that matched the threshold criteria, can be further qualified by edge detection.

The uses of the flags and fields in the CCCRs are discussed in greater detail in Section 18.6.3.5, "Programming the Performance Counters for Non-Retirement Events."

18.6.3.4 Debug Store (DS) Mechanism

The debug store (DS) mechanism was introduced with processors based on Intel NetBurst microarchitecture to allow various types of information to be collected in memory-resident buffers for use in debugging and tuning programs. The DS mechanism can be used to collect two types of information: branch records and processor event-based sampling (PEBS) records. The availability of the DS mechanism in a processor is indicated with the DS feature flag (bit 21) returned by the CPUID instruction.

See Section 17.4.5, "Branch Trace Store (BTS)," and Section 18.6.3.8, "Processor Event-Based Sampling (PEBS)," for a description of these facilities. Records collected with the DS mechanism are saved in the DS save area. See Section 17.4.9, "BTS and DS Save Area."

18.6.3.5 Programming the Performance Counters for Non-Retirement Events

The basic steps to program a performance counter and to count events include the following:

1. Select the event or events to be counted.
2. For each event, select an ESCR that supports the event using the values in the ESCR restrictions row in Table 19-31, Chapter 19.
3. Match the CCCR Select value and ESCR name in Table 19-31 to a value listed in Table 18-70; select a CCCR and performance counter.
4. Set up an ESCR for the specific event or events to be counted and the privilege levels at which the are to be counted.
5. Set up the CCCR for the performance counter by selecting the ESCR and the desired event filters.
6. Set up the CCCR for optional cascading of event counts, so that when the selected counter overflows its alternate counter starts.
7. Set up the CCCR to generate an optional performance monitor interrupt (PMI) when the counter overflows. If PMI generation is enabled, the local APIC must be set up to deliver the interrupt to the processor and a handler for the interrupt must be in place.
8. Enable the counter to begin counting.

18.6.3.5.1 Selecting Events to Count

Table 19-32 in Chapter 19 lists a set of at-retirement events for processors based on Intel NetBurst microarchitecture. For each event listed in Table 19-32, setup information is provided. Table 18-71 gives an example of one of the events.

Table 18-71. Event Example

Event Name	Event Parameters	Parameter Value	Description
branch_retired			Counts the retirement of a branch. Specify one or more mask bits to select any combination of branch taken, not-taken, predicted and mispredicted.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	See Table 15-3 for the addresses of the ESCR MSRs.
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	The counter numbers associated with each ESCR are provided. The performance counters and corresponding CCCRs can be obtained from Table 15-3.
	ESCR Event Select	06H	ESCR[31:25]
	ESCR Event Mask	 Bit 0: MMNP 1: MMNM 2: MMTP 3: MMTM	ESCR[24:9] Branch Not-taken Predicted Branch Not-taken Mispredicted Branch Taken Predicted Branch Taken Mispredicted
	CCCR Select	05H	CCCR[15:13]
	Event Specific Notes		P6: EMON_BR_INST_RETIRED
	Can Support PEBS	No	
	Requires Additional MSRs for Tagging	No	

For Table 19-31 and Table 19-32, Chapter 19, the name of the event is listed in the Event Name column and parameters that define the event and other information are listed in the Event Parameters column. The Parameter Value and Description columns give specific parameters for the event and additional description information. Entries in the Event Parameters column are described below.

- **ESCR restrictions —** Lists the ESCRs that can be used to program the event. Typically only one ESCR is needed to count an event.
- **Counter numbers per ESCR —** Lists which performance counters are associated with each ESCR. Table 18-70 gives the name of the counter and CCCR for each counter number. Typically only one counter is needed to count the event.
- **ESCR event select —** Gives the value to be placed in the event select field of the ESCR to select the event.
- **ESCR event mask —** Gives the value to be placed in the Event Mask field of the ESCR to select sub-events to be counted. The parameter value column defines the documented bits with relative bit position offset starting from 0, where the absolute bit position of relative offset 0 is bit 9 of the ESCR. All undocumented bits are reserved and should be set to 0.
- **CCCR select —** Gives the value to be placed in the ESCR select field of the CCCR associated with the counter to select the ESCR to be used to define the event. This value is not the address of the ESCR; it is the number of the ESCR from the Number column in Table 18-70.
- **Event specific notes —** Gives additional information about the event, such as the name of the same or a similar event defined for the P6 family processors.
- **Can support PEBS —** Indicates if PEBS is supported for the event (only supplied for at-retirement events listed in Table 19-32.)
- **Requires additional MSR for tagging —** Indicates which if any additional MSRs must be programmed to count the events (only supplied for the at-retirement events listed in Table 19-32.)

NOTE

The performance-monitoring events listed in Chapter 19, "Performance Monitoring Events," are intended to be used as guides for performance tuning. The counter values reported are not guaranteed to be absolutely accurate and should be used as a relative guide for tuning. Known discrepancies are documented where applicable.

The following procedure shows how to set up a performance counter for basic counting; that is, the counter is set up to count a specified event indefinitely, wrapping around whenever it reaches its maximum count. This procedure is continued through the following four sections.

Using information in Table 19-31, Chapter 19, an event to be counted can be selected as follows:

1. Select the event to be counted.
2. Select the ESCR to be used to select events to be counted from the ESCRs field.
3. Select the number of the counter to be used to count the event from the Counter Numbers Per ESCR field.
4. Determine the name of the counter and the CCCR associated with the counter, and determine the MSR addresses of the counter, CCCR, and ESCR from Table 18-70.
5. Use the WRMSR instruction to write the ESCR Event Select and ESCR Event Mask values into the appropriate fields in the ESCR. At the same time set or clear the USR and OS flags in the ESCR as desired.
6. Use the WRMSR instruction to write the CCCR Select value into the appropriate field in the CCCR.

NOTE

Typically all the fields and flags of the CCCR will be written with one WRMSR instruction; however, in this procedure, several WRMSR writes are used to more clearly demonstrate the uses of the various CCCR fields and flags.

This setup procedure is continued in the next section, Section 18.6.3.5.2, "Filtering Events."

18.6.3.5.2 Filtering Events

Each counter receives up to 4 input lines from the processor hardware from which it is counting events. The counter treats these inputs as binary inputs (input 0 has a value of 1, input 1 has a value of 2, input 3 has a value of 4, and input 3 has a value of 8). When a counter is enabled, it adds this binary input value to the counter value on each clock cycle. For each clock cycle, the value added to the counter can then range from 0 (no event) to 15.

For many events, only the 0 input line is active, so the counter is merely counting the clock cycles during which the 0 input is asserted. However, for some events two or more input lines are used. Here, the counters threshold setting can be used to filter events. The compare, complement, threshold, and edge fields control the filtering of counter increments by input value.

If the compare flag is set, then a "greater than" or a "less than or equal to" comparison of the input value vs. a threshold value can be made. The complement flag selects "less than or equal to" (flag set) or "greater than" (flag clear). The threshold field selects a threshold value of from 0 to 15. For example, if the complement flag is cleared and the threshold field is set to 6, than any input value of 7 or greater on the 4 inputs to the counter will cause the counter to be incremented by 1, and any value less than 7 will cause an increment of 0 (or no increment) of the counter. Conversely, if the complement flag is set, any value from 0 to 6 will increment the counter and any value from 7 to 15 will not increment the counter. Note that when a threshold condition has been satisfied, the input to the counter is always 1, not the input value that is presented to the threshold filter.

The edge flag provides further filtering of the counter inputs when a threshold comparison is being made. The edge flag is only active when the compare flag is set. When the edge flag is set, the resulting output from the threshold filter (a value of 0 or 1) is used as an input to the edge filter. Each clock cycle, the edge filter examines the last and current input values and sends a count to the counter only when it detects a "rising edge" event; that is, a false-to-true transition. Figure 18-48 illustrates rising edge filtering.

The following procedure shows how to configure a CCCR to filter events using the threshold filter and the edge filter. This procedure is a continuation of the setup procedure introduced in Section 18.6.3.5.1, "Selecting Events to Count."

7. (Optional) To set up the counter for threshold filtering, use the WRMSR instruction to write values in the CCCR compare and complement flags and the threshold field:
   — Set the compare flag.
   — Set or clear the complement flag for less than or equal to or greater than comparisons, respectively.
   — Enter a value from 0 to 15 in the threshold field.
8. (Optional) Select rising edge filtering by setting the CCCR edge flag.

This setup procedure is continued in the next section, Section 18.6.3.5.3, "Starting Event Counting."

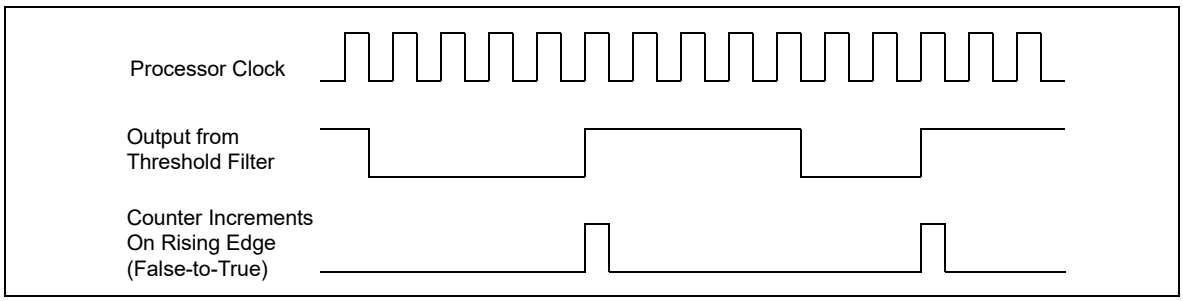

Figure 18-48. Effects of Edge Filtering

18.6.3.5.3 Starting Event Counting

Event counting by a performance counter can be initiated in either of two ways. The typical way is to set the enable flag in the counter's CCCR. Following the instruction to set the enable flag, event counting begins and continues until it is stopped (see Section 18.6.3.5.5, "Halting Event Counting").

The following procedural step shows how to start event counting. This step is a continuation of the setup procedure introduced in Section 18.6.3.5.2, "Filtering Events."

9. To start event counting, use the WRMSR instruction to set the CCCR enable flag for the performance counter.

This setup procedure is continued in the next section, Section 18.6.3.5.4, "Reading a Performance Counter's Count."

The second way that a counter can be started by using the cascade feature. Here, the overflow of one counter automatically starts its alternate counter (see Section 18.6.3.5.6, "Cascading Counters").

18.6.3.5.4 Reading a Performance Counter's Count

Performance counters can be read using either the RDPMC or RDMSR instructions. The enhanced functions of the RDPMC instruction (including fast read) are described in Section 18.6.3.2, "Performance Counters." These instructions can be used to read a performance counter while it is counting or when it is stopped.

The following procedural step shows how to read the event counter. This step is a continuation of the setup procedure introduced in Section 18.6.3.5.3, "Starting Event Counting."

10. To read a performance counters current event count, execute the RDPMC instruction with the counter number obtained from Table 18-70 used as an operand.

This setup procedure is continued in the next section, Section 18.6.3.5.5, "Halting Event Counting."

18.6.3.5.5 Halting Event Counting

After a performance counter has been started (enabled), it continues counting indefinitely. If the counter overflows (goes one count past its maximum count), it wraps around and continues counting. When the counter wraps

around, it sets its OVF flag to indicate that the counter has overflowed. The OVF flag is a sticky flag that indicates that the counter has overflowed at least once since the OVF bit was last cleared.

To halt counting, the CCCR enable flag for the counter must be cleared.

The following procedural step shows how to stop event counting. This step is a continuation of the setup procedure introduced in Section 18.6.3.5.4, "Reading a Performance Counter's Count."

11. To stop event counting, execute a WRMSR instruction to clear the CCCR enable flag for the performance counter.

To halt a cascaded counter (a counter that was started when its alternate counter overflowed), either clear the Cascade flag in the cascaded counter's CCCR MSR or clear the OVF flag in the alternate counter's CCCR MSR.

18.6.3.5.6 Cascading Counters

As described in Section 18.6.3.2, "Performance Counters," eighteen performance counters are implemented in pairs. Nine pairs of counters and associated CCCRs are further organized as four blocks: BPU, MS, FLAME, and IQ (see Table 18-70). The first three blocks contain two pairs each. The IQ block contains three pairs of counters (12 through 17) with associated CCCRs (MSR_IQ_CCCR0 through MSR_IQ_CCCR5).

The first 8 counter pairs (0 through 15) can be programmed using ESCRs to detect performance monitoring events. Pairs of ESCRs in each of the four blocks allow many different types of events to be counted. The cascade flag in the CCCR MSR allows nested monitoring of events to be performed by cascading one counter to a second counter located in another pair in the same block (see Figure 18-47 for the location of the flag).

Counters 0 and 1 form the first pair in the BPU block. Either counter 0 or 1 can be programmed to detect an event via MSR_MO B_ESCR0. Counters 0 and 2 can be cascaded in any order, as can counters 1 and 3. It's possible to set up 4 counters in the same block to cascade on two pairs of independent events. The pairing described also applies to subsequent blocks. Since the IQ PUB has two extra counters, cascading operates somewhat differently if 16 and 17 are involved. In the IQ block, counter 16 can only be cascaded from counter 14 (not from 12); counter 14 cannot be cascaded from counter 16 using the CCCR cascade bit mechanism. Similar restrictions apply to counter 17.

Example 18-1. Counting Events

Assume a scenario where counter X is set up to count 200 occurrences of event A; then counter Y is set up to count 400 occurrences of event B. Each counter is set up to count a specific event and overflow to the next counter. In the above example, counter X is preset for a count of -200 and counter Y for a count of -400; this setup causes the counters to overflow on the 200th and 400th counts respectively.

Continuing this scenario, counter X is set up to count indefinitely and wraparound on overflow. This is described in the basic performance counter setup procedure that begins in Section 18.6.3.5.1, "Selecting Events to Count." Counter Y is set up with the cascade flag in its associated CCCR MSR set to 1 and its enable flag set to 0.

To begin the nested counting, the enable bit for the counter X is set. Once enabled, counter X counts until it overflows. At this point, counter Y is automatically enabled and begins counting. Thus counter X overflows after 200 occurrences of event A. Counter Y then starts, counting 400 occurrences of event B before overflowing. When performance counters are cascaded, the counter Y would typically be set up to generate an interrupt on overflow. This is described in Section 18.6.3.5.8, "Generating an Interrupt on Overflow."

The cascading counters mechanism can be used to count a single event. The counting begins on one counter then continues on the second counter after the first counter overflows. This technique doubles the number of event counts that can be recorded, since the contents of the two counters can be added together.

18.6.3.5.7 EXTENDED CASCADING

Extended cascading is a model-specific feature in the Intel NetBurst microarchitecture with CPUID DisplayFamily_DisplayModel 0F_02, 0F_03, 0F_04, 0F_06. This feature uses bit 11 in CCCRs associated with the IQ

block. See Table 18-72.

Table 18-72. CCR Names and Bit Positions

CCCR Name:Bit Position	Bit Name	Description
MSR_IQ_CCCR1|2:11	Reserved	
MSR_IQ_CCCR0:11	CASCNT4INTO0	Allow counter 4 to cascade into counter 0
MSR_IQ_CCCR3:11	CASCNT5INTO3	Allow counter 5 to cascade into counter 3
MSR_IQ_CCCR4:11	CASCNT5INTO4	Allow counter 5 to cascade into counter 4
MSR_IQ_CCCR5:11	CASCNT4INTO5	Allow counter 4 to cascade into counter 5

The extended cascading feature can be adapted to the Interrupt based sampling usage model for performance monitoring. However, it is known that performance counters do not generate PMI in cascade mode or extended cascade mode due to an erratum. This erratum applies to processors with CPUID DisplayFamily_DisplayModel signature of 0F_02. For processors with CPUID DisplayFamily_DisplayModel signature of 0F_00 and 0F_01, the erratum applies to processors with stepping encoding greater than 09H.

Counters 16 and 17 in the IQ block are frequently used in processor event-based sampling or at-retirement counting of events indicating a stalled condition in the pipeline. Neither counter 16 or 17 can initiate the cascading of counter pairs using the cascade bit in a CCCR.

Extended cascading permits performance monitoring tools to use counters 16 and 17 to initiate cascading of two counters in the IQ block. Extended cascading from counter 16 and 17 is conceptually similar to cascading other counters, but instead of using CASCADE bit of a CCCR, one of the four CASCNTxINTOy bits is used.

Example 18-2. Scenario for Extended Cascading

A usage scenario for extended cascading is to sample instructions retired on logical processor 1 after the first 4096 instructions retired on logical processor 0. A procedure to program extended cascading in this scenario is outlined below:

1. Write the value 0 to counter 12.
2. Write the value 04000603H to MSR_CRU_ESCR0 (corresponding to selecting the NBOGNTAG and NBOGTAG event masks with qualification restricted to logical processor 1).
3. Write the value 04038800H to MSR_IQ_CCCR0. This enables CASCNT4INTO0 and OVF_PMI. An ISR can sample on instruction addresses in this case (do not set ENABLE, or CASCADE).
4. Write the value FFFFF000H into counter 16.1.
5. Write the value 0400060CH to MSR_CRU_ESCR2 (corresponding to selecting the NBOGNTAG and NBOGTAG event masks with qualification restricted to logical processor 0).
6. Write the value 00039000H to MSR_IQ_CCCR4 (set ENABLE bit, but not OVF_PMI).

Another use for cascading is to locate stalled execution in a multithreaded application. Assume MOB replays in thread B cause thread A to stall. Getting a sample of the stalled execution in this scenario could be accomplished by:

1. Set up counter B to count MOB replays on thread B.
2. Set up counter A to count resource stalls on thread A; set its force overflow bit and the appropriate CASCNTx-INTOy bit.
3. Use the performance monitoring interrupt to capture the program execution data of the stalled thread.

18.6.3.5.8 Generating an Interrupt on Overflow

Any performance counter can be configured to generate a performance monitor interrupt (PMI) if the counter overflows. The PMI interrupt service routine can then collect information about the state of the processor or program

when overflow occurred. This information can then be used with a tool like the Intel® VTune™ Performance Analyzer to analyze and tune program performance.

To enable an interrupt on counter overflow, the OVR_PMI flag in the counter's associated CCCR MSR must be set. When overflow occurs, a PMI is generated through the local APIC. (Here, the performance counter entry in the local vector table [LVT] is set up to deliver the interrupt generated by the PMI to the processor.)

The PMI service routine can use the OVF flag to determine which counter overflowed when multiple counters have been configured to generate PMIs. Also, note that these processors mask PMIs upon receiving an interrupt. Clear this condition before leaving the interrupt handler.

When generating interrupts on overflow, the performance counter being used should be preset to value that will cause an overflow after a specified number of events are counted plus 1. The simplest way to select the preset value is to write a negative number into the counter, as described in Section 18.6.3.5.6, "Cascading Counters." Here, however, if an interrupt is to be generated after 100 event counts, the counter should be preset to minus 100 plus 1 (-100 + 1), or -99. The counter will then overflow after it counts 99 events and generate an interrupt on the next (100th) event counted. The difference of 1 for this count enables the interrupt to be generated immediately after the selected event count has been reached, instead of waiting for the overflow to be propagation through the counter.

Because of latency in the microarchitecture between the generation of events and the generation of interrupts on overflow, it is sometimes difficult to generate an interrupt close to an event that caused it. In these situations, the FORCE_OVF flag in the CCCR can be used to improve reporting. Setting this flag causes the counter to overflow on every counter increment, which in turn triggers an interrupt after every counter increment.

18.6.3.5.9 Counter Usage Guideline

There are some instances where the user must take care to configure counting logic properly, so that it is not powered down. To use any ESCR, even when it is being used just for tagging, (any) one of the counters that the particular ESCR (or its paired ESCR) can be connected to should be enabled. If this is not done, 0 counts may result. Likewise, to use any counter, there must be some event selected in a corresponding ESCR (other than no_event, which generally has a select value of 0).

18.6.3.6 At-Retirement Counting

At-retirement counting provides a means counting only events that represent work committed to architectural state and ignoring work that was performed speculatively and later discarded.

One example of this speculative activity is branch prediction. When a branch misprediction occurs, the results of instructions that were decoded and executed down the mispredicted path are canceled. If a performance counter was set up to count all executed instructions, the count would include instructions whose results were canceled as well as those whose results committed to architectural state.

To provide finer granularity in event counting in these situations, the performance monitoring facilities provided in the Pentium 4 and Intel Xeon processors provide a mechanism for tagging events and then counting only those tagged events that represent committed results. This mechanism is called "at-retirement counting."

Tables 19-32 through 19-36 list predefined at-retirement events and event metrics that can be used to for tagging events when using at retirement counting. The following terminology is used in describing at-retirement counting:

- **Bogus, non-bogus, retire —** In at-retirement event descriptions, the term "bogus" refers to instructions or μops that must be canceled because they are on a path taken from a mispredicted branch. The terms "retired" and "non-bogus" refer to instructions or μops along the path that results in committed architectural state changes as required by the program being executed. Thus instructions and μops are either bogus or non-bogus, but not both. Several of the Pentium 4 and Intel Xeon processors' performance monitoring events (such as, Instruction_Retired and Uops_Retired in Table 19-32) can count instructions or μops that are retired based on the characterization of bogus" versus non-bogus.
- **Tagging —** Tagging is a means of marking μops that have encountered a particular performance event so they can be counted at retirement. During the course of execution, the same event can happen more than once per μop and a direct count of the event would not provide an indication of how many μops encountered that event.

  The tagging mechanisms allow a μop to be tagged once during its lifetime and thus counted once at retirement. The retired suffix is used for performance metrics that increment a count once per μop, rather than once per

event. For example, a μop may encounter a cache miss more than once during its life time, but a "Miss Retired" metric (that counts the number of retired μops that encountered a cache miss) will increment only once for that μop. A "Miss Retired" metric would be useful for characterizing the performance of the cache hierarchy for a particular instruction sequence. Details of various performance metrics and how these can be constructed using the Pentium 4 and Intel Xeon processors performance events are provided in the *Intel Pentium 4 Processor Optimization Reference Manual* (see Section 1.4, "Related Literature").

- **Replay —** To maximize performance for the common case, the Intel NetBurst microarchitecture aggressively schedules μops for execution before all the conditions for correct execution are guaranteed to be satisfied. In the event that all of these conditions are not satisfied, μops must be reissued. The mechanism that the Pentium 4 and Intel Xeon processors use for this reissuing of μops is called replay. Some examples of replay causes are cache misses, dependence violations, and unforeseen resource constraints. In normal operation, some number of replays is common and unavoidable. An excessive number of replays is an indication of a performance problem.
- **Assist —** When the hardware needs the assistance of microcode to deal with some event, the machine takes an assist. One example of this is an underflow condition in the input operands of a floating-point operation. The hardware must internally modify the format of the operands in order to perform the computation. Assists clear the entire machine of μops before they begin and are costly.

18.6.3.6.1 Using At-Retirement Counting

Processors based on Intel NetBurst microarchitecture allow counting both events and μops that encountered a specified event. For a subset of the at-retirement events listed in Table 19-32, a μop may be tagged when it encounters that event. The tagging mechanisms can be used in Interrupt-based event sampling, and a subset of these mechanisms can be used in PEBS. There are four independent tagging mechanisms, and each mechanism uses a different event to count μops tagged with that mechanism:

- **Front-end tagging —** This mechanism pertains to the tagging of μops that encountered front-end events (for example, trace cache and instruction counts) and are counted with the Front_end_event event.
- **Execution tagging —** This mechanism pertains to the tagging of μops that encountered execution events (for example, instruction types) and are counted with the Execution_Event event.
- **Replay tagging —** This mechanism pertains to tagging of μops whose retirement is replayed (for example, a cache miss) and are counted with the Replay_event event. Branch mispredictions are also tagged with this mechanism.
- **No tags —** This mechanism does not use tags. It uses the Instr_retired and the Uops_ retired events.

Each tagging mechanism is independent from all others; that is, a μop that has been tagged using one mechanism will not be detected with another mechanism's tagged-μop detector. For example, if μops are tagged using the front-end tagging mechanisms, the Replay_event will not count those as tagged μops unless they are also tagged using the replay tagging mechanism. However, execution tags allow up to four different types of μops to be counted at retirement through execution tagging.

The independence of tagging mechanisms does not hold when using PEBS. When using PEBS, only one tagging mechanism should be used at a time.

Certain kinds of μops that cannot be tagged, including I/O, uncacheable and locked accesses, returns, and far transfers.

Table 19-32 lists the performance monitoring events that support at-retirement counting: specifically the Front_end_event, Execution_event, Replay_event, Inst_retired and Uops_retired events. The following sections describe the tagging mechanisms for using these events to tag μop and count tagged μops.

18.6.3.6.2 Tagging Mechanism for Front_end_event

The Front_end_event counts μops that have been tagged as encountering any of the following events:

- **μop decode events —** Tagging μops for μop decode events requires specifying bits in the ESCR associated with the performance-monitoring event, Uop_type.
- **Trace cache events —** Tagging μops for trace cache events may require specifying certain bits in the MSR_TC_PRECISE_EVENT MSR (see Table 19-34).

Table 19-32 describes the Front_end_event and Table 19-34 describes metrics that are used to set up a Front_end_event count.

The MSRs specified in the Table 19-32 that are supported by the front-end tagging mechanism must be set and one or both of the NBOGUS and BOGUS bits in the Front_end_event event mask must be set to count events. None of the events currently supported requires the use of the MSR_TC_PRECISE_EVENT MSR.

18.6.3.6.3 Tagging Mechanism For Execution_event

Table 19-32 describes the Execution_event and Table 19-35 describes metrics that are used to set up an Execution_event count.

The execution tagging mechanism differs from other tagging mechanisms in how it causes tagging. One *upstream* ESCR is used to specify an event to detect and to specify a tag value (bits 5 through 8) to identify that event. A second *downstream* ESCR is used to detect μops that have been tagged with that tag value identifier using Execution_event for the event selection.

The upstream ESCR that counts the event must have its tag enable flag (bit 4) set and must have an appropriate tag value mask entered in its tag value field. The 4-bit tag value mask specifies which of tag bits should be set for a particular μop. The value selected for the tag value should coincide with the event mask selected in the downstream ESCR. For example, if a tag value of 1 is set, then the event mask of NBOGUS0 should be enabled, correspondingly in the downstream ESCR. The downstream ESCR detects and counts tagged μops. The normal (not tag value) mask bits in the downstream ESCR specify which tag bits to count. If any one of the tag bits selected by the mask is set, the related counter is incremented by one. This mechanism is summarized in the Table 19-35 metrics that are supported by the execution tagging mechanism. The tag enable and tag value bits are irrelevant for the downstream ESCR used to select the Execution_event.

The four separate tag bits allow the user to simultaneously but distinctly count up to four execution events at retirement. (This applies for interrupt-based event sampling. There are additional restrictions for PEBS as noted in Section 18.6.3.8.3, "Setting Up the PEBS Buffer.") It is also possible to detect or count combinations of events by setting multiple tag value bits in the upstream ESCR or multiple mask bits in the downstream ESCR. For example, use a tag value of 3H in the upstream ESCR and use NBOGUS0/NBOGUS1 in the downstream ESCR event mask.

18.6.3.7 Tagging Mechanism for Replay_event

Table 19-32 describes the Replay_event and Table 19-36 describes metrics that are used to set up an Replay_event count.

The replay mechanism enables tagging of μops for a subset of all replays before retirement. Use of the replay mechanism requires selecting the type of μop that may experience the replay in the MSR_PEBS_MATRIX_VERT MSR and selecting the type of event in the MSR_PEBS_ENABLE MSR. Replay tagging must also be enabled with the UOP_Tag flag (bit 24) in the MSR_PEBS_ENABLE MSR.

The Table 19-36 lists the metrics that are support the replay tagging mechanism and the at-retirement events that use the replay tagging mechanism, and specifies how the appropriate MSRs need to be configured. The replay tags defined in Table A-5 also enable Processor Event-Based Sampling (PEBS, see Section 17.4.9). Each of these replay tags can also be used in normal sampling by not setting Bit 24 nor Bit 25 in IA_32_PEBS_ENABLE_MSR. Each of these metrics requires that the Replay_Event (see Table 19-32) be used to count the tagged μops.

18.6.3.8 Processor Event-Based Sampling (PEBS)

The debug store (DS) mechanism in processors based on Intel NetBurst microarchitecture allow two types of information to be collected for use in debugging and tuning programs: PEBS records and BTS records. See Section 17.4.5, "Branch Trace Store (BTS)," for a description of the BTS mechanism.

PEBS permits the saving of precise architectural information associated with one or more performance events in the precise event records buffer, which is part of the DS save area (see Section 17.4.9, "BTS and DS Save Area"). To use this mechanism, a counter is configured to overflow after it has counted a preset number of events. After the counter overflows, the processor copies the current state of the general-purpose and EFLAGS registers and instruction pointer into a record in the precise event records buffer. The processor then resets the count in the performance counter and restarts the counter. When the precise event records buffer is nearly full, an interrupt is

generated, allowing the precise event records to be saved. A circular buffer is not supported for precise event records.

PEBS is supported only for a subset of the at-retirement events: Execution_event, Front_end_event, and Replay_event. Also, PEBS can only be carried out using the one performance counter, the MSR_IQ_COUNTER4 MSR.

In processors based on Intel Core microarchitecture, a similar PEBS mechanism is also supported using IA32_PMC0 and IA32_PERFEVTSEL0 MSRs (See Section 18.6.2.4).

18.6.3.8.1 Detection of the Availability of the PEBS Facilities

The DS feature flag (bit 21) returned by the CPUID instruction indicates (when set) the availability of the DS mechanism in the processor, which supports the PEBS (and BTS) facilities. When this bit is set, the following PEBS facilities are available:

- The PEBS_UNAVAILABLE flag in the IA32_MISC_ENABLE MSR indicates (when clear) the availability of the PEBS facilities, including the MSR_PEBS_ENABLE MSR.
- The enable PEBS flag (bit 24) in the MSR_PEBS_ENABLE MSR allows PEBS to be enabled (set) or disabled (clear).
- The IA32_DS_AREA MSR can be programmed to point to the DS save area.

18.6.3.8.2 Setting Up the DS Save Area

Section 17.4.9.2, "Setting Up the DS Save Area," describes how to set up and enable the DS save area. This procedure is common for PEBS and BTS.

18.6.3.8.3 Setting Up the PEBS Buffer

Only the MSR_IQ_COUNTER4 performance counter can be used for PEBS. Use the following procedure to set up the processor and this counter for PEBS:

1. Set up the precise event buffering facilities. Place values in the precise event buffer base, precise event index, precise event absolute maximum, and precise event interrupt threshold, and precise event counter reset fields of the DS buffer management area (see Figure 17-5) to set up the precise event records buffer in memory.
2. Enable PEBS. Set the Enable PEBS flag (bit 24) in MSR_PEBS_ENABLE MSR.
3. Set up the MSR_IQ_COUNTER4 performance counter and its associated CCCR and one or more ESCRs for PEBS as described in Tables 19-32 through 19-36.

18.6.3.8.4 Writing a PEBS Interrupt Service Routine

The PEBS facilities share the same interrupt vector and interrupt service routine (called the DS ISR) with the non-precise event-based sampling and BTS facilities. To handle PEBS interrupts, PEBS handler code must be included in the DS ISR. See Section 17.4.9.5, "Writing the DS Interrupt Service Routine," for guidelines for writing the DS ISR.

18.6.3.8.5 Other DS Mechanism Implications

The DS mechanism is not available in the SMM. It is disabled on transition to the SMM mode. Similarly the DS mechanism is disabled on the generation of a machine check exception and is cleared on processor RESET and INIT.

The DS mechanism is available in real address mode.

18.6.3.9 Operating System Implications

The DS mechanism can be used by the operating system as a debugging extension to facilitate failure analysis. When using this facility, a 25 to 30 times slowdown can be expected due to the effects of the trace store occurring on every taken branch.

Depending upon intended usage, the instruction pointers that are part of the branch records or the PEBS records need to have an association with the corresponding process. One solution requires the ability for the DS specific operating system module to be chained to the context switch. A separate buffer can then be maintained for each process of interest and the MSR pointing to the configuration area saved and setup appropriately on each context switch.

If the BTS facility has been enabled, then it must be disabled and state stored on transition of the system to a sleep state in which processor context is lost. The state must be restored on return from the sleep state.

It is required that an interrupt gate be used for the DS interrupt as opposed to a trap gate to prevent the generation of an endless interrupt loop.

Pages that contain buffers must have mappings to the same physical address for all processes/logical processors, such that any change to CR3 will not change DS addresses. If this requirement cannot be satisfied (that is, the feature is enabled on a per thread/process basis), then the operating system must ensure that the feature is enabled/disabled appropriately in the context switch code.

18.6.4 Performance Monitoring and Intel Hyper-Threading Technology in Processors Based on Intel NetBurst® Microarchitecture

The performance monitoring capability of processors based on Intel NetBurst microarchitecture and supporting Intel Hyper-Threading Technology is similar to that described in Section 18.6.3. However, the capability is extended so that:

- Performance counters can be programmed to select events qualified by logical processor IDs.
- Performance monitoring interrupts can be directed to a specific logical processor within the physical processor.

The sections below describe performance counters, event qualification by logical processor ID, and special purpose bits in ESCRs/CCCRs. They also describe MSR_PEBS_ENABLE, MSR_PEBS_MATRIX_VERT, and MSR_TC_PRECISE_EVENT.

18.6.4.1 ESCR MSRs

Figure 18-49 shows the layout of an ESCR MSR in processors supporting Intel Hyper-Threading Technology.

The functions of the flags and fields are as follows:

- **T1_USR flag, bit 0 —** When set, events are counted when thread 1 (logical processor 1) is executing at a current privilege level (CPL) of 1, 2, or 3. These privilege levels are generally used by application code and unprotected operating system code.

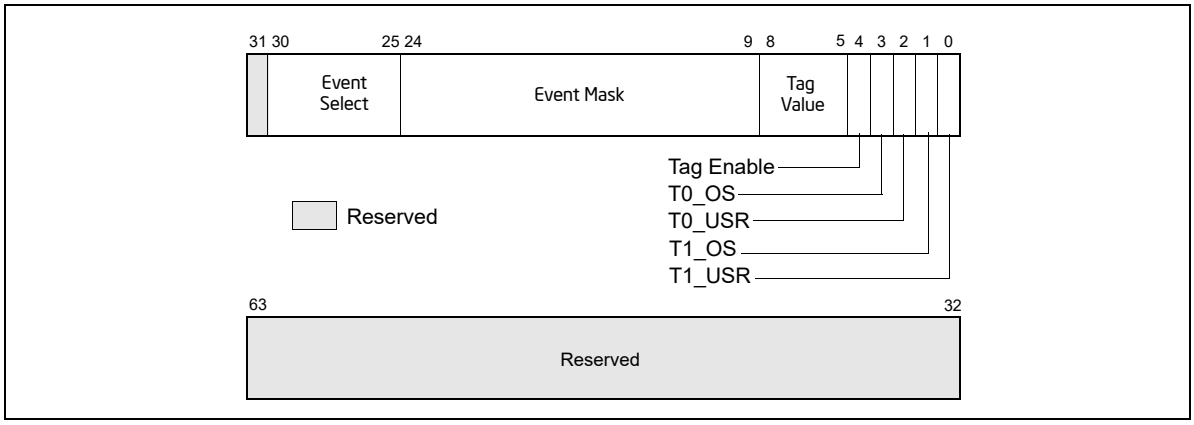

Figure 18-49. Event Selection Control Register (ESCR) for the Pentium 4 Processor, Intel Xeon Processor and Intel Xeon Processor MP Supporting Hyper-Threading Technology

- **T1_OS flag, bit 1 —** When set, events are counted when thread 1 (logical processor 1) is executing at CPL of 0. This privilege level is generally reserved for protected operating system code. (When both the T1_OS and T1_USR flags are set, thread 1 events are counted at all privilege levels.)
- **T0_USR flag, bit 2 —** When set, events are counted when thread 0 (logical processor 0) is executing at a CPL of 1, 2, or 3.
- **T0_OS flag, bit 3 —** When set, events are counted when thread 0 (logical processor 0) is executing at CPL of 0. (When both the T0_OS and T0_USR flags are set, thread 0 events are counted at all privilege levels.)
- **Tag enable, bit 4 —** When set, enables tagging of μops to assist in at-retirement event counting; when clear, disables tagging. See Section 18.6.3.6, "At-Retirement Counting."
- **Tag value field, bits 5 through 8 —** Selects a tag value to associate with a μop to assist in at-retirement event counting.
- **Event mask field, bits 9 through 24 —** Selects events to be counted from the event class selected with the event select field.
- **Event select field, bits 25 through 30) —** Selects a class of events to be counted. The events within this class that are counted are selected with the event mask field.

The T0_OS and T0_USR flags and the T1_OS and T1_USR flags allow event counting and sampling to be specified for a specific logical processor (0 or 1) within an Intel Xeon processor MP (See also: Section 8.4.5, "Identifying Logical Processors in an MP System," in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*).

Not all performance monitoring events can be detected within an Intel Xeon processor MP on a per logical processor basis (see Section 18.6.4.4, "Performance Monitoring Events"). Some sub-events (specified by an event mask bits) are counted or sampled without regard to which logical processor is associated with the detected event.

18.6.4.2 CCCR MSRs

Figure 18-50 shows the layout of a CCCR MSR in processors supporting Intel Hyper-Threading Technology. The functions of the flags and fields are as follows:

- **Enable flag, bit 12 —** When set, enables counting; when clear, the counter is disabled. This flag is cleared on reset
- **ESCR select field, bits 13 through 15 —** Identifies the ESCR to be used to select events to be counted with the counter associated with the CCCR.
- **Active thread field, bits 16 and 17 —** Enables counting depending on which logical processors are active (executing a thread). This field enables filtering of events based on the state (active or inactive) of the logical processors. The encodings of this field are as follows:

  00 — None. Count only when neither logical processor is active.

  01 — Single. Count only when one logical processor is active (either 0 or 1).

  10 — Both. Count only when both logical processors are active.

  11 — Any. Count when either logical processor is active.

  A halted logical processor or a logical processor in the "wait for SIPI" state is considered inactive.

- **Compare flag, bit 18 —** When set, enables filtering of the event count; when clear, disables filtering. The filtering method is selected with the threshold, complement, and edge flags.

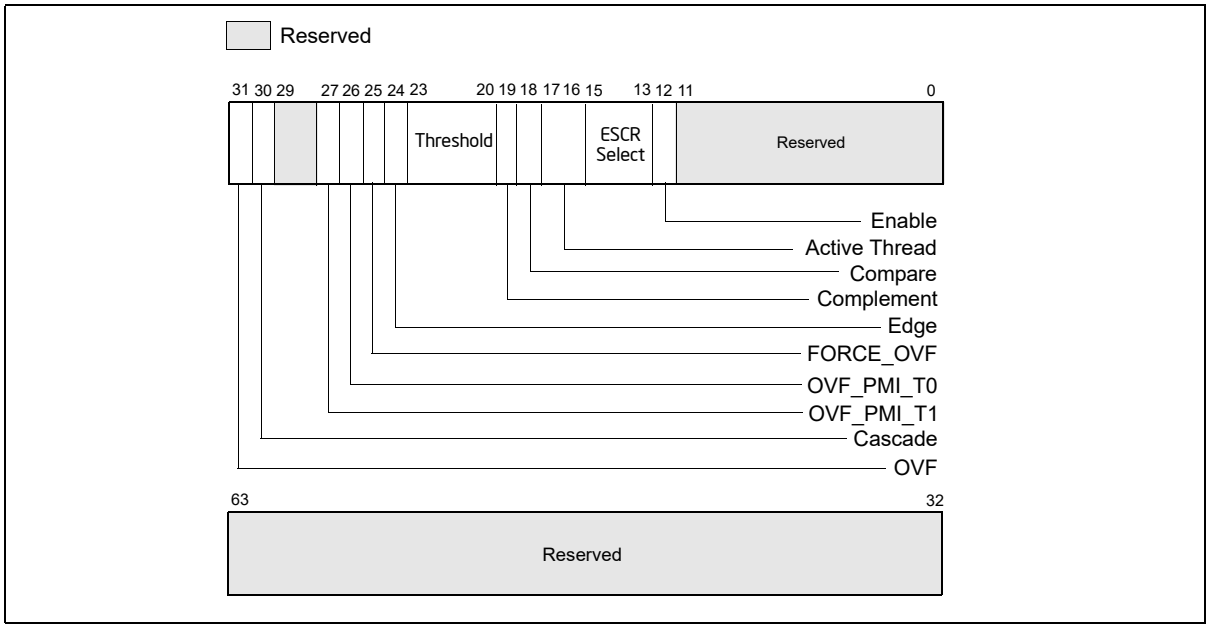

Figure 18-50. Counter Configuration Control Register (CCCR)

- **Complement flag, bit 19 —** Selects how the incoming event count is compared with the threshold value. When set, event counts that are less than or equal to the threshold value result in a single count being delivered to the performance counter; when clear, counts greater than the threshold value result in a count being delivered to the performance counter (see Section 18.6.3.5.2, "Filtering Events"). The compare flag is not active unless the compare flag is set.
- **Threshold field, bits 20 through 23 —** Selects the threshold value to be used for comparisons. The processor examines this field only when the compare flag is set, and uses the complement flag setting to determine the type of threshold comparison to be made. The useful range of values that can be entered in this field depend on the type of event being counted (see Section 18.6.3.5.2, "Filtering Events").
- **Edge flag, bit 24 —** When set, enables rising edge (false-to-true) edge detection of the threshold comparison output for filtering event counts; when clear, rising edge detection is disabled. This flag is active only when the compare flag is set.
- **FORCE_OVF flag, bit 25 —** When set, forces a counter overflow on every counter increment; when clear, overflow only occurs when the counter actually overflows.
- **OVF_PMI_T0 flag, bit 26 —** When set, causes a performance monitor interrupt (PMI) to be sent to logical processor 0 when the counter overflows occurs; when clear, disables PMI generation for logical processor 0. Note that the PMI is generate on the next event count after the counter has overflowed.
- **OVF_PMI_T1 flag, bit 27 —** When set, causes a performance monitor interrupt (PMI) to be sent to logical processor 1 when the counter overflows occurs; when clear, disables PMI generation for logical processor 1. Note that the PMI is generate on the next event count after the counter has overflowed.
- **Cascade flag, bit 30 —** When set, enables counting on one counter of a counter pair when its alternate counter in the other the counter pair in the same counter group overflows (see Section 18.6.3.2, "Performance Counters," for further details); when clear, disables cascading of counters.
- **OVF flag, bit 31 —** Indicates that the counter has overflowed when set. This flag is a sticky flag that must be explicitly cleared by software.

18.6.4.3 IA32_PEBS_ENABLE MSR

In a processor supporting Intel Hyper-Threading Technology and based on the Intel NetBurst microarchitecture, PEBS is enabled and qualified with two bits in the MSR_PEBS_ENABLE MSR: bit 25 (ENABLE_PEBS_MY_THR) and 26 (ENABLE_PEBS_OTH_THR) respectively. These bits do not explicitly identify a specific logical processor by logic

processor ID(T0 or T1); instead, they allow a software agent to enable PEBS for subsequent threads of execution on the same logical processor on which the agent is running ("my thread") or for the other logical processor in the physical package on which the agent is not running ("other thread").

PEBS is supported for only a subset of the at-retirement events: Execution_event, Front_end_event, and Replay_event. Also, PEBS can be carried out only with two performance counters: MSR_IQ_CCCR4 (MSR address 370H) for logical processor 0 and MSR_IQ_CCCR5 (MSR address 371H) for logical processor 1.

Performance monitoring tools should use a processor affinity mask to bind the kernel mode components that need to modify the ENABLE_PEBS_MY_THR and ENABLE_PEBS_OTH_THR bits in the MSR_PEBS_ENABLE MSR to a specific logical processor. This is to prevent these kernel mode components from migrating between different logical processors due to OS scheduling.

18.6.4.4 Performance Monitoring Events

All of the events listed in Table 19-31 and 19-32 are available in an Intel Xeon processor MP. When Intel Hyper-Threading Technology is active, many performance monitoring events can be can be qualified by the logical processor ID, which corresponds to bit 0 of the initial APIC ID. This allows for counting an event in any or all of the logical processors. However, not all the events have this logic processor specificity, or thread specificity.

Here, each event falls into one of two categories:

- **Thread specific (TS) —** The event can be qualified as occurring on a specific logical processor.
- **Thread independent (TI) —** The event cannot be qualified as being associated with a specific logical processor.

Table 19-37 gives logical processor specific information (TS or TI) for each of the events described in Tables 19-31 and 19-32. If for example, a TS event occurred in logical processor T0, the counting of the event (as shown in Table 18-73) depends only on the setting of the T0_USR and T0_OS flags in the ESCR being used to set up the event counter. The T1_USR and T1_OS flags have no effect on the count.

Table 18-73. Effect of Logical Processor and CPL Qualification for Logical-Processor-Specific (TS) Events

	T1_OS/T1_USR = 00	T1_OS/T1_USR = 01	T1_OS/T1_USR = 11	T1_OS/T1_USR = 10
T0_OS/T0_USR = 00	Zero count	Counts while T1 in USR	Counts while T1 in OS or USR	Counts while T1 in OS
T0_OS/T0_USR = 01	Counts while T0 in USR	Counts while T0 in USR or T1 in USR	Counts while (a) T0 in USR or (b) T1 in OS or (c) T1 in USR	Counts while (a) T0 in OS or (b) T1 in OS
T0_OS/T0_USR = 11	Counts while T0 in OS or USR	Counts while (a) T0 in OS or (b) T0 in USR or (c) T1 in USR	Counts irrespective of CPL, T0, T1	Counts while (a) T0 in OS or (b) or T0 in USR or (c) T1 in OS
T0_OS/T0_USR = 10	Counts T0 in OS	Counts T0 in OS or T1 in USR	Counts while (a)T0 in Os or (b) T1 in OS or (c) T1 in USR	Counts while (a) T0 in OS or (b) T1 in OS

When a bit in the event mask field is TI, the effect of specifying bit-0-3 of the associated ESCR are described in Table 15-6. For events that are marked as TI in Chapter 19, the effect of selectively specifying T0_USR, T0_OS, T1_USR, T1_OS bits is shown in Table 18-74.

Table 18-74. Effect of Logical Processor and CPL Qualification for Non-logical-Processor-specific (TI) Events

	T1_OS/T1_USR = 00	T1_OS/T1_USR = 01	T1_OS/T1_USR = 11	T1_OS/T1_USR = 10
T0_OS/T0_USR = 00	Zero count	Counts while (a) T0 in USR or (b) T1 in USR	Counts irrespective of CPL, T0, T1	Counts while (a) T0 in OS or (b) T1 in OS
T0_OS/T0_USR = 01	Counts while (a) T0 in USR or (b) T1 in USR	Counts while (a) T0 in USR or (b) T1 in USR	Counts irrespective of CPL, T0, T1	Counts irrespective of CPL, T0, T1
T0_OS/T0_USR = 11	Counts irrespective of CPL, T0, T1	Counts irrespective of CPL, T0, T1	Counts irrespective of CPL, T0, T1	Counts irrespective of CPL, T0, T1
T0_OS/T0_USR = 0	Counts while (a) T0 in OS or (b) T1 in OS	Counts irrespective of CPL, T0, T1	Counts irrespective of CPL, T0, T1	Counts while (a) T0 in OS or (b) T1 in OS

18.6.4.5 Counting Clocks on systems with Intel Hyper-Threading Technology in Processors Based on Intel NetBurst® Microarchitecture

18.6.4.5.1 Non-Halted Clockticks

Use the following procedure to program ESCRs and CCCRs to obtain non-halted clockticks on processors based on Intel NetBurst microarchitecture:

1. Select an ESCR for the global_power_events and specify the RUNNING sub-event mask and the desired T0_OS/T0_USR/T1_OS/T1_USR bits for the targeted processor.
2. Select an appropriate counter.
3. Enable counting in the CCCR for that counter by setting the enable bit.

18.6.4.5.2 Non-Sleep Clockticks

Performance monitoring counters can be configured to count clockticks whenever the performance monitoring hardware is not powered-down. To count Non-sleep Clockticks with a performance-monitoring counter, do the following:

1. Select one of the 18 counters.
2. Select any of the ESCRs whose events the selected counter can count. Set its event select to anything other than "no_event"; the counter may be disabled if this is not done.
3. Turn threshold comparison on in the CCCR by setting the compare bit to "1".
4. Set the threshold to "15" and the complement to "1" in the CCCR. Since no event can exceed this threshold, the threshold condition is met every cycle and the counter counts every cycle. Note that this overrides any qualification (e.g. by CPL) specified in the ESCR.
5. Enable counting in the CCCR for the counter by setting the enable bit.

In most cases, the counts produced by the non-halted and non-sleep metrics are equivalent if the physical package supports one logical processor and is not placed in a power-saving state. Operating systems may execute an HLT instruction and place a physical processor in a power-saving state.

On processors that support Intel Hyper-Threading Technology (Intel HT Technology), each physical package can support two or more logical processors. Current implementation of Intel HT Technology provides two logical processors for each physical processor. While both logical processors can execute two threads simultaneously, one logical processor may halt to allow the other logical processor to execute without sharing execution resources between two logical processors.

Non-halted Clockticks can be set up to count the number of processor clock cycles for each logical processor whenever the logical processor is not halted (the count may include some portion of the clock cycles for that logical processor to complete a transition to a halted state). Physical processors that support Intel HT Technology enter into a power-saving state if all logical processors halt.

The Non-sleep Clockticks mechanism uses a filtering mechanism in CCCRs. The mechanism will continue to increment as long as one logical processor is not halted or in a power-saving state. Applications may cause a processor to enter into a power-saving state by using an OS service that transfers control to an OS's idle loop. The idle loop then may place the processor into a power-saving state after an implementation-dependent period if there is no work for the processor.

18.6.5 Performance Monitoring and Dual-Core Technology

The performance monitoring capability of dual-core processors duplicates the microarchitectural resources of a single-core processor implementation. Each processor core has dedicated performance monitoring resources.

In the case of Pentium D processor, each logical processor is associated with dedicated resources for performance monitoring. In the case of Pentium processor Extreme edition, each processor core has dedicated resources, but two logical processors in the same core share performance monitoring resources (see Section 18.6.4, "Performance Monitoring and Intel Hyper-Threading Technology in Processors Based on Intel NetBurst® Microarchitecture").

18.6.6 Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache

The 64-bit Intel Xeon processor MP with up to 8-MByte L3 cache has a CPUID signature of family [0FH], model [03H or 04H]. Performance monitoring capabilities available to Pentium 4 and Intel Xeon processors with the same values (see Section 18.1 and Section 18.6.4) apply to the 64-bit Intel Xeon processor MP with an L3 cache.

The level 3 cache is connected between the system bus and IOQ through additional control logic. See Figure 18-51.

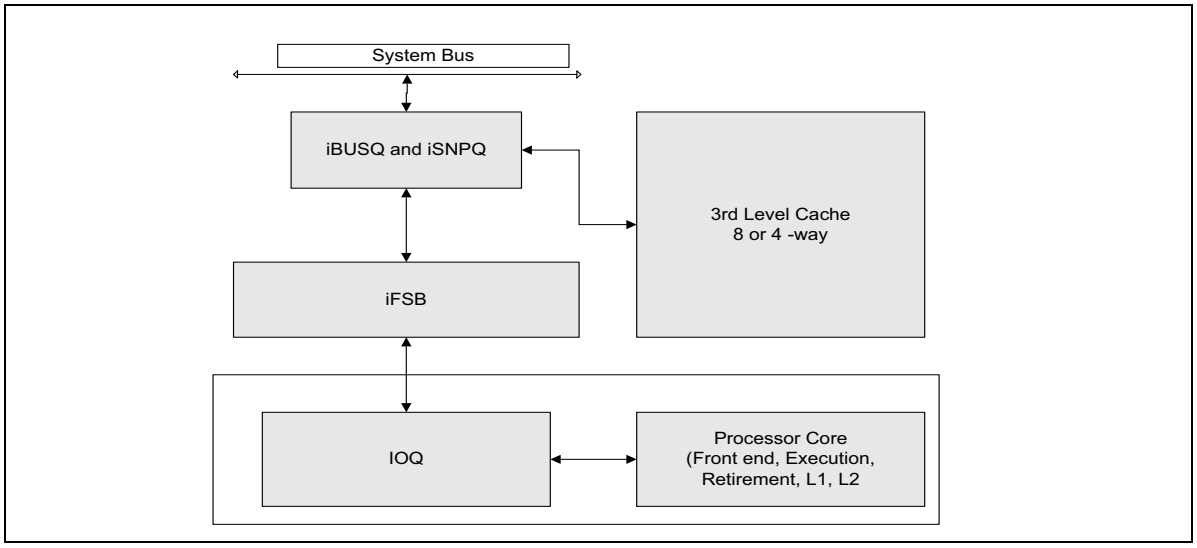

Figure 18-51. Block Diagram of 64-bit Intel Xeon Processor MP with 8-MByte L3

Additional performance monitoring capabilities and facilities unique to 64-bit Intel Xeon processor MP with an L3 cache are described in this section. The facility for monitoring events consists of a set of dedicated model-specific registers (MSRs), each dedicated to a specific event. Programming of these MSRs requires using RDMSR/WRMSR instructions with 64-bit values.

The lower 32-bits of the MSRs at addresses 107CC through 107D3 are treated as 32 bit performance counter registers. These performance counters can be accessed using RDPMC instruction with the index starting from 18 through 25. The EDX register returns zero when reading these 8 PMCs.

The performance monitoring capabilities consist of four events. These are:

- **IBUSQ event —** This event detects the occurrence of micro-architectural conditions related to the iBUSQ unit. It provides two MSRs: MSR_IFSB_IBUSQ0 and MSR_IFSB_IBUSQ1. Configure sub-event qualification and enable/disable functions using the high 32 bits of these MSRs. The low 32 bits act as a 32-bit event counter. Counting starts after software writes a non-zero value to one or more of the upper 32 bits. See Figure 18-52.

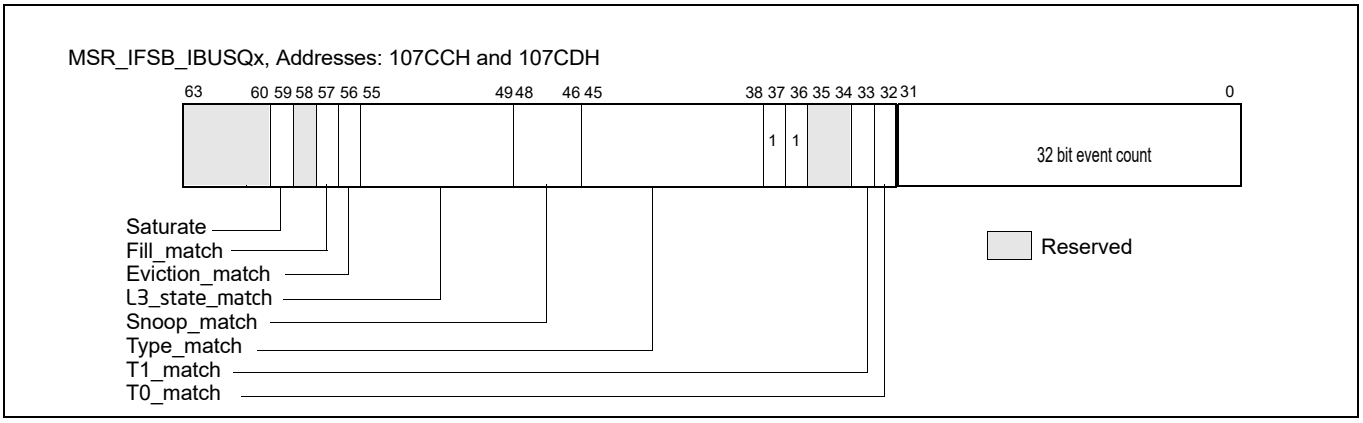

Figure 18-52. MSR_IFSB_IBUSQx, Addresses: 107CCH and 107CDH

- **ISNPQ event —** This event detects the occurrence of microarchitectural conditions related to the iSNPQ unit. It provides two MSRs: MSR_IFSB_ISNPQ0 and MSR_IFSB_ISNPQ1. Configure sub-event qualifications and enable/disable functions using the high 32 bits of the MSRs. The low 32-bits act as a 32-bit event counter. Counting starts after software writes a non-zero value to one or more of the upper 32-bits. See Figure 18-53.

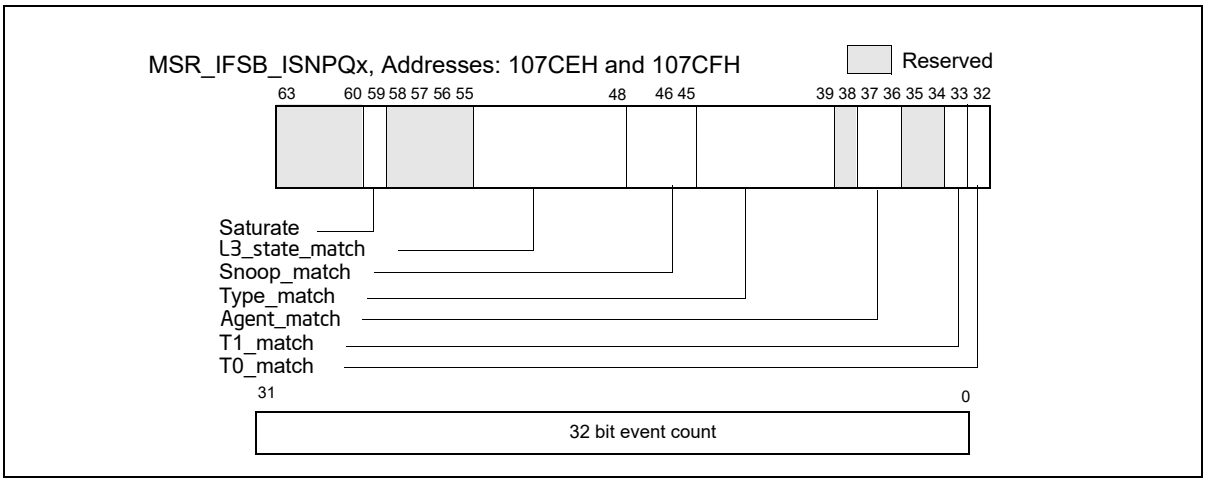

Figure 18-53. MSR_IFSB_ISNPQx, Addresses: 107CEH and 107CFH

- **EFSB event —** This event can detect the occurrence of micro-architectural conditions related to the iFSB unit or system bus. It provides two MSRs: MSR_EFSB_DRDY0 and MSR_EFSB_DRDY1. Configure sub-event qualifications and enable/disable functions using the high 32 bits of the 64-bit MSR. The low 32-bit act as a 32-bit event counter. Counting starts after software writes a non-zero value to one or more of the qualification bits in the upper 32-bits of the MSR. See Figure 18-54.

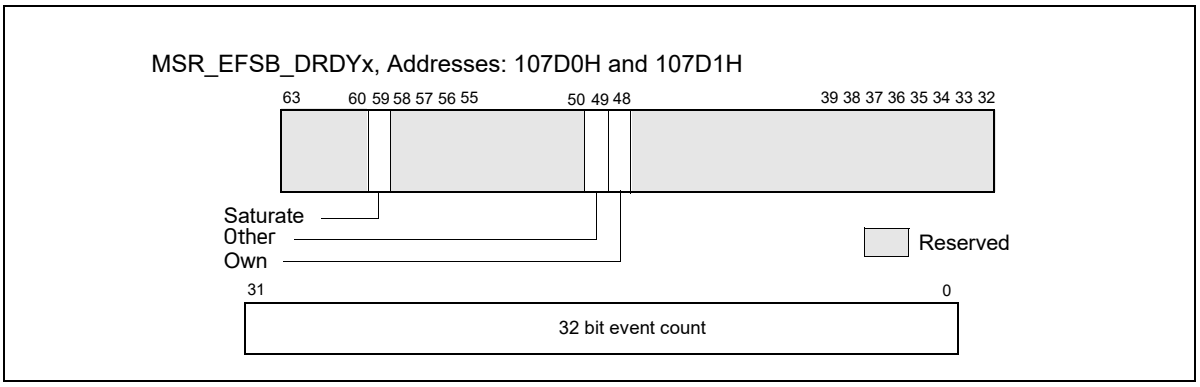

Figure 18-54. MSR_EFSB_DRDYx, Addresses: 107D0H and 107D1H

- **IBUSQ Latency event —** This event accumulates weighted cycle counts for latency measurement of transactions in the iBUSQ unit. The count is enabled by setting MSR_IFSB_CTRL6[bit 26] to 1; the count freezes after software sets MSR_IFSB_CTRL6[bit 26] to 0. MSR_IFSB_CNTR7 acts as a 64-bit event counter for this event. See Figure 18-55.

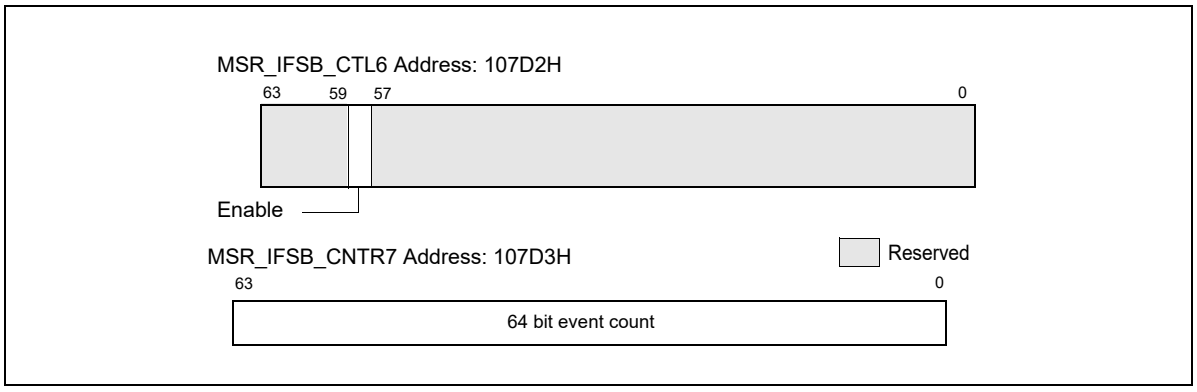

Figure 18-55. MSR_IFSB_CTL6, Address: 107D2H; MSR_IFSB_CNTR7, Address: 107D3H

18.6.7 Performance Monitoring on L3 and Caching Bus Controller Sub-Systems

The Intel Xeon processor 7400 series and Dual-Core Intel Xeon processor 7100 series employ a distinct L3/caching bus controller sub-system. These sub-system have a unique set of performance monitoring capability and programming interfaces that are largely common between these two processor families.

Intel Xeon processor 7400 series are based on 45 nm enhanced Intel Core microarchitecture. The CPUID signature is indicated by DisplayFamily_DisplayModel value of 06_1DH (see CPUID instruction in Chapter 3, "Instruction Set Reference, A-L" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A*). Intel Xeon processor 7400 series have six processor cores that share an L3 cache.

Dual-Core Intel Xeon processor 7100 series are based on Intel NetBurst microarchitecture, have a CPUID signature of family [0FH], model [06H] and a unified L3 cache shared between two cores. Each core in an Intel Xeon processor 7100 series supports Intel Hyper-Threading Technology, providing two logical processors per core.

Both Intel Xeon processor 7400 series and Intel Xeon processor 7100 series support multi-processor configurations using system bus interfaces. In Intel Xeon processor 7400 series, the L3/caching bus controller sub-system provides three Simple Direct Interface (SDI) to service transactions originated the XQ-replacement SDI logic in each dual-core modules. In Intel Xeon processor 7100 series, the IOQ logic in each processor core is replaced with a Simple Direct Interface (SDI) logic. The L3 cache is connected between the system bus and the SDI through addi-

tional control logic. See Figure 18-56 for the block configuration of six processor cores and the L3/Caching bus controller sub-system in Intel Xeon processor 7400 series. Figure 18-56 shows the block configuration of two processor cores (four logical processors) and the L3/Caching bus controller sub-system in Intel Xeon processor 7100 series.

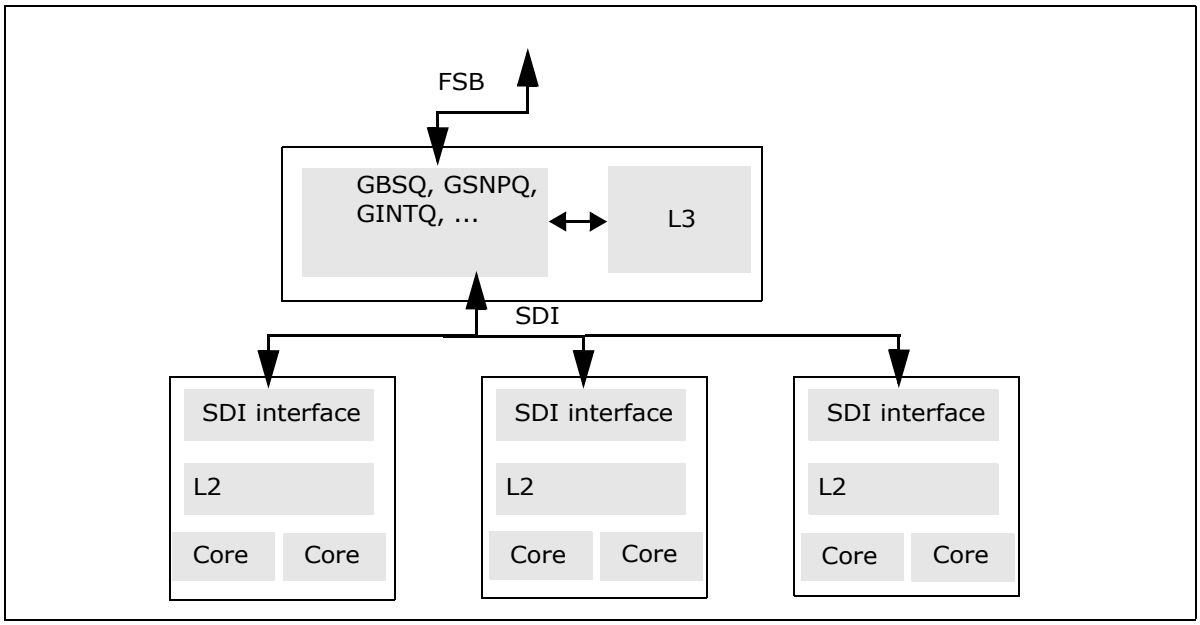

Figure 18-56. Block Diagram of Intel Xeon Processor 7400 Series

Almost all of the performance monitoring capabilities available to processor cores with the same CPUID signatures (see Section 18.1 and Section 18.6.4) apply to Intel Xeon processor 7100 series. The MSRs used by performance monitoring interface are shared between two logical processors in the same processor core.

The performance monitoring capabilities available to processor with DisplayFamily_DisplayModel signature 06_17H also apply to Intel Xeon processor 7400 series. Each processor core provides its own set of MSRs for performance monitoring interface.

The IOQ_allocation and IOQ_active_entries events are not supported in Intel Xeon processor 7100 series and 7400 series. Additional performance monitoring capabilities applicable to the L3/caching bus controller sub-system are described in this section.

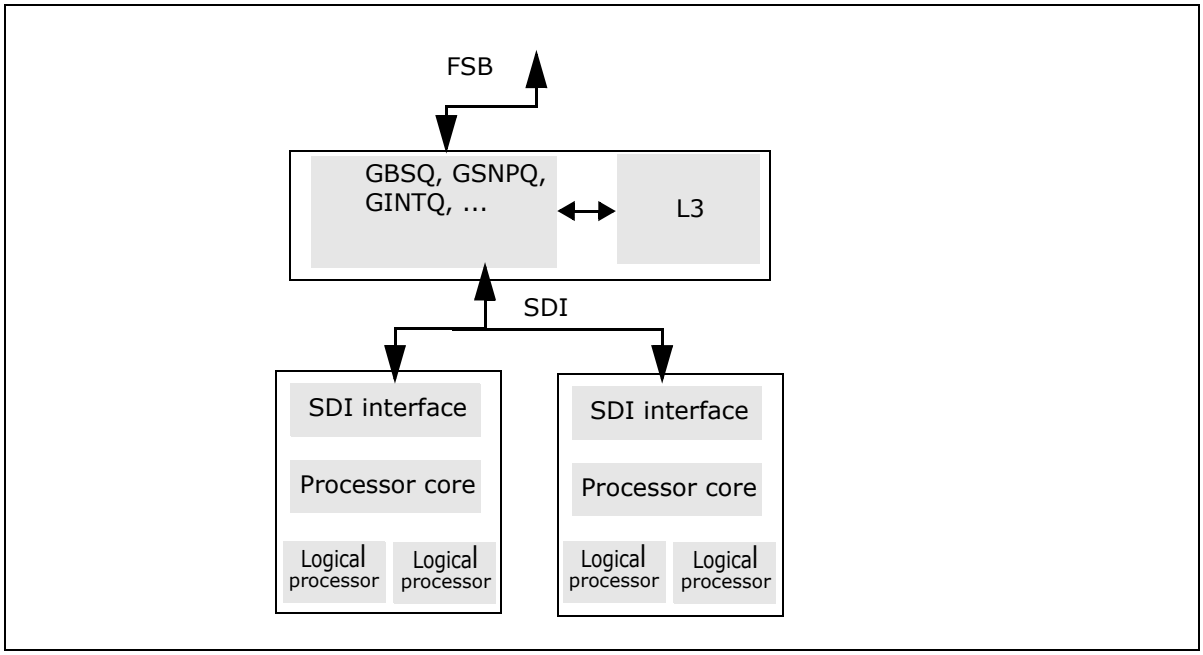

Figure 18-57. Block Diagram of Intel Xeon Processor 7100 Series

18.6.7.1 Overview of Performance Monitoring with L3/Caching Bus Controller

The facility for monitoring events consists of a set of dedicated model-specific registers (MSRs). There are eight event select/counting MSRs that are dedicated to counting events associated with specified microarchitectural conditions. Programming of these MSRs requires using RDMSR/WRMSR instructions with 64-bit values. In addition, an MSR MSR_EMON_L3_GL_CTL provides simplified interface to control freezing, resetting, re-enabling operation of any combination of these event select/counting MSRs.

The eight MSRs dedicated to count occurrences of specific conditions are further divided to count three sub-classes of microarchitectural conditions:

- Two MSRs (MSR_EMON_L3_CTR_CTL0 and MSR_EMON_L3_CTR_CTL1) are dedicated to counting GBSQ events. Up to two GBSQ events can be programmed and counted simultaneously.
- Two MSRs (MSR_EMON_L3_CTR_CTL2 and MSR_EMON_L3_CTR_CTL3) are dedicated to counting GSNPQ events. Up to two GBSQ events can be programmed and counted simultaneously.
- Four MSRs (MSR_EMON_L3_CTR_CTL4, MSR_EMON_L3_CTR_CTL5, MSR_EMON_L3_CTR_CTL6, and MSR_EMON_L3_CTR_CTL7) are dedicated to counting external bus operations.

The bit fields in each of eight MSRs share the following common characteristics:

- Bits 63:32 is the event control field that includes an event mask and other bit fields that control counter operation. The event mask field specifies details of the microarchitectural condition, and its definition differs across GBSQ, GSNPQ, FSB.
- Bits 31:0 is the event count field. If the specified condition is met during each relevant clock domain of the event logic, the matched condition signals the counter logic to increment the associated event count field. The lower 32-bits of these 8 MSRs at addresses 107CC through 107D3 are treated as 32 bit performance counter registers.

In Dual-Core Intel Xeon processor 7100 series, the uncore performance counters can be accessed using RDPMC instruction with the index starting from 18 through 25. The EDX register returns zero when reading these 8 PMCs.

In Intel Xeon processor 7400 series, RDPMC with ECX between 2 and 9 can be used to access the eight uncore performance counter/control registers.

18.6.7.2 GBSQ Event Interface

The layout of MSR_EMON_L3_CTR_CTL0 and MSR_EMON_L3_CTR_CTL1 is given in Figure 18-58. Counting starts after software writes a non-zero value to one or more of the upper 32 bits.

The event mask field (bits 58:32) consists of the following eight attributes:

- Agent_Select (bits 35:32): The definition of this field differs slightly between Intel Xeon processor 7100 and 7400.

  For Intel Xeon processor 7100 series, each bit specifies a logical processor in the physical package. The lower two bits corresponds to two logical processors in the first processor core, the upper two bits corresponds to two logical processors in the second processor core. 0FH encoding matches transactions from any logical processor.

  For Intel Xeon processor 7400 series, each bit of [34:32] specifies the SDI logic of a dual-core module as the originator of the transaction. A value of 0111B in bits [35:32] specifies transaction from any processor core.

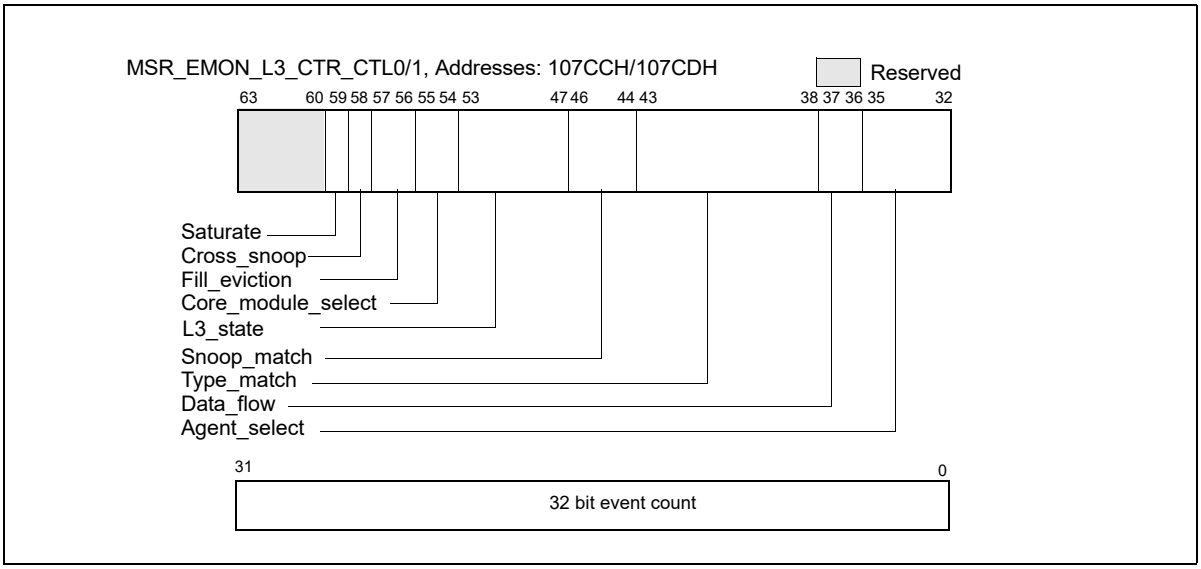

Figure 18-58. MSR_EMON_L3_CTR_CTL0/1, Addresses: 107CCH/107CDH

- Data_Flow (bits 37:36): Bit 36 specifies demand transactions, bit 37 specifies prefetch transactions.
- Type_Match (bits 43:38): Specifies transaction types. If all six bits are set, event count will include all transaction types.
- Snoop_Match: (bits 46:44): The three bits specify (in ascending bit position) clean snoop result, HIT snoop result, and HITM snoop results respectively.
- L3_State (bits 53:47): Each bit specifies an L2 coherency state.
- Core_Module_Select (bits 55:54): The valid encodings for L3 lookup differ slightly between Intel Xeon processor 7100 and 7400.

  For Intel Xeon processor 7100 series,

  — 00B: Match transactions from any core in the physical package

  — 01B: Match transactions from this core only

  — 10B: Match transactions from the other core in the physical package

  — 11B: Match transaction from both cores in the physical package

  For Intel Xeon processor 7400 series,

  — 00B: Match transactions from any dual-core module in the physical package

  — 01B: Match transactions from this dual-core module only

  — 10B: Match transactions from either one of the other two dual-core modules in the physical package

  - 11B: Match transaction from more than one dual-core modules in the physical package
- Fill_Eviction (bits 57:56): The valid encodings are
  - 00B: Match any transactions
  - 01B: Match transactions that fill L3
  - 10B: Match transactions that fill L3 without an eviction
  - 11B: Match transaction fill L3 with an eviction
- Cross_Snoop (bit 58): The encodings are \
  - 0B: Match any transactions
  - 1B: Match cross snoop transactions

For each counting clock domain, if all eight attributes match, event logic signals to increment the event count field.

18.6.7.3 GSNPQ Event Interface

The layout of MSR_EMON_L3_CTR_CTL2 and MSR_EMON_L3_CTR_CTL3 is given in Figure 18-59. Counting starts after software writes a non-zero value to one or more of the upper 32 bits.

The event mask field (bits 58:32) consists of the following six attributes:

- Agent_Select (bits 37:32): The definition of this field differs slightly between Intel Xeon processor 7100 and 7400.
- For Intel Xeon processor 7100 series, each of the lowest 4 bits specifies a logical processor in the physical package. The lowest two bits corresponds to two logical processors in the first processor core, the next two bits corresponds to two logical processors in the second processor core. Bit 36 specifies other symmetric agent transactions. Bit 37 specifies central agent transactions. 3FH encoding matches transactions from any logical processor.

  For Intel Xeon processor 7400 series, each of the lowest 3 bits specifies a dual-core module in the physical package. Bit 37 specifies central agent transactions.
- Type_Match (bits 43:38): Specifies transaction types. If all six bits are set, event count will include any transaction types.
- Snoop_Match: (bits 46:44): The three bits specify (in ascending bit position) clean snoop result, HIT snoop result, and HITM snoop results respectively.
- L2_State (bits 53:47): Each bit specifies an L3 coherency state.
- Core_Module_Select (bits 56:54): Bit 56 enables Core_Module_Select matching. If bit 56 is clear, Core_Module_Select encoding is ignored. The valid encodings for the lower two bits (bit 55, 54) differ slightly between Intel Xeon processor 7100 and 7400.

  For Intel Xeon processor 7100 series, if bit 56 is set, the valid encodings for the lower two bits (bit 55, 54) are
  - 00B: Match transactions from only one core (irrespective which core) in the physical package
  - 01B: Match transactions from this core and not the other core
  - 10B: Match transactions from the other core in the physical package, but not this core
  - 11B: Match transaction from both cores in the physical package

  For Intel Xeon processor 7400 series, if bit 56 is set, the valid encodings for the lower two bits (bit 55, 54) are
  - 00B: Match transactions from only one dual-core module (irrespective which module) in the physical package.
  - 01B: Match transactions from one or more dual-core modules.
  - 10B: Match transactions from two or more dual-core modules.
  - 11B: Match transaction from all three dual-core modules in the physical package.
- Block_Snoop (bit 57): specifies blocked snoop.

For each counting clock domain, if all six attributes match, event logic signals to increment the event count field.

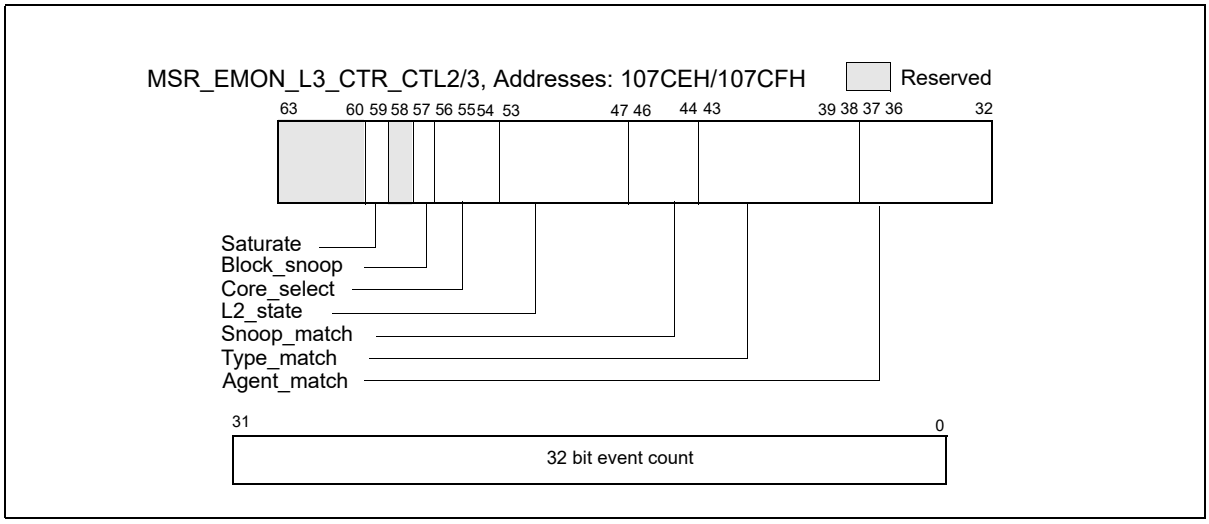

Figure 18-59. MSR_EMON_L3_CTR_CTL2/3, Addresses: 107CEH/107CFH

18.6.7.4 FSB Event Interface

The layout of MSR_EMON_L3_CTR_CTL4 through MSR_EMON_L3_CTR_CTL7 is given in Figure 18-60. Counting starts after software writes a non-zero value to one or more of the upper 32 bits.

The event mask field (bits 58:32) is organized as follows:

- Bit 58: must set to 1.
- FSB_Submask (bits 57:32): Specifies FSB-specific sub-event mask.

The FSB sub-event mask defines a set of independent attributes. The event logic signals to increment the associated event count field if one of the attribute matches. Some of the sub-event mask bit counts durations. A duration event increments at most once per cycle.

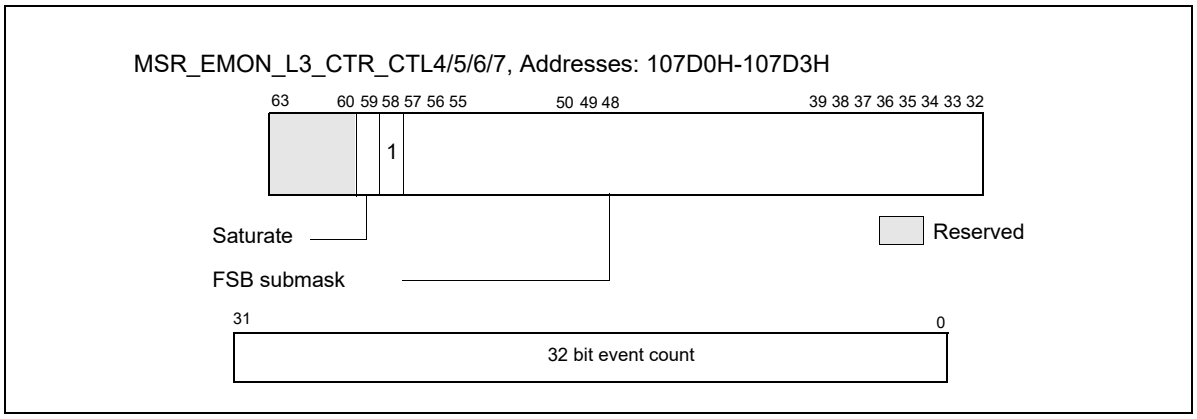

Figure 18-60. MSR_EMON_L3_CTR_CTL4/5/6/7, Addresses: 107D0H-107D3H

18.6.7.4.1 FSB Sub-Event Mask Interface

- FSB_type (bit 37:32): Specifies different FSB transaction types originated from this physical package.
- FSB_L_clear (bit 38): Count clean snoop results from any source for transaction originated from this physical package.
- FSB_L_hit (bit 39): Count HIT snoop results from any source for transaction originated from this physical package.

- FSB_L_hitm (bit 40): Count HITM snoop results from any source for transaction originated from this physical package.
- FSB_L_defer (bit 41): Count DEFER responses to this processor's transactions.
- FSB_L_retry (bit 42): Count RETRY responses to this processor's transactions.
- FSB_L_snoop_stall (bit 43): Count snoop stalls to this processor's transactions.
- FSB_DBSY (bit 44): Count DBSY assertions by this processor (without a concurrent DRDY).
- FSB_DRDY (bit 45): Count DRDY assertions by this processor.
- FSB_BNR (bit 46): Count BNR assertions by this processor.
- FSB_IOQ_empty (bit 47): Counts each bus clocks when the IOQ is empty.
- FSB_IOQ_full (bit 48): Counts each bus clocks when the IOQ is full.
- FSB_IOQ_active (bit 49): Counts each bus clocks when there is at least one entry in the IOQ.
- FSB_WW_data (bit 50): Counts back-to-back write transaction's data phase.
- FSB_WW_issue (bit 51): Counts back-to-back write transaction request pairs issued by this processor.
- FSB_WR_issue (bit 52): Counts back-to-back write-read transaction request pairs issued by this processor.
- FSB_RW_issue (bit 53): Counts back-to-back read-write transaction request pairs issued by this processor.
- FSB_other_DBSY (bit 54): Count DBSY assertions by another agent (without a concurrent DRDY).
- FSB_other_DRDY (bit 55): Count DRDY assertions by another agent.
- FSB_other_snoop_stall (bit 56): Count snoop stalls on the FSB due to another agent.
- FSB_other_BNR (bit 57): Count BNR assertions from another agent.

18.6.7.5 Common Event Control Interface

The MSR_EMON_L3_GL_CTL MSR provides simplified access to query overflow status of the GBSQ, GSNPQ, FSB event counters. It also provides control bit fields to freeze, unfreeze, or reset those counters. The following bit fields are supported:

- GL_freeze_cmd (bit 0): Freeze the event counters specified by the GL_event_select field.
- GL_unfreeze_cmd (bit 1): Unfreeze the event counters specified by the GL_event_select field.
- GL_reset_cmd (bit 2): Clear the event count field of the event counters specified by the GL_event_select field. The event select field is not affected.
- GL_event_select (bit 23:16): Selects one or more event counters to subject to specified command operations indicated by bits 2:0. Bit 16 corresponds to MSR_EMON_L3_CTR_CTL0, bit 23 corresponds to MSR_EMON_L3_CTR_CTL7.
- GL_event_status (bit 55:48): Indicates the overflow status of each event counters. Bit 48 corresponds to MSR_EMON_L3_CTR_CTL0, bit 55 corresponds to MSR_EMON_L3_CTR_CTL7.

In the event control field (bits 63:32) of each MSR, if the saturate control (bit 59, see Figure 18-58 for example) is set, the event logic forces the value FFFF_FFFFH into the event count field instead of incrementing it.

18.6.8 Performance Monitoring (P6 Family Processor)

The P6 family processors provide two 40-bit performance counters, allowing two types of events to be monitored simultaneously. These can either count events or measure duration. When counting events, a counter increments each time a specified event takes place or a specified number of events takes place. When measuring duration, it counts the number of processor clocks that occur while a specified condition is true. The counters can count events or measure durations that occur at any privilege level.

Table 19-40, Chapter 19, lists the events that can be counted with the P6 family performance monitoring counters.

NOTE

The performance-monitoring events listed in Chapter 19 are intended to be used as guides for performance tuning. Counter values reported are not guaranteed to be accurate and should be used as a relative guide for tuning. Known discrepancies are documented where applicable.

The performance-monitoring counters are supported by four MSRs: the performance event select MSRs (PerfEvtSel0 and PerfEvtSel1) and the performance counter MSRs (PerfCtr0 and PerfCtr1). These registers can be read from and written to using the RDMSR and WRMSR instructions, respectively. They can be accessed using these instructions only when operating at privilege level 0. The PerfCtr0 and PerfCtr1 MSRs can be read from any privilege level using the RDPMC (read performance-monitoring counters) instruction.

NOTE

The PerfEvtSel0, PerfEvtSel1, PerfCtr0, and PerfCtr1 MSRs and the events listed in Table 19-40 are model-specific for P6 family processors. They are not guaranteed to be available in other IA-32 processors.

18.6.8.1 PerfEvtSel0 and PerfEvtSel1 MSRs

The PerfEvtSel0 and PerfEvtSel1 MSRs control the operation of the performance-monitoring counters, with one register used to set up each counter. They specify the events to be counted, how they should be counted, and the privilege levels at which counting should take place. Figure 18-61 shows the flags and fields in these MSRs.

The functions of the flags and fields in the PerfEvtSel0 and PerfEvtSel1 MSRs are as follows:

- **Event select field (bits 0 through 7) —** Selects the event logic unit to detect certain microarchitectural conditions (see Table 19-40, for a list of events and their 8-bit codes).
- **Unit mask (UMASK) field (bits 8 through 15) —** Further qualifies the event logic unit selected in the event select field to detect a specific microarchitectural condition. For example, for some cache events, the mask is used as a MESI-protocol qualifier of cache states (see Table 19-40).

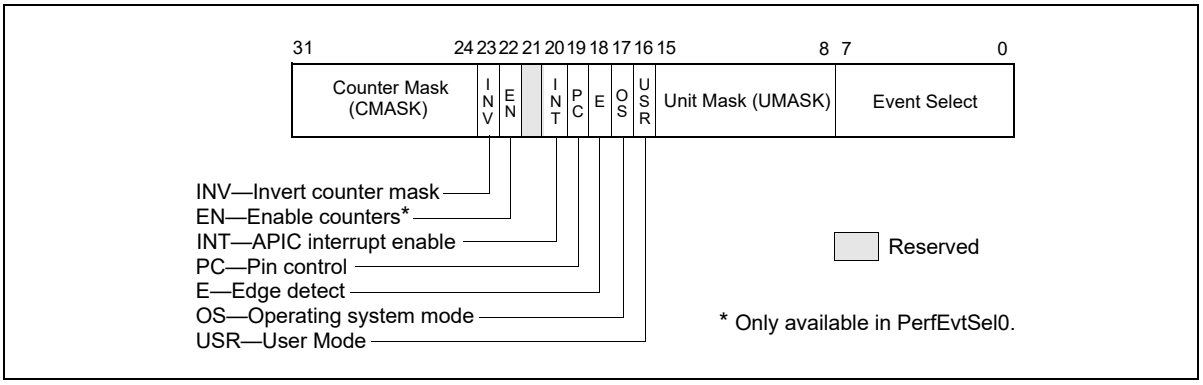

Figure 18-61. PerfEvtSel0 and PerfEvtSel1 MSRs

- **USR (user mode) flag (bit 16) —** Specifies that events are counted only when the processor is operating at privilege levels 1, 2 or 3. This flag can be used in conjunction with the OS flag.
- **OS (operating system mode) flag (bit 17) —** Specifies that events are counted only when the processor is operating at privilege level 0. This flag can be used in conjunction with the USR flag.
- **E (edge detect) flag (bit 18) —** Enables (when set) edge detection of events. The processor counts the number of deasserted to asserted transitions of any condition that can be expressed by the other fields. The mechanism is limited in that it does not permit back-to-back assertions to be distinguished. This mechanism allows software to measure not only the fraction of time spent in a particular state, but also the average length of time spent in such a state (for example, the time spent waiting for an interrupt to be serviced).

- **PC (pin control) flag (bit 19) —** When set, the processor toggles the PM*i* pins and increments the counter when performance-monitoring events occur; when clear, the processor toggles the PM*i* pins when the counter overflows. The toggling of a pin is defined as assertion of the pin for a single bus clock followed by deassertion.
- **INT (APIC interrupt enable) flag (bit 20) —** When set, the processor generates an exception through its local APIC on counter overflow.
- **EN (Enable Counters) Flag (bit 22) —** This flag is only present in the PerfEvtSel0 MSR. When set, performance counting is enabled in both performance-monitoring counters; when clear, both counters are disabled.
- **INV (invert) flag (bit 23) —** When set, inverts the counter-mask (CMASK) comparison, so that both greater than or equal to and less than comparisons can be made (0: greater than or equal; 1: less than). Note if counter-mask is programmed to zero, INV flag is ignored.
- **Counter mask (CMASK) field (bits 24 through 31) —** When nonzero, the processor compares this mask to the number of events counted during a single cycle. If the event count is greater than or equal to this mask, the counter is incremented by one. Otherwise the counter is not incremented. This mask can be used to count events only if multiple occurrences happen per clock (for example, two or more instructions retired per clock). If the counter-mask field is 0, then the counter is incremented each cycle by the number of events that occurred that cycle.

18.6.8.2 PerfCtr0 and PerfCtr1 MSRs

The performance-counter MSRs (PerfCtr0 and PerfCtr1) contain the event or duration counts for the selected events being counted. The RDPMC instruction can be used by programs or procedures running at any privilege level and in virtual-8086 mode to read these counters. The PCE flag in control register CR4 (bit 8) allows the use of this instruction to be restricted to only programs and procedures running at privilege level 0.

The RDPMC instruction is not serializing or ordered with other instructions. Thus, it does not necessarily wait until all previous instructions have been executed before reading the counter. Similarly, subsequent instructions may begin execution before the RDPMC instruction operation is performed.

Only the operating system, executing at privilege level 0, can directly manipulate the performance counters, using the RDMSR and WRMSR instructions. A secure operating system would clear the PCE flag during system initialization to disable direct user access to the performance-monitoring counters, but provide a user-accessible programming interface that emulates the RDPMC instruction.

The WRMSR instruction cannot arbitrarily write to the performance-monitoring counter MSRs (PerfCtr0 and PerfCtr1). Instead, the lower-order 32 bits of each MSR may be written with any value, and the high-order 8 bits are sign-extended according to the value of bit 31. This operation allows writing both positive and negative values to the performance counters.

18.6.8.3 Starting and Stopping the Performance-Monitoring Counters

The performance-monitoring counters are started by writing valid setup information in the PerfEvtSel0 and/or PerfEvtSel1 MSRs and setting the enable counters flag in the PerfEvtSel0 MSR. If the setup is valid, the counters begin counting following the execution of a WRMSR instruction that sets the enable counter flag. The counters can be stopped by clearing the enable counters flag or by clearing all the bits in the PerfEvtSel0 and PerfEvtSel1 MSRs. Counter 1 alone can be stopped by clearing the PerfEvtSel1 MSR.

18.6.8.4 Event and Time-Stamp Monitoring Software

To use the performance-monitoring counters and time-stamp counter, the operating system needs to provide an event-monitoring device driver. This driver should include procedures for handling the following operations:

- Feature checking.
- Initialize and start counters.
- Stop counters.
- Read the event counters.
- Read the time-stamp counter.

The event monitor feature determination procedure must check whether the current processor supports the performance-monitoring counters and time-stamp counter. This procedure compares the family and model of the processor returned by the CPUID instruction with those of processors known to support performance monitoring. (The Pentium and P6 family processors support performance counters.) The procedure also checks the MSR and TSC flags returned to register EDX by the CPUID instruction to determine if the MSRs and the RDTSC instruction are supported.

The initialize and start counters procedure sets the PerfEvtSel0 and/or PerfEvtSel1 MSRs for the events to be counted and the method used to count them and initializes the counter MSRs (PerfCtr0 and PerfCtr1) to starting counts. The stop counters procedure stops the performance counters (see Section 18.6.8.3, "Starting and Stopping the Performance-Monitoring Counters").

The read counters procedure reads the values in the PerfCtr0 and PerfCtr1 MSRs, and a read time-stamp counter procedure reads the time-stamp counter. These procedures would be provided in lieu of enabling the RDTSC and RDPMC instructions that allow application code to read the counters.

18.6.8.5 Monitoring Counter Overflow

The P6 family processors provide the option of generating a local APIC interrupt when a performance-monitoring counter overflows. This mechanism is enabled by setting the interrupt enable flag in either the PerfEvtSel0 or the PerfEvtSel1 MSR. The primary use of this option is for statistical performance sampling.

To use this option, the operating system should do the following things on the processor for which performance events are required to be monitored:

- Provide an interrupt vector for handling the counter-overflow interrupt.
- Initialize the APIC PERF local vector entry to enable handling of performance-monitor counter overflow events.
- Provide an entry in the IDT that points to a stub exception handler that returns without executing any instructions.
- Provide an event monitor driver that provides the actual interrupt handler and modifies the reserved IDT entry to point to its interrupt routine.

When interrupted by a counter overflow, the interrupt handler needs to perform the following actions:

- Save the instruction pointer (EIP register), code-segment selector, TSS segment selector, counter values and other relevant information at the time of the interrupt.
- Reset the counter to its initial setting and return from the interrupt.

An event monitor application utility or another application program can read the information collected for analysis of the performance of the profiled application.

18.6.9 Performance Monitoring (Pentium Processors)

The Pentium processor provides two 40-bit performance counters, which can be used to count events or measure duration. The counters are supported by three MSRs: the control and event select MSR (CESR) and the performance counter MSRs (CTR0 and CTR1). These can be read from and written to using the RDMSR and WRMSR instructions, respectively. They can be accessed using these instructions only when operating at privilege level 0.

Each counter has an associated external pin (PM0/BP0 and PM1/BP1), which can be used to indicate the state of the counter to external hardware.

NOTES

The CESR, CTR0, and CTR1 MSRs and the events listed in Table 19-41 are model-specific for the Pentium processor.

The performance-monitoring events listed in Chapter 19 are intended to be used as guides for performance tuning. Counter values reported are not guaranteed to be accurate and should be used as a relative guide for tuning. Known discrepancies are documented where applicable.

18.6.9.1 Control and Event Select Register (CESR)

The 32-bit control and event select MSR (CESR) controls the operation of performance-monitoring counters CTR0 and CTR1 and the associated pins (see Figure 18-62). To control each counter, the CESR register contains a 6-bit event select field (ES0 and ES1), a pin control flag (PC0 and PC1), and a 3-bit counter control field (CC0 and CC1). The functions of these fields are as follows:

- **ES0 and ES1 (event select) fields (bits 0-5, bits 16-21) —** Selects (by entering an event code in the field) up to two events to be monitored. See Table 19-41 for a list of available event codes.

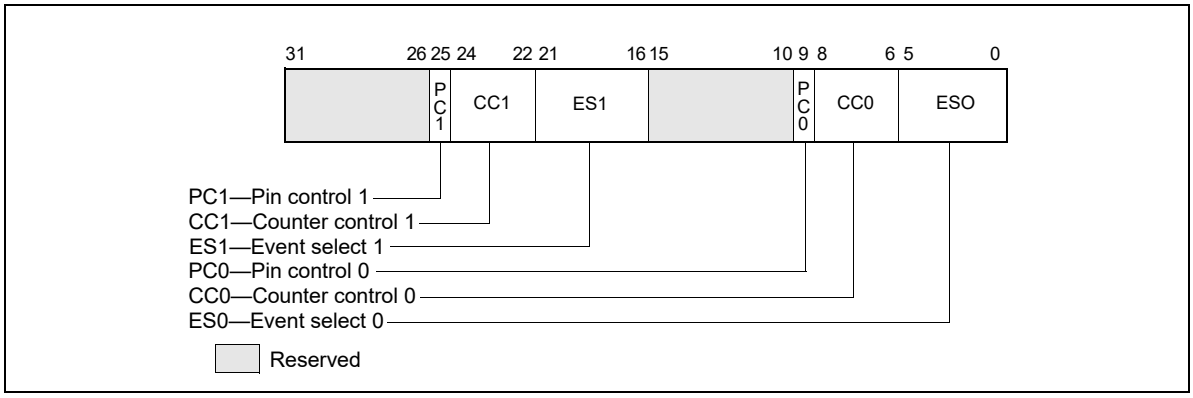

Figure 18-62. CESR MSR (Pentium Processor Only)

- **CC0 and CC1 (counter control) fields (bits 6-8, bits 22-24) —** Controls the operation of the counter. Control codes are as follows:

  000 — Count nothing (counter disabled).

  001 — Count the selected event while CPL is 0, 1, or 2.

  010 — Count the selected event while CPL is 3.

  011 — Count the selected event regardless of CPL.

  100 — Count nothing (counter disabled).

  101 — Count clocks (duration) while CPL is 0, 1, or 2.

  110 — Count clocks (duration) while CPL is 3.

  111 — Count clocks (duration) regardless of CPL.

  The highest order bit selects between counting events and counting clocks (duration); the middle bit enables counting when the CPL is 3; and the low-order bit enables counting when the CPL is 0, 1, or 2.

- **PC0 and PC1 (pin control) flags (bits 9, 25) —** Selects the function of the external performance-monitoring counter pin (PM0/BP0 and PM1/BP1). Setting one of these flags to 1 causes the processor to assert its associated pin when the counter has overflowed; setting the flag to 0 causes the pin to be asserted when the counter has been incremented. These flags permit the pins to be individually programmed to indicate the overflow or incremented condition. The external signalling of the event on the pins will lag the internal event by a few clocks as the signals are latched and buffered.

While a counter need not be stopped to sample its contents, it must be stopped and cleared or preset before switching to a new event. It is not possible to set one counter separately. If only one event needs to be changed, the CESR register must be read, the appropriate bits modified, and all bits must then be written back to CESR. At reset, all bits in the CESR register are cleared.

18.6.9.2 Use of the Performance-Monitoring Pins

When performance-monitor pins PM0/BP0 and/or PM1/BP1 are configured to indicate when the performance-monitor counter has incremented and an "occurrence event" is being counted, the associated pin is asserted (high) each time the event occurs. When a "duration event" is being counted, the associated PM pin is asserted for the

entire duration of the event. When the performance-monitor pins are configured to indicate when the counter has overflowed, the associated PM pin is asserted when the counter has overflowed.

When the PM0/BP0 and/or PM1/BP1 pins are configured to signal that a counter has incremented, it should be noted that although the counters may increment by 1 or 2 in a single clock, the pins can only indicate that the event occurred. Moreover, since the internal clock frequency may be higher than the external clock frequency, a single external clock may correspond to multiple internal clocks.

A "count up to" function may be provided when the event pin is programmed to signal an overflow of the counter. Because the counters are 40 bits, a carry out of bit 39 indicates an overflow. A counter may be preset to a specific value less then $2^{40} - 1$. After the counter has been enabled and the prescribed number of events has transpired, the counter will overflow.

Approximately 5 clocks later, the overflow is indicated externally and appropriate action, such as signaling an interrupt, may then be taken.

The PM0/BP0 and PM1/BP1 pins also serve to indicate breakpoint matches during in-circuit emulation, during which time the counter increment or overflow function of these pins is not available. After RESET, the PM0/BP0 and PM1/BP1 pins are configured for performance monitoring, however a hardware debugger may reconfigure these pins to indicate breakpoint matches.

18.6.9.3 Events Counted

Events that performance-monitoring counters can be set to count and record (using CTR0 and CTR1) are divided in two categories: occurrence and duration:

- **Occurrence events** — Counts are incremented each time an event takes place. If PM0/BP0 or PM1/BP1 pins are used to indicate when a counter increments, the pins are asserted each clock counters increment. But if an event happens twice in one clock, the counter increments by 2 (the pins are asserted only once).
- **Duration events** — Counters increment the total number of clocks that the condition is true. When used to indicate when counters increment, PM0/BP0 and/or PM1/BP1 pins are asserted for the duration.

18.7 COUNTING CLOCKS

The count of cycles, also known as clockticks, forms the basis for measuring how long a program takes to execute. Clockticks are also used as part of efficiency ratios like cycles per instruction (CPI). Processor clocks may stop ticking under circumstances like the following:

- The processor is halted when there is nothing for the CPU to do. For example, the processor may halt to save power while the computer is servicing an I/O request. When Intel Hyper-Threading Technology is enabled, both logical processors must be halted for performance-monitoring counters to be powered down.
- The processor is asleep as a result of being halted or because of a power-management scheme. There are different levels of sleep. In the some deep sleep levels, the time-stamp counter stops counting.

In addition, processor core clocks may undergo transitions at different ratios relative to the processor's bus clock frequency. Some of the situations that can cause processor core clock to undergo frequency transitions include:

- TM2 transitions.
- Enhanced Intel SpeedStep Technology transitions (P-state transitions).

For Intel processors that support TM2, the processor core clocks may operate at a frequency that differs from the Processor Base frequency (as indicated by processor frequency information reported by CPUID instruction). See Section 18.7.2 for more detail.

Due to the above considerations there are several important clocks referenced in this manual:

- **Base Clock —** The frequency of this clock is the frequency of the processor when the processor is not in turbo mode, and not being throttled via Intel SpeedStep.
- **Maximum Clock —** This is the maximum frequency of the processor when turbo mode is at the highest point.
- **Bus Clock —** These clockticks increment at a fixed frequency and help coordinate the bus on some systems.

- **Core Crystal Clock —** This is a clock that runs at fixed frequency; it coordinates the clocks on all packages across the system.
- **Non-halted Clockticks —** Measures clock cycles in which the specified logical processor is not halted and is not in any power-saving state. When Intel Hyper-Threading Technology is enabled, ticks can be measured on a per-logical-processor basis. There are also performance events on dual-core processors that measure clockticks per logical processor when the processor is not halted.
- **Non-sleep Clockticks —** Measures clock cycles in which the specified physical processor is not in a sleep mode or in a power-saving state. These ticks cannot be measured on a logical-processor basis.
- **Time-stamp Counter —** See Section 17.17, "Time-Stamp Counter".
- **Reference Clockticks —** TM2 or Enhanced Intel SpeedStep technology are two examples of processor features that can cause processor core clockticks to represent non-uniform tick intervals due to change of bus ratios. Performance events that counts clockticks of a constant reference frequency was introduced Intel Core Duo and Intel Core Solo processors. The mechanism is further enhanced on processors based on Intel Core microarchitecture.

Some processor models permit clock cycles to be measured when the physical processor is not in deep sleep (by using the time-stamp counter and the RDTSC instruction). Note that such ticks cannot be measured on a per-logical-processor basis. See Section 17.17, "Time-Stamp Counter," for detail on processor capabilities.

The first two methods use performance counters and can be set up to cause an interrupt upon overflow (for sampling). They may also be useful where it is easier for a tool to read a performance counter than to use a time stamp counter (the timestamp counter is accessed using the RDTSC instruction).

For applications with a significant amount of I/O, there are two ratios of interest:

- **Non-halted CPI —** Non-halted clockticks/instructions retired measures the CPI for phases where the CPU was being used. This ratio can be measured on a logical-processor basis when Intel Hyper-Threading Technology is enabled.
- **Nominal CPI —** Time-stamp counter ticks/instructions retired measures the CPI over the duration of a program, including those periods when the machine halts while waiting for I/O.

18.7.1 Non-Halted Reference Clockticks

Software can use UnHalted Reference Cycles on either a general purpose performance counter using event mask 0x3C and umask 0x01 or on fixed function performance counter 2 to count at a constant rate. These events count at a consistent rate irrespective of P-state, TM2, or frequency transitions that may occur to the processor. The UnHalted Reference Cycles event may count differently on the general purpose event and fixed counter.

18.7.2 Cycle Counting and Opportunistic Processor Operation

As a result of the state transitions due to opportunistic processor performance operation (see Chapter 14, "Power and Thermal Management"), a logical processor or a processor core can operate at frequency different from the Processor Base frequency.

The following items are expected to hold true irrespective of when opportunistic processor operation causes state transitions:

- The time stamp counter operates at a fixed-rate frequency of the processor.
- The IA32_MPERF counter increments at a fixed frequency irrespective of any transitions caused by opportunistic processor operation.
- The IA32_FIXED_CTR2 counter increments at the same TSC frequency irrespective of any transitions caused by opportunistic processor operation.
- The Local APIC timer operation is unaffected by opportunistic processor operation.
- The TSC, IA32_MPERF, and IA32_FIXED_CTR2 operate at close to the maximum non-turbo frequency, which is equal to the product of scalable bus frequency and maximum non-turbo ratio.

18.7.3 Determining the Processor Base Frequency

For Intel processors in which the nominal core crystal clock frequency is enumerated in CPUID.15H.ECX and the core crystal clock ratio is encoded in CPUID.15H (see Table 3-8 "Information Returned by CPUID Instruction"), the nominal TSC frequency can be determined by using the following equation:

Nominal TSC frequency = (CPUID.15H.ECX[31:0] * CPUID.15H.EBX[31:0]) ÷ CPUID.15H.EAX[31:0]

For Intel processors in which CPUID.15H.EBX[31:0] ÷ CPUID.0x15.EAX[31:0] is enumerated but CPUID.15H.ECX is not enumerated, Table 18-75 can be used to look up the nominal core crystal clock frequency.

Table 18-75. Nominal Core Crystal Clock Frequency

Processor Families/Processor Number Series[1]	Nominal Core Crystal Clock Frequency
Future Intel® Xeon® processors with CPUID signature 06_55H.	25 MHz
6th and 7th generation Intel® Core™ processors (does not include Intel® Xeon® processors).	24 MHz
Next Generation Intel® Atom™ processors based on Goldmont Microarchitecture with CPUID signature 06_5CH (does not include Intel Xeon processors).	19.2 MHz

NOTES:

1. For any processor in which CPUID.15H is enumerated and MSR_PLATFORM_INFO[15:8] (which gives the scalable bus frequency) is available, a more accurate frequency can be obtained by using CPUID.15H.

18.7.3.1 For Intel® Processors Based on Microarchitecture Code Name Sandy Bridge, Ivy Bridge, Haswell and Broadwell

The scalable bus frequency is encoded in the bit field MSR_PLATFORM_INFO[15:8] and the nominal TSC frequency can be determined by multiplying this number by a bus speed of 100 MHz.

18.7.3.2 For Intel® Processors Based on Microarchitecture Code Name Nehalem

The scalable bus frequency is encoded in the bit field MSR_PLATFORM_INFO[15:8] and the nominal TSC frequency can be determined by multiplying this number by a bus speed of 133.33 MHz.

18.7.3.3 For Intel® Atom™ Processors Based on the Silvermont Microarchitecture (Including Intel Processors Based on Airmont Microarchitecture)

The scalable bus frequency is encoded in the bit field MSR_PLATFORM_INFO[15:8] and the nominal TSC frequency can be determined by multiplying this number by the scalable bus frequency. The scalable bus frequency is encoded in the bit field MSR_FSB_FREQ[2:0] for Intel Atom processors based on the Silvermont microarchitecture, and in bit field MSR_FSB_FREQ[3:0] for processors based on the Airmont microarchitecture; see Chapter 2, "Model-Specific Registers (MSRs)" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4*.

18.7.3.4 For Intel® Core™ 2 Processor Family and for Intel® Xeon® Processors Based on Intel Core Microarchitecture

For processors based on Intel Core microarchitecture, the scalable bus frequency is encoded in the bit field MSR_FSB_FREQ[2:0] at (0CDH), see Chapter 2, "Model-Specific Registers (MSRs)" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4*. The maximum resolved bus ratio can be read from the following bit field:

- If XE operation is disabled, the maximum resolved bus ratio can be read in MSR_PLATFORM_ID[12:8]. It corresponds to the Processor Base frequency.
- IF XE operation is enabled, the maximum resolved bus ratio is given in MSR_PERF_STATUS[44:40], it corresponds to the maximum XE operation frequency configured by BIOS.

XE operation of an Intel 64 processor is implementation specific. XE operation can be enabled only by BIOS. If MSR_PERF_STATUS[31] is set, XE operation is enabled. The MSR_PERF_STATUS[31] field is read-only.

18.8 IA32_PERF_CAPABILITIES MSR ENUMERATION

The layout of IA32_PERF_CAPABILITIES MSR is shown in Figure 18-63, it provides enumeration of a variety of interfaces:

- IA32_PERF_CAPABILITIES.LBR_FMT[bits 5:0]: encodes the LBR format, details are described in Section 17.4.8.1.
- IA32_PERF_CAPABILITIES.PEBSTrap[6]: Trap/Fault-like indicator of PEBS recording assist, see Section 18.6.2.4.2.
- IA32_PERF_CAPABILITIES.PEBSArchRegs[7]: Indicator of PEBS assist save architectural registers, see Section 18.6.2.4.2.
- IA32_PERF_CAPABILITIES.PEBS_FMT[bits 11:8]: Specifies the encoding of the layout of PEBS records, see Section 18.6.2.4.2.
- IA32_PERF_CAPABILITIES.FREEZE_WHILE_SMM[12]: Indicates IA32_DEBUGCTL.FREEZE_WHILE_SMM is supported if 1, see Section 18.8.1.
- IA32_PERF_CAPABILITIES.FULL_WRITE[13]: Indicates the processor supports IA32_A_PMCx interface for updating bits 32 and above of IA32_PMCx, see Section 18.2.5.

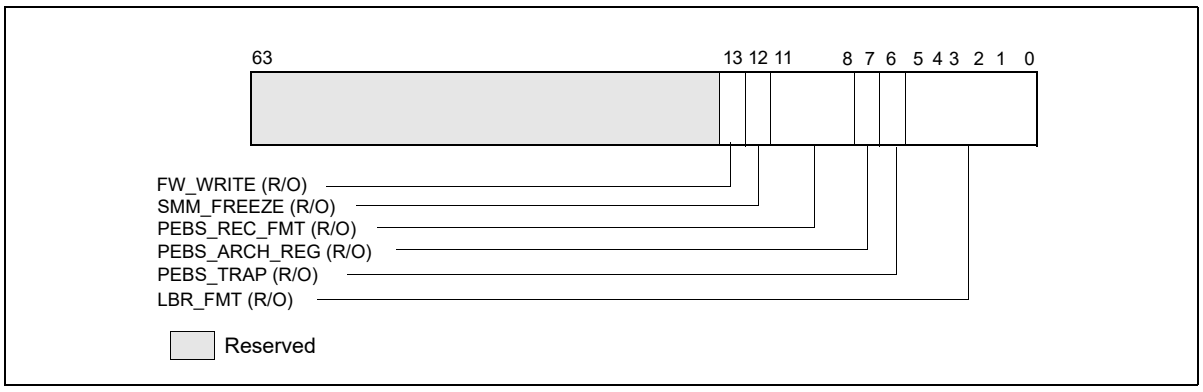

Figure 18-63. Layout of IA32_PERF_CAPABILITIES MSR

18.8.1 Filtering of SMM Handler Overhead

When performance monitoring facilities and/or branch profiling facilities (see Section 17.5, "Last Branch, Interrupt, and Exception Recording (Intel® Core™ 2 Duo and Intel® Atom™ Processors)") are enabled, these facilities capture event counts, branch records and branch trace messages occurring in a logical processor. The occurrence of interrupts, instruction streams due to various interrupt handlers all contribute to the results recorded by these facilities.

If CPUID.01H:ECX.PDCM[bit 15] is 1, the processor supports the IA32_PERF_CAPABILITIES MSR. If IA32_PERF_CAPABILITIES.FREEZE_WHILE_SMM[Bit 12] is 1, the processor supports the ability for system software using performance monitoring and/or branch profiling facilities to filter out the effects of servicing system management interrupts.

If the FREEZE_WHILE_SMM capability is enabled on a logical processor and after an SMI is delivered, the processor will clear all the enable bits of IA32_PERF_GLOBAL_CTRL, save a copy of the content of IA32_DEBUGCTL and disable LBR, BTF, TR, and BTS fields of IA32_DEBUGCTL before transferring control to the SMI handler.

The enable bits of IA32_PERF_GLOBAL_CTRL will be set to 1, the saved copy of IA32_DEBUGCTL prior to SMI delivery will be restored , after the SMI handler issues RSM to complete its servicing.

It is the responsibility of the SMM code to ensure the state of the performance monitoring and branch profiling facilities are preserved upon entry or until prior to exiting the SMM. If any of this state is modified due to actions by the SMM code, the SMM code is required to restore such state to the values present at entry to the SMM handler.

System software is allowed to set IA32_DEBUGCTL.FREEZE_WHILE_SMM[bit 14] to 1 only supported as indicated by IA32_PERF_CAPABILITIES.FREEZE_WHILE_SMM[Bit 12] reporting 1.

19. Updates to Chapter 19, Volume 3B

Change bars show changes to Chapter 19 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B:* System Programming Guide, Part 2.

Changes to this chapter: Added ROB_MISC_EVENTS.LBR_INSERTS event to Table 19-4 "Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture".

CHAPTER 19
PERFORMANCE MONITORING EVENTS

This chapter lists the performance monitoring events that can be monitored with the Intel 64 or IA-32 processors. The ability to monitor performance events and the events that can be monitored in these processors are mostly model-specific, except for architectural performance events, described in Section 19.1.

Model-specific performance events are listed for each generation of microarchitecture:

- Section 19.2 - Processors based on Skylake microarchitecture
- Section 19.3 - Processors based on Skylake and Kaby Lake microarchitectures
- Section 19.4 - Processors based on Knights Landing microarchitecture
- Section 19.5 - Processors based on Broadwell microarchitecture
- Section 19.6 - Processors based on Haswell microarchitecture
- Section 19.6.1 - Processors based on Haswell-E microarchitecture
- Section 19.7 - Processors based on Ivy Bridge microarchitecture
- Section 19.7.1 - Processors based on Ivy Bridge-E microarchitecture
- Section 19.8 - Processors based on Sandy Bridge microarchitecture
- Section 19.9 - Processors based on Intel® microarchitecture code name Nehalem
- Section 19.10 - Processors based on Intel® microarchitecture code name Westmere
- Section 19.11 - Processors based on Enhanced Intel® Core™ microarchitecture
- Section 19.12 - Processors based on Intel® Core™ microarchitecture
- Section 19.13 - Processors based on the Goldmont microarchitecture
- Section 19.15 - Processors based on the Silvermont microarchitecture
- Section 19.15.1 - Processors based on the Airmont microarchitecture
- Section 19.16 - 45 nm and 32 nm Intel® Atom™ Processors
- Section 19.17 - Intel® Core™ Solo and Intel® Core™ Duo processors
- Section 19.18 - Processors based on Intel NetBurst® microarchitecture
- Section 19.19 - Pentium® M family processors
- Section 19.20 - P6 family processors
- Section 19.21 - Pentium® processors

NOTE

These performance monitoring events are intended to be used as guides for performance tuning. The counter values reported by the performance monitoring events are approximate and believed to be useful as relative guides for tuning software. Known discrepancies are documented where applicable.

All performance event encodings not documented in the appropriate tables for the given processor are considered reserved, and their use will result in undefined counter updates with associated overflow actions.

The event tables listed this chapter provide information for tool developers to support architectural and model-specific performance monitoring events. The tables are up to date at processor launch, but are subject to changes. The most up to date event tables and additional details of performance event implementation for end-user (including additional details beyond event code/umask) can found at the “perfmon” repository provided by The Intel Open Source Technology Center (https://download.01.org/perfmon/).

19.1 ARCHITECTURAL PERFORMANCE MONITORING EVENTS

Architectural performance events are introduced in Intel Core Solo and Intel Core Duo processors. They are also supported on processors based on Intel Core microarchitecture. Table 19-1 lists pre-defined architectural performance events that can be configured using general-purpose performance counters and associated event-select registers.

Table 19-1. Architectural Performance Events

Event Num.	Event Mask Name	Umask Value	Description
3CH	UnHalted Core Cycles	00H	Counts core clock cycles whenever the logical processor is in C0 state (not halted). The frequency of this event varies with state transitions in the core.
3CH	UnHalted Reference Cycles[1]	01H	Counts at a fixed frequency whenever the logical processor is in C0 state (not halted).
C0H	Instructions Retired	00H	Counts when the last uop of an instruction retires.
2EH	LLC Reference	4FH	Counts requests originating from the core that reference a cache line in the last level on-die cache.
2EH	LLC Misses	41H	Counts each cache miss condition for references to the last level on-die cache.
C4H	Branch Instruction Retired	00H	Counts when the last uop of a branch instruction retires.
C5H	Branch Misses Retired	00H	Counts when the last uop of a branch instruction retires which corrected misprediction of the branch prediction hardware at execution time.

NOTES:

1. Current implementations count at core crystal clock, TSC, or bus clock frequency.

Fixed-function performance counters count only events defined in Table 19-2.

Table 19-2. Fixed-Function Performance Counter and Pre-defined Performance Events

Fixed-Function Performance Counter	Address	Event Mask Mnemonic	Description
IA32_PERF_FIXED_CTR0	309H	Inst_Retired.Any	This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers.
IA32_PERF_FIXED_CTR1	30AH	CPU_CLK_UNHALTED.THREAD/CPU_CLK_UNHALTED.CORE/CPU_CLK_UNHALTED.THREAD_ANY	The CPU_CLK_UNHALTED.THREAD event counts the number of core cycles while the logical processor is not in a halt state. If there is only one logical processor in a processor core, CPU_CLK_UNHALTED.CORE counts the unhalted cycles of the processor core. If there are more than one logical processor in a processor core, CPU_CLK_UNHALTED.THREAD_ANY is supported by programming IA32_FIXED_CTR_CTRL[bit 6]AnyThread = 1. The core frequency may change from time to time due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason this event may have a changing ratio with regards to time.

Table 19-2. Fixed-Function Performance Counter and Pre-defined Performance Events (Contd.)

Fixed-Function Performance Counter	Address	Event Mask Mnemonic	Description
IA32_PERF_FIXED_CTR2	30BH	CPU_CLK_UNHALTED.REF_TSC	This event counts the number of reference cycles at the TSC rate when the core is not in a halt state and not in a TM stop-clock state. The core enters the halt state when it is running the HLT instruction or the MWAIT instruction. This event is not affected by core frequency changes (e.g., P states) but counts at the same frequency as the time stamp counter. This event can approximate elapsed time while the core was not in a halt state and not in a TM stopclock state.

19.2 PERFORMANCE MONITORING EVENTS FOR INTEL® XEON® PROCESSOR SCALABLE FAMILY

The Intel® Xeon® Processor Scalable Family is based on the Skylake microarchitecture. These processors support the architectural performance monitoring events listed in Table 19-1. Fixed counters in the core PMU support the architecture events defined in Table 19-2. Model-specific performance monitoring events in the processor core are listed in Table 19-4. The events in Table 19-4 apply to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following value: 06_55H .

The comment column in Table 19-4 uses abbreviated letters to indicate additional conditions applicable to the Event Mask Mnemonic. For event umasks listed in Table 19-4 that do not show "AnyT", users should refrain from programming "AnyThread =1" in IA32_PERF_EVTSELx.

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
00H	01H	INST_RETIRED.ANY	Counts the number of instructions retired from execution. For instructions that consist of multiple micro-ops, Counts the retirement of the last micro-op of the instruction. Counting continues during hardware interrupts, traps, and inside interrupt handlers. Notes: INST_RETIRED.ANY is counted by a designated fixed counter, leaving the four (eight when Hyperthreading is disabled) programmable counters available for other events. INST_RETIRED.ANY_P is counted by a programmable counter and it is an architectural performance event. Counting: Faulting executions of GETSEC/VM entry/VM Exit/MWait will not count as retired instructions.	Fixed Counter
00H	02H	CPU_CLK_UNHALTED.THREAD	Counts the number of core cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios. The core frequency may change from time to time due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason this event may have a changing ratio with regards to time. When the core frequency is constant, this event can approximate elapsed time while the core was not in the halt state. It is counted on a dedicated fixed counter, leaving the four (eight when Hyperthreading is disabled) programmable counters available for other events.	Fixed Counter

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
00H	02H	CPU_CLK_UNHALTED.THREAD_ANY	Core cycles when at least one thread on the physical core is not in halt state.	AnyThread=1
00H	03H	CPU_CLK_UNHALTED.REF_TSC	Counts the number of reference cycles when the core is not in a halt state. The core enters the halt state when it is running the HLT instruction or the MWAIT instruction. This event is not affected by core frequency changes (for example, P states, TM2 transitions) but has the same incrementing frequency as the time stamp counter. This event can approximate elapsed time while the core was not in a halt state. This event has a constant ratio with the CPU_CLK_UNHALTED.REF_XCLK event. It is counted on a dedicated fixed counter, leaving the four (eight when Hyperthreading is disabled) programmable counters available for other events. Note: On all current platforms this event stops counting during 'throttling (TM)' states duty off periods the processor is 'halted'. The counter update is done at a lower clock rate then the core clock the overflow status bit for this counter may appear 'sticky'. After the counter has overflowed and software clears the overflow status bit and resets the counter to less than MAX. The reset value to the counter is not clocked immediately so the overflow status bit will flip "high (1)" and generate another PMI (if enabled) after which the reset value gets clocked into the counter. Therefore, software will get the interrupt, read the overflow status bit '1 for bit 34 while the counter value is less than MAX. Software should ignore this case.	Fixed Counter
03H	02H	LD_BLOCKS.STORE_FORWARD	Counts how many times the load operation got the true Block-on-Store blocking code preventing store forwarding. This includes cases when: a. preceding store conflicts with the load (incomplete overlap), b. store forwarding is impossible due to u-arch limitations, c. preceding lock RMW operations are not forwarded, d. store has the no-forward bit set (uncacheable/page-split/masked stores), e. all-blocking stores are used (mostly, fences and port I/O), and others. The most common case is a load blocked due to its address range overlapping with a preceding smaller uncompleted store. Note: This event does not take into account cases of out-of-SW-control (for example, SbTailHit), unknown physical STA, and cases of blocking loads on store due to being non-WB memory type or a lock. These cases are covered by other events. See the table of not supported store forwards in the Optimization Guide.	
03H	08H	LD_BLOCKS.NO_SR	The number of times that split load operations are temporarily blocked because all resources for handling the split accesses are in use.	

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
07H	01H	LD_BLOCKS_PARTIAL.ADDRESS_ALIAS	Counts false dependencies in MOB when the partial comparison upon loose net check and dependency was resolved by the Enhanced Loose net mechanism. This may not result in high performance penalties. Loose net checks can fail when loads and stores are 4k aliased.	
08H	01H	DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK	Counts demand data loads that caused a page walk of any page size (4K/2M/4M/1G). This implies it missed in all TLB levels, but the walk need not have completed.	
08H	02H	DTLB_LOAD_MISSES.WALK_COMPLETED_4K	Counts demand data loads that caused a completed page walk (4K page size). This implies it missed in all TLB levels. The page walk can end with or without a fault.	
08H	04H	DTLB_LOAD_MISSES.WALK_COMPLETED_2M_4M	Counts demand data loads that caused a completed page walk (2M and 4M page sizes). This implies it missed in all TLB levels. The page walk can end with or without a fault.	
08H	08H	DTLB_LOAD_MISSES.WALK_COMPLETED_1G	Counts load misses in all DTLB levels that cause a completed page walk (1G page size). The page walk can end with or without a fault.	
08H	0EH	DTLB_LOAD_MISSES.WALK_COMPLETED	Counts demand data loads that caused a completed page walk of any page size (4K/2M/4M/1G). This implies it missed in all TLB levels. The page walk can end with or without a fault.	
08H	10H	DTLB_LOAD_MISSES.WALK_PENDING	Counts 1 per cycle for each PMH that is busy with a page walk for a load. EPT page walk duration are excluded in Skylake microarchitecture.	
08H	10H	DTLB_LOAD_MISSES.WALK_ACTIVE	Counts cycles when at least one PMH (Page Miss Handler) is busy with a page walk for a load.	CounterMask=1 CMSK1
08H	20H	DTLB_LOAD_MISSES.STLB_HIT	Counts loads that miss the DTLB (Data TLB) and hit the STLB (Second level TLB).	
0DH	01H	INT_MISC.RECOVERY_CYCLES	Core cycles the Resource allocator was stalled due to recovery from an earlier branch misprediction or machine clear event.	
0DH	01H	INT_MISC.RECOVERY_CYCLES_ANY	Core cycles the allocator was stalled due to recovery from earlier clear event for any thread running on the physical core (e.g. misprediction or memory nuke).	AnyThread=1 AnyT
0DH	80H	INT_MISC.CLEAR_RESTEER_CYCLES	Cycles the issue-stage is waiting for front-end to fetch from resteered path following branch misprediction or machine clear events.	
0EH	01H	UOPS_ISSUED.ANY	Counts the number of uops that the Resource Allocation Table (RAT) issues to the Reservation Station (RS).	
0EH	01H	UOPS_ISSUED.STALL_CYCLES	Counts cycles during which the Resource Allocation Table (RAT) does not issue any uops to the reservation station (RS) for the current thread.	CounterMask=1 Invert=1 CMSK1, INV

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0EH	02H	UOPS_ISSUED.VECTOR_WIDTH_MISMATCH	Counts the number of Blend Uops issued by the Resource Allocation Table (RAT) to the reservation station (RS) in order to preserve upper bits of vector registers. Starting with the Skylake microarchitecture, these Blend uops are needed since every Intel SSE instruction executed in Dirty Upper State needs to preserve bits 128-255 of the destination register. For more information, refer to Mixing Intel AVX and Intel SSE Code section of the Optimization Guide.	
0EH	20H	UOPS_ISSUED.SLOW_LEA	Number of slow LEA uops being allocated. A uop is generally considered SlowLea if it has 3 sources (e.g. 2 sources + immediate) regardless if as a result of LEA instruction or not.	
14H	01H	ARITH.DIVIDER_ACTIVE	Cycles when divide unit is busy executing divide or square root operations. Accounts for integer and floating-point operations.	CounterMask=1
24H	21H	L2_RQSTS.DEMAND_DATA_RD_MISS	Counts the number of demand Data Read requests that miss L2 cache. Only not rejected loads are counted.	
24H	22H	L2_RQSTS.RFO_MISS	Counts the RFO (Read-for-Ownership) requests that miss L2 cache.	
24H	24H	L2_RQSTS.CODE_RD_MISS	Counts L2 cache misses when fetching instructions.	
24H	27H	L2_RQSTS.ALL_DEMAND_MISS	Demand requests that miss L2 cache.	
24H	38H	L2_RQSTS.PF_MISS	Counts requests from the L1/L2/L3 hardware prefetchers or Load software prefetches that miss L2 cache.	
24H	3FH	L2_RQSTS.MISS	All requests that miss L2 cache.	
24H	41H	L2_RQSTS.DEMAND_DATA_RD_HIT	Counts the number of demand Data Read requests that hit L2 cache. Only non rejected loads are counted.	
24H	42H	L2_RQSTS.RFO_HIT	Counts the RFO (Read-for-Ownership) requests that hit L2 cache.	
24H	44H	L2_RQSTS.CODE_RD_HIT	Counts L2 cache hits when fetching instructions, code reads.	
24H	D8H	L2_RQSTS.PF_HIT	Counts requests from the L1/L2/L3 hardware prefetchers or Load software prefetches that hit L2 cache.	
24H	E1H	L2_RQSTS.ALL_DEMAND_DATA_RD	Counts the number of demand Data Read requests (including requests from L1D hardware prefetchers). These loads may hit or miss L2 cache. Only non rejected loads are counted.	
24H	E2H	L2_RQSTS.ALL_RFO	Counts the total number of RFO (read for ownership) requests to L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.	
24H	E4H	L2_RQSTS.ALL_CODE_RD	Counts the total number of L2 code requests.	
24H	E7H	L2_RQSTS.ALL_DEMAND_REFERENCES	Demand requests to L2 cache.	
24H	F8H	L2_RQSTS.ALL_PF	Counts the total number of requests from the L2 hardware prefetchers.	

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
24H	FFH	L2_RQSTS.REFERENCES	All L2 requests.	
28H	07H	CORE_POWER.LVL0_TURBO_LICENSE	Core cycles where the core was running with power-delivery for baseline license level 0. This includes non-AVX codes, SSE, AVX 128-bit, and low-current AVX 256-bit codes.	
28H	18H	CORE_POWER.LVL1_TURBO_LICENSE	Core cycles where the core was running with power-delivery for license level 1. This includes high current AVX 256-bit instructions as well as low current AVX 512-bit instructions.	
28H	20H	CORE_POWER.LVL2_TURBO_LICENSE	Core cycles where the core was running with power-delivery for license level 2 (introduced in Skylake Server microarchitecture). This includes high current AVX 512-bit instructions.	
28H	40H	CORE_POWER.THROTTLE	Core cycles the out-of-order engine was throttled due to a pending power level request.	
2EH	41H	LONGEST_LAT_CACHE.MISS	Counts core-originated cacheable requests that miss the L3 cache (Longest Latency cache). Requests include data and code reads, Reads-for-Ownership (RFOs), speculative accesses and hardware prefetches from L1 and L2. It does not include all misses to the L3.	See Table 19-1.
2EH	4FH	LONGEST_LAT_CACHE.REFERENCE	Counts core-originated cacheable requests to the L3 cache (Longest Latency cache). Requests include data and code reads, Reads-for-Ownership (RFOs), speculative accesses and hardware prefetches from L1 and L2. It does not include all accesses to the L3.	See Table 19-1.
3CH	00H	CPU_CLK_UNHALTED.THREAD_P	This is an architectural event that counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling. For this reason, this event may have a changing ratio with regards to wall clock time.	See Table 19-1.
3CH	00H	CPU_CLK_UNHALTED.THREAD_P_ANY	Core cycles when at least one thread on the physical core is not in halt state.	AnyThread=1 AnyT
3CH	00H	CPU_CLK_UNHALTED.RING0_TRANS	Counts when the Current Privilege Level (CPL) transitions from ring 1, 2 or 3 to ring 0 (Kernel).	EdgeDetect=1 CounterMask=1
3CH	01H	CPU_CLK_THREAD_UNHALTED.REF_XCLK	Core crystal clock cycles when the thread is unhalted.	See Table 19-1.
3CH	01H	CPU_CLK_THREAD_UNHALTED.REF_XCLK_ANY	Core crystal clock cycles when at least one thread on the physical core is unhalted.	AnyThread=1 AnyT
3CH	01H	CPU_CLK_UNHALTED.REF_XCLK	Core crystal clock cycles when the thread is unhalted.	See Table 19-1.
3CH	01H	CPU_CLK_UNHALTED.REF_XCLK_ANY	Core crystal clock cycles when at least one thread on the physical core is unhalted.	AnyThread=1 AnyT
3CH	02H	CPU_CLK_THREAD_UNHALTED.ONE_THREAD_ACTIVE	Core crystal clock cycles when this thread is unhalted and the other thread is halted.	
3CH	02H	CPU_CLK_UNHALTED.ONE_THREAD_ACTIVE	Core crystal clock cycles when this thread is unhalted and the other thread is halted.	

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
48H	01H	L1D_PEND_MISS.PENDING	Counts duration of L1D miss outstanding, that is each cycle number of Fill Buffers (FB) outstanding required by Demand Reads. FB either is held by demand loads, or it is held by non-demand loads and gets hit at least once by demand. The valid outstanding interval is defined until the FB deallocation by one of the following ways: from FB allocation, if FB is allocated by demand from the demand Hit FB, if it is allocated by hardware or software prefetch.Note: In the L1D, a Demand Read contains cacheable or noncacheable demand loads, including ones causing cache-line splits and reads due to page walks resulted from any request type.	
48H	01H	L1D_PEND_MISS.PENDING_CYCLES	Counts duration of L1D miss outstanding in cycles.	CounterMask=1 CMSK1
48H	01H	L1D_PEND_MISS.PENDING_CYCLES_ANY	Cycles with L1D load Misses outstanding from any thread on physical core.	CounterMask=1 AnyThread=1 CMSK1, AnyT
48H	02H	L1D_PEND_MISS.FB_FULL	Number of times a request needed a FB (Fill Buffer) entry but there was no entry available for it. A request includes cacheable/uncacheable demands that are load, store or SW prefetch instructions.	
49H	01H	DTLB_STORE_MISSES.MISS_CAUSES_A_WALK	Counts demand data stores that caused a page walk of any page size (4K/2M/4M/1G). This implies it missed in all TLB levels, but the walk need not have completed.	
49H	02H	DTLB_STORE_MISSES.WALK_COMPLETED_4K	Counts demand data stores that caused a completed page walk (4K page size). This implies it missed in all TLB levels. The page walk can end with or without a fault.	
49H	04H	DTLB_STORE_MISSES.WALK_COMPLETED_2M_4M	Counts demand data stores that caused a completed page walk (2M and 4M page sizes). This implies it missed in all TLB levels. The page walk can end with or without a fault.	
49H	08H	DTLB_STORE_MISSES.WALK_COMPLETED_1G	Counts store misses in all DTLB levels that cause a completed page walk (1G page size). The page walk can end with or without a fault.	
49H	0EH	DTLB_STORE_MISSES.WALK_COMPLETED	Counts demand data stores that caused a completed page walk of any page size (4K/2M/4M/1G). This implies it missed in all TLB levels. The page walk can end with or without a fault.	
49H	10H	DTLB_STORE_MISSES.WALK_PENDING	Counts 1 per cycle for each PMH that is busy with a page walk for a store. EPT page walk duration are excluded in Skylake microarchitecture.	
49H	10H	DTLB_STORE_MISSES.WALK_ACTIVE	Counts cycles when at least one PMH (Page Miss Handler) is busy with a page walk for a store.	CounterMask=1 CMSK1
49H	20H	DTLB_STORE_MISSES.STLB_HIT	Stores that miss the DTLB (Data TLB) and hit the STLB (2nd Level TLB).	

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
4CH	01H	LOAD_HIT_PRE.SW_PF	Counts all not software-prefetch load dispatches that hit the fill buffer (FB) allocated for the software prefetch. It can also be incremented by some lock instructions. So it should only be used with profiling so that the locks can be excluded by ASM (Assembly File) inspection of the nearby instructions.	
4FH	10H	EPT.WALK_PENDING	Counts cycles for each PMH (Page Miss Handler) that is busy with an EPT (Extended Page Table) walk for any request type.	
51H	01H	L1D.REPLACEMENT	Counts L1D data line replacements including opportunistic replacements, and replacements that require stall-for-replace or block-for-replace.	
54H	01H	TX_MEM.ABORT_CONFLICT	Number of times a TSX line had a cache conflict.	
54H	02H	TX_MEM.ABORT_CAPACITY	Number of times a transactional abort was signaled due to a data capacity limitation for transactional reads or writes.	
54H	04H	TX_MEM.ABORT_HLE_STORE_TO_ELIDED_LOCK	Number of times a TSX Abort was triggered due to a non-release/commit store to lock.	
54H	08H	TX_MEM.ABORT_HLE_ELISION_BUFFER_NOT_EMPTY	Number of times a TSX Abort was triggered due to commit but Lock Buffer not empty.	
54H	10H	TX_MEM.ABORT_HLE_ELISION_BUFFER_MISMATCH	Number of times a TSX Abort was triggered due to release/commit but data and address mismatch.	
54H	20H	TX_MEM.ABORT_HLE_ELISION_BUFFER_UNSUPPORTED_ALIGNMENT	Number of times a TSX Abort was triggered due to attempting an unsupported alignment from Lock Buffer.	
54H	40H	TX_MEM.HLE_ELISION_BUFFER_FULL	Number of times we could not allocate Lock Buffer.	
5DH	01H	TX_EXEC.MISC1	Unfriendly TSX abort triggered by a flowmarker.	
5DH	02H	TX_EXEC.MISC2	Unfriendly TSX abort triggered by a vzeroupper instruction.	
5DH	04H	TX_EXEC.MISC3	Unfriendly TSX abort triggered by a nest count that is too deep.	
5DH	08H	TX_EXEC.MISC4	RTM region detected inside HLE.	
5DH	10H	TX_EXEC.MISC5	Counts the number of times an HLE XACQUIRE instruction was executed inside an RTM transactional region.	
5EH	01H	RS_EVENTS.EMPTY_CYCLES	Counts cycles during which the reservation station (RS) is empty for the thread.; Note: In ST-mode, not active thread should drive 0. This is usually caused by severely costly branch mispredictions, or allocator/FE issues.	
5EH	01H	RS_EVENTS.EMPTY_END	Counts end of periods where the Reservation Station (RS) was empty. Could be useful to precisely locate front-end Latency Bound issues.	EdgeDetect=1 CounterMask=1 Invert=1 CMSK1, INV

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
60H	01H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD	Counts the number of offcore outstanding Demand Data Read transactions in the super queue (SQ) every cycle. A transaction is considered to be in the Offcore outstanding state between L2 miss and transaction completion sent to requestor. See the corresponding Umask under OFFCORE_REQUESTS. Note: A prefetch promoted to Demand is counted from the promotion point.	
60H	01H	OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DEMAND_DATA_RD	Counts cycles when offcore outstanding Demand Data Read transactions are present in the super queue (SQ). A transaction is considered to be in the Offcore outstanding state between L2 miss and transaction completion sent to requestor (SQ de-allocation).	CounterMask=1 CMSK1
60H	01H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD_GE_6	Cycles with at least 6 offcore outstanding Demand Data Read transactions in uncore queue.	CounterMask=6 CMSK6
60H	02H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_CODE_RD	Counts the number of offcore outstanding Code Reads transactions in the super queue every cycle. The 'Offcore outstanding' state of the transaction lasts from the L2 miss until the sending transaction completion to requestor (SQ deallocation). See the corresponding Umask under OFFCORE_REQUESTS.	CounterMask=1 CMSK1
60H	02H	OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DEMAND_CODE_RD	Counts the number of offcore outstanding Code Reads transactions in the super queue every cycle. The 'Offcore outstanding' state of the transaction lasts from the L2 miss until the sending transaction completion to requestor (SQ deallocation). See the corresponding Umask under OFFCORE_REQUESTS.	CMSK1
60H	04H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_RFO	Counts the number of offcore outstanding RFO (store) transactions in the super queue (SQ) every cycle. A transaction is considered to be in the Offcore outstanding state between L2 miss and transaction completion sent to requestor (SQ de-allocation). See corresponding Umask under OFFCORE_REQUESTS.	CounterMask=1 CMSK1
60H	04H	OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DEMAND_RFO	Counts the number of offcore outstanding demand rfo Reads transactions in the super queue every cycle. The 'Offcore outstanding' state of the transaction lasts from the L2 miss until the sending transaction completion to requestor (SQ deallocation). See the corresponding Umask under OFFCORE_REQUESTS.	CMSK1
60H	08H	OFFCORE_REQUESTS_OUTSTANDING.ALL_DATA_RD	Counts the number of offcore outstanding cacheable Core Data Read transactions in the super queue every cycle. A transaction is considered to be in the Offcore outstanding state between L2 miss and transaction completion sent to requestor (SQ de-allocation). See corresponding Umask under OFFCORE_REQUESTS.	
60H	08H	OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DATA_RD	Counts cycles when offcore outstanding cacheable Core Data Read transactions are present in the super queue. A transaction is considered to be in the Offcore outstanding state between L2 miss and transaction completion sent to requestor (SQ de-allocation). See corresponding Umask under OFFCORE_REQUESTS.	CounterMask=1 CMSK1

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
60H	10H	OFFCORE_REQUESTS_OUTSTANDING.L3_MISS_DEMAND_DATA_RD	Counts number of Offcore outstanding Demand Data Read requests that miss L3 cache in the superQ every cycle.	
60H	10H	OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_L3_MISS_DEMAND_DATA_RD	Cycles with at least 1 Demand Data Read requests who miss L3 cache in the superQ.	CounterMask=1 CMSK1
60H	10H	OFFCORE_REQUESTS_OUTSTANDING.L3_MISS_DEMAND_DATA_RD_GE_6	Cycles with at least 6 Demand Data Read requests that miss L3 cache in the superQ.	CounterMask=6 CMSK6
79H	04H	IDQ.MITE_UOPS	Counts the number of uops delivered to Instruction Decode Queue (IDQ) from the MITE path. Counting includes uops that may 'bypass' the IDQ. This also means that uops are not being delivered from the Decode Stream Buffer (DSB).	
79H	04H	IDQ.MITE_CYCLES	Counts cycles during which uops are being delivered to Instruction Decode Queue (IDQ) from the MITE path. Counting includes uops that may 'bypass' the IDQ.	CounterMask=1 CMSK1
79H	08H	IDQ.DSB_UOPS	Counts the number of uops delivered to Instruction Decode Queue (IDQ) from the Decode Stream Buffer (DSB) path. Counting includes uops that may 'bypass' the IDQ.	
79H	08H	IDQ.DSB_CYCLES	Counts cycles during which uops are being delivered to Instruction Decode Queue (IDQ) from the Decode Stream Buffer (DSB) path. Counting includes uops that may 'bypass' the IDQ.	CounterMask=1 CMSK1
79H	10H	IDQ.MS_DSB_CYCLES	Counts cycles during which uops initiated by Decode Stream Buffer (DSB) are being delivered to Instruction Decode Queue (IDQ) while the Microcode Sequencer (MS) is busy. Counting includes uops that may 'bypass' the IDQ.	CounterMask=1
79H	18H	IDQ.ALL_DSB_CYCLES_4_UOPS	Counts the number of cycles 4 uops were delivered to Instruction Decode Queue (IDQ) from the Decode Stream Buffer (DSB) path. Count includes uops that may 'bypass' the IDQ.	CounterMask=4 CMSK4
79H	18H	IDQ.ALL_DSB_CYCLES_ANY_UOPS	Counts the number of cycles uops were delivered to Instruction Decode Queue (IDQ) from the Decode Stream Buffer (DSB) path. Count includes uops that may 'bypass' the IDQ.	CounterMask=1 CMSK1
79H	20H	IDQ.MS_MITE_UOPS	Counts the number of uops initiated by MITE and delivered to Instruction Decode Queue (IDQ) while the Microcode Sequencer (MS) is busy. Counting includes uops that may 'bypass' the IDQ.	
79H	24H	IDQ.ALL_MITE_CYCLES_4_UOPS	Counts the number of cycles 4 uops were delivered to the Instruction Decode Queue (IDQ) from the MITE (legacy decode pipeline) path. Counting includes uops that may 'bypass' the IDQ. During these cycles uops are not being delivered from the Decode Stream Buffer (DSB).	CounterMask=4 CMSK4

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
79H	24H	IDQ.ALL_MITE_CYCLES_ANY_UOPS	Counts the number of cycles uops were delivered to the Instruction Decode Queue (IDQ) from the MITE (legacy decode pipeline) path. Counting includes uops that may 'bypass' the IDQ. During these cycles uops are not being delivered from the Decode Stream Buffer (DSB).	CounterMask=1 CMSK1
79H	30H	IDQ.MS_CYCLES	Counts cycles during which uops are being delivered to Instruction Decode Queue (IDQ) while the Microcode Sequencer (MS) is busy. Counting includes uops that may 'bypass' the IDQ. Uops maybe initiated by Decode Stream Buffer (DSB) or MITE.	CounterMask=1 CMSK1
79H	30H	IDQ.MS_SWITCHES	Number of switches from DSB (Decode Stream Buffer) or MITE (legacy decode pipeline) to the Microcode Sequencer.	EdgeDetect=1 CounterMask=1 EDGE
79H	30H	IDQ.MS_UOPS	Counts the total number of uops delivered by the Microcode Sequencer (MS). Any instruction over 4 uops will be delivered by the MS. Some instructions such as transcendentals may additionally generate uops from the MS.	
80H	04H	ICACHE_16B.IFDATA_STALL	Cycles where a code line fetch is stalled due to an L1 instruction cache miss. The legacy decode pipeline works at a 16 Byte granularity.	
83H	01H	ICACHE_64B.IFTAG_HIT	Instruction fetch tag lookups that hit in the instruction cache (L1I). Counts at 64-byte cache-line granularity.	
83H	02H	ICACHE_64B.IFTAG_MISS	Instruction fetch tag lookups that miss in the instruction cache (L1I). Counts at 64-byte cache-line granularity.	
83H	04H	ICACHE_64B.IFTAG_STALL	Cycles where a code fetch is stalled due to L1 instruction cache tag miss.	
85H	01H	ITLB_MISSES.MISS_CAUSES_A_WALK	Counts page walks of any page size (4K/2M/4M/1G) caused by a code fetch. This implies it missed in the ITLB and further levels of TLB, but the walk need not have completed.	
85H	02H	ITLB_MISSES.WALK_COMPLETED_4K	Counts completed page walks (4K page size) caused by a code fetch. This implies it missed in the ITLB and further levels of TLB. The page walk can end with or without a fault.	
85H	04H	ITLB_MISSES.WALK_COMPLETED_2M_4M	Counts completed page walks of any page size (4K/2M/4M/1G) caused by a code fetch. This implies it missed in the ITLB and further levels of TLB. The page walk can end with or without a fault.	
85H	08H	ITLB_MISSES.WALK_COMPLETED_1G	Counts store misses in all DTLB levels that cause a completed page walk (1G page size). The page walk can end with or without a fault.	
85H	0EH	ITLB_MISSES.WALK_COMPLETED	Counts completed page walks (2M and 4M page sizes) caused by a code fetch. This implies it missed in the ITLB and further levels of TLB. The page walk can end with or without a fault.	

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
85H	10H	ITLB_MISSES.WALK_PENDING	Counts 1 per cycle for each PMH that is busy with a page walk for an instruction fetch request. EPT page walk duration are excluded in Skylake microarchitecture.	
85H	10H	ITLB_MISSES.WALK_ACTIVE	Cycles when at least one PMH is busy with a page walk for code (instruction fetch) request. EPT page walk duration are excluded in Skylake microarchitecture.	CounterMask=1
85H	20H	ITLB_MISSES.STLB_HIT	Instruction fetch requests that miss the ITLB and hit the STLB.	
87H	01H	ILD_STALL.LCP	Counts cycles that the Instruction Length decoder (ILD) stalls occurred due to dynamically changing prefix length of the decoded instruction (by operand size prefix instruction 0x66, address size prefix instruction 0x67 or REX.W for Intel64). Count is proportional to the number of prefixes in a 16B-line. This may result in a three-cycle penalty for each LCP (Length changing prefix) in a 16-byte chunk.	
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CORE	Counts the number of uops not delivered to Resource Allocation Table (RAT) per thread adding “4 – x” ? when Resource Allocation Table (RAT) is not stalled and Instruction Decode Queue (IDQ) delivers x uops to Resource Allocation Table (RAT) (where x belongs to {0,1,2,3}). Counting does not cover cases when: a. IDQ-Resource Allocation Table (RAT) pipe serves the other thread. b. Resource Allocation Table (RAT) is stalled for the thread (including uop drops and clear BE conditions). c. Instruction Decode Queue (IDQ) delivers four uops.	
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CYCLES_0_UOPS_DELIV.CORE	Counts, on the per-thread basis, cycles when no uops are delivered to Resource Allocation Table (RAT). IDQ_Uops_Not_Delivered.core =4.	CounterMask=4 CMSK4
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CYCLES_LE_1_UOP_DELIV.CORE	Counts, on the per-thread basis, cycles when less than 1 uop is delivered to Resource Allocation Table (RAT). IDQ_Uops_Not_Delivered.core >= 3.	CounterMask=3 CMSK3
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CYCLES_LE_2_UOP_DELIV.CORE	Cycles with less than 2 uops delivered by the front end.	CounterMask=2 CMSK2
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CYCLES_LE_3_UOP_DELIV.CORE	Cycles with less than 3 uops delivered by the front end.	CounterMask=1 CMSK1
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CYCLES_FE_WAS_OK	Counts cycles FE delivered 4 uops or Resource Allocation Table (RAT) was stalling FE.	CounterMask=1 Invert=1 CMSK, INV
A1H	01H	UOPS_DISPATCHED_PORT.PORT_0	Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 0.	
A1H	02H	UOPS_DISPATCHED_PORT.PORT_1	Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 1.	
A1H	04H	UOPS_DISPATCHED_PORT.PORT_2	Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 2.	

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
A1H	08H	UOPS_DISPATCHED_PORT.PORT_3	Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 3.	
A1H	10H	UOPS_DISPATCHED_PORT.PORT_4	Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 4.	
A1H	20H	UOPS_DISPATCHED_PORT.PORT_5	Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 5.	
A1H	40H	UOPS_DISPATCHED_PORT.PORT_6	Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 6.	
A1H	80H	UOPS_DISPATCHED_PORT.PORT_7	Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 7.	
A2H	01H	RESOURCE_STALLS.ANY	Counts resource-related stall cycles. Reasons for stalls can be as follows: a. *any* u-arch structure got full (LB, SB, RS, ROB, BOB, LM, Physical Register Reclaim Table (PRRT), or Physical History Table (PHT) slots). b. *any* u-arch structure got empty (like INT/SIMD FreeLists). c. FPU control word (FPCW), MXCSR.and others. This counts cycles that the pipeline back end blocked uop delivery from the front end.	
A2H	08H	RESOURCE_STALLS.SB	Counts allocation stall cycles caused by the store buffer (SB) being full. This counts cycles that the pipeline back end blocked uop delivery from the front end.	
A3H	01H	CYCLE_ACTIVITY.CYCLES_L2_MISS	Cycles while L2 cache miss demand load is outstanding.	CounterMask=1 CMSK1
A3H	02H	CYCLE_ACTIVITY.CYCLES_L3_MISS	Cycles while L3 cache miss demand load is outstanding.	CounterMask=2 CMSK2
A3H	04H	CYCLE_ACTIVITY.STALLS_TOTAL	Total execution stalls.	CounterMask=4 CMSK4
A3H	05H	CYCLE_ACTIVITY.STALLS_L2_MISS	Execution stalls while L2 cache miss demand load is outstanding.	CounterMask=5 CMSK5
A3H	06H	CYCLE_ACTIVITY.STALLS_L3_MISS	Execution stalls while L3 cache miss demand load is outstanding.	CounterMask=6 CMSK6
A3H	08H	CYCLE_ACTIVITY.CYCLES_L1D_MISS	Cycles while L1 cache miss demand load is outstanding.	CounterMask=8 CMSK8
A3H	0CH	CYCLE_ACTIVITY.STALLS_L1D_MISS	Execution stalls while L1 cache miss demand load is outstanding.	CounterMask=12 CMSK12
A3H	10H	CYCLE_ACTIVITY.CYCLES_MEM_ANY	Cycles while memory subsystem has an outstanding load.	CounterMask=16 CMSK16
A3H	14H	CYCLE_ACTIVITY.STALLS_MEM_ANY	Execution stalls while memory subsystem has an outstanding load.	CounterMask=20 CMSK20
A6H	01H	EXE_ACTIVITY.EXE_BOUND_0_PORTS	Counts cycles during which no uops were executed on all ports and Reservation Station (RS) was not empty.	

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
A6H	02H	EXE_ACTIVITY.1_PORTS_UTIL	Counts cycles during which a total of 1 uop was executed on all ports and Reservation Station (RS) was not empty.	
A6H	04H	EXE_ACTIVITY.2_PORTS_UTIL	Counts cycles during which a total of 2 uops were executed on all ports and Reservation Station (RS) was not empty.	
A6H	08H	EXE_ACTIVITY.3_PORTS_UTIL	Cycles total of 3 uops are executed on all ports and Reservation Station (RS) was not empty.	
A6H	10H	EXE_ACTIVITY.4_PORTS_UTIL	Cycles total of 4 uops are executed on all ports and Reservation Station (RS) was not empty.	
A6H	40H	EXE_ACTIVITY.BOUND_ON_STORES	Cycles where the Store Buffer was full and no outstanding load.	
A8H	01H	LSD.UOPS	Number of uops delivered to the back-end by the LSD (Loop Stream Detector).	
A8H	01H	LSD.CYCLES_ACTIVE	Counts the cycles when at least one uop is delivered by the LSD (Loop-stream detector).	CounterMask=1 CMSK1
A8H	01H	LSD.CYCLES_4_UOPS	Counts the cycles when 4 uops are delivered by the LSD (Loop-stream detector).	CounterMask=4 CMSK4
ABH	02H	DSB2MITE_SWITCHES.PENALTY_CYCLES	Counts Decode Stream Buffer (DSB)-to-MITE switch true penalty cycles. These cycles do not include uops routed through because of the switch itself, for example, when Instruction Decode Queue (IDQ) pre-allocation is unavailable, or Instruction Decode Queue (IDQ) is full. SBD-to-MITE switch true penalty cycles happen after the merge mux (MM) receives Decode Stream Buffer (DSB) Sync-indication until receiving the first MITE uop. MM is placed before Instruction Decode Queue (IDQ) to merge uops being fed from the MITE and Decode Stream Buffer (DSB) paths. Decode Stream Buffer (DSB) inserts the Sync-indication whenever a Decode Stream Buffer (DSB)-to-MITE switch occurs.Penalty: A Decode Stream Buffer (DSB) hit followed by a Decode Stream Buffer (DSB) miss can cost up to six cycles in which no uops are delivered to the IDQ. Most often, such switches from the Decode Stream Buffer (DSB) to the legacy pipeline cost 0 to 2 cycles.	
AEH	01H	ITLB.ITLB_FLUSH	Counts the number of flushes of the big or small ITLB pages. Counting include both TLB Flush (covering all sets) and TLB Set Clear (set-specific).	
B0H	01H	OFFCORE_REQUESTS.DEMAND_DATA_RD	Counts the Demand Data Read requests sent to uncore. Use it in conjunction with OFFCORE_REQUESTS_OUTSTANDING to determine average latency in the uncore.	
B0H	02H	OFFCORE_REQUESTS.DEMAND_CODE_RD	Counts both cacheable and non-cacheable code read requests.	
B0H	04H	OFFCORE_REQUESTS.DEMAND_RFO	Counts the demand RFO (read for ownership) requests including regular RFOs, locks, ItoM.	

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
B0H	08H	OFFCORE_REQUESTS.ALL_DATA_RD	Counts the demand and prefetch data reads. All Core Data Reads include cacheable 'Demands' and L2 prefetchers (not L3 prefetchers). Counting also covers reads due to page walks resulted from any request type.	
B0H	10H	OFFCORE_REQUESTS.L3_MISS_DEMAND_DATA_RD	Demand Data Read requests who miss L3 cache.	
B0H	80H	OFFCORE_REQUESTS.ALL_REQUESTS	Counts memory transactions reached the super queue including requests initiated by the core, all L3 prefetches, page walks, etc.	
B1H	01H	UOPS_EXECUTED.THREAD	Number of uops to be executed per-thread each cycle.	
B1H	01H	UOPS_EXECUTED.STALL_CYCLES	Counts cycles during which no uops were dispatched from the Reservation Station (RS) per thread.	CounterMask=1 Invert=1 CMSK, INV
B1H	01H	UOPS_EXECUTED.CYCLES_GE_1_UOP_EXEC	Cycles where at least 1 uop was executed per-thread.	CounterMask=1 CMSK1
B1H	01H	UOPS_EXECUTED.CYCLES_GE_2_UOPS_EXEC	Cycles where at least 2 uops were executed per-thread.	CounterMask=2 CMSK2
B1H	01H	UOPS_EXECUTED.CYCLES_GE_3_UOPS_EXEC	Cycles where at least 3 uops were executed per-thread.	CounterMask=3 CMSK3
B1H	01H	UOPS_EXECUTED.CYCLES_GE_4_UOPS_EXEC	Cycles where at least 4 uops were executed per-thread.	CounterMask=4 CMSK4
B1H	02H	UOPS_EXECUTED.CORE	Number of uops executed from any thread.	
B1H	02H	UOPS_EXECUTED.CORE_CYCLES_GE_1	Cycles at least 1 micro-op is executed from any thread on physical core.	CounterMask=1 CMSK1
B1H	02H	UOPS_EXECUTED.CORE_CYCLES_GE_2	Cycles at least 2 micro-op is executed from any thread on physical core.	CounterMask=2 CMSK2
B1H	02H	UOPS_EXECUTED.CORE_CYCLES_GE_3	Cycles at least 3 micro-op is executed from any thread on physical core.	CounterMask=3 CMSK3
B1H	02H	UOPS_EXECUTED.CORE_CYCLES_GE_4	Cycles at least 4 micro-op is executed from any thread on physical core.	CounterMask=4 CMSK4
B1H	02H	UOPS_EXECUTED.CORE_CYCLES_NONE	Cycles with no micro-ops executed from any thread on physical core.	CounterMask=1 Invert=1 CMSK1, INV
B1H	10H	UOPS_EXECUTED.X87	Counts the number of x87 uops executed.	
B2H	01H	OFFCORE_REQUESTS_BUFFER.SQ_FULL	Counts the number of cases when the offcore requests buffer cannot take more entries for the core. This can happen when the superqueue does not contain eligible entries, or when L1D writeback pending FIFO requests is full. Note: Writeback pending FIFO has six entries.	
BDH	01H	TLB_FLUSH.DTLB_THREAD	Counts the number of DTLB flush attempts of the thread-specific entries.	
BDH	20H	TLB_FLUSH.STLB_ANY	Counts the number of any STLB flush attempts (such as entire, VPID, PCID, InvPage, CR3 write, etc.).	
C0H	00H	INST_RETIRED.ANY_P	Counts the number of instructions (EOMs) retired. Counting covers macro-fused instructions individually (that is, increments by two).	See Table 19-1.

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C0H	01H	INST_RETIRED.PREC_DIST	A version of INST_RETIRED that allows for a more unbiased distribution of samples across instructions retired. It utilizes the Precise Distribution of Instructions Retired (PDIR) feature to mitigate some bias in how retired instructions get sampled.	Precise event capable Requires PEBS on General Counter 1(PDIR).
C1H	3FH	OTHER_ASSISTS.ANY	Number of times a microcode assist is invoked by HW other than FP-assist. Examples include AD (page Access Dirty) and AVX* related assists.	
C2H	01H	UOPS_RETIRED.STALL_CYCLES	This is a non-precise version (that is, does not use PEBS) of the event that counts cycles without actually retired uops.	CounterMask=1 Invert=1 CMSK1, INV
C2H	01H	UOPS_RETIRED.TOTAL_CYCLES	Number of cycles using always true condition (uops_ret < 16) applied to non PEBS uops retired event.	CounterMask=10 Invert=1 CMSK10, INV
C2H	02H	UOPS_RETIRED.RETIRE_SLOTS	Counts the retirement slots used.	
C3H	01H	MACHINE_CLEARS.COUNT	Number of machine clears (nukes) of any type.	EdgeDetect=1 CounterMask=1 CMSK1, EDG
C3H	02H	MACHINE_CLEARS.MEMORY_ORDERING	Counts the number of memory ordering Machine Clears detected. Memory Ordering Machine Clears can result from one of the following: a. memory disambiguation, b. external snoop, or c. cross SMT-HW-thread snoop (stores) hitting load buffer.	
C3H	04H	MACHINE_CLEARS.SMC	Counts self-modifying code (SMC) detected, which causes a machine clear.	
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Counts all (macro) branch instructions retired.	Precise event capable. See Table 19-1.
C4H	01H	BR_INST_RETIRED.CONDITIONAL	This is a non-precise version (that is, does not use PEBS) of the event that counts conditional branch instructions retired.	Precise event capable. PS
C4H	02H	BR_INST_RETIRED.NEAR_CALL	This is a non-precise version (that is, does not use PEBS) of the event that counts both direct and indirect near call instructions retired.	Precise event capable. PS
C4H	08H	BR_INST_RETIRED.NEAR_RETURN	This is a non-precise version (that is, does not use PEBS) of the event that counts return instructions retired.	Precise event capable. PS
C4H	10H	BR_INST_RETIRED.NOT_TAKEN	This is a non-precise version (that is, does not use PEBS) of the event that counts not taken branch instructions retired.	
C4H	20H	BR_INST_RETIRED.NEAR_TAKEN	This is a non-precise version (that is, does not use PEBS) of the event that counts taken branch instructions retired.	Precise event capable. PS
C4H	40H	BR_INST_RETIRED.FAR_BRANCH	This is a non-precise version (that is, does not use PEBS) of the event that counts far branch instructions retired.	Precise event capable. PS

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Counts all the retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor incorrectly predicts the destination of the branch. When the misprediction is discovered at execution, all the instructions executed in the wrong (speculative) path must be discarded, and the processor must start fetching from the correct path.	Precise event capable. See Table 19-1.
C5H	01H	BR_MISP_RETIRED.CONDITIONAL	This is a non-precise version (that is, does not use PEBS) of the event that counts mispredicted conditional branch instructions retired.	Precise event capable. PS
C5H	02H	BR_MISP_RETIRED.NEAR_CALL	Counts both taken and not taken retired mispredicted direct and indirect near calls, including both register and memory indirect.	Precise event capable.
C5H	20H	BR_MISP_RETIRED.NEAR_TAKEN	Number of near branch instructions retired that were mispredicted and taken.	Precise event capable. PS
C6H	01H	FRONTEND_RETIRED.DSB_MISS	Counts retired Instructions that experienced DSB (Decode stream buffer, i.e. the decoded instruction-cache) miss.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.L1I_MISS	Retired Instructions who experienced Instruction L1 Cache true miss.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.L2_MISS	Retired Instructions who experienced Instruction L2 Cache true miss.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.ITLB_MISS	Counts retired Instructions that experienced iTLB (Instruction TLB) true miss.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.STLB_MISS	Counts retired Instructions that experienced STLB (2nd level TLB) true miss.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_2	Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 2 cycles which was not interrupted by a back-end stall.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_4	Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 4 cycles which was not interrupted by a back-end stall.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_8	Counts retired instructions that are delivered to the back end after a front-end stall of at least 8 cycles. During this period the front end delivered no uops.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_16	Counts retired instructions that are delivered to the back end after a front-end stall of at least 16 cycles. During this period the front end delivered no uops.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_32	Counts retired instructions that are delivered to the back end after a front-end stall of at least 32 cycles. During this period the front end delivered no uops.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_64	Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 64 cycles which was not interrupted by a back-end stall.	Precise event capable.

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_128	Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 128 cycles which was not interrupted by a back-end stall.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_256	Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 256 cycles which was not interrupted by a back-end stall.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_512	Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 512 cycles which was not interrupted by a back-end stall.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_2_BUBBLES_GE_1	Counts retired instructions that are delivered to the back end after the front end had at least 1 bubble-slot for a period of 2 cycles. A bubble-slot is an empty issue-pipeline slot while there was no RAT stall.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_2_BUBBLES_GE_2	Retired instructions that are fetched after an interval where the front end had at least 2 bubble-slots for a period of 2 cycles which was not interrupted by a back-end stall.	Precise event capable.
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_2_BUBBLES_GE_3	Retired instructions that are fetched after an interval where the front end had at least 3 bubble-slots for a period of 2 cycles which was not interrupted by a back-end stall.	Precise event capable.
C7H	01H	FP_ARITH_INST_RETIRED.SCALAR_DOUBLE	Number of SSE/AVX computational scalar double precision floating-point instructions retired. Each count represents 1 computation. Applies to SSE* and AVX* scalar double precision floating-point instructions: ADD SUB MUL DIV MIN MAX SQRT FM(N)ADD/SUB. FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element.	Software may treat each count as one DP FLOP.
C7H	02H	FP_ARITH_INST_RETIRED.SCALAR_SINGLE	Number of SSE/AVX computational scalar single precision floating-point instructions retired. Each count represents 1 computation. Applies to SSE* and AVX* scalar single precision floating-point instructions: ADD SUB MUL DIV MIN MAX RCP RSQRT SQRT FM(N)ADD/SUB. FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element.	Software may treat each count as one SP FLOP.
C7H	04H	FP_ARITH_INST_RETIRED.128B_PACKED_DOUBLE	Number of SSE/AVX computational 128-bit packed double precision floating-point instructions retired. Each count represents 2 computations. Applies to SSE* and AVX* packed double precision floating-point instructions: ADD SUB MUL DIV MIN MAX SQRT DPP FM(N)ADD/SUB. DPP and FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element.	Software may treat each count as two DP FLOPs.

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C7H	08H	FP_ARITH_INST_RETIRED.128B_PACKED_SINGLE	Number of SSE/AVX computational 128-bit packed single precision floating-point instructions retired. Each count represents 4 computations. Applies to SSE* and AVX* packed single precision floating-point instructions: ADD SUB MUL DIV MIN MAX RCP RSQRT SQRT DPP FM(N)ADD/SUB. DPP and FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element.	Software may treat each count as four SP FLOPs.
C7H	10H	FP_ARITH_INST_RETIRED.256B_PACKED_DOUBLE	Number of SSE/AVX computational 256-bit packed double precision floating-point instructions retired. Each count represents 4 computations. Applies to SSE* and AVX* packed double precision floating-point instructions: ADD SUB MUL DIV MIN MAX SQRT DPP FM(N)ADD/SUB. DPP and FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element.	Software may treat each count as four DP FLOPs.
C7H	20H	FP_ARITH_INST_RETIRED.256B_PACKED_SINGLE	Number of SSE/AVX computational 256-bit packed single precision floating-point instructions retired. Each count represents 8 computations. Applies to SSE* and AVX* packed single precision floating-point instructions: ADD SUB MUL DIV MIN MAX RCP RSQRT SQRT DPP FM(N)ADD/SUB. DPP and FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element.	Software may treat each count as eight SP FLOPs.
C7H	40H	FP_ARITH_INST_RETIRED.512B_PACKED_DOUBLE	Number of Packed Double-Precision FP arithmetic instructions (use operation multiplier of 8).	Only applicable when AVX-512 is enabled.
C7H	80H	FP_ARITH_INST_RETIRED.512B_PACKED_SINGLE	Number of Packed Single-Precision FP arithmetic instructions (use operation multiplier of 16).	Only applicable when AVX-512 is enabled.
C8H	01H	HLE_RETIRED.START	Number of times we entered an HLE region. Does not count nested transactions.	
C8H	02H	HLE_RETIRED.COMMIT	Number of times HLE commit succeeded.	
C8H	04H	HLE_RETIRED.ABORTED	Number of times HLE abort was triggered.	Precise event capable.
C8H	08H	HLE_RETIRED.ABORTED_MEM	Number of times an HLE execution aborted due to various memory events (e.g., read/write capacity and conflicts).	
C8H	10H	HLE_RETIRED.ABORTED_TIMER	Number of times an HLE execution aborted due to hardware timer expiration.	
C8H	20H	HLE_RETIRED.ABORTED_UNFRIENDLY	Number of times an HLE execution aborted due to HLE-unfriendly instructions and certain unfriendly events (such as AD assists etc.).	
C8H	40H	HLE_RETIRED.ABORTED_MEMTYPE	Number of times an HLE execution aborted due to incompatible memory type.	
C8H	80H	HLE_RETIRED.ABORTED_EVENTS	Number of times an HLE execution aborted due to unfriendly events (such as interrupts).	
C9H	01H	RTM_RETIRED.START	Number of times we entered an RTM region. Does not count nested transactions.	
C9H	02H	RTM_RETIRED.COMMIT	Number of times RTM commit succeeded.	
C9H	04H	RTM_RETIRED.ABORTED	Number of times RTM abort was triggered.	Precise event capable.

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C9H	08H	RTM_RETIRED.ABORTED_MEM	Number of times an RTM execution aborted due to various memory events (e.g. read/write capacity and conflicts).	
C9H	10H	RTM_RETIRED.ABORTED_TIMER	Number of times an RTM execution aborted due to uncommon conditions.	
C9H	20H	RTM_RETIRED.ABORTED_UNFRIENDLY	Number of times an RTM execution aborted due to HLE-unfriendly instructions.	
C9H	40H	RTM_RETIRED.ABORTED_MEMTYPE	Number of times an RTM execution aborted due to incompatible memory type.	
C9H	80H	RTM_RETIRED.ABORTED_EVENTS	Number of times an RTM execution aborted due to none of the previous 4 categories (e.g. interrupt).	
CAH	1EH	FP_ASSIST.ANY	Counts cycles with any input and output SSE or x87 FP assist. If an input and output assist are detected on the same cycle the event increments by 1.	CounterMask=1 CMSK1
CBH	01H	HW_INTERRUPTS.RECEIVED	Counts the number of hardware interruptions received by the processor.	
CCH	20H	ROB_MISC_EVENTS.LBR_INSERTS	Increments when an entry is added to the Last Branch Record (LBR) array (or removed from the array in case of RETURNs in call stack mode). The event requires LBR enable via IA32_DEBUGCTL MSR and branch type selection via MSR_LBR_SELECT.	
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY_GT_4	Counts loads when the latency from first dispatch to completion is greater than 4 cycles. Reported latency may be longer than just the memory latency.	Precise event capable. Specify threshold in MSR 3F6H.
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY_GT_8	Counts loads when the latency from first dispatch to completion is greater than 8 cycles. Reported latency may be longer than just the memory latency.	Precise event capable. Specify threshold in MSR 3F6H.
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY_GT_16	Counts loads when the latency from first dispatch to completion is greater than 16 cycles. Reported latency may be longer than just the memory latency.	Precise event capable. Specify threshold in MSR 3F6H.
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY_GT_32	Counts loads when the latency from first dispatch to completion is greater than 32 cycles. Reported latency may be longer than just the memory latency.	Precise event capable. Specify threshold in MSR 3F6H.
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY_GT_64	Counts loads when the latency from first dispatch to completion is greater than 64 cycles. Reported latency may be longer than just the memory latency.	Precise event capable. Specify threshold in MSR 3F6H.
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY_GT_128	Counts loads when the latency from first dispatch to completion is greater than 128 cycles. Reported latency may be longer than just the memory latency.	Precise event capable. Specify threshold in MSR 3F6H.
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY_GT_256	Counts loads when the latency from first dispatch to completion is greater than 256 cycles. Reported latency may be longer than just the memory latency.	Precise event capable. Specify threshold in MSR 3F6H.
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY_GT_512	Counts loads when the latency from first dispatch to completion is greater than 512 cycles. Reported latency may be longer than just the memory latency.	Precise event capable. Specify threshold in MSR 3F6H.
D0H	11H	MEM_INST_RETIRED.STLB_MISS_LOADS	Retired load instructions that miss the STLB.	Precise event capable. PSDLA

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D0H	12H	MEM_INST_RETIRED.STLB_MISS_STORES	Retired store instructions that miss the STLB.	Precise event capable. PSDLA
D0H	21H	MEM_INST_RETIRED.LOCK_LOADS	Retired load instructions with locked access.	Precise event capable. PSDLA
D0H	41H	MEM_INST_RETIRED.SPLIT_LOADS	Counts retired load instructions that split across a cacheline boundary.	Precise event capable. PSDLA
D0H	42H	MEM_INST_RETIRED.SPLIT_STORES	Counts retired store instructions that split across a cacheline boundary.	Precise event capable. PSDLA
D0H	81H	MEM_INST_RETIRED.ALL_LOADS	All retired load instructions.	Precise event capable. PSDLA
D0H	82H	MEM_INST_RETIRED.ALL_STORES	All retired store instructions.	Precise event capable. PSDLA
D1H	01H	MEM_LOAD_RETIRED.L1_HIT	Counts retired load instructions with at least one uop that hit in the L1 data cache. This event includes all SW prefetches and lock instructions regardless of the data source.	Precise event capable. PSDLA
D1H	02H	MEM_LOAD_RETIRED.L2_HIT	Retired load instructions with L2 cache hits as data sources.	Precise event capable. PSDLA
D1H	04H	MEM_LOAD_RETIRED.L3_HIT	Counts retired load instructions with at least one uop that hit in the L3 cache.	Precise event capable. PSDLA
D1H	08H	MEM_LOAD_RETIRED.L1_MISS	Counts retired load instructions with at least one uop that missed in the L1 cache.	Precise event capable. PSDLA
D1H	10H	MEM_LOAD_RETIRED.L2_MISS	Retired load instructions missed L2 cache as data sources.	Precise event capable. PSDLA
D1H	20H	MEM_LOAD_RETIRED.L3_MISS	Counts retired load instructions with at least one uop that missed in the L3 cache.	Precise event capable. PSDLA
D1H	40H	MEM_LOAD_RETIRED.FB_HIT	Counts retired load instructions with at least one uop was load missed in L1 but hit FB (Fill Buffers) due to preceding miss to the same cache line with data not ready.	Precise event capable. PSDLA
D2H	01H	MEM_LOAD_L3_HIT_RETIRED.XSNP_MISS	Retired load instructions which data sources were L3 hit and cross-core snoop missed in on-pkg core cache.	Precise event capable. PSDLA
D2H	02H	MEM_LOAD_L3_HIT_RETIRED.XSNP_HIT	Retired load instructions which data sources were L3 and cross-core snoop hits in on-pkg core cache.	Precise event capable. PSDLA
D2H	04H	MEM_LOAD_L3_HIT_RETIRED.XSNP_HITM	Retired load instructions which data sources were HitM responses from shared L3.	Precise event capable. PSDLA
D2H	08H	MEM_LOAD_L3_HIT_RETIRED.XSNP_NONE	Retired load instructions which data sources were hits in L3 without snoops required.	Precise event capable. PSDLA
D3H	01H	MEM_LOAD_L3_MISS_RETIRED.LOCAL_DRAM	Retired load instructions which data sources missed L3 but serviced from local DRAM.	Precise event capable.
D3H	02H	MEM_LOAD_L3_MISS_RETIRED.REMOTE_DRAM	Retired load instructions which data sources missed L3 but serviced from remote dram.	Precise event capable.
D3H	04H	MEM_LOAD_L3_MISS_RETIRED.REMOTE_HITM	Retired load instructions whose data sources was remote HITM.	Precise event capable.
D3H	08H	MEM_LOAD_L3_MISS_RETIRED.REMOTE_FWD	Retired load instructions whose data sources was forwarded from a remote cache.	

Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D4H	04H	MEM_LOAD_MISC_RETIRED.UC	Retired instructions with at least 1 uncacheable load or lock.	Precise event capable.
E6H	01H	BACLEARS.ANY	Counts the number of times the front-end is resteered when it finds a branch instruction in a fetch line. This occurs for the first time a branch instruction is fetched or when the branch is not tracked by the BPU (Branch Prediction Unit) anymore.	
F0H	40H	L2_TRANS.L2_WB	Counts L2 writebacks that access L2 cache.	
F1H	1FH	L2_LINES_IN.ALL	Counts the number of L2 cache lines filling the L2. Counting does not cover rejects.	
F2H	01H	L2_LINES_OUT.SILENT	Counts the number of lines that are silently dropped by L2 cache when triggered by an L2 cache fill. These lines are typically in Shared state. A non-threaded event.	
F2H	02H	L2_LINES_OUT.NON_SILENT	Counts the number of lines that are evicted by L2 cache when triggered by an L2 cache fill. Those lines can be either in modified state or clean state. Modified lines may either be written back to L3 or directly written to memory and not allocated in L3. Clean lines may either be allocated in L3 or dropped.	
F2H	04H	L2_LINES_OUT.USELESS_PREF	Counts the number of lines that have been hardware prefetched but not used and now evicted by L2 cache.	
F2H	04H	L2_LINES_OUT.USELESS_HWPF	Counts the number of lines that have been hardware prefetched but not used and now evicted by L2 cache.	
F4H	10H	SQ_MISC.SPLIT_LOCK	Counts the number of cache line split locks sent to the uncore.	
FEH	02H	IDI_MISC.WB_UPGRADE	Counts number of cache lines that are allocated and written back to L3 with the intention that they are more likely to be reused shortly.	
FEH	04H	IDI_MISC.WB_DOWNGRADE	Counts number of cache lines that are dropped and not written back to L3 as they are deemed to be less likely to be reused shortly.	

19.3 PERFORMANCE MONITORING EVENTS FOR 6TH GENERATION INTEL® CORE™ PROCESSOR AND 7TH GENERATION INTEL® CORE™ PROCESSOR

6th Generation Intel® Core™ processors are based on the Skylake microarchitecture. They support the architectural performance monitoring events listed in Table 19-1. Fixed counters in the core PMU support the architecture events defined in Table 19-2. Model-specific performance monitoring events in the processor core are listed in Table 19-4. The events in Table 19-4 apply to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following values: 06_4EH and 06_5EH. Table 19-10 lists performance events supporting Intel TSX (see Section 18.3.6.5) and the events are applicable to processors based on Skylake microarchitecture. Where Skylake microarchitecture implements TSX-related event semantics that differ from Table 19-10, they are listed in Table 19-5.

7th Generation Intel® Core™ processors are based on the Kaby Lake microarchitecture. Model-specific performance monitoring events in the processor core are listed in Table 19-4. The events in Table 19-4 apply to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following values: 06_8EH and 06_9EH.

The comment column in Table 19-4 uses abbreviated letters to indicate additional conditions applicable to the Event Mask Mnemonic. For event umasks listed in Table 19-4 that do not show "AnyT", users should refrain from programming "AnyThread =1" in IA32_PERF_EVTSELx.

Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	02H	LD_BLOCKS.STORE_FORWARD	Loads blocked by overlapping with store buffer that cannot be forwarded.	
03H	08H	LD_BLOCKS.NO_SR	The number of times that split load operations are temporarily blocked because all resources for handling the split accesses are in use.	
07H	01H	LD_BLOCKS_PARTIAL.ADDRESS_ALIAS	False dependencies in MOB due to partial compare on address.	
08H	01H	DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK	Load misses in all TLB levels that cause a page walk of any page size.	
08H	0EH	DTLB_LOAD_MISSES.WALK_COMPLETED	Load misses in all TLB levels causes a page walk that completes. (All page sizes.)	
08H	10H	DTLB_LOAD_MISSES.WALK_PENDING	Counts 1 per cycle for each PMH that is busy with a page walk for a load.	
08H	10H	DTLB_LOAD_MISSES.WALK_ACTIVE	Cycles when at least one PMH is busy with a walk for a load.	CMSK1
08H	20H	DTLB_LOAD_MISSES.STLB_HIT	Loads that miss the DTLB but hit STLB.	
0DH	01H	INT_MISC.RECOVERY_CYCLES	Core cycles the allocator was stalled due to recovery from earlier machine clear event for this thread (for example, misprediction or memory order conflict).	
0DH	01H	INT_MISC.RECOVERY_CYCLES_ANY	Core cycles the allocator was stalled due to recovery from earlier machine clear event for any logical thread in this processor core.	AnyT
0DH	80H	INT_MISC.CLEAR_RESTEER_CYCLES	Cycles the issue-stage is waiting for front end to fetch from resteered path following branch misprediction or machine clear events.	
0EH	01H	UOPS_ISSUED.ANY	The number of uops issued by the RAT to RS.	
0EH	01H	UOPS_ISSUED.STALL_CYCLES	Cycles when the RAT does not issue uops to RS for the thread.	CMSK1, INV
0EH	02H	UOPS_ISSUED.VECTOR_WIDTH_MISMATCH	Uops inserted at issue-stage in order to preserve upper bits of vector registers.	
0EH	20H	UOPS_ISSUED.SLOW_LEA	Number of slow LEA or similar uops allocated. Such uop has 3 sources (for example, 2 sources + immediate) regardless of whether it is a result of LEA instruction or not.	
14H	01H	ARITH.FPU_DIVIDER_ACTIVE	Cycles when divider is busy executing divide or square root operations. Accounts for FP operations including integer divides.	
24H	21H	L2_RQSTS.DEMAND_DATA_RD_MISS	Demand Data Read requests that missed L2, no rejects.	
24H	22H	L2_RQSTS.RFO_MISS	RFO requests that missed L2.	
24H	24H	L2_RQSTS.CODE_RD_MISS	L2 cache misses when fetching instructions.	
24H	27H	L2_RQSTS.ALL_DEMAND_MISS	Demand requests that missed L2.	

Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
60H	10H	OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_L3_MISS_DEMAND_DATA_RD	Cycles with at least one offcore outstanding demand data read requests from SQ that missed L3.	CMSK1
60H	10H	OFFCORE_REQUESTS_OUTSTANDING.L3_MISS_DEMAND_DATA_RD_GE_6	Cycles with at least one offcore outstanding demand data read requests from SQ that missed L3.	CMSK6
63H	02H	LOCK_CYCLES.CACHE_LOCK_DURATION	Cycles in which the L1D is locked.	
79H	04H	IDQ.MITE_UOPS	Increment each cycle # of uops delivered to IDQ from MITE path.	
79H	04H	IDQ.MITE_CYCLES	Cycles when uops are being delivered to IDQ from MITE path.	CMSK1
79H	08H	IDQ.DSB_UOPS	Increment each cycle. # of uops delivered to IDQ from DSB path.	
79H	08H	IDQ.DSB_CYCLES	Cycles when uops are being delivered to IDQ from DSB path.	CMSK1
79H	10H	IDQ.MS_DSB_UOPS	Increment each cycle # of uops delivered to IDQ by DSB when MS_busy.	
79H	18H	IDQ.ALL_DSB_CYCLES_ANY_UOPS	Cycles DSB is delivered at least one uops.	CMSK1
79H	18H	IDQ.ALL_DSB_CYCLES_4_UOPS	Cycles DSB is delivered four uops.	CMSK4
79H	20H	IDQ.MS_MITE_UOPS	Increment each cycle # of uops delivered to IDQ by MITE when MS_busy.	
79H	24H	IDQ.ALL_MITE_CYCLES_ANY_UOPS	Counts cycles MITE is delivered at least one uops.	CMSK1
79H	24H	IDQ.ALL_MITE_CYCLES_4_UOPS	Counts cycles MITE is delivered four uops.	CMSK4
79H	30H	IDQ.MS_UOPS	Increment each cycle # of uops delivered to IDQ while MS is busy.	
79H	30H	IDQ.MS_SWITCHES	Number of switches from DSB or MITE to MS.	EDG
79H	30H	IDQ.MS_CYCLES	Cycles MS is delivered at least one uops.	CMSK1
80H	04H	ICACHE_16B.IFDATA_STALL	Cycles where a code fetch is stalled due to L1 instruction cache miss.	
80H	04H	ICACHE_64B.IFDATA_STALL	Cycles where a code fetch is stalled due to L1 instruction cache tag miss.	
83H	01H	ICACHE_64B.IFTAG_HIT	Instruction fetch tag lookups that hit in the instruction cache (L1I). Counts at 64-byte cache-line granularity.	
83H	02H	ICACHE_64B.IFTAG_MISS	Instruction fetch tag lookups that miss in the instruction cache (L1I). Counts at 64-byte cache-line granularity.	
85H	01H	ITLB_MISSES.MISS_CAUSES_A_WALK	Misses at all ITLB levels that cause page walks.	
85H	0EH	ITLB_MISSES.WALK_COMPLETED	Counts completed page walks in any TLB level due to code fetch misses (all page sizes).	
85H	10H	ITLB_MISSES.WALK_PENDING	Counts 1 per cycle for each PMH that is busy with a page walk for an instruction fetch request.	

Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
85H	20H	ITLB_MISSES.STLB_HIT	ITLB misses that hit STLB.	
87H	01H	ILD_STALL.LCP	Stalls caused by changing prefix length of the instruction.	
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CORE	Count issue pipeline slots where no uop was delivered from the front end to the back end when there is no back-end stall.	
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CYCLES_0_UOP_DELIV.CORE	Cycles which 4 issue pipeline slots had no uop delivered from the front end to the back end when there is no back-end stall.	CMSK4
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CYCLES_LE_n_UOP_DELIV.CORE	Cycles which "4-n" issue pipeline slots had no uop delivered from the front end to the back end when there is no back-end stall.	Set CMSK = 4-n; n = 1, 2, 3
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CYCLES_FE_WAS_OK	Cycles which front end delivered 4 uops or the RAT was stalling FE.	CMSK, INV
A1H	01H	UOPS_DISPATCHED_PORT.PORT_0	Counts the number of cycles in which a uop is dispatched to port 0.	
A1H	02H	UOPS_DISPATCHED_PORT.PORT_1	Counts the number of cycles in which a uop is dispatched to port 1.	
A1H	04H	UOPS_DISPATCHED_PORT.PORT_2	Counts the number of cycles in which a uop is dispatched to port 2.	
A1H	08H	UOPS_DISPATCHED_PORT.PORT_3	Counts the number of cycles in which a uop is dispatched to port 3.	
A1H	10H	UOPS_DISPATCHED_PORT.PORT_4	Counts the number of cycles in which a uop is dispatched to port 4.	
A1H	20H	UOPS_DISPATCHED_PORT.PORT_5	Counts the number of cycles in which a uop is dispatched to port 5.	
A1H	40H	UOPS_DISPATCHED_PORT.PORT_6	Counts the number of cycles in which a uop is dispatched to port 6.	
A1H	80H	UOPS_DISPATCHED_PORT.PORT_7	Counts the number of cycles in which a uop is dispatched to port 7.	
A2H	01H	RESOURCE_STALLS.ANY	Resource-related stall cycles.	
A2H	08H	RESOURCE_STALLS.SB	Cycles stalled due to no store buffers available (not including draining form sync).	
A3H	01H	CYCLE_ACTIVITY.CYCLES_L2_MISS	Cycles while L2 cache miss demand load is outstanding.	CMSK1
A3H	02H	CYCLE_ACTIVITY.CYCLES_L3_MISS	Cycles while L3 cache miss demand load is outstanding.	CMSK2
A3H	04H	CYCLE_ACTIVITY.STALLS_TOTAL	Total execution stalls.	CMSK4
A3H	05H	CYCLE_ACTIVITY.STALLS_L2_MISS	Execution stalls while L2 cache miss demand load is outstanding.	CMSK5
A3H	06H	CYCLE_ACTIVITY.STALLS_L3_MISS	Execution stalls while L3 cache miss demand load is outstanding.	CMSK6
A3H	08H	CYCLE_ACTIVITY.CYCLES_L1D_MISS	Cycles while L1 data cache miss demand load is outstanding.	CMSK8
A3H	0CH	CYCLE_ACTIVITY.STALLS_L1D_MISS	Execution stalls while L1 data cache miss demand load is outstanding.	CMSK12

Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
A3H	10H	CYCLE_ACTIVITY.CYCLES_MEM_ANY	Cycles while memory subsystem has an outstanding load.	CMSK16
A3H	14H	CYCLE_ACTIVITY.STALLS_MEM_ANY	Execution stalls while memory subsystem has an outstanding load.	CMSK20
A6H	01H	EXE_ACTIVITY.EXE_BOUND_0_PORTS	Cycles for which no uops began execution, the Reservation Station was not empty, the Store Buffer was full and there was no outstanding load.	
A6H	02H	EXE_ACTIVITY.1_PORTS_UTIL	Cycles for which one uop began execution on any port, and the Reservation Station was not empty.	
A6H	04H	EXE_ACTIVITY.2_PORTS_UTIL	Cycles for which two uops began execution, and the Reservation Station was not empty.	
A6H	08H	EXE_ACTIVITY.3_PORTS_UTIL	Cycles for which three uops began execution, and the Reservation Station was not empty.	
A6H	04H	EXE_ACTIVITY.4_PORTS_UTIL	Cycles for which four uops began execution, and the Reservation Station was not empty.	
A6H	40H	EXE_ACTIVITY.BOUND_ON_STORES	Cycles where the Store Buffer was full and no outstanding load.	
A8H	01H	LSD.UOPS	Number of uops delivered by the LSD.	
A8H	01H	LSD.CYCLES_ACTIVE	Cycles with at least one uop delivered by the LSD and none from the decoder.	CMSK1
A8H	01H	LSD.CYCLES_4_UOPS	Cycles with 4 uops delivered by the LSD and none from the decoder.	CMSK4
ABH	02H	DSB2MITE_SWITCHES.PENALTY_CYCLES	DSB-to-MITE switch true penalty cycles.	
AEH	01H	ITLB.ITLB_FLUSH	Flushing of the Instruction TLB (ITLB) pages, includes 4k/2M/4M pages.	
B0H	01H	OFFCORE_REQUESTS.DEMAND_DATA_RD	Demand data read requests sent to uncore.	
B0H	02H	OFFCORE_REQUESTS.DEMAND_CODE_RD	Demand code read requests sent to uncore.	
B0H	04H	OFFCORE_REQUESTS.DEMAND_RFO	Demand RFO read requests sent to uncore, including regular RFOs, locks, ItoM.	
B0H	08H	OFFCORE_REQUESTS.ALL_DATA_RD	Data read requests sent to uncore (demand and prefetch).	
B0H	10H	OFFCORE_REQUESTS.L3_MISS_DEMAND_DATA_RD	Demand data read requests that missed L3.	
B0H	80H	OFFCORE_REQUESTS.ALL_REQUESTS	Any memory transaction that reached the SQ.	
B1H	01H	UOPS_EXECUTED.THREAD	Counts the number of uops that begin execution across all ports.	
B1H	01H	UOPS_EXECUTED.STALL_CYCLES	Cycles where there were no uops that began execution.	CMSK, INV
B1H	01H	UOPS_EXECUTED.CYCLES_GE_1_UOP_EXEC	Cycles where there was at least one uop that began execution.	CMSK1
B1H	01H	UOPS_EXECUTED.CYCLES_GE_2_UOP_EXEC	Cycles where there were at least two uops that began execution.	CMSK2

Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
B1H	01H	UOPS_EXECUTED.CYCLES_GE_3_UOP_EXEC	Cycles where there were at least three uops that began execution.	CMSK3
B1H	01H	UOPS_EXECUTED.CYCLES_GE_4_UOP_EXEC	Cycles where there were at least four uops that began execution.	CMSK4
B1H	02H	UOPS_EXECUTED.CORE	Counts the number of uops from any logical processor in this core that begin execution.	
B1H	02H	UOPS_EXECUTED.CORE_CYCLES_GE_1	Cycles where there was at least one uop, from any logical processor in this core, that began execution.	CMSK1
B1H	02H	UOPS_EXECUTED.CORE_CYCLES_GE_2	Cycles where there were at least two uops, from any logical processor in this core, that began execution.	CMSK2
B1H	02H	UOPS_EXECUTED.CORE_CYCLES_GE_3	Cycles where there were at least three uops, from any logical processor in this core, that began execution.	CMSK3
B1H	02H	UOPS_EXECUTED.CORE_CYCLES_GE_4	Cycles where there were at least four uops, from any logical processor in this core, that began execution.	CMSK4
B1H	02H	UOPS_EXECUTED.CORE_CYCLES_NONE	Cycles where there were no uops from any logical processor in this core that began execution.	CMSK1, INV
B1H	10H	UOPS_EXECUTED.X87	Counts the number of X87 uops that begin execution.	
B2H	01H	OFF_CORE_REQUEST_BUFFER.SQ_FULL	Offcore requests buffer cannot take more entries for this core.	
B7H	01H	OFF_CORE_RESPONSE_0	See Section 18.3.4.5, "Off-core Response Performance Monitoring".	Requires MSR 01A6H
BBH	01H	OFF_CORE_RESPONSE_1	See Section 18.3.4.5, "Off-core Response Performance Monitoring".	Requires MSR 01A7H
BDH	01H	TLB_FLUSH.DTLB_THREAD	DTLB flush attempts of the thread-specific entries.	
BDH	01H	TLB_FLUSH.STLB_ANY	STLB flush attempts.	
C0H	00H	INST_RETIRED.ANY_P	Number of instructions at retirement.	See Table 19-1.
C0H	01H	INST_RETIRED.PREC_DIST	Precise instruction retired event with HW to reduce effect of PEBS shadow in IP distribution.	PMC1 only;
C0H	01H	INST_RETIRED.TOTAL_CYCLES	Number of cycles using always true condition applied to PEBS instructions retired event.	CMSK10, PS
C1H	3FH	OTHER_ASSISTS.ANY	Number of times a microcode assist is invoked by HW other than FP-assist. Examples include AD (page Access Dirty) and AVX* related assists.	
C2H	01H	UOPS_RETIRED.STALL_CYCLES	Cycles without actually retired uops.	CMSK1, INV
C2H	01H	UOPS_RETIRED.TOTAL_CYCLES	Cycles with less than 10 actually retired uops.	CMSK10, INV
C2H	02H	UOPS_RETIRED.RETIRE_SLOTS	Retirement slots used.	
C3H	01H	MACHINE_CLEARS.COUNT	Number of machine clears of any type.	CMSK1, EDG
C3H	02H	MACHINE_CLEARS.MEMORY_ORDERING	Counts the number of machine clears due to memory order conflicts.	
C3H	04H	MACHINE_CLEARS.SMC	Number of self-modifying-code machine clears detected.	
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Branch instructions that retired.	See Table 19-1.
C4H	01H	BR_INST_RETIRED.CONDITIONAL	Counts the number of conditional branch instructions retired.	PS

Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C4H	02H	BR_INST_RETIRED.NEAR_CALL	Direct and indirect near call instructions retired.	PS
C4H	04H	BR_INST_RETIRED.ALL_BRANCHES	Counts the number of branch instructions retired.	PS
C4H	08H	BR_INST_RETIRED.NEAR_RETURN	Counts the number of near return instructions retired.	PS
C4H	10H	BR_INST_RETIRED.NOT_TAKEN	Counts the number of not taken branch instructions retired.	
C4H	20H	BR_INST_RETIRED.NEAR_TAKEN	Number of near taken branches retired.	PS
C4H	40H	BR_INST_RETIRED.FAR_BRANCH	Number of far branches retired.	PS
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted branch instructions at retirement.	See Table 19-1.
C5H	01H	BR_MISP_RETIRED.CONDITIONAL	Mispredicted conditional branch instructions retired.	PS
C5H	04H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted macro branch instructions retired.	PS
C5H	20H	BR_MISP_RETIRED.NEAR_TAKEN	Number of near branch instructions retired that were mispredicted and taken.	PS
C6H	01H	FRONTEND_RETIRED.DSB_MISS	Retired instructions which experienced DSB miss. Specify MSR_PEBS_FRONTEND.EVTSEL=11H.	PS
C6H	01H	FRONTEND_RETIRED.L1I_MISS	Retired instructions which experienced instruction L1 cache true miss. Specify MSR_PEBS_FRONTEND.EVTSEL=12H.	PS
C6H	01H	FRONTEND_RETIRED.L2_MISS	Retired instructions which experienced L2 cache true miss. Specify MSR_PEBS_FRONTEND.EVTSEL=13H.	PS
C6H	01H	FRONTEND_RETIRED.ITLB_MISS	Retired instructions which experienced ITLB true miss. Specify MSR_PEBS_FRONTEND.EVTSEL=14H.	PS
C6H	01H	FRONTEND_RETIRED.STLB_MISS	Retired instructions which experienced STLB true miss. Specify MSR_PEBS_FRONTEND.EVTSEL=15H.	PS
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_16	Retired instructions that are fetched after an interval where the front end delivered no uops for at least 16 cycles. Specify the following fields in MSR_PEBS_FRONTEND: EVTSEL=16H, IDQ_Bubble_Length =16, IDQ_Bubble_Width = 4.	PS
C6H	01H	FRONTEND_RETIRED.LATENCY_GE_2_BUBBLES_GE_m	Retired instructions that are fetched after an interval where the front end had 'm' IDQ slots delivered, no uops for at least 2 cycles. Specify the following fields in MSR_PEBS_FRONTEND: EVTSEL=16H, IDQ_Bubble_Length =2, IDQ_Bubble_Width = m.	PS, m = 1, 2, 3
C7H	01H	FP_ARITH_INST_RETIRED.SCALAR_DOUBLE	Number of double-precision, floating-point, scalar SSE/AVX computational instructions that are retired. Each scalar FMA instruction counts as 2.	Software may treat each count as one DP FLOP.
C7H	02H	FP_ARITH_INST_RETIRED.SCALAR_SINGLE	Number of single-precision, floating-point, scalar SSE/AVX computational instructions that are retired. Each scalar FMA instruction counts as 2.	Software may treat each count as one SP FLOP.

Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C7H	04H	FP_ARITH_INST_RETIRED.128B_PACKED_DOUBLE	Number of double-precision, floating-point, 128-bit SSE/AVX computational instructions that are retired. Each 128-bit FMA or (V)DPPD instruction counts as 2.	Software may treat each count as two DP FLOPs.
C7H	08H	FP_ARITH_INST_RETIRED.128B_PACKED_SINGLE	Number of single-precision, floating-point, 128-bit SSE/AVX computational instructions that are retired. Each 128-bit FMA or (V)DPPS instruction counts as 2.	Software may treat each count as four SP FLOPs.
C7H	10H	FP_ARITH_INST_RETIRED.256B_PACKED_DOUBLE	Number of double-precision, floating-point, 256-bit SSE/AVX computational instructions that are retired. Each 256-bit FMA instruction counts as 2.	Software may treat each count as four DP FLOPs.
C7H	20H	FP_ARITH_INST_RETIRED.256B_PACKED_SINGLE	Number of single-precision, floating-point, 256-bit SSE/AVX computational instructions that are retired. Each 256-bit FMA or VDPPS instruction counts as 2.	Software may treat each count as eight SP FLOPs.
CAH	1EH	FP_ASSIST.ANY	Cycles with any input/output SSE* or FP assists.	CMSK1
CBH	01H	HW_INTERRUPTS.RECEIVED	Number of hardware interrupts received by the processor.	
CCH	20H	ROB_MISC_EVENTS.LBR_INSERTS	Increments when an entry is added to the Last Branch Record (LBR) array (or removed from the array in case of RETURNs in call stack mode). The event requires LBR enable via IA32_DEBUGCTL MSR and branch type selection via MSR_LBR_SELECT.	
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY	Randomly sampled loads whose latency is above a user defined threshold. A small fraction of the overall loads are sampled due to randomization.	Specify threshold in MSR 3F6H. PSDLA
D0H	11H	MEM_INST_RETIRED.STLB_MISS_LOADS	Retired load instructions that miss the STLB.	PSDLA
D0H	12H	MEM_INST_RETIRED.STLB_MISS_STORES	Retired store instructions that miss the STLB.	PSDLA
D0H	21H	MEM_INST_RETIRED.LOCK_LOADS	Retired load instructions with locked access.	PSDLA
D0H	41H	MEM_INST_RETIRED.SPLIT_LOADS	Number of load instructions retired with cache-line splits that may impact performance.	PSDLA
D0H	42H	MEM_INST_RETIRED.SPLIT_STORES	Number of store instructions retired with line-split.	PSDLA
D0H	81H	MEM_INST_RETIRED.ALL_LOADS	All retired load instructions.	PSDLA
D0H	82H	MEM_INST_RETIRED.ALL_STORES	All retired store instructions.	PSDLA
D1H	01H	MEM_LOAD_RETIRED.L1_HIT	Retired load instructions with L1 cache hits as data sources.	PSDLA
D1H	02H	MEM_LOAD_RETIRED.L2_HIT	Retired load instructions with L2 cache hits as data sources.	PSDLA
D1H	04H	MEM_LOAD_RETIRED.L3_HIT	Retired load instructions with L3 cache hits as data sources.	PSDLA
D1H	08H	MEM_LOAD_RETIRED.L1_MISS	Retired load instructions missed L1 cache as data sources.	PSDLA
D1H	10H	MEM_LOAD_RETIRED.L2_MISS	Retired load instructions missed L2. Unknown data source excluded.	PSDLA

Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D1H	20H	MEM_LOAD_RETIRED.L3_MISS	Retired load instructions missed L3. Excludes unknown data source.	PSDLA
D1H	40H	MEM_LOAD_RETIRED.FB_HIT	Retired load instructions where data sources were load uops missed L1 but hit FB due to preceding miss to the same cache line with data not ready.	PSDLA
D2H	01H	MEM_LOAD_L3_HIT_RETIRED.XSNP_MISS	Retired load instructions where data sources were L3 hit and cross-core snoop missed in on-pkg core cache.	PSDLA
D2H	02H	MEM_LOAD_L3_HIT_RETIRED.XSNP_HIT	Retired load Instructions where data sources were L3 and cross-core snoop hits in on-pkg core cache.	PSDLA
D2H	04H	MEM_LOAD_L3_HIT_RETIRED.XSNP_HITM	Retired load instructions where data sources were HitM responses from shared L3.	PSDLA
D2H	08H	MEM_LOAD_L3_HIT_RETIRED.XSNP_NONE	Retired load instructions where data sources were hits in L3 without snoops required.	PSDLA
E6H	01H	BACLEARS.ANY	Number of front end re-steers due to BPU misprediction.	
F0H	40H	L2_TRANS.L2_WB	L2 writebacks that access L2 cache.	
F1H	07H	L2_LINES_IN.ALL	L2 cache lines filling L2.	

CMSK1: Counter Mask = 1 required; CMSK4: CounterMask = 4 required; CMSK6: CounterMask = 6 required; CMSK8: CounterMask = 8 required; CMSK10: CounterMask = 10 required; CMSK12: CounterMask = 12 required; CMSK16: CounterMask = 16 required; CMSK20: CounterMask = 20 required.

AnyT: AnyThread = 1 required.

INV: Invert = 1 required.

EDG: EDGE = 1 required.

PSDLA: Also supports PEBS and DataLA.

PS: Also supports PEBS.

Table 19-10 lists performance events supporting Intel TSX (see Section 18.3.6.5) and the events are applicable to processors based on Skylake microarchitecture. Where Skylake microarchitecture implements TSX-related event semantics that differ from Table 19-10, they are listed in Table 19-5.

Table 19-5. Intel® TSX Performance Event Addendum in Processors based on Skylake Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
54H	02H	TX_MEM.ABORT_CAPACITY	Number of times a transactional abort was signaled due to a data capacity limitation for transactional reads or writes.	

19.4 PERFORMANCE MONITORING EVENTS FOR INTEL® XEON PHI™ PROCESSOR 3200, 5200, 7200 SERIES

Intel® Xeon Phi™ processors 3200/5200/7200 series are based on the Knights Landing microarchitecture. Model-specific performance monitoring events in the processor core are listed in Table 19-6. The events in Table 19-6 apply to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following value 06_57H.

Table 19-6. Performance Events of the Processor Core Supported by Knights Landing Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	01H	RECYCLEQ.LD_BLOCK_ST_FORWARD	Counts the number of occurrences a retired load gets blocked because its address partially overlaps with a store.	PSDLA
03H	02H	RECYCLEQ.LD_BLOCK_STD_NOT READY	Counts the number of occurrences a retired load gets blocked because its address overlaps with a store whose data is not ready.	
03H	04H	RECYCLEQ.ST_SPLITS	Counts the number of occurrences a retired store that is a cache line split. Each split should be counted only once.	
03H	08H	RECYCLEQ.LD_SPLITS	Counts the number of occurrences a retired load that is a cache line split. Each split should be counted only once.	PSDLA
03H	10H	RECYCLEQ.LOCK	Counts all the retired locked loads. It does not include stores because we would double count if we count stores.	
03H	20H	RECYCLEQ.STA_FULL	Counts the store micro-ops retired that were pushed in the recycle queue because the store address buffer is full.	
03H	40H	RECYCLEQ.ANY_LD	Counts any retired load that was pushed into the recycle queue for any reason.	
03H	80H	RECYCLEQ.ANY_ST	Counts any retired store that was pushed into the recycle queue for any reason.	
04H	01H	MEM_UOPS_RETIRED.L1_MISS_ LOADS	Counts the number of load micro-ops retired that miss in L1 D cache.	
04H	02H	MEM_UOPS_RETIRED.L2_HIT_L OADS	Counts the number of load micro-ops retired that hit in the L2.	PSDLA
04H	04H	MEM_UOPS_RETIRED.L2_MISS_ LOADS	Counts the number of load micro-ops retired that miss in the L2.	PSDLA
04H	08H	MEM_UOPS_RETIRED.DTLB_MIS S_LOADS	Counts the number of load micro-ops retired that cause a DTLB miss.	PSDLA
04H	10H	MEM_UOPS_RETIRED.UTLB_MIS S_LOADS	Counts the number of load micro-ops retired that caused micro TLB miss.	
04H	20H	MEM_UOPS_RETIRED.HITM	Counts the loads retired that get the data from the other core in the same tile in M state.	
04H	40H	MEM_UOPS_RETIRED.ALL_LOAD S	Counts all the load micro-ops retired.	
04H	80H	MEM_UOPS_RETIRED.ALL_STOR ES	Counts all the store micro-ops retired.	
05H	01H	PAGE_WALKS.D_SIDE_WALKS	Counts the total D-side page walks that are completed or started. The page walks started in the speculative path will also be counted.	EdgeDetect=1
05H	01H	PAGE_WALKS.D_SIDE_CYCLES	Counts the total number of core cycles for all the D-side page walks. The cycles for page walks started in speculative path will also be included.	
05H	02H	PAGE_WALKS.I_SIDE_WALKS	Counts the total I-side page walks that are completed.	EdgeDetect=1

Table 19-6. Performance Events of the Processor Core Supported by Knights Landing Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
05H	02H	PAGE_WALKS.I_SIDE_CYCLES	Counts the total number of core cycles for all the I-side page walks. The cycles for page walks started in speculative path will also be included.	
05H	03H	PAGE_WALKS.WALKS	Counts the total page walks that are completed (I-side and D-side).	EdgeDetect=1
05H	03H	PAGE_WALKS.CYCLES	Counts the total number of core cycles for all the page walks. The cycles for page walks started in speculative path will also be included.	
2EH	41H	LONGEST_LAT_CACHE.MISS	Counts the number of L2 cache misses. Also called L2_REQUESTS_MISS.	
2EH	4FH	LONGEST_LAT_CACHE.REFERENCE	Counts the total number of L2 cache references. Also called L2_REQUESTS_REFERENCE.	
30H	00H	L2_REQUESTS_REJECT.ALL	Counts the number of MEC requests from the L2Q that reference a cache line (cacheable requests) excluding SW prefetches filling only to L2 cache and L1 evictions (automatically excludes L2HWP, UC, WC) that were rejected - Multiple repeated rejects should be counted multiple times.	
31H	00H	CORE_REJECT_L2Q.ALL	Counts the number of MEC requests that were not accepted into the L2Q because of any L2 queue reject condition. There is no concept of at-ret here. It might include requests due to instructions in the speculative path.	
3CH	00H	CPU_CLK_UNHALTED.THREAD_P	Counts the number of unhalted core clock cycles.	
3CH	01H	CPU_CLK_UNHALTED.REF	Counts the number of unhalted reference clock cycles.	
3EH	04H	L2_PREFETCHER.ALLOC_XQ	Counts the number of L2HWP allocated into XQ GP.	
80H	01H	ICACHE.HIT	Counts all instruction fetches that hit the instruction cache.	
80H	02H	ICACHE.MISSES	Counts all instruction fetches that miss the instruction cache or produce memory requests. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.	
80H	03H	ICACHE.ACCESSES	Counts all instruction fetches, including uncacheable fetches.	
86H	04H	FETCH_STALL.ICACHE_FILL_PENDING_CYCLES	Counts the number of core cycles the fetch stalls because of an icache miss. This is a cumulative count of core cycles the fetch stalled for all icache misses.	
B7H	01H	OFFCORE_RESPONSE_0	See Section 18.4.1.1.2.	Requires MSR_OFFCORE_RESP 0 to specify request type and response.
B7H	02H	OFFCORE_RESPONSE_1	See Section 18.4.1.1.2.	Requires MSR_OFFCORE_RESP 1 to specify request type and response.
C0H	00H	INST_RETIRED.ANY_P	Counts the total number of instructions retired.	PS

Table 19-6. Performance Events of the Processor Core Supported by Knights Landing Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C2H	01H	UOPS_RETIRED.MS	Counts the number of micro-ops retired that are from the complex flows issued by the micro-sequencer (MS).	
C2H	10H	UOPS_RETIRED.ALL	Counts the number of micro-ops retired.	
C2H	20H	UOPS_RETIRED.SCALAR_SIMD	Counts the number of scalar SSE, AVX, AVX2, and AVX-512 micro-ops except for loads (memory-to-register mov-type micro ops), division and sqrt.	
C2H	40H	UOPS_RETIRED.PACKED_SIMD	Counts the number of packed SSE, AVX, AVX2, and AVX-512 micro-ops (both floating point and integer) except for loads (memory-to-register mov-type micro-ops), packed byte and word multiplies.	
C3H	01H	MACHINE_CLEARS.SMC	Counts the number of times that the machine clears due to program modifying data within 1K of a recently fetched code page.	
C3H	02H	MACHINE_CLEARS.MEMORY_ORDERING	Counts the number of times the machine clears due to memory ordering hazards.	
C3H	04H	MACHINE_CLEARS.FP_ASSIST	Counts the number of floating operations retired that required microcode assists.	
C3H	08H	MACHINE_CLEARS.ALL	Counts all machine clears.	
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Counts the number of branch instructions retired.	PS
C4H	7EH	BR_INST_RETIRED.JCC	Counts the number of JCC branch instructions retired.	PS
C4H	BFH	BR_INST_RETIRED.FAR_BRANCH	Counts the number of far branch instructions retired.	PS
C4H	EBH	BR_INST_RETIRED.NON_RETURN_IND	Counts the number of branch instructions retired that were near indirect CALL or near indirect JMP.	PS
C4H	F7H	BR_INST_RETIRED.RETURN	Counts the number of near RET branch instructions retired.	PS
C4H	F9H	BR_INST_RETIRED.CALL	Counts the number of near CALL branch instructions retired.	PS
C4H	FBH	BR_INST_RETIRED.IND_CALL	Counts the number of near indirect CALL branch instructions retired.	PS
C4H	FDH	BR_INST_RETIRED.REL_CALL	Counts the number of near relative CALL branch instructions retired.	PS
C4H	FEH	BR_INST_RETIRED.TAKEN_JCC	Counts the number of branch instructions retired that were taken conditional jumps.	PS
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Counts the number of mispredicted branch instructions retired.	PS
C5H	7EH	BR_MISP_RETIRED.JCC	Counts the number of mispredicted JCC branch instructions retired.	PS
C5H	BFH	BR_MISP_RETIRED.FAR_BRANCH	Counts the number of mispredicted far branch instructions retired.	PS
C5H	EBH	BR_MISP_RETIRED.NON_RETURN_IND	Counts the number of mispredicted branch instructions retired that were near indirect CALL or near indirect JMP.	PS
C5H	F7H	BR_MISP_RETIRED.RETURN	Counts the number of mispredicted near RET branch instructions retired.	PS

Table 19-6. Performance Events of the Processor Core Supported by Knights Landing Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C5H	F9H	BR_MISP_RETIRED.CALL	Counts the number of mispredicted near CALL branch instructions retired.	PS
C5H	FBH	BR_MISP_RETIRED.IND_CALL	Counts the number of mispredicted near indirect CALL branch instructions retired.	PS
C5H	FDH	BR_MISP_RETIRED.REL_CALL	Counts the number of mispredicted near relative CALL branch instructions retired.	PS
C5H	FEH	BR_MISP_RETIRED.TAKEN_JCC	Counts the number of mispredicted branch instructions retired that were taken conditional jumps.	PS
CAH	01H	NO_ALLOC_CYCLES.ROB_FULL	Counts the number of core cycles when no micro-ops are allocated and the ROB is full.	
CAH	04H	NO_ALLOC_CYCLES.MISPREDICTS	Counts the number of core cycles when no micro-ops are allocated and the alloc pipe is stalled waiting for a mispredicted branch to retire.	
CAH	20H	NO_ALLOC_CYCLES.RAT_STALL	Counts the number of core cycles when no micro-ops are allocated and a RATstall (caused by reservation station full) is asserted.	
CAH	90H	NO_ALLOC_CYCLES.NOT_DELIVERED	Counts the number of core cycles when no micro-ops are allocated, the IQ is empty, and no other condition is blocking allocation.	
CAH	7FH	NO_ALLOC_CYCLES.ALL	Counts the total number of core cycles when no micro-ops are allocated for any reason.	
CBH	01H	RS_FULL_STALL.MEC	Counts the number of core cycles when allocation pipeline is stalled and is waiting for a free MEC reservation station entry.	
CBH	1FH	RS_FULL_STALL.ALL	Counts the total number of core cycles the allocation pipeline is stalled when any one of the reservation stations is full.	
CDH	01H	CYCLES_DIV_BUSY.ALL	Cycles the number of core cycles when divider is busy. Does not imply a stall waiting for the divider.	
E6H	01H	BACLEARS.ALL	Counts the number of times the front end resteers for any branch as a result of another branch handling mechanism in the front end.	
E6H	08H	BACLEARS.RETURN	Counts the number of times the front end resteers for RET branches as a result of another branch handling mechanism in the front end.	
E6H	10H	BACLEARS.COND	Counts the number of times the front end resteers for conditional branches as a result of another branch handling mechanism in the front end.	
E7H	01H	MS_DECODED.MS_ENTRY	Counts the number of times the MSROM starts a flow of uops.	

PS: Also supports PEBS.

PSDLA: Also supports PEBS and DataLA.

19.5 PERFORMANCE MONITORING EVENTS FOR THE INTEL® CORE™ M AND 5TH GENERATION INTEL® CORE™ PROCESSORS

The Intel® Core™ M processors, the 5th generation Intel® Core™ processors and the Intel Xeon processor E3 1200 v4 product family are based on the Broadwell microarchitecture. They support the architectural performance monitoring events listed in Table 19-1. Model-specific performance monitoring events in the processor core are listed in Table 19-7. The events in Table 19-7 apply to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following values: 06_3DH and 06_47H. Table 19-10 lists performance events supporting Intel TSX (see Section 18.3.6.5) and the events are available on processors based on Broadwell microarchitecture. Fixed counters in the core PMU support the architecture events defined in Table 19-2.

Model-specific performance monitoring events that are located in the uncore sub-system are implementation specific between different platforms using processors based on Broadwell microarchitecture and with different DisplayFamily_DisplayModel signatures. Processors with CPUID signature of DisplayFamily_DisplayModel 06_3DH and 06_47H support uncore performance events listed in Table 19-11.

Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	02H	LD_BLOCKS.STORE_FORWARD	Loads blocked by overlapping with store buffer that cannot be forwarded.	
03H	08H	LD_BLOCKS.NO_SR	The number of times that split load operations are temporarily blocked because all resources for handling the split accesses are in use.	
05H	01H	MISALIGN_MEM_REF.LOADS	Speculative cache-line split load uops dispatched to L1D.	
05H	02H	MISALIGN_MEM_REF.STORES	Speculative cache-line split store-address uops dispatched to L1D.	
07H	01H	LD_BLOCKS_PARTIAL.ADDRESS_ALIAS	False dependencies in MOB due to partial compare on address.	
08H	01H	DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK	Load misses in all TLB levels that cause a page walk of any page size.	
08H	02H	DTLB_LOAD_MISSES.WALK_COMPLETED_4K	Completed page walks due to demand load misses that caused 4K page walks in any TLB levels.	
08H	10H	DTLB_LOAD_MISSES.WALK_DURATION	Cycle PMH is busy with a walk.	
08H	20H	DTLB_LOAD_MISSES.STLB_HIT_4K	Load misses that missed DTLB but hit STLB (4K).	
0DH	03H	INT_MISC.RECOVERY_CYCLES	Cycles waiting to recover after Machine Clears except JEClear. Set Cmask= 1.	Set Edge to count occurrences.
0EH	01H	UOPS_ISSUED.ANY	Increments each cycle the # of uops issued by the RAT to RS. Set Cmask = 1, Inv = 1, Any= 1to count stalled cycles of this core.	Set Cmask = 1, Inv = 1to count stalled cycles.
0EH	10H	UOPS_ISSUED.FLAGS_MERGE	Number of flags-merge uops allocated. Such uops add delay.	
0EH	20H	UOPS_ISSUED.SLOW_LEA	Number of slow LEA or similar uops allocated. Such uop has 3 sources (for example, 2 sources + immediate) regardless of whether it is a result of LEA instruction or not.	
0EH	40H	UOPS_ISSUED.SINGLE_MUL	Number of multiply packed/scalar single precision uops allocated.	

Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
14H	01H	ARITH.FPU_DIV_ACTIVE	Cycles when divider is busy executing divide operations.	
24H	21H	L2_RQSTS.DEMAND_DATA_RD_MISS	Demand data read requests that missed L2, no rejects.	
24H	41H	L2_RQSTS.DEMAND_DATA_RD_HIT	Demand data read requests that hit L2 cache.	
24H	50H	L2_RQSTS.L2_PF_HIT	Counts all L2 HW prefetcher requests that hit L2.	
24H	30H	L2_RQSTS.L2_PF_MISS	Counts all L2 HW prefetcher requests that missed L2.	
24H	E1H	L2_RQSTS.ALL_DEMAND_DATA_RD	Counts any demand and L1 HW prefetch data load requests to L2.	
24H	E2H	L2_RQSTS.ALL_RFO	Counts all L2 store RFO requests.	
24H	E4H	L2_RQSTS.ALL_CODE_RD	Counts all L2 code requests.	
24H	F8H	L2_RQSTS.ALL_PF	Counts all L2 HW prefetcher requests.	
27H	50H	L2_DEMAND_RQSTS.WB_HIT	Not rejected writebacks that hit L2 cache.	
2EH	4FH	LONGEST_LAT_CACHE.REFERENCE	This event counts requests originating from the core that reference a cache line in the last level cache.	See Table 19-1.
2EH	41H	LONGEST_LAT_CACHE.MISS	This event counts each cache miss condition for references to the last level cache.	See Table 19-1.
3CH	00H	CPU_CLK_UNHALTED.THREAD_P	Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling.	See Table 19-1.
3CH	01H	CPU_CLK_THREAD_UNHALTED.REF_XCLK	Increments at the frequency of XCLK (100 MHz) when not halted.	See Table 19-1.
48H	01H	L1D_PEND_MISS.PENDING	Increments the number of outstanding L1D misses every cycle. Set Cmask = 1 and Edge =1 to count occurrences.	Counter 2 only. Set Cmask = 1 to count cycles.
49H	01H	DTLB_STORE_MISSES.MISS_CAUSES_A_WALK	Miss in all TLB levels causes a page walk of any page size (4K/2M/4M/1G).	
49H	02H	DTLB_STORE_MISSES.WALK_COMPLETED_4K	Completed page walks due to store misses in one or more TLB levels of 4K page structure.	
49H	10H	DTLB_STORE_MISSES.WALK_DURATION	Cycles PMH is busy with this walk.	
49H	20H	DTLB_STORE_MISSES.STLB_HIT_4K	Store misses that missed DTLB but hit STLB (4K).	
4CH	02H	LOAD_HIT_PRE.HW_PF	Non-SW-prefetch load dispatches that hit fill buffer allocated for H/W prefetch.	
4FH	10H	EPT.WALK_CYCLES	Cycles of Extended Page Table walks.	
51H	01H	L1D.REPLACEMENT	Counts the number of lines brought into the L1 data cache.	
58H	04H	MOVE_ELIMINATION.INT_NOT_ELIMINATED	Number of integer move elimination candidate uops that were not eliminated.	

Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
58H	08H	MOVE_ELIMINATION.SIMD_NOT_ELIMINATED	Number of SIMD move elimination candidate uops that were not eliminated.	
58H	01H	MOVE_ELIMINATION.INT_ELIMINATED	Number of integer move elimination candidate uops that were eliminated.	
58H	02H	MOVE_ELIMINATION.SIMD_ELIMINATED	Number of SIMD move elimination candidate uops that were eliminated.	
5CH	01H	CPL_CYCLES.RING0	Unhalted core cycles when the thread is in ring 0.	Use Edge to count transition.
5CH	02H	CPL_CYCLES.RING123	Unhalted core cycles when the thread is not in ring 0.	
5EH	01H	RS_EVENTS.EMPTY_CYCLES	Cycles the RS is empty for the thread.	
60H	01H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD	Offcore outstanding demand data read transactions in SQ to uncore. Set Cmask=1 to count cycles.	Use only when HTT is off.
60H	02H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_CODE_RD	Offcore outstanding demand code read transactions in SQ to uncore. Set Cmask=1 to count cycles.	Use only when HTT is off.
60H	04H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_RFO	Offcore outstanding RFO store transactions in SQ to uncore. Set Cmask=1 to count cycles.	Use only when HTT is off.
60H	08H	OFFCORE_REQUESTS_OUTSTANDING.ALL_DATA_RD	Offcore outstanding cacheable data read transactions in SQ to uncore. Set Cmask=1 to count cycles.	Use only when HTT is off.
63H	01H	LOCK_CYCLES.SPLIT_LOCK_UC_LOCK_DURATION	Cycles in which the L1D and L2 are locked, due to a UC lock or split lock.	
63H	02H	LOCK_CYCLES.CACHE_LOCK_DURATION	Cycles in which the L1D is locked.	
79H	02H	IDQ.EMPTY	Counts cycles the IDQ is empty.	
79H	04H	IDQ.MITE_UOPS	Increment each cycle # of uops delivered to IDQ from MITE path. Set Cmask = 1 to count cycles.	Can combine Umask 04H and 20H.
79H	08H	IDQ.DSB_UOPS	Increment each cycle # of uops delivered to IDQ from DSB path. Set Cmask = 1 to count cycles.	Can combine Umask 08H and 10H.
79H	10H	IDQ.MS_DSB_UOPS	Increment each cycle # of uops delivered to IDQ when MS_busy by DSB. Set Cmask = 1 to count cycles. Add Edge=1 to count # of delivery.	Can combine Umask 04H, 08H.
79H	20H	IDQ.MS_MITE_UOPS	Increment each cycle # of uops delivered to IDQ when MS_busy by MITE. Set Cmask = 1 to count cycles.	Can combine Umask 04H, 08H.
79H	30H	IDQ.MS_UOPS	Increment each cycle # of uops delivered to IDQ from MS by either DSB or MITE. Set Cmask = 1 to count cycles.	Can combine Umask 04H, 08H.
79H	18H	IDQ.ALL_DSB_CYCLES_ANY_UOPS	Counts cycles DSB is delivered at least one uops. Set Cmask = 1.	
79H	18H	IDQ.ALL_DSB_CYCLES_4_UOPS	Counts cycles DSB is delivered four uops. Set Cmask = 4.	
79H	24H	IDQ.ALL_MITE_CYCLES_ANY_UOPS	Counts cycles MITE is delivered at least one uop. Set Cmask = 1.	
79H	24H	IDQ.ALL_MITE_CYCLES_4_UOPS	Counts cycles MITE is delivered four uops. Set Cmask = 4.	
79H	3CH	IDQ.MITE_ALL_UOPS	Number of uops delivered to IDQ from any path.	

Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
80H	02H	ICACHE.MISSES	Number of Instruction Cache, Streaming Buffer and Victim Cache Misses. Includes UC accesses.	
85H	01H	ITLB_MISSES.MISS_CAUSES_A_WALK	Misses in ITLB that cause a page walk of any page size.	
85H	02H	ITLB_MISSES.WALK_COMPLETED_4K	Completed page walks due to misses in ITLB 4K page entries.	
85H	10H	ITLB_MISSES.WALK_DURATION	Cycle PMH is busy with a walk.	
85H	20H	ITLB_MISSES.STLB_HIT_4K	ITLB misses that hit STLB (4K).	
87H	01H	ILD_STALL.LCP	Stalls caused by changing prefix length of the instruction.	
88H	01H	BR_INST_EXEC.COND	Qualify conditional near branch instructions executed, but not necessarily retired.	Must combine with umask 40H, 80H.
88H	02H	BR_INST_EXEC.DIRECT_JMP	Qualify all unconditional near branch instructions excluding calls and indirect branches.	Must combine with umask 80H.
88H	04H	BR_INST_EXEC.INDIRECT_JMP_NON_CALL_RET	Qualify executed indirect near branch instructions that are not calls or returns.	Must combine with umask 80H.
88H	08H	BR_INST_EXEC.RETURN_NEAR	Qualify indirect near branches that have a return mnemonic.	Must combine with umask 80H.
88H	10H	BR_INST_EXEC.DIRECT_NEAR_CALL	Qualify unconditional near call branch instructions, excluding non-call branch, executed.	Must combine with umask 80H.
88H	20H	BR_INST_EXEC.INDIRECT_NEAR_CALL	Qualify indirect near calls, including both register and memory indirect, executed.	Must combine with umask 80H.
88H	40H	BR_INST_EXEC.NONTAKEN	Qualify non-taken near branches executed.	Applicable to umask 01H only.
88H	80H	BR_INST_EXEC.TAKEN	Qualify taken near branches executed. Must combine with 01H,02H, 04H, 08H, 10H, 20H.	
88H	FFH	BR_INST_EXEC.ALL_BRANCHES	Counts all near executed branches (not necessarily retired).	
89H	01H	BR_MISP_EXEC.COND	Qualify conditional near branch instructions mispredicted.	Must combine with umask 40H, 80H.
89H	04H	BR_MISP_EXEC.INDIRECT_JMP_NON_CALL_RET	Qualify mispredicted indirect near branch instructions that are not calls or returns.	Must combine with umask 80H.
89H	08H	BR_MISP_EXEC.RETURN_NEAR	Qualify mispredicted indirect near branches that have a return mnemonic.	Must combine with umask 80H.
89H	10H	BR_MISP_EXEC.DIRECT_NEAR_CALL	Qualify mispredicted unconditional near call branch instructions, excluding non-call branch, executed.	Must combine with umask 80H.
89H	20H	BR_MISP_EXEC.INDIRECT_NEAR_CALL	Qualify mispredicted indirect near calls, including both register and memory indirect, executed.	Must combine with umask 80H.
89H	40H	BR_MISP_EXEC.NONTAKEN	Qualify mispredicted non-taken near branches executed.	Applicable to umask 01H only.
89H	80H	BR_MISP_EXEC.TAKEN	Qualify mispredicted taken near branches executed. Must combine with 01H,02H, 04H, 08H, 10H, 20H.	
89H	FFH	BR_MISP_EXEC.ALL_BRANCHES	Counts all near executed branches (not necessarily retired).	

Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CORE	Count issue pipeline slots where no uop was delivered from the front end to the back end when there is no back end stall.	Use Cmask to qualify uop b/w.
A1H	01H	UOPS_DISPATCHED_PORT.PORT_0	Counts the number of cycles in which a uop is dispatched to port 0.	Set AnyThread to count per core.
A1H	02H	UOPS_DISPATCHED_PORT.PORT_1	Counts the number of cycles in which a uop is dispatched to port 1.	Set AnyThread to count per core.
A1H	04H	UOPS_DISPATCHED_PORT.PORT_2	Counts the number of cycles in which a uop is dispatched to port 2.	Set AnyThread to count per core.
A1H	08H	UOPS_DISPATCHED_PORT.PORT_3	Counts the number of cycles in which a uop is dispatched to port 3.	Set AnyThread to count per core.
A1H	10H	UOPS_DISPATCHED_PORT.PORT_4	Counts the number of cycles in which a uop is dispatched to port 4.	Set AnyThread to count per core.
A1H	20H	UOPS_DISPATCHED_PORT.PORT_5	Counts the number of cycles in which a uop is dispatched to port 5.	Set AnyThread to count per core.
A1H	40H	UOPS_DISPATCHED_PORT.PORT_6	Counts the number of cycles in which a uop is dispatched to port 6.	Set AnyThread to count per core.
A1H	80H	UOPS_DISPATCHED_PORT.PORT_7	Counts the number of cycles in which a uop is dispatched to port 7.	Set AnyThread to count per core.
A2H	01H	RESOURCE_STALLS.ANY	Cycles Allocation is stalled due to resource related reason.	
A2H	04H	RESOURCE_STALLS.RS	Cycles stalled due to no eligible RS entry available.	
A2H	08H	RESOURCE_STALLS.SB	Cycles stalled due to no store buffers available (not including draining form sync).	
A2H	10H	RESOURCE_STALLS.ROB	Cycles stalled due to re-order buffer full.	
A8H	01H	LSD.UOPS	Number of uops delivered by the LSD.	
ABH	02H	DSB2MITE_SWITCHES.PENALTY_CYCLES	Cycles of delay due to Decode Stream Buffer to MITE switches.	
AEH	01H	ITLB.ITLB_FLUSH	Counts the number of ITLB flushes; includes 4k/2M/4M pages.	
B0H	01H	OFFCORE_REQUESTS.DEMAND_DATA_RD	Demand data read requests sent to uncore.	Use only when HTT is off.
B0H	02H	OFFCORE_REQUESTS.DEMAND_CODE_RD	Demand code read requests sent to uncore.	Use only when HTT is off.
B0H	04H	OFFCORE_REQUESTS.DEMAND_RFO	Demand RFO read requests sent to uncore, including regular RFOs, locks, ItoM.	Use only when HTT is off.
B0H	08H	OFFCORE_REQUESTS.ALL_DATA_RD	Data read requests sent to uncore (demand and prefetch).	Use only when HTT is off.
B1H	01H	UOPS_EXECUTED.THREAD	Counts total number of uops to be executed per-logical-processor each cycle.	Use Cmask to count stall cycles.
B1H	02H	UOPS_EXECUTED.CORE	Counts total number of uops to be executed per-core each cycle.	Do not need to set ANY.
B7H	01H	OFF_CORE_RESPONSE_0	See Section 18.3.4.5, "Off-core Response Performance Monitoring".	Requires MSR 01A6H.

Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
BBH	01H	OFF_CORE_RESPONSE_1	See Section 18.3.4.5, "Off-core Response Performance Monitoring".	Requires MSR 01A7H.
BCH	11H	PAGE_WALKER_LOADS.DTLB_L1	Number of DTLB page walker loads that hit in the L1+FB.	
BCH	21H	PAGE_WALKER_LOADS.ITLB_L1	Number of ITLB page walker loads that hit in the L1+FB.	
BCH	12H	PAGE_WALKER_LOADS.DTLB_L2	Number of DTLB page walker loads that hit in the L2.	
BCH	22H	PAGE_WALKER_LOADS.ITLB_L2	Number of ITLB page walker loads that hit in the L2.	
BCH	14H	PAGE_WALKER_LOADS.DTLB_L3	Number of DTLB page walker loads that hit in the L3.	
BCH	24H	PAGE_WALKER_LOADS.ITLB_L3	Number of ITLB page walker loads that hit in the L3.	
BCH	18H	PAGE_WALKER_LOADS.DTLB_MEMORY	Number of DTLB page walker loads from memory.	
C0H	00H	INST_RETIRED.ANY_P	Number of instructions at retirement.	See Table 19-1.
C0H	01H	INST_RETIRED.PREC_DIST	Precise instruction retired event with HW to reduce effect of PEBS shadow in IP distribution.	PMC1 only.
C0H	02H	INST_RETIRED.X87	FP operations retired. X87 FP operations that have no exceptions.	
C1H	08H	OTHER_ASSISTS.AVX_TO_SSE	Number of transitions from AVX-256 to legacy SSE when penalty applicable.	
C1H	10H	OTHER_ASSISTS.SSE_TO_AVX	Number of transitions from SSE to AVX-256 when penalty applicable.	
C1H	40H	OTHER_ASSISTS.ANY_WB_ASSIST	Number of microcode assists invoked by HW upon uop writeback.	
C2H	01H	UOPS_RETIRED.ALL	Counts the number of micro-ops retired. Use cmask=1 and invert to count active cycles or stalled cycles.	Supports PEBS and DataLA, use Any=1 for core granular.
C2H	02H	UOPS_RETIRED.RETIRE_SLOTS	Counts the number of retirement slots used each cycle.	Supports PEBS.
C3H	01H	MACHINE_CLEARS.CYCLES	Counts cycles while a machine clears stalled forward progress of a logical processor or a processor core.	
C3H	02H	MACHINE_CLEARS.MEMORY_ORDERING	Counts the number of machine clears due to memory order conflicts.	
C3H	04H	MACHINE_CLEARS.SMC	Number of self-modifying-code machine clears detected.	
C3H	20H	MACHINE_CLEARS.MASKMOV	Counts the number of executed AVX masked load operations that refer to an illegal address range with the mask bits set to 0.	
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Branch instructions at retirement.	See Table 19-1.
C4H	01H	BR_INST_RETIRED.CONDITIONAL	Counts the number of conditional branch instructions retired.	Supports PEBS.
C4H	02H	BR_INST_RETIRED.NEAR_CALL	Direct and indirect near call instructions retired.	Supports PEBS.
C4H	04H	BR_INST_RETIRED.ALL_BRANCHES	Counts the number of branch instructions retired.	Supports PEBS.

Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C4H	08H	BR_INST_RETIRED.NEAR_RETURN	Counts the number of near return instructions retired.	Supports PEBS.
C4H	10H	BR_INST_RETIRED.NOT_TAKEN	Counts the number of not taken branch instructions retired.	
C4H	20H	BR_INST_RETIRED.NEAR_TAKEN	Number of near taken branches retired.	Supports PEBS.
C4H	40H	BR_INST_RETIRED.FAR_BRANCH	Number of far branches retired.	
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted branch instructions at retirement.	See Table 19-1.
C5H	01H	BR_MISP_RETIRED.CONDITIONAL	Mispredicted conditional branch instructions retired.	Supports PEBS.
C5H	04H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted macro branch instructions retired.	Supports PEBS.
CAH	02H	FP_ASSIST.X87_OUTPUT	Number of X87 FP assists due to output values.	
CAH	04H	FP_ASSIST.X87_INPUT	Number of X87 FP assists due to input values.	
CAH	08H	FP_ASSIST.SIMD_OUTPUT	Number of SIMD FP assists due to output values.	
CAH	10H	FP_ASSIST.SIMD_INPUT	Number of SIMD FP assists due to input values.	
CAH	1EH	FP_ASSIST.ANY	Cycles with any input/output SSE* or FP assists.	
CCH	20H	ROB_MISC_EVENTS.LBR_INSERTS	Count cases of saving new LBR records by hardware.	
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY	Randomly sampled loads whose latency is above a user defined threshold. A small fraction of the overall loads are sampled due to randomization.	Specify threshold in MSR 3F6H.
D0H	11H	MEM_UOPS_RETIRED.STLB_MISS_LOADS	Retired load uops that miss the STLB.	Supports PEBS and DataLA.
D0H	12H	MEM_UOPS_RETIRED.STLB_MISS_STORES	Retired store uops that miss the STLB.	Supports PEBS and DataLA.
D0H	21H	MEM_UOPS_RETIRED.LOCK_LOADS	Retired load uops with locked access.	Supports PEBS and DataLA.
D0H	41H	MEM_UOPS_RETIRED.SPLIT_LOADS	Retired load uops that split across a cacheline boundary.	Supports PEBS and DataLA.
D0H	42H	MEM_UOPS_RETIRED.SPLIT_STORES	Retired store uops that split across a cacheline boundary.	Supports PEBS and DataLA.
D0H	81H	MEM_UOPS_RETIRED.ALL_LOADS	All retired load uops.	Supports PEBS and DataLA.
D0H	82H	MEM_UOPS_RETIRED.ALL_STORES	All retired store uops.	Supports PEBS and DataLA.
D1H	01H	MEM_LOAD_UOPS_RETIRED.L1_HIT	Retired load uops with L1 cache hits as data sources.	Supports PEBS and DataLA.
D1H	02H	MEM_LOAD_UOPS_RETIRED.L2_HIT	Retired load uops with L2 cache hits as data sources.	Supports PEBS and DataLA.
D1H	04H	MEM_LOAD_UOPS_RETIRED.L3_HIT	Retired load uops with L3 cache hits as data sources.	Supports PEBS and DataLA.
D1H	08H	MEM_LOAD_UOPS_RETIRED.L1_MISS	Retired load uops missed L1 cache as data sources.	Supports PEBS and DataLA.

Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D1H	10H	MEM_LOAD_UOPS_RETIRED.L2_MISS	Retired load uops missed L2. Unknown data source excluded.	Supports PEBS and DataLA.
D1H	20H	MEM_LOAD_UOPS_RETIRED.L3_MISS	Retired load uops missed L3. Excludes unknown data source.	Supports PEBS and DataLA.
D1H	40H	MEM_LOAD_UOPS_RETIRED.HIT_LFB	Retired load uops where data sources were load uops missed L1 but hit FB due to preceding miss to the same cache line with data not ready.	Supports PEBS and DataLA.
D2H	01H	MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_MISS	Retired load uops where data sources were L3 hit and cross-core snoop missed in on-pkg core cache.	Supports PEBS and DataLA.
D2H	02H	MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HIT	Retired load uops where data sources were L3 and cross-core snoop hits in on-pkg core cache.	Supports PEBS and DataLA.
D2H	04H	MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HITM	Retired load uops where data sources were HitM responses from shared L3.	Supports PEBS and DataLA.
D2H	08H	MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_NONE	Retired load uops where data sources were hits in L3 without snoops required.	Supports PEBS and DataLA.
D3H	01H	MEM_LOAD_UOPS_L3_MISS_RETIRED.LOCAL_DRAM	Retired load uops where data sources missed L3 but serviced from local dram.	Supports PEBS and DataLA.
F0H	01H	L2_TRANS.DEMAND_DATA_RD	Demand data read requests that access L2 cache.	
F0H	02H	L2_TRANS.RFO	RFO requests that access L2 cache.	
F0H	04H	L2_TRANS.CODE_RD	L2 cache accesses when fetching instructions.	
F0H	08H	L2_TRANS.ALL_PF	Any MLC or L3 HW prefetch accessing L2, including rejects.	
F0H	10H	L2_TRANS.L1D_WB	L1D writebacks that access L2 cache.	
F0H	20H	L2_TRANS.L2_FILL	L2 fill requests that access L2 cache.	
F0H	40H	L2_TRANS.L2_WB	L2 writebacks that access L2 cache.	
F0H	80H	L2_TRANS.ALL_REQUESTS	Transactions accessing L2 pipe.	
F1H	01H	L2_LINES_IN.I	L2 cache lines in I state filling L2.	Counting does not cover rejects.
F1H	02H	L2_LINES_IN.S	L2 cache lines in S state filling L2.	Counting does not cover rejects.
F1H	04H	L2_LINES_IN.E	L2 cache lines in E state filling L2.	Counting does not cover rejects.
F1H	07H	L2_LINES_IN.ALL	L2 cache lines filling L2.	Counting does not cover rejects.
F2H	05H	L2_LINES_OUT.DEMAND_CLEAN	Clean L2 cache lines evicted by demand.	

Table 19-10 lists performance events supporting Intel TSX (see Section 18.3.6.5) and the events are applicable to processors based on Broadwell microarchitecture. Where Broadwell microarchitecture implements TSX-related event semantics that differ from Table 19-10, they are listed in Table 19-8.

Table 19-8. Intel® TSX Performance Event Addendum in Processors Based on Broadwell Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
54H	02H	TX_MEM.ABORT_CAPACITY	Number of times a transactional abort was signaled due to a data capacity limitation for transactional reads or writes.	

19.6 PERFORMANCE MONITORING EVENTS FOR THE 4TH GENERATION INTEL® CORE™ PROCESSORS

4th generation Intel® Core™ processors and Intel Xeon processor E3-1200 v3 product family are based on the Haswell microarchitecture. They support the architectural performance monitoring events listed in Table 19-1. Model-specific performance monitoring events in the processor core are listed in Table 19-9. The events in Table 19-9 apply to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following values: 06_3CH, 06_45H and 06_46H. Table 19-10 lists performance events focused on supporting Intel TSX (see Section 18.3.6.5). Fixed counters in the core PMU support the architecture events defined in Table 19-2.

Additional information on event specifics (e.g., derivative events using specific IA32_PERFEVTSELx modifiers, limitations, special notes and recommendations) can be found at https://software.intel.com/en-us/forums/software-tuning-performance-optimization-platform-monitoring.

Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	02H	LD_BLOCKS.STORE_FORWARD	Loads blocked by overlapping with store buffer that cannot be forwarded.	
03H	08H	LD_BLOCKS.NO_SR	The number of times that split load operations are temporarily blocked because all resources for handling the split accesses are in use.	
05H	01H	MISALIGN_MEM_REF.LOADS	Speculative cache-line split load uops dispatched to L1D.	
05H	02H	MISALIGN_MEM_REF.STORES	Speculative cache-line split store-address uops dispatched to L1D.	
07H	01H	LD_BLOCKS_PARTIAL.ADDRESS_ALIAS	False dependencies in MOB due to partial compare on address.	
08H	01H	DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK	Misses in all TLB levels that cause a page walk of any page size.	
08H	02H	DTLB_LOAD_MISSES.WALK_COMPLETED_4K	Completed page walks due to demand load misses that caused 4K page walks in any TLB levels.	
08H	04H	DTLB_LOAD_MISSES.WALK_COMPLETED_2M_4M	Completed page walks due to demand load misses that caused 2M/4M page walks in any TLB levels.	
08H	0EH	DTLB_LOAD_MISSES.WALK_COMPLETED	Completed page walks in any TLB of any page size due to demand load misses.	
08H	10H	DTLB_LOAD_MISSES.WALK_DURATION	Cycle PMH is busy with a walk.	
08H	20H	DTLB_LOAD_MISSES.STLB_HIT_4K	Load misses that missed DTLB but hit STLB (4K).	
08H	40H	DTLB_LOAD_MISSES.STLB_HIT_2M	Load misses that missed DTLB but hit STLB (2M).	
08H	60H	DTLB_LOAD_MISSES.STLB_HIT	Number of cache load STLB hits. No page walk.	
08H	80H	DTLB_LOAD_MISSES.PDE_CACHE_MISS	DTLB demand load misses with low part of linear-to-physical address translation missed.	
0DH	03H	INT_MISC.RECOVERY_CYCLES	Cycles waiting to recover after Machine Clears except JEClear. Set Cmask= 1.	Set Edge to count occurrences.
0EH	01H	UOPS_ISSUED.ANY	Increments each cycle the # of uops issued by the RAT to RS. Set Cmask = 1, Inv = 1, Any= 1 to count stalled cycles of this core.	Set Cmask = 1, Inv = 1to count stalled cycles.
0EH	10H	UOPS_ISSUED.FLAGS_MERGE	Number of flags-merge uops allocated. Such uops add delay.	

Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0EH	20H	UOPS_ISSUED.SLOW_LEA	Number of slow LEA or similar uops allocated. Such uop has 3 sources (for example, 2 sources + immediate) regardless of whether it is a result of LEA instruction or not.	
0EH	40H	UOPS_ISSUED.SINGLE_MUL	Number of multiply packed/scalar single precision uops allocated.	
24H	21H	L2_RQSTS.DEMAND_DATA_RD_MISS	Demand data read requests that missed L2, no rejects.	
24H	41H	L2_RQSTS.DEMAND_DATA_RD_HIT	Demand data read requests that hit L2 cache.	
24H	E1H	L2_RQSTS.ALL_DEMAND_DATA_RD	Counts any demand and L1 HW prefetch data load requests to L2.	
24H	42H	L2_RQSTS.RFO_HIT	Counts the number of store RFO requests that hit the L2 cache.	
24H	22H	L2_RQSTS.RFO_MISS	Counts the number of store RFO requests that miss the L2 cache.	
24H	E2H	L2_RQSTS.ALL_RFO	Counts all L2 store RFO requests.	
24H	44H	L2_RQSTS.CODE_RD_HIT	Number of instruction fetches that hit the L2 cache.	
24H	24H	L2_RQSTS.CODE_RD_MISS	Number of instruction fetches that missed the L2 cache.	
24H	27H	L2_RQSTS.ALL_DEMAND_MISS	Demand requests that miss L2 cache.	
24H	E7H	L2_RQSTS.ALL_DEMAND_REFERENCES	Demand requests to L2 cache.	
24H	E4H	L2_RQSTS.ALL_CODE_RD	Counts all L2 code requests.	
24H	50H	L2_RQSTS.L2_PF_HIT	Counts all L2 HW prefetcher requests that hit L2.	
24H	30H	L2_RQSTS.L2_PF_MISS	Counts all L2 HW prefetcher requests that missed L2.	
24H	F8H	L2_RQSTS.ALL_PF	Counts all L2 HW prefetcher requests.	
24H	3FH	L2_RQSTS.MISS	All requests that missed L2.	
24H	FFH	L2_RQSTS.REFERENCES	All requests to L2 cache.	
27H	50H	L2_DEMAND_RQSTS.WB_HIT	Not rejected writebacks that hit L2 cache.	
2EH	4FH	LONGEST_LAT_CACHE.REFERENCE	This event counts requests originating from the core that reference a cache line in the last level cache.	See Table 19-1.
2EH	41H	LONGEST_LAT_CACHE.MISS	This event counts each cache miss condition for references to the last level cache.	See Table 19-1.
3CH	00H	CPU_CLK_UNHALTED.THREAD_P	Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling.	See Table 19-1.
3CH	01H	CPU_CLK_THREAD_UNHALTED.REF_XCLK	Increments at the frequency of XCLK (100 MHz) when not halted.	See Table 19-1.
48H	01H	L1D_PEND_MISS.PENDING	Increments the number of outstanding L1D misses every cycle. Set Cmask = 1 and Edge =1 to count occurrences.	Counter 2 only. Set Cmask = 1 to count cycles.

Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
49H	01H	DTLB_STORE_MISSES.MISS_CAUSES_A_WALK	Miss in all TLB levels causes a page walk of any page size (4K/2M/4M/1G).	
49H	02H	DTLB_STORE_MISSES.WALK_COMPLETED_4K	Completed page walks due to store misses in one or more TLB levels of 4K page structure.	
49H	04H	DTLB_STORE_MISSES.WALK_COMPLETED_2M_4M	Completed page walks due to store misses in one or more TLB levels of 2M/4M page structure.	
49H	0EH	DTLB_STORE_MISSES.WALK_COMPLETED	Completed page walks due to store miss in any TLB levels of any page size (4K/2M/4M/1G).	
49H	10H	DTLB_STORE_MISSES.WALK_DURATION	Cycles PMH is busy with this walk.	
49H	20H	DTLB_STORE_MISSES.STLB_HIT_4K	Store misses that missed DTLB but hit STLB (4K).	
49H	40H	DTLB_STORE_MISSES.STLB_HIT_2M	Store misses that missed DTLB but hit STLB (2M).	
49H	60H	DTLB_STORE_MISSES.STLB_HIT	Store operations that miss the first TLB level but hit the second and do not cause page walks.	
49H	80H	DTLB_STORE_MISSES.PDE_CACHE_MISS	DTLB store misses with low part of linear-to-physical address translation missed.	
4CH	01H	LOAD_HIT_PRE.SW_PF	Non-SW-prefetch load dispatches that hit fill buffer allocated for S/W prefetch.	
4CH	02H	LOAD_HIT_PRE.HW_PF	Non-SW-prefetch load dispatches that hit fill buffer allocated for H/W prefetch.	
51H	01H	L1D.REPLACEMENT	Counts the number of lines brought into the L1 data cache.	
58H	04H	MOVE_ELIMINATION.INT_NOT_ELIMINATED	Number of integer move elimination candidate uops that were not eliminated.	
58H	08H	MOVE_ELIMINATION.SIMD_NOT_ELIMINATED	Number of SIMD move elimination candidate uops that were not eliminated.	
58H	01H	MOVE_ELIMINATION.INT_ELIMINATED	Number of integer move elimination candidate uops that were eliminated.	
58H	02H	MOVE_ELIMINATION.SIMD_ELIMINATED	Number of SIMD move elimination candidate uops that were eliminated.	
5CH	01H	CPL_CYCLES.RING0	Unhalted core cycles when the thread is in ring 0.	Use Edge to count transition.
5CH	02H	CPL_CYCLES.RING123	Unhalted core cycles when the thread is not in ring 0.	
5EH	01H	RS_EVENTS.EMPTY_CYCLES	Cycles the RS is empty for the thread.	
60H	01H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD	Offcore outstanding demand data read transactions in SQ to uncore. Set Cmask=1 to count cycles.	Use only when HTT is off.
60H	02H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_CODE_RD	Offcore outstanding Demand code Read transactions in SQ to uncore. Set Cmask=1 to count cycles.	Use only when HTT is off.
60H	04H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_RFO	Offcore outstanding RFO store transactions in SQ to uncore. Set Cmask=1 to count cycles.	Use only when HTT is off.
60H	08H	OFFCORE_REQUESTS_OUTSTANDING.ALL_DATA_RD	Offcore outstanding cacheable data read transactions in SQ to uncore. Set Cmask=1 to count cycles.	Use only when HTT is off.
63H	01H	LOCK_CYCLES.SPLIT_LOCK_UC_LOCK_DURATION	Cycles in which the L1D and L2 are locked, due to a UC lock or split lock.	

Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
63H	02H	LOCK_CYCLES.CACHE_LOCK_DURATION	Cycles in which the L1D is locked.	
79H	02H	IDQ.EMPTY	Counts cycles the IDQ is empty.	
79H	04H	IDQ.MITE_UOPS	Increment each cycle # of uops delivered to IDQ from MITE path. Set Cmask = 1 to count cycles.	Can combine Umask 04H and 20H.
79H	08H	IDQ.DSB_UOPS	Increment each cycle. # of uops delivered to IDQ from DSB path. Set Cmask = 1 to count cycles.	Can combine Umask 08H and 10H.
79H	10H	IDQ.MS_DSB_UOPS	Increment each cycle # of uops delivered to IDQ when MS_busy by DSB. Set Cmask = 1 to count cycles. Add Edge=1 to count # of delivery.	Can combine Umask 04H, 08H.
79H	20H	IDQ.MS_MITE_UOPS	Increment each cycle # of uops delivered to IDQ when MS_busy by MITE. Set Cmask = 1 to count cycles.	Can combine Umask 04H, 08H.
79H	30H	IDQ.MS_UOPS	Increment each cycle # of uops delivered to IDQ from MS by either DSB or MITE. Set Cmask = 1 to count cycles.	Can combine Umask 04H, 08H.
79H	18H	IDQ.ALL_DSB_CYCLES_ANY_UOPS	Counts cycles DSB is delivered at least one uops. Set Cmask = 1.	
79H	18H	IDQ.ALL_DSB_CYCLES_4_UOPS	Counts cycles DSB is delivered four uops. Set Cmask = 4.	
79H	24H	IDQ.ALL_MITE_CYCLES_ANY_UOPS	Counts cycles MITE is delivered at least one uop. Set Cmask = 1.	
79H	24H	IDQ.ALL_MITE_CYCLES_4_UOPS	Counts cycles MITE is delivered four uops. Set Cmask = 4.	
79H	3CH	IDQ.MITE_ALL_UOPS	# of uops delivered to IDQ from any path.	
80H	02H	ICACHE.MISSES	Number of Instruction Cache, Streaming Buffer and Victim Cache Misses. Includes UC accesses.	
85H	01H	ITLB_MISSES.MISS_CAUSES_A_WALK	Misses in ITLB that causes a page walk of any page size.	
85H	02H	ITLB_MISSES.WALK_COMPLETED_4K	Completed page walks due to misses in ITLB 4K page entries.	
85H	04H	ITLB_MISSES.WALK_COMPLETED_2M_4M	Completed page walks due to misses in ITLB 2M/4M page entries.	
85H	0EH	ITLB_MISSES.WALK_COMPLETED	Completed page walks in ITLB of any page size.	
85H	10H	ITLB_MISSES.WALK_DURATION	Cycle PMH is busy with a walk.	
85H	20H	ITLB_MISSES.STLB_HIT_4K	ITLB misses that hit STLB (4K).	
85H	40H	ITLB_MISSES.STLB_HIT_2M	ITLB misses that hit STLB (2M).	
85H	60H	ITLB_MISSES.STLB_HIT	ITLB misses that hit STLB. No page walk.	
87H	01H	ILD_STALL.LCP	Stalls caused by changing prefix length of the instruction.	
87H	04H	ILD_STALL.IQ_FULL	Stall cycles due to IQ is full.	
88H	01H	BR_INST_EXEC.COND	Qualify conditional near branch instructions executed, but not necessarily retired.	Must combine with umask 40H, 80H.
88H	02H	BR_INST_EXEC.DIRECT_JMP	Qualify all unconditional near branch instructions excluding calls and indirect branches.	Must combine with umask 80H.

Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
88H	04H	BR_INST_EXEC.INDIRECT_JMP_NON_CALL_RET	Qualify executed indirect near branch instructions that are not calls or returns.	Must combine with umask 80H.
88H	08H	BR_INST_EXEC.RETURN_NEAR	Qualify indirect near branches that have a return mnemonic.	Must combine with umask 80H.
88H	10H	BR_INST_EXEC.DIRECT_NEAR_CALL	Qualify unconditional near call branch instructions, excluding non-call branch, executed.	Must combine with umask 80H.
88H	20H	BR_INST_EXEC.INDIRECT_NEAR_CALL	Qualify indirect near calls, including both register and memory indirect, executed.	Must combine with umask 80H.
88H	40H	BR_INST_EXEC.NONTAKEN	Qualify non-taken near branches executed.	Applicable to umask 01H only.
88H	80H	BR_INST_EXEC.TAKEN	Qualify taken near branches executed. Must combine with 01H,02H, 04H, 08H, 10H, 20H.	
88H	FFH	BR_INST_EXEC.ALL_BRANCHES	Counts all near executed branches (not necessarily retired).	
89H	01H	BR_MISP_EXEC.COND	Qualify conditional near branch instructions mispredicted.	Must combine with umask 40H, 80H.
89H	04H	BR_MISP_EXEC.INDIRECT_JMP_NON_CALL_RET	Qualify mispredicted indirect near branch instructions that are not calls or returns.	Must combine with umask 80H.
89H	08H	BR_MISP_EXEC.RETURN_NEAR	Qualify mispredicted indirect near branches that have a return mnemonic.	Must combine with umask 80H.
89H	10H	BR_MISP_EXEC.DIRECT_NEAR_CALL	Qualify mispredicted unconditional near call branch instructions, excluding non-call branch, executed.	Must combine with umask 80H.
89H	20H	BR_MISP_EXEC.INDIRECT_NEAR_CALL	Qualify mispredicted indirect near calls, including both register and memory indirect, executed.	Must combine with umask 80H.
89H	40H	BR_MISP_EXEC.NONTAKEN	Qualify mispredicted non-taken near branches executed.	Applicable to umask 01H only.
89H	80H	BR_MISP_EXEC.TAKEN	Qualify mispredicted taken near branches executed. Must combine with 01H,02H, 04H, 08H, 10H, 20H.	
89H	FFH	BR_MISP_EXEC.ALL_BRANCHES	Counts all near executed branches (not necessarily retired).	
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CORE	Count issue pipeline slots where no uop was delivered from the front end to the back end when there is no back-end stall.	Use Cmask to qualify uop b/w.
A1H	01H	UOPS_EXECUTED_PORT.PORT_0	Cycles which a uop is dispatched on port 0 in this thread.	Set AnyThread to count per core.
A1H	02H	UOPS_EXECUTED_PORT.PORT_1	Cycles which a uop is dispatched on port 1 in this thread.	Set AnyThread to count per core.
A1H	04H	UOPS_EXECUTED_PORT.PORT_2	Cycles which a uop is dispatched on port 2 in this thread.	Set AnyThread to count per core.
A1H	08H	UOPS_EXECUTED_PORT.PORT_3	Cycles which a uop is dispatched on port 3 in this thread.	Set AnyThread to count per core.
A1H	10H	UOPS_EXECUTED_PORT.PORT_4	Cycles which a uop is dispatched on port 4 in this thread.	Set AnyThread to count per core.
A1H	20H	UOPS_EXECUTED_PORT.PORT_5	Cycles which a uop is dispatched on port 5 in this thread.	Set AnyThread to count per core.
A1H	40H	UOPS_EXECUTED_PORT.PORT_6	Cycles which a uop is dispatched on port 6 in this thread.	Set AnyThread to count per core.

Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
A1H	80H	UOPS_EXECUTED_PORT.PORT_7	Cycles which a uop is dispatched on port 7 in this thread	Set AnyThread to count per core.
A2H	01H	RESOURCE_STALLS.ANY	Cycles allocation is stalled due to resource related reason.	
A2H	04H	RESOURCE_STALLS.RS	Cycles stalled due to no eligible RS entry available.	
A2H	08H	RESOURCE_STALLS.SB	Cycles stalled due to no store buffers available (not including draining form sync).	
A2H	10H	RESOURCE_STALLS.ROB	Cycles stalled due to re-order buffer full.	
A3H	01H	CYCLE_ACTIVITY.CYCLES_L2_PENDING	Cycles with pending L2 miss loads. Set Cmask=2 to count cycle.	Use only when HTT is off.
A3H	02H	CYCLE_ACTIVITY.CYCLES_LDM_PENDING	Cycles with pending memory loads. Set Cmask=2 to count cycle.	
A3H	05H	CYCLE_ACTIVITY.STALLS_L2_PENDING	Number of loads missed L2.	Use only when HTT is off.
A3H	08H	CYCLE_ACTIVITY.CYCLES_L1D_PENDING	Cycles with pending L1 data cache miss loads. Set Cmask=8 to count cycle.	PMC2 only.
A3H	0CH	CYCLE_ACTIVITY.STALLS_L1D_PENDING	Execution stalls due to L1 data cache miss loads. Set Cmask=0CH.	PMC2 only.
A8H	01H	LSD.UOPS	Number of uops delivered by the LSD.	
AEH	01H	ITLB.ITLB_FLUSH	Counts the number of ITLB flushes, includes 4k/2M/4M pages.	
B0H	01H	OFFCORE_REQUESTS.DEMAND_DATA_RD	Demand data read requests sent to uncore.	Use only when HTT is off.
B0H	02H	OFFCORE_REQUESTS.DEMAND_CODE_RD	Demand code read requests sent to uncore.	Use only when HTT is off.
B0H	04H	OFFCORE_REQUESTS.DEMAND_RFO	Demand RFO read requests sent to uncore, including regular RFOs, locks, ItoM.	Use only when HTT is off.
B0H	08H	OFFCORE_REQUESTS.ALL_DATA_RD	Data read requests sent to uncore (demand and prefetch).	Use only when HTT is off.
B1H	02H	UOPS_EXECUTED.CORE	Counts total number of uops to be executed per-core each cycle.	Do not need to set ANY.
B7H	01H	OFF_CORE_RESPONSE_0	See Table 18-28 or Table 18-29.	Requires MSR 01A6H.
BBH	01H	OFF_CORE_RESPONSE_1	See Table 18-28 or Table 18-29.	Requires MSR 01A7H.
BCH	11H	PAGE_WALKER_LOADS.DTLB_L1	Number of DTLB page walker loads that hit in the L1+FB.	
BCH	21H	PAGE_WALKER_LOADS.ITLB_L1	Number of ITLB page walker loads that hit in the L1+FB.	
BCH	12H	PAGE_WALKER_LOADS.DTLB_L2	Number of DTLB page walker loads that hit in the L2.	
BCH	22H	PAGE_WALKER_LOADS.ITLB_L2	Number of ITLB page walker loads that hit in the L2.	
BCH	14H	PAGE_WALKER_LOADS.DTLB_L3	Number of DTLB page walker loads that hit in the L3.	
BCH	24H	PAGE_WALKER_LOADS.ITLB_L3	Number of ITLB page walker loads that hit in the L3.	
BCH	18H	PAGE_WALKER_LOADS.DTLB_MEMORY	Number of DTLB page walker loads from memory.	
BCH	28H	PAGE_WALKER_LOADS.ITLB_MEMORY	Number of ITLB page walker loads from memory.	

Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
BDH	01H	TLB_FLUSH.DTLB_THREAD	DTLB flush attempts of the thread-specific entries.	
BDH	20H	TLB_FLUSH.STLB_ANY	Count number of STLB flush attempts.	
C0H	00H	INST_RETIRED.ANY_P	Number of instructions at retirement.	See Table 19-1.
C0H	01H	INST_RETIRED.PREC_DIST	Precise instruction retired event with HW to reduce effect of PEBS shadow in IP distribution.	PMC1 only.
C1H	08H	OTHER_ASSISTS.AVX_TO_SSE	Number of transitions from AVX-256 to legacy SSE when penalty applicable.	
C1H	10H	OTHER_ASSISTS.SSE_TO_AVX	Number of transitions from SSE to AVX-256 when penalty applicable.	
C1H	40H	OTHER_ASSISTS.ANY_WB_ASSIST	Number of microcode assists invoked by HW upon uop writeback.	
C2H	01H	UOPS_RETIRED.ALL	Counts the number of micro-ops retired. Use Cmask=1 and invert to count active cycles or stalled cycles.	Supports PEBS and DataLA; use Any=1 for core granular.
C2H	02H	UOPS_RETIRED.RETIRE_SLOTS	Counts the number of retirement slots used each cycle.	Supports PEBS.
C3H	02H	MACHINE_CLEARS.MEMORY_ORDERING	Counts the number of machine clears due to memory order conflicts.	
C3H	04H	MACHINE_CLEARS.SMC	Number of self-modifying-code machine clears detected.	
C3H	20H	MACHINE_CLEARS.MASKMOV	Counts the number of executed AVX masked load operations that refer to an illegal address range with the mask bits set to 0.	
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Branch instructions at retirement.	See Table 19-1.
C4H	01H	BR_INST_RETIRED.CONDITIONAL	Counts the number of conditional branch instructions retired.	Supports PEBS.
C4H	02H	BR_INST_RETIRED.NEAR_CALL	Direct and indirect near call instructions retired.	Supports PEBS.
C4H	04H	BR_INST_RETIRED.ALL_BRANCHES	Counts the number of branch instructions retired.	Supports PEBS.
C4H	08H	BR_INST_RETIRED.NEAR_RETURN	Counts the number of near return instructions retired.	Supports PEBS.
C4H	10H	BR_INST_RETIRED.NOT_TAKEN	Counts the number of not taken branch instructions retired.	
C4H	20H	BR_INST_RETIRED.NEAR_TAKEN	Number of near taken branches retired.	Supports PEBS.
C4H	40H	BR_INST_RETIRED.FAR_BRANCH	Number of far branches retired.	
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted branch instructions at retirement.	See Table 19-1.
C5H	01H	BR_MISP_RETIRED.CONDITIONAL	Mispredicted conditional branch instructions retired.	Supports PEBS.
C5H	04H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted macro branch instructions retired.	Supports PEBS.
C5H	20H	BR_MISP_RETIRED.NEAR_TAKEN	Number of near branch instructions retired that were taken but mispredicted.	

Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
CAH	02H	FP_ASSIST.X87_OUTPUT	Number of X87 FP assists due to output values.	
CAH	04H	FP_ASSIST.X87_INPUT	Number of X87 FP assists due to input values.	
CAH	08H	FP_ASSIST.SIMD_OUTPUT	Number of SIMD FP assists due to output values.	
CAH	10H	FP_ASSIST.SIMD_INPUT	Number of SIMD FP assists due to input values.	
CAH	1EH	FP_ASSIST.ANY	Cycles with any input/output SSE* or FP assists.	
CCH	20H	ROB_MISC_EVENTS.LBR_INSERTS	Count cases of saving new LBR records by hardware.	
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY	Randomly sampled loads whose latency is above a user defined threshold. A small fraction of the overall loads are sampled due to randomization.	Specify threshold in MSR 3F6H.
D0H	11H	MEM_UOPS_RETIRED.STLB_MISS_LOADS	Retired load uops that miss the STLB.	Supports PEBS and DataLA.
D0H	12H	MEM_UOPS_RETIRED.STLB_MISS_STORES	Retired store uops that miss the STLB.	Supports PEBS and DataLA.
D0H	21H	MEM_UOPS_RETIRED.LOCK_LOADS	Retired load uops with locked access.	Supports PEBS and DataLA.
D0H	41H	MEM_UOPS_RETIRED.SPLIT_LOADS	Retired load uops that split across a cacheline boundary.	Supports PEBS and DataLA.
D0H	42H	MEM_UOPS_RETIRED.SPLIT_STORES	Retired store uops that split across a cacheline boundary.	Supports PEBS and DataLA.
D0H	81H	MEM_UOPS_RETIRED.ALL_LOADS	All retired load uops.	Supports PEBS and DataLA.
D0H	82H	MEM_UOPS_RETIRED.ALL_STORES	All retired store uops.	Supports PEBS and DataLA.
D1H	01H	MEM_LOAD_UOPS_RETIRED.L1_HIT	Retired load uops with L1 cache hits as data sources.	Supports PEBS and DataLA.
D1H	02H	MEM_LOAD_UOPS_RETIRED.L2_HIT	Retired load uops with L2 cache hits as data sources.	Supports PEBS and DataLA.
D1H	04H	MEM_LOAD_UOPS_RETIRED.L3_HIT	Retired load uops with L3 cache hits as data sources.	Supports PEBS and DataLA.
D1H	08H	MEM_LOAD_UOPS_RETIRED.L1_MISS	Retired load uops missed L1 cache as data sources.	Supports PEBS and DataLA.
D1H	10H	MEM_LOAD_UOPS_RETIRED.L2_MISS	Retired load uops missed L2. Unknown data source excluded.	Supports PEBS and DataLA.
D1H	20H	MEM_LOAD_UOPS_RETIRED.L3_MISS	Retired load uops missed L3. Excludes unknown data source .	Supports PEBS and DataLA.
D1H	40H	MEM_LOAD_UOPS_RETIRED.HIT_LFB	Retired load uops which data sources were load uops missed L1 but hit FB due to preceding miss to the same cache line with data not ready.	Supports PEBS and DataLA.
D2H	01H	MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_MISS	Retired load uops which data sources were L3 hit and cross-core snoop missed in on-pkg core cache.	Supports PEBS and DataLA.
D2H	02H	MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HIT	Retired load uops which data sources were L3 and cross-core snoop hits in on-pkg core cache.	Supports PEBS and DataLA.
D2H	04H	MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HITM	Retired load uops which data sources were HitM responses from shared L3.	Supports PEBS and DataLA.

Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D2H	08H	MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_NONE	Retired load uops which data sources were hits in L3 without snoops required.	Supports PEBS and DataLA.
D3H	01H	MEM_LOAD_UOPS_L3_MISS_RETIRED.LOCAL_DRAM	Retired load uops which data sources missed L3 but serviced from local dram.	Supports PEBS and DataLA.
E6H	1FH	BACLEARS.ANY	Number of front end re-steers due to BPU misprediction.	
F0H	01H	L2_TRANS.DEMAND_DATA_RD	Demand data read requests that access L2 cache.	
F0H	02H	L2_TRANS.RFO	RFO requests that access L2 cache.	
F0H	04H	L2_TRANS.CODE_RD	L2 cache accesses when fetching instructions.	
F0H	08H	L2_TRANS.ALL_PF	Any MLC or L3 HW prefetch accessing L2, including rejects.	
F0H	10H	L2_TRANS.L1D_WB	L1D writebacks that access L2 cache.	
F0H	20H	L2_TRANS.L2_FILL	L2 fill requests that access L2 cache.	
F0H	40H	L2_TRANS.L2_WB	L2 writebacks that access L2 cache.	
F0H	80H	L2_TRANS.ALL_REQUESTS	Transactions accessing L2 pipe.	
F1H	01H	L2_LINES_IN.I	L2 cache lines in I state filling L2.	Counting does not cover rejects.
F1H	02H	L2_LINES_IN.S	L2 cache lines in S state filling L2.	Counting does not cover rejects.
F1H	04H	L2_LINES_IN.E	L2 cache lines in E state filling L2.	Counting does not cover rejects.
F1H	07H	L2_LINES_IN.ALL	L2 cache lines filling L2.	Counting does not cover rejects.
F2H	05H	L2_LINES_OUT.DEMAND_CLEAN	Clean L2 cache lines evicted by demand.	
F2H	06H	L2_LINES_OUT.DEMAND_DIRTY	Dirty L2 cache lines evicted by demand.	

Table 19-10. Intel TSX Performance Events in Processors Based on Haswell Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
54H	01H	TX_MEM.ABORT_CONFLICT	Number of times a transactional abort was signaled due to a data conflict on a transactionally accessed address.	
54H	02H	TX_MEM.ABORT_CAPACITY_WRITE	Number of times a transactional abort was signaled due to a data capacity limitation for transactional writes.	
54H	04H	TX_MEM.ABORT_HLE_STORE_TO_ELIDED_LOCK	Number of times a HLE transactional region aborted due to a non XRELEASE prefixed instruction writing to an elided lock in the elision buffer.	
54H	08H	TX_MEM.ABORT_HLE_ELISION_BUFFER_NOT_EMPTY	Number of times an HLE transactional execution aborted due to NoAllocatedElisionBuffer being non-zero.	
54H	10H	TX_MEM.ABORT_HLE_ELISION_BUFFER_MISMATCH	Number of times an HLE transactional execution aborted due to XRELEASE lock not satisfying the address and value requirements in the elision buffer.	
54H	20H	TX_MEM.ABORT_HLE_ELISION_BUFFER_UNSUPPORTED_ALIGNMENT	Number of times an HLE transactional execution aborted due to an unsupported read alignment from the elision buffer.	

Table 19-10. Intel TSX Performance Events in Processors Based on Haswell Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
54H	40H	TX_MEM.HLE_ELISION_BUFFER_FULL	Number of times HLE lock could not be elided due to ElisionBufferAvailable being zero.	
5DH	01H	TX_EXEC.MISC1	Counts the number of times a class of instructions that may cause a transactional abort was executed. Since this is the count of execution, it may not always cause a transactional abort.	
5DH	02H	TX_EXEC.MISC2	Counts the number of times a class of instructions (for example, vzeroupper) that may cause a transactional abort was executed inside a transactional region.	
5DH	04H	TX_EXEC.MISC3	Counts the number of times an instruction execution caused the transactional nest count supported to be exceeded.	
5DH	08H	TX_EXEC.MISC4	Counts the number of times an XBEGIN instruction was executed inside an HLE transactional region.	
5DH	10H	TX_EXEC.MISC5	Counts the number of times an instruction with HLE-XACQUIRE semantic was executed inside an RTM transactional region.	
C8H	01H	HLE_RETIRED.START	Number of times an HLE execution started.	IF HLE is supported.
C8H	02H	HLE_RETIRED.COMMIT	Number of times an HLE execution successfully committed.	
C8H	04H	HLE_RETIRED.ABORTED	Number of times an HLE execution aborted due to any reasons (multiple categories may count as one). Supports PEBS.	
C8H	08H	HLE_RETIRED.ABORTED_MEM	Number of times an HLE execution aborted due to various memory events (for example, read/write capacity and conflicts).	
C8H	10H	HLE_RETIRED.ABORTED_TIMER	Number of times an HLE execution aborted due to uncommon conditions.	
C8H	20H	HLE_RETIRED.ABORTED_UNFRIENDLY	Number of times an HLE execution aborted due to HLE-unfriendly instructions.	
C8H	40H	HLE_RETIRED.ABORTED_MEMTYPE	Number of times an HLE execution aborted due to incompatible memory type.	
C8H	80H	HLE_RETIRED.ABORTED_EVENTS	Number of times an HLE execution aborted due to none of the previous 4 categories (for example, interrupts).	
C9H	01H	RTM_RETIRED.START	Number of times an RTM execution started.	IF RTM is supported.
C9H	02H	RTM_RETIRED.COMMIT	Number of times an RTM execution successfully committed.	
C9H	04H	RTM_RETIRED.ABORTED	Number of times an RTM execution aborted due to any reasons (multiple categories may count as one). Supports PEBS.	

Table 19-10. Intel TSX Performance Events in Processors Based on Haswell Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C9H	08H	RTM_RETIRED.ABORTED_MEM	Number of times an RTM execution aborted due to various memory events (for example, read/write capacity and conflicts).	IF RTM is supported.
C9H	10H	RTM_RETIRED.ABORTED_TIMER	Number of times an RTM execution aborted due to uncommon conditions.	
C9H	20H	RTM_RETIRED.ABORTED_UNFRIENDLY	Number of times an RTM execution aborted due to HLE-unfriendly instructions.	
C9H	40H	RTM_RETIRED.ABORTED_MEMTYPE	Number of times an RTM execution aborted due to incompatible memory type.	
C9H	80H	RTM_RETIRED.ABORTED_EVENTS	Number of times an RTM execution aborted due to none of the previous 4 categories (for example, interrupt).	

Model-specific performance monitoring events that are located in the uncore sub-system are implementation specific between different platforms using processors based on Haswell microarchitecture and with different DisplayFamily_DisplayModel signatures. Processors with CPUID signature of DisplayFamily_DisplayModel 06_3CH and 06_45H support performance events listed in Table 19-11.

Table 19-11. Uncore Performance Events in the 4th Generation Intel® Core™ Processors

Event Num.[1]	Umask Value	Event Mask Mnemonic	Description	Comment
22H	01H	UNC_CBO_XSNP_RESPONSE.MISS	A snoop misses in some processor core.	Must combine with one of the umask values of 20H, 40H, 80H.
22H	02H	UNC_CBO_XSNP_RESPONSE.INVAL	A snoop invalidates a non-modified line in some processor core.	
22H	04H	UNC_CBO_XSNP_RESPONSE.HIT	A snoop hits a non-modified line in some processor core.	
22H	08H	UNC_CBO_XSNP_RESPONSE.HITM	A snoop hits a modified line in some processor core.	
22H	10H	UNC_CBO_XSNP_RESPONSE.INVAL_M	A snoop invalidates a modified line in some processor core.	
22H	20H	UNC_CBO_XSNP_RESPONSE.EXTERNAL_FILTER	Filter on cross-core snoops initiated by this Cbox due to external snoop request.	Must combine with at least one of 01H, 02H, 04H, 08H, 10H.
22H	40H	UNC_CBO_XSNP_RESPONSE.XCORE_FILTER	Filter on cross-core snoops initiated by this Cbox due to processor core memory request.	
22H	80H	UNC_CBO_XSNP_RESPONSE.EVICTION_FILTER	Filter on cross-core snoops initiated by this Cbox due to L3 eviction.	
34H	01H	UNC_CBO_CACHE_LOOKUP.M	L3 lookup request that access cache and found line in M-state.	Must combine with one of the umask values of 10H, 20H, 40H, 80H.
34H	06H	UNC_CBO_CACHE_LOOKUP.ES	L3 lookup request that access cache and found line in E or S state.	
34H	08H	UNC_CBO_CACHE_LOOKUP.I	L3 lookup request that access cache and found line in I-state.	
34H	10H	UNC_CBO_CACHE_LOOKUP.READ_FILTER	Filter on processor core initiated cacheable read requests. Must combine with at least one of 01H, 02H, 04H, 08H.	

Table 19-11. Uncore Performance Events in the 4th Generation Intel® Core™ Processors (Contd.)

Event Num.[1]	Umask Value	Event Mask Mnemonic	Description	Comment
34H	20H	UNC_CBO_CACHE_LOOKUP.WRITE_FILTER	Filter on processor core initiated cacheable write requests. Must combine with at least one of 01H, 02H, 04H, 08H.	
34H	40H	UNC_CBO_CACHE_LOOKUP.EXTSNP_FILTER	Filter on external snoop requests. Must combine with at least one of 01H, 02H, 04H, 08H.	
34H	80H	UNC_CBO_CACHE_LOOKUP.ANY_REQUEST_FILTER	Filter on any IRQ or IPQ initiated requests including uncacheable, non-coherent requests. Must combine with at least one of 01H, 02H, 04H, 08H.	
80H	01H	UNC_ARB_TRK_OCCUPANCY.ALL	Counts cycles weighted by the number of requests waiting for data returning from the memory controller. Accounts for coherent and non-coherent requests initiated by IA cores, processor graphic units, or L3.	Counter 0 only.
81H	01H	UNC_ARB_TRK_REQUEST.ALL	Counts the number of coherent and in-coherent requests initiated by IA cores, processor graphic units, or L3.	
81H	20H	UNC_ARB_TRK_REQUEST.WRITES	Counts the number of allocated write entries, include full, partial, and L3 evictions.	
81H	80H	UNC_ARB_TRK_REQUEST.EVICTIONS	Counts the number of L3 evictions allocated.	
83H	01H	UNC_ARB_COH_TRK_OCCUPANCY.ALL	Cycles weighted by number of requests pending in Coherency Tracker.	Counter 0 only.
84H	01H	UNC_ARB_COH_TRK_REQUEST.ALL	Number of requests allocated in Coherency Tracker.	

NOTES:

1. The uncore events must be programmed using MSRs located in specific performance monitoring units in the uncore. UNC_CBO* events are supported using MSR_UNC_CBO* MSRs; UNC_ARB* events are supported using MSR_UNC_ARB*MSRs.

19.6.1 Performance Monitoring Events in the Processor Core of Intel Xeon Processor E5 v3 Family

Model-specific performance monitoring events in the processor core that are applicable only to Intel Xeon processor E5 v3 family based on the Haswell-E microarchitecture, with CPUID signature of DisplayFamily_DisplayModel 06_3FH, are listed in Table 19-12. The performance events listed in Table 19-9 and Table 19-10 also apply Intel Xeon processor E5 v3 family, except that the OFF_CORE_RESPONSE_x event listed in Table 19-9 should reference Table 18-30.

Uncore performance monitoring events for Intel Xeon Processor E5 v3 families are described in "Intel® Xeon® Processor E5 v3 Uncore Performance Monitoring Programming Reference Manual".

Table 19-12. Performance Events Applicable only to the Processor Core of Intel® Xeon® Processor E5 v3 Family

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D3H	04H	MEM_LOAD_UOPS_L3_MISS_RETIRED.REMOTE_DRAM	Retired load uops whose data sources were remote DRAM (snoop not needed, Snoop Miss).	Supports PEBS.
D3H	10H	MEM_LOAD_UOPS_L3_MISS_RETIRED.REMOTE_HITM	Retired load uops whose data sources were remote cache HITM.	Supports PEBS.
D3H	20H	MEM_LOAD_UOPS_L3_MISS_RETIRED.REMOTE_FWD	Retired load uops whose data sources were forwards from a remote cache.	Supports PEBS.

19.7 PERFORMANCE MONITORING EVENTS FOR 3RD GENERATION INTEL® CORE™ PROCESSORS

3rd generation Intel® Core™ processors and Intel Xeon processor E3-1200 v2 product family are based on Intel microarchitecture code name Ivy Bridge. They support architectural performance monitoring events listed in Table 19-1. Model-specific performance monitoring events in the processor core are listed in Table 19-13. The events in Table 19-13 apply to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following values: 06_3AH. Fixed counters in the core PMU support the architecture events defined in Table 19-24.

Additional information on event specifics (e.g. derivative events using specific IA32_PERFEVTSELx modifiers, limitations, special notes and recommendations) can be found at found at https://software.intel.com/en-us/forums/software-tuning-performance-optimization-platform-monitoring.

Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	02H	LD_BLOCKS.STORE_FORWARD	Loads blocked by overlapping with store buffer that cannot be forwarded.	
03H	08H	LD_BLOCKS.NO_SR	The number of times that split load operations are temporarily blocked because all resources for handling the split accesses are in use.	
05H	01H	MISALIGN_MEM_REF.LOADS	Speculative cache-line split load uops dispatched to L1D.	
05H	02H	MISALIGN_MEM_REF.STORES	Speculative cache-line split Store-address uops dispatched to L1D.	
07H	01H	LD_BLOCKS_PARTIAL.ADDRESS_ALIAS	False dependencies in MOB due to partial compare on address.	
08H	81H	DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK	Misses in all TLB levels that cause a page walk of any page size from demand loads.	
08H	82H	DTLB_LOAD_MISSES.WALK_COMPLETED	Misses in all TLB levels that caused page walk completed of any size by demand loads.	
08H	84H	DTLB_LOAD_MISSES.WALK_DURATION	Cycle PMH is busy with a walk due to demand loads.	
08H	88H	DTLB_LOAD_MISSES.LARGE_PAGE_WALK_DURATION	Page walk for a large page completed for Demand load.	
0EH	01H	UOPS_ISSUED.ANY	Increments each cycle the # of Uops issued by the RAT to RS. Set Cmask = 1, Inv = 1, Any= 1to count stalled cycles of this core.	Set Cmask = 1, Inv = 1to count stalled cycles.
0EH	10H	UOPS_ISSUED.FLAGS_MERGE	Number of flags-merge uops allocated. Such uops adds delay.	
0EH	20H	UOPS_ISSUED.SLOW_LEA	Number of slow LEA or similar uops allocated. Such uop has 3 sources (e.g. 2 sources + immediate) regardless if as a result of LEA instruction or not.	
0EH	40H	UOPS_ISSUED.SINGLE_MUL	Number of multiply packed/scalar single precision uops allocated.	
10H	01H	FP_COMP_OPS_EXE.X87	Counts number of X87 uops executed.	
10H	10H	FP_COMP_OPS_EXE.SSE_FP_PACKED_DOUBLE	Counts number of SSE* or AVX-128 double precision FP packed uops executed.	
10H	20H	FP_COMP_OPS_EXE.SSE_FP_SCALAR_SINGLE	Counts number of SSE* or AVX-128 single precision FP scalar uops executed.	
10H	40H	FP_COMP_OPS_EXE.SSE_PACKED SINGLE	Counts number of SSE* or AVX-128 single precision FP packed uops executed.	

Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
10H	80H	FP_COMP_OPS_EXE.SSE_SCALAR_DOUBLE	Counts number of SSE* or AVX-128 double precision FP scalar uops executed.	
11H	01H	SIMD_FP_256.PACKED_SINGLE	Counts 256-bit packed single-precision floating-point instructions.	
11H	02H	SIMD_FP_256.PACKED_DOUBLE	Counts 256-bit packed double-precision floating-point instructions.	
14H	01H	ARITH.FPU_DIV_ACTIVE	Cycles that the divider is active, includes INT and FP. Set 'edge =1, cmask=1' to count the number of divides.	
24H	01H	L2_RQSTS.DEMAND_DATA_RD_HIT	Demand Data Read requests that hit L2 cache.	
24H	03H	L2_RQSTS.ALL_DEMAND_DATA_RD	Counts any demand and L1 HW prefetch data load requests to L2.	
24H	04H	L2_RQSTS.RFO_HITS	Counts the number of store RFO requests that hit the L2 cache.	
24H	08H	L2_RQSTS.RFO_MISS	Counts the number of store RFO requests that miss the L2 cache.	
24H	0CH	L2_RQSTS.ALL_RFO	Counts all L2 store RFO requests.	
24H	10H	L2_RQSTS.CODE_RD_HIT	Number of instruction fetches that hit the L2 cache.	
24H	20H	L2_RQSTS.CODE_RD_MISS	Number of instruction fetches that missed the L2 cache.	
24H	30H	L2_RQSTS.ALL_CODE_RD	Counts all L2 code requests.	
24H	40H	L2_RQSTS.PF_HIT	Counts all L2 HW prefetcher requests that hit L2.	
24H	80H	L2_RQSTS.PF_MISS	Counts all L2 HW prefetcher requests that missed L2.	
24H	C0H	L2_RQSTS.ALL_PF	Counts all L2 HW prefetcher requests.	
27H	01H	L2_STORE_LOCK_RQSTS.MISS	RFOs that miss cache lines.	
27H	08H	L2_STORE_LOCK_RQSTS.HIT_M	RFOs that hit cache lines in M state.	
27H	0FH	L2_STORE_LOCK_RQSTS.ALL	RFOs that access cache lines in any state.	
28H	01H	L2_L1D_WB_RQSTS.MISS	Not rejected writebacks that missed LLC.	
28H	04H	L2_L1D_WB_RQSTS.HIT_E	Not rejected writebacks from L1D to L2 cache lines in E state.	
28H	08H	L2_L1D_WB_RQSTS.HIT_M	Not rejected writebacks from L1D to L2 cache lines in M state.	
28H	0FH	L2_L1D_WB_RQSTS.ALL	Not rejected writebacks from L1D to L2 cache lines in any state.	
2EH	4FH	LONGEST_LAT_CACHE.REFERENCE	This event counts requests originating from the core that reference a cache line in the last level cache.	See Table 19-1
2EH	41H	LONGEST_LAT_CACHE.MISS	This event counts each cache miss condition for references to the last level cache.	See Table 19-1
3CH	00H	CPU_CLK_UNHALTED.THREAD_P	Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling.	See Table 19-1.

Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
3CH	01H	CPU_CLK_THREAD_UNHALTED.REF_XCLK	Increments at the frequency of XCLK (100 MHz) when not halted.	See Table 19-1.
48H	01H	L1D_PEND_MISS.PENDING	Increments the number of outstanding L1D misses every cycle. Set Cmask = 1 and Edge =1 to count occurrences.	PMC2 only; Set Cmask = 1 to count cycles.
49H	01H	DTLB_STORE_MISSES.MISS_CAUSES_A_WALK	Miss in all TLB levels causes a page walk of any page size (4K/2M/4M/1G).	
49H	02H	DTLB_STORE_MISSES.WALK_COMPLETED	Miss in all TLB levels causes a page walk that completes of any page size (4K/2M/4M/1G).	
49H	04H	DTLB_STORE_MISSES.WALK_DURATION	Cycles PMH is busy with this walk.	
49H	10H	DTLB_STORE_MISSES.STLB_HIT	Store operations that miss the first TLB level but hit the second and do not cause page walks.	
4CH	01H	LOAD_HIT_PRE.SW_PF	Non-SW-prefetch load dispatches that hit fill buffer allocated for S/W prefetch.	
4CH	02H	LOAD_HIT_PRE.HW_PF	Non-SW-prefetch load dispatches that hit fill buffer allocated for H/W prefetch.	
51H	01H	L1D.REPLACEMENT	Counts the number of lines brought into the L1 data cache.	
58H	04H	MOVE_ELIMINATION.INT_NOT_ELIMINATED	Number of integer Move Elimination candidate uops that were not eliminated.	
58H	08H	MOVE_ELIMINATION.SIMD_NOT_ELIMINATED	Number of SIMD Move Elimination candidate uops that were not eliminated.	
58H	01H	MOVE_ELIMINATION.INT_ELIMINATED	Number of integer Move Elimination candidate uops that were eliminated.	
58H	02H	MOVE_ELIMINATION.SIMD_ELIMINATED	Number of SIMD Move Elimination candidate uops that were eliminated.	
5CH	01H	CPL_CYCLES.RING0	Unhalted core cycles when the thread is in ring 0.	Use Edge to count transition.
5CH	02H	CPL_CYCLES.RING123	Unhalted core cycles when the thread is not in ring 0.	
5EH	01H	RS_EVENTS.EMPTY_CYCLES	Cycles the RS is empty for the thread.	
5FH	04H	DTLB_LOAD_MISSES.STLB_HIT	Counts load operations that missed 1st level DTLB but hit the 2nd level.	
60H	01H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD	Offcore outstanding Demand Data Read transactions in SQ to uncore. Set Cmask=1 to count cycles.	
60H	02H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_CODE_RD	Offcore outstanding Demand Code Read transactions in SQ to uncore. Set Cmask=1 to count cycles.	
60H	04H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_RFO	Offcore outstanding RFO store transactions in SQ to uncore. Set Cmask=1 to count cycles.	
60H	08H	OFFCORE_REQUESTS_OUTSTANDING.ALL_DATA_RD	Offcore outstanding cacheable data read transactions in SQ to uncore. Set Cmask=1 to count cycles.	
63H	01H	LOCK_CYCLES.SPLIT_LOCK_UC_LOCK_DURATION	Cycles in which the L1D and L2 are locked, due to a UC lock or split lock.	

Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
63H	02H	LOCK_CYCLES.CACHE_LOCK_DURATION	Cycles in which the L1D is locked.	
79H	02H	IDQ.EMPTY	Counts cycles the IDQ is empty.	
79H	04H	IDQ.MITE_UOPS	Increment each cycle # of uops delivered to IDQ from MITE path. Set Cmask = 1 to count cycles.	Can combine Umask 04H and 20H.
79H	08H	IDQ.DSB_UOPS	Increment each cycle. # of uops delivered to IDQ from DSB path. Set Cmask = 1 to count cycles.	Can combine Umask 08H and 10H.
79H	10H	IDQ.MS_DSB_UOPS	Increment each cycle # of uops delivered to IDQ when MS_busy by DSB. Set Cmask = 1 to count cycles. Add Edge=1 to count # of delivery.	Can combine Umask 04H, 08H.
79H	20H	IDQ.MS_MITE_UOPS	Increment each cycle # of uops delivered to IDQ when MS_busy by MITE. Set Cmask = 1 to count cycles.	Can combine Umask 04H, 08H.
79H	30H	IDQ.MS_UOPS	Increment each cycle # of uops delivered to IDQ from MS by either DSB or MITE. Set Cmask = 1 to count cycles.	Can combine Umask 04H, 08H.
79H	18H	IDQ.ALL_DSB_CYCLES_ANY_UOPS	Counts cycles DSB is delivered at least one uops. Set Cmask = 1.	
79H	18H	IDQ.ALL_DSB_CYCLES_4_UOPS	Counts cycles DSB is delivered four uops. Set Cmask = 4.	
79H	24H	IDQ.ALL_MITE_CYCLES_ANY_UOPS	Counts cycles MITE is delivered at least one uops. Set Cmask = 1.	
79H	24H	IDQ.ALL_MITE_CYCLES_4_UOPS	Counts cycles MITE is delivered four uops. Set Cmask = 4.	
79H	3CH	IDQ.MITE_ALL_UOPS	# of uops delivered to IDQ from any path.	
80H	04H	ICACHE.IFETCH_STALL	Cycles where a code-fetch stalled due to L1 instruction-cache miss or an iTLB miss.	
80H	02H	ICACHE.MISSES	Number of Instruction Cache, Streaming Buffer and Victim Cache Misses. Includes UC accesses.	
85H	01H	ITLB_MISSES.MISS_CAUSES_A_WALK	Misses in all ITLB levels that cause page walks.	
85H	02H	ITLB_MISSES.WALK_COMPLETED	Misses in all ITLB levels that cause completed page walks.	
85H	04H	ITLB_MISSES.WALK_DURATION	Cycle PMH is busy with a walk.	
85H	10H	ITLB_MISSES.STLB_HIT	Number of cache load STLB hits. No page walk.	
87H	01H	ILD_STALL.LCP	Stalls caused by changing prefix length of the instruction.	
87H	04H	ILD_STALL.IQ_FULL	Stall cycles due to IQ is full.	
88H	01H	BR_INST_EXEC.COND	Qualify conditional near branch instructions executed, but not necessarily retired.	Must combine with umask 40H, 80H.
88H	02H	BR_INST_EXEC.DIRECT_JMP	Qualify all unconditional near branch instructions excluding calls and indirect branches.	Must combine with umask 80H.
88H	04H	BR_INST_EXEC.INDIRECT_JMP_NON_CALL_RET	Qualify executed indirect near branch instructions that are not calls or returns.	Must combine with umask 80H.
88H	08H	BR_INST_EXEC.RETURN_NEAR	Qualify indirect near branches that have a return mnemonic.	Must combine with umask 80H.

Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
88H	10H	BR_INST_EXEC.DIRECT_NEAR_CALL	Qualify unconditional near call branch instructions, excluding non-call branch, executed.	Must combine with umask 80H.
88H	20H	BR_INST_EXEC.INDIRECT_NEAR_CALL	Qualify indirect near calls, including both register and memory indirect, executed.	Must combine with umask 80H.
88H	40H	BR_INST_EXEC.NONTAKEN	Qualify non-taken near branches executed.	Applicable to umask 01H only.
88H	80H	BR_INST_EXEC.TAKEN	Qualify taken near branches executed. Must combine with 01H,02H, 04H, 08H, 10H, 20H.	
88H	FFH	BR_INST_EXEC.ALL_BRANCHES	Counts all near executed branches (not necessarily retired).	
89H	01H	BR_MISP_EXEC.COND	Qualify conditional near branch instructions mispredicted.	Must combine with umask 40H, 80H.
89H	04H	BR_MISP_EXEC.INDIRECT_JMP_NON_CALL_RET	Qualify mispredicted indirect near branch instructions that are not calls or returns.	Must combine with umask 80H.
89H	08H	BR_MISP_EXEC.RETURN_NEAR	Qualify mispredicted indirect near branches that have a return mnemonic.	Must combine with umask 80H.
89H	10H	BR_MISP_EXEC.DIRECT_NEAR_CALL	Qualify mispredicted unconditional near call branch instructions, excluding non-call branch, executed.	Must combine with umask 80H.
89H	20H	BR_MISP_EXEC.INDIRECT_NEAR_CALL	Qualify mispredicted indirect near calls, including both register and memory indirect, executed.	Must combine with umask 80H.
89H	40H	BR_MISP_EXEC.NONTAKEN	Qualify mispredicted non-taken near branches executed.	Applicable to umask 01H only.
89H	80H	BR_MISP_EXEC.TAKEN	Qualify mispredicted taken near branches executed. Must combine with 01H,02H, 04H, 08H, 10H, 20H.	
89H	FFH	BR_MISP_EXEC.ALL_BRANCHES	Counts all near executed branches (not necessarily retired).	
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CORE	Count issue pipeline slots where no uop was delivered from the front end to the back end when there is no back-end stall.	Use Cmask to qualify uop b/w.
A1H	01H	UOPS_DISPATCHED_PORT.PORT_0	Cycles which a Uop is dispatched on port 0.	
A1H	02H	UOPS_DISPATCHED_PORT.PORT_1	Cycles which a Uop is dispatched on port 1.	
A1H	0CH	UOPS_DISPATCHED_PORT.PORT_2	Cycles which a Uop is dispatched on port 2.	
A1H	30H	UOPS_DISPATCHED_PORT.PORT_3	Cycles which a Uop is dispatched on port 3.	
A1H	40H	UOPS_DISPATCHED_PORT.PORT_4	Cycles which a Uop is dispatched on port 4.	
A1H	80H	UOPS_DISPATCHED_PORT.PORT_5	Cycles which a Uop is dispatched on port 5.	
A2H	01H	RESOURCE_STALLS.ANY	Cycles Allocation is stalled due to Resource Related reason.	
A2H	04H	RESOURCE_STALLS.RS	Cycles stalled due to no eligible RS entry available.	
A2H	08H	RESOURCE_STALLS.SB	Cycles stalled due to no store buffers available (not including draining form sync).	
A2H	10H	RESOURCE_STALLS.ROB	Cycles stalled due to re-order buffer full.	

Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
A3H	01H	CYCLE_ACTIVITY.CYCLES_L2_PENDING	Cycles with pending L2 miss loads. Set AnyThread to count per core.	
A3H	02H	CYCLE_ACTIVITY.CYCLES_LDM_PENDING	Cycles with pending memory loads. Set AnyThread to count per core.	Restricted to counters 0-3 when HTT is disabled.
A3H	04H	CYCLE_ACTIVITY.CYCLES_NO_EXECUTE	Cycles of dispatch stalls. Set AnyThread to count per core.	Restricted to counters 0-3 when HTT is disabled.
A3H	05H	CYCLE_ACTIVITY.STALLS_L2_PENDING	Number of loads missed L2.	Restricted to counters 0-3 when HTT is disabled.
A3H	06H	CYCLE_ACTIVITY.STALLS_LDM_PENDING		Restricted to counters 0-3 when HTT is disabled.
A3H	08H	CYCLE_ACTIVITY.CYCLES_L1D_PENDING	Cycles with pending L1 cache miss loads. Set AnyThread to count per core.	PMC2 only.
A3H	0CH	CYCLE_ACTIVITY.STALLS_L1D_PENDING	Execution stalls due to L1 data cache miss loads. Set Cmask=0CH.	PMC2 only.
A8H	01H	LSD.UOPS	Number of Uops delivered by the LSD.	
ABH	01H	DSB2MITE_SWITCHES.COUNT	Number of DSB to MITE switches.	
ABH	02H	DSB2MITE_SWITCHES.PENALTY_CYCLES	Cycles DSB to MITE switches caused delay.	
ACH	08H	DSB_FILL.EXCEED_DSB_LINES	DSB Fill encountered > 3 DSB lines.	
AEH	01H	ITLB.ITLB_FLUSH	Counts the number of ITLB flushes, includes 4k/2M/4M pages.	
B0H	01H	OFFCORE_REQUESTS.DEMAND_DATA_RD	Demand data read requests sent to uncore.	
B0H	02H	OFFCORE_REQUESTS.DEMAND_CODE_RD	Demand code read requests sent to uncore.	
B0H	04H	OFFCORE_REQUESTS.DEMAND_RFO	Demand RFO read requests sent to uncore, including regular RFOs, locks, ItoM.	
B0H	08H	OFFCORE_REQUESTS.ALL_DATA_RD	Data read requests sent to uncore (demand and prefetch).	
B1H	01H	UOPS_EXECUTED.THREAD	Counts total number of uops to be executed per-thread each cycle. Set Cmask = 1, INV =1 to count stall cycles.	
B1H	02H	UOPS_EXECUTED.CORE	Counts total number of uops to be executed per-core each cycle.	Do not need to set ANY.
B7H	01H	OFFCORE_RESPONSE_0	See Section 18.3.4.5, "Off-core Response Performance Monitoring".	Requires MSR 01A6H.
BBH	01H	OFFCORE_RESPONSE_1	See Section 18.3.4.5, "Off-core Response Performance Monitoring".	Requires MSR 01A7H.
BDH	01H	TLB_FLUSH.DTLB_THREAD	DTLB flush attempts of the thread-specific entries.	
BDH	20H	TLB_FLUSH.STLB_ANY	Count number of STLB flush attempts.	
C0H	00H	INST_RETIRED.ANY_P	Number of instructions at retirement.	See Table 19-1.
C0H	01H	INST_RETIRED.PREC_DIST	Precise instruction retired event with HW to reduce effect of PEBS shadow in IP distribution.	PMC1 only.
C1H	08H	OTHER_ASSISTS.AVX_STORE	Number of assists associated with 256-bit AVX store operations.	

Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C1H	10H	OTHER_ASSISTS.AVX_TO_SSE	Number of transitions from AVX-256 to legacy SSE when penalty applicable.	
C1H	20H	OTHER_ASSISTS.SSE_TO_AVX	Number of transitions from SSE to AVX-256 when penalty applicable.	
C1H	80H	OTHER_ASSISTS.WB	Number of times microcode assist is invoked by hardware upon uop writeback.	
C2H	01H	UOPS_RETIRED.ALL	Counts the number of micro-ops retired, Use cmask=1 and invert to count active cycles or stalled cycles.	Supports PEBS, use Any=1 for core granular.
C2H	02H	UOPS_RETIRED.RETIRE_SLOTS	Counts the number of retirement slots used each cycle.	Supports PEBS.
C3H	02H	MACHINE_CLEARS.MEMORY_ORDERING	Counts the number of machine clears due to memory order conflicts.	
C3H	04H	MACHINE_CLEARS.SMC	Number of self-modifying-code machine clears detected.	
C3H	20H	MACHINE_CLEARS.MASKMOV	Counts the number of executed AVX masked load operations that refer to an illegal address range with the mask bits set to 0.	
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Branch instructions at retirement.	See Table 19-1.
C4H	01H	BR_INST_RETIRED.CONDITIONAL	Counts the number of conditional branch instructions retired.	Supports PEBS.
C4H	02H	BR_INST_RETIRED.NEAR_CALL	Direct and indirect near call instructions retired.	Supports PEBS.
C4H	04H	BR_INST_RETIRED.ALL_BRANCHES	Counts the number of branch instructions retired.	Supports PEBS.
C4H	08H	BR_INST_RETIRED.NEAR_RETURN	Counts the number of near return instructions retired.	Supports PEBS.
C4H	10H	BR_INST_RETIRED.NOT_TAKEN	Counts the number of not taken branch instructions retired.	Supports PEBS.
C4H	20H	BR_INST_RETIRED.NEAR_TAKEN	Number of near taken branches retired.	Supports PEBS.
C4H	40H	BR_INST_RETIRED.FAR_BRANCH	Number of far branches retired.	Supports PEBS.
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted branch instructions at retirement.	See Table 19-1.
C5H	01H	BR_MISP_RETIRED.CONDITIONAL	Mispredicted conditional branch instructions retired.	Supports PEBS.
C5H	04H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted macro branch instructions retired.	Supports PEBS.
C5H	20H	BR_MISP_RETIRED.NEAR_TAKEN	Mispredicted taken branch instructions retired.	Supports PEBS.
CAH	02H	FP_ASSIST.X87_OUTPUT	Number of X87 FP assists due to output values.	Supports PEBS.
CAH	04H	FP_ASSIST.X87_INPUT	Number of X87 FP assists due to input values.	Supports PEBS.
CAH	08H	FP_ASSIST.SIMD_OUTPUT	Number of SIMD FP assists due to output values.	Supports PEBS.
CAH	10H	FP_ASSIST.SIMD_INPUT	Number of SIMD FP assists due to input values.	
CAH	1EH	FP_ASSIST.ANY	Cycles with any input/output SSE* or FP assists.	
CCH	20H	ROB_MISC_EVENTS.LBR_INSERTS	Count cases of saving new LBR records by hardware.	

Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY	Randomly sampled loads whose latency is above a user defined threshold. A small fraction of the overall loads are sampled due to randomization.	Specify threshold in MSR 3F6H. PMC 3 only.
CDH	02H	MEM_TRANS_RETIRED.PRECISE_STORE	Sample stores and collect precise store operation via PEBS record. PMC3 only.	See Section 18.3.4.4.3.
D0H	11H	MEM_UOPS_RETIRED.STLB_MISS_LOADS	Retired load uops that miss the STLB.	Supports PEBS.
D0H	12H	MEM_UOPS_RETIRED.STLB_MISS_STORES	Retired store uops that miss the STLB.	Supports PEBS.
D0H	21H	MEM_UOPS_RETIRED.LOCK_LOADS	Retired load uops with locked access.	Supports PEBS.
D0H	41H	MEM_UOPS_RETIRED.SPLIT_LOADS	Retired load uops that split across a cacheline boundary.	Supports PEBS.
D0H	42H	MEM_UOPS_RETIRED.SPLIT_STORES	Retired store uops that split across a cacheline boundary.	Supports PEBS.
D0H	81H	MEM_UOPS_RETIRED.ALL_LOADS	All retired load uops.	Supports PEBS.
D0H	82H	MEM_UOPS_RETIRED.ALL_STORES	All retired store uops.	Supports PEBS.
D1H	01H	MEM_LOAD_UOPS_RETIRED.L1_HIT	Retired load uops with L1 cache hits as data sources.	Supports PEBS.
D1H	02H	MEM_LOAD_UOPS_RETIRED.L2_HIT	Retired load uops with L2 cache hits as data sources.	Supports PEBS.
D1H	04H	MEM_LOAD_UOPS_RETIRED.LLC_HIT	Retired load uops whose data source was LLC hit with no snoop required.	Supports PEBS.
D1H	08H	MEM_LOAD_UOPS_RETIRED.L1_MISS	Retired load uops whose data source followed an L1 miss.	Supports PEBS.
D1H	10H	MEM_LOAD_UOPS_RETIRED.L2_MISS	Retired load uops that missed L2, excluding unknown sources.	Supports PEBS.
D1H	20H	MEM_LOAD_UOPS_RETIRED.LLC_MISS	Retired load uops whose data source is LLC miss.	Supports PEBS. Restricted to counters 0-3 when HTT is disabled.
D1H	40H	MEM_LOAD_UOPS_RETIRED.HIT_LFB	Retired load uops which data sources were load uops missed L1 but hit FB due to preceding miss to the same cache line with data not ready.	Supports PEBS.
D2H	01H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_MISS	Retired load uops whose data source was an on-package core cache LLC hit and cross-core snoop missed.	Supports PEBS.
D2H	02H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HIT	Retired load uops whose data source was an on-package LLC hit and cross-core snoop hits.	Supports PEBS.
D2H	04H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HITM	Retired load uops whose data source was an on-package core cache with HitM responses.	Supports PEBS.
D2H	08H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_NONE	Retired load uops whose data source was LLC hit with no snoop required.	Supports PEBS.
D3H	01H	MEM_LOAD_UOPS_LLC_MISS_RETIRED.LOCAL_DRAM	Retired load uops whose data source was local memory (cross-socket snoop not needed or missed).	Supports PEBS.
E6H	1FH	BACLEARS.ANY	Number of front end re-steers due to BPU misprediction.	

Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
F0H	01H	L2_TRANS.DEMAND_DATA_RD	Demand Data Read requests that access L2 cache.	
F0H	02H	L2_TRANS.RFO	RFO requests that access L2 cache.	
F0H	04H	L2_TRANS.CODE_RD	L2 cache accesses when fetching instructions.	
F0H	08H	L2_TRANS.ALL_PF	Any MLC or LLC HW prefetch accessing L2, including rejects.	
F0H	10H	L2_TRANS.L1D_WB	L1D writebacks that access L2 cache.	
F0H	20H	L2_TRANS.L2_FILL	L2 fill requests that access L2 cache.	
F0H	40H	L2_TRANS.L2_WB	L2 writebacks that access L2 cache.	
F0H	80H	L2_TRANS.ALL_REQUESTS	Transactions accessing L2 pipe.	
F1H	01H	L2_LINES_IN.I	L2 cache lines in I state filling L2.	Counting does not cover rejects.
F1H	02H	L2_LINES_IN.S	L2 cache lines in S state filling L2.	Counting does not cover rejects.
F1H	04H	L2_LINES_IN.E	L2 cache lines in E state filling L2.	Counting does not cover rejects.
F1H	07H	L2_LINES_IN.ALL	L2 cache lines filling L2.	Counting does not cover rejects.
F2H	01H	L2_LINES_OUT.DEMAND_CLEAN	Clean L2 cache lines evicted by demand.	
F2H	02H	L2_LINES_OUT.DEMAND_DIRTY	Dirty L2 cache lines evicted by demand.	
F2H	04H	L2_LINES_OUT.PF_CLEAN	Clean L2 cache lines evicted by the MLC prefetcher.	
F2H	08H	L2_LINES_OUT.PF_DIRTY	Dirty L2 cache lines evicted by the MLC prefetcher.	
F2H	0AH	L2_LINES_OUT.DIRTY_ALL	Dirty L2 cache lines filling the L2.	Counting does not cover rejects.

19.7.1 Performance Monitoring Events in the Processor Core of Intel Xeon Processor E5 v2 Family and Intel Xeon Processor E7 v2 Family

Model-specific performance monitoring events in the processor core that are applicable only to Intel Xeon processor E5 v2 family and Intel Xeon processor E7 v2 family based on the Ivy Bridge-E microarchitecture, with CPUID signature of DisplayFamily_DisplayModel 06_3EH, are listed in Table 19-14.

Table 19-14. Performance Events Applicable Only to the Processor Core of Intel® Xeon® Processor E5 v2 Family and Intel® Xeon® Processor E7 v2 Family

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D3H	03H	MEM_LOAD_UOPS_LLC_MISS_RETIRED.LOCAL_DRAM	Retired load uops whose data sources were local DRAM (snoop not needed, Snoop Miss, or Snoop Hit data not forwarded).	Supports PEBS.
D3H	0CH	MEM_LOAD_UOPS_LLC_MISS_RETIRED.REMOTE_DRAM	Retired load uops whose data source was remote DRAM (snoop not needed, Snoop Miss, or Snoop Hit data not forwarded).	Supports PEBS.
D3H	10H	MEM_LOAD_UOPS_LLC_MISS_RETIRED.REMOTE_HITM	Retired load uops whose data sources were remote HITM.	Supports PEBS.
D3H	20H	MEM_LOAD_UOPS_LLC_MISS_RETIRED.REMOTE_FWD	Retired load uops whose data sources were forwards from a remote cache.	Supports PEBS.

19.8 PERFORMANCE MONITORING EVENTS FOR 2ND GENERATION INTEL® CORE™ I7-2XXX, INTEL® CORE™ I5-2XXX, INTEL® CORE™ I3-2XXX PROCESSOR SERIES

2nd generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx processor series, and Intel Xeon processor E3-1200 product family are based on the Intel microarchitecture code name Sandy Bridge. They support architectural performance monitoring events listed in Table 19-1. Model-specific performance monitoring events in the processor core are listed in Table 19-15, Table 19-16, and Table 19-17. The events in Table 19-15 apply to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following values: 06_2AH and 06_2DH. The events in Table 19-16 apply to processors with CPUID signature 06_2AH. The events in Table 19-17 apply to processors with CPUID signature 06_2DH. Fixed counters in the core PMU support the architecture events defined in Table 19-2.

Additional information on event specifics (e.g. derivative events using specific IA32_PERFEVTSELx modifiers, limitations, special notes and recommendations) can be found at found at https://software.intel.com/en-us/forums/software-tuning-performance-optimization-platform-monitoring.

Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	01H	LD_BLOCKS.DATA_UNKNOWN	Blocked loads due to store buffer blocks with unknown data.	
03H	02H	LD_BLOCKS.STORE_FORWARD	Loads blocked by overlapping with store buffer that cannot be forwarded.	
03H	08H	LD_BLOCKS.NO_SR	# of Split loads blocked due to resource not available.	
03H	10H	LD_BLOCKS.ALL_BLOCK	Number of cases where any load is blocked but has no DCU miss.	
05H	01H	MISALIGN_MEM_REF.LOADS	Speculative cache-line split load uops dispatched to L1D.	
05H	02H	MISALIGN_MEM_REF.STORES	Speculative cache-line split Store-address uops dispatched to L1D.	
07H	01H	LD_BLOCKS_PARTIAL.ADDRESS_ALIAS	False dependencies in MOB due to partial compare on address.	
07H	08H	LD_BLOCKS_PARTIAL.ALL_STA_BLOCK	The number of times that load operations are temporarily blocked because of older stores, with addresses that are not yet known. A load operation may incur more than one block of this type.	
08H	01H	DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK	Misses in all TLB levels that cause a page walk of any page size.	
08H	02H	DTLB_LOAD_MISSES.WALK_COMPLETED	Misses in all TLB levels that caused page walk completed of any size.	
08H	04H	DTLB_LOAD_MISSES.WALK_DURATION	Cycle PMH is busy with a walk.	
08H	10H	DTLB_LOAD_MISSES.STLB_HIT	Number of cache load STLB hits. No page walk.	
0DH	03H	INT_MISC.RECOVERY_CYCLES	Cycles waiting to recover after Machine Clears or JEClear. Set Cmask= 1.	Set Edge to count occurrences.
0DH	40H	INT_MISC.RAT_STALL_CYCLES	Cycles RAT external stall is sent to IDQ for this thread.	

Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0EH	01H	UOPS_ISSUED.ANY	Increments each cycle the # of Uops issued by the RAT to RS. Set Cmask = 1, Inv = 1, Any= 1to count stalled cycles of this core.	Set Cmask = 1, Inv = 1to count stalled cycles.
10H	01H	FP_COMP_OPS_EXE.X87	Counts number of X87 uops executed.	
10H	10H	FP_COMP_OPS_EXE.SSE_FP_PACKED_DOUBLE	Counts number of SSE* double precision FP packed uops executed.	
10H	20H	FP_COMP_OPS_EXE.SSE_FP_SCALAR_SINGLE	Counts number of SSE* single precision FP scalar uops executed.	
10H	40H	FP_COMP_OPS_EXE.SSE_PACKED SINGLE	Counts number of SSE* single precision FP packed uops executed.	
10H	80H	FP_COMP_OPS_EXE.SSE_SCALAR_DOUBLE	Counts number of SSE* double precision FP scalar uops executed.	
11H	01H	SIMD_FP_256.PACKED_SINGLE	Counts 256-bit packed single-precision floating-point instructions.	
11H	02H	SIMD_FP_256.PACKED_DOUBLE	Counts 256-bit packed double-precision floating-point instructions.	
14H	01H	ARITH.FPU_DIV_ACTIVE	Cycles that the divider is active, includes INT and FP. Set 'edge =1, cmask=1' to count the number of divides.	
17H	01H	INSTS_WRITTEN_TO_IQ.INSTS	Counts the number of instructions written into the IQ every cycle.	
24H	01H	L2_RQSTS.DEMAND_DATA_RD_HIT	Demand Data Read requests that hit L2 cache.	
24H	03H	L2_RQSTS.ALL_DEMAND_DATA_RD	Counts any demand and L1 HW prefetch data load requests to L2.	
24H	04H	L2_RQSTS.RFO_HITS	Counts the number of store RFO requests that hit the L2 cache.	
24H	08H	L2_RQSTS.RFO_MISS	Counts the number of store RFO requests that miss the L2 cache.	
24H	0CH	L2_RQSTS.ALL_RFO	Counts all L2 store RFO requests.	
24H	10H	L2_RQSTS.CODE_RD_HIT	Number of instruction fetches that hit the L2 cache.	
24H	20H	L2_RQSTS.CODE_RD_MISS	Number of instruction fetches that missed the L2 cache.	
24H	30H	L2_RQSTS.ALL_CODE_RD	Counts all L2 code requests.	
24H	40H	L2_RQSTS.PF_HIT	Requests from L2 Hardware prefetcher that hit L2.	
24H	80H	L2_RQSTS.PF_MISS	Requests from L2 Hardware prefetcher that missed L2.	
24H	C0H	L2_RQSTS.ALL_PF	Any requests from L2 Hardware prefetchers.	
27H	01H	L2_STORE_LOCK_RQSTS.MISS	RFOs that miss cache lines.	
27H	04H	L2_STORE_LOCK_RQSTS.HIT_E	RFOs that hit cache lines in E state.	
27H	08H	L2_STORE_LOCK_RQSTS.HIT_M	RFOs that hit cache lines in M state.	
27H	0FH	L2_STORE_LOCK_RQSTS.ALL	RFOs that access cache lines in any state.	

Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
28H	01H	L2_L1D_WB_RQSTS.MISS	Not rejected writebacks from L1D to L2 cache lines that missed L2.	
28H	02H	L2_L1D_WB_RQSTS.HIT_S	Not rejected writebacks from L1D to L2 cache lines in S state.	
28H	04H	L2_L1D_WB_RQSTS.HIT_E	Not rejected writebacks from L1D to L2 cache lines in E state.	
28H	08H	L2_L1D_WB_RQSTS.HIT_M	Not rejected writebacks from L1D to L2 cache lines in M state.	
28H	0FH	L2_L1D_WB_RQSTS.ALL	Not rejected writebacks from L1D to L2 cache.	
2EH	4FH	LONGEST_LAT_CACHE.REFERENCE	This event counts requests originating from the core that reference a cache line in the last level cache.	See Table 19-1.
2EH	41H	LONGEST_LAT_CACHE.MISS	This event counts each cache miss condition for references to the last level cache.	See Table 19-1.
3CH	00H	CPU_CLK_UNHALTED.THREAD_P	Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling.	See Table 19-1.
3CH	01H	CPU_CLK_THREAD_UNHALTED.REF_XCLK	Increments at the frequency of XCLK (100 MHz) when not halted.	See Table 19-1.
48H	01H	L1D_PEND_MISS.PENDING	Increments the number of outstanding L1D misses every cycle. Set Cmask = 1 and Edge =1 to count occurrences.	PMC2 only; Set Cmask = 1 to count cycles.
49H	01H	DTLB_STORE_MISSES.MISS_CAUSES_A_WALK	Miss in all TLB levels causes a page walk of any page size (4K/2M/4M/1G).	
49H	02H	DTLB_STORE_MISSES.WALK_COMPLETED	Miss in all TLB levels causes a page walk that completes of any page size (4K/2M/4M/1G).	
49H	04H	DTLB_STORE_MISSES.WALK_DURATION	Cycles PMH is busy with this walk.	
49H	10H	DTLB_STORE_MISSES.STLB_HIT	Store operations that miss the first TLB level but hit the second and do not cause page walks.	
4CH	01H	LOAD_HIT_PRE.SW_PF	Not SW-prefetch load dispatches that hit fill buffer allocated for S/W prefetch.	
4CH	02H	LOAD_HIT_PRE.HW_PF	Not SW-prefetch load dispatches that hit fill buffer allocated for H/W prefetch.	
4EH	02H	HW_PRE_REQ.DL1_MISS	Hardware Prefetch requests that miss the L1D cache. A request is being counted each time it access the cache & miss it, including if a block is applicable or if hit the Fill Buffer for example.	This accounts for both L1 streamer and IP-based (IPP) HW prefetchers.
51H	01H	L1D.REPLACEMENT	Counts the number of lines brought into the L1 data cache.	
51H	02H	L1D.ALLOCATED_IN_M	Counts the number of allocations of modified L1D cache lines.	
51H	04H	L1D.EVICTION	Counts the number of modified lines evicted from the L1 data cache due to replacement.	

Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
51H	08H	L1D.ALL_M_REPLACEMENT	Cache lines in M state evicted out of L1D due to Snoop HitM or dirty line replacement.	
59H	20H	PARTIAL_RAT_STALLS.FLAGS_MERGE_UOP	Increments the number of flags-merge uops in flight each cycle. Set Cmask = 1 to count cycles.	
59H	40H	PARTIAL_RAT_STALLS.SLOW_LEA_WINDOW	Cycles with at least one slow LEA uop allocated.	
59H	80H	PARTIAL_RAT_STALLS.MUL_SINGLE_UOP	Number of Multiply packed/scalar single precision uops allocated.	
5BH	0CH	RESOURCE_STALLS2.ALL_FL_EMPTY	Cycles stalled due to free list empty.	PMC0-3 only regardless HTT.
5BH	0FH	RESOURCE_STALLS2.ALL_PRF_CONTROL	Cycles stalled due to control structures full for physical registers.	
5BH	40H	RESOURCE_STALLS2.BOB_FULL	Cycles Allocator is stalled due Branch Order Buffer.	
5BH	4FH	RESOURCE_STALLS2.OOO_RSRC	Cycles stalled due to out of order resources full.	
5CH	01H	CPL_CYCLES.RING0	Unhalted core cycles when the thread is in ring 0.	Use Edge to count transition.
5CH	02H	CPL_CYCLES.RING123	Unhalted core cycles when the thread is not in ring 0.	
5EH	01H	RS_EVENTS.EMPTY_CYCLES	Cycles the RS is empty for the thread.	
60H	01H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD	Offcore outstanding Demand Data Read transactions in SQ to uncore. Set Cmask=1 to count cycles.	
60H	04H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND_RFO	Offcore outstanding RFO store transactions in SQ to uncore. Set Cmask=1 to count cycles.	
60H	08H	OFFCORE_REQUESTS_OUTSTANDING.ALL_DATA_RD	Offcore outstanding cacheable data read transactions in SQ to uncore. Set Cmask=1 to count cycles.	
63H	01H	LOCK_CYCLES.SPLIT_LOCK_UC_LOCK_DURATION	Cycles in which the L1D and L2 are locked, due to a UC lock or split lock.	
63H	02H	LOCK_CYCLES.CACHE_LOCK_DURATION	Cycles in which the L1D is locked.	
79H	02H	IDQ.EMPTY	Counts cycles the IDQ is empty.	
79H	04H	IDQ.MITE_UOPS	Increment each cycle # of uops delivered to IDQ from MITE path. Set Cmask = 1 to count cycles.	Can combine Umask 04H and 20H.
79H	08H	IDQ.DSB_UOPS	Increment each cycle. # of uops delivered to IDQ from DSB path. Set Cmask = 1 to count cycles.	Can combine Umask 08H and 10H.
79H	10H	IDQ.MS_DSB_UOPS	Increment each cycle # of uops delivered to IDQ when MS busy by DSB. Set Cmask = 1 to count cycles MS is busy. Set Cmask=1 and Edge =1 to count MS activations.	Can combine Umask 08H and 10H.
79H	20H	IDQ.MS_MITE_UOPS	Increment each cycle # of uops delivered to IDQ when MS is busy by MITE. Set Cmask = 1 to count cycles.	Can combine Umask 04H and 20H.

Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
79H	30H	IDQ.MS_UOPS	Increment each cycle # of uops delivered to IDQ from MS by either DSB or MITE. Set Cmask = 1 to count cycles.	Can combine Umask 04H, 08H and 30H.
80H	02H	ICACHE.MISSES	Number of Instruction Cache, Streaming Buffer and Victim Cache Misses. Includes UC accesses.	
85H	01H	ITLB_MISSES.MISS_CAUSES_A_WALK	Misses in all ITLB levels that cause page walks.	
85H	02H	ITLB_MISSES.WALK_COMPLETED	Misses in all ITLB levels that cause completed page walks.	
85H	04H	ITLB_MISSES.WALK_DURATION	Cycle PMH is busy with a walk.	
85H	10H	ITLB_MISSES.STLB_HIT	Number of cache load STLB hits. No page walk.	
87H	01H	ILD_STALL.LCP	Stalls caused by changing prefix length of the instruction.	
87H	04H	ILD_STALL.IQ_FULL	Stall cycles due to IQ is full.	
88H	41H	BR_INST_EXEC.NONTAKEN_CONDITIONAL	Not-taken macro conditional branches.	
88H	81H	BR_INST_EXEC.TAKEN_CONDITIONAL	Taken speculative and retired conditional branches.	
88H	82H	BR_INST_EXEC.TAKEN_DIRECT_JUMP	Taken speculative and retired conditional branches excluding calls and indirects.	
88H	84H	BR_INST_EXEC.TAKEN_INDIRECT_JUMP_NON_CALL_RET	Taken speculative and retired indirect branches excluding calls and returns.	
88H	88H	BR_INST_EXEC.TAKEN_INDIRECT_NEAR_RETURN	Taken speculative and retired indirect branches that are returns.	
88H	90H	BR_INST_EXEC.TAKEN_DIRECT_NEAR_CALL	Taken speculative and retired direct near calls.	
88H	A0H	BR_INST_EXEC.TAKEN_INDIRECT_NEAR_CALL	Taken speculative and retired indirect near calls.	
88H	C1H	BR_INST_EXEC.ALL_CONDITIONAL	Speculative and retired conditional branches.	
88H	C2H	BR_INST_EXEC.ALL_DIRECT_JUMP	Speculative and retired conditional branches excluding calls and indirects.	
88H	C4H	BR_INST_EXEC.ALL_INDIRECT_JUMP_NON_CALL_RET	Speculative and retired indirect branches excluding calls and returns.	
88H	C8H	BR_INST_EXEC.ALL_INDIRECT_NEAR_RETURN	Speculative and retired indirect branches that are returns.	
88H	D0H	BR_INST_EXEC.ALL_NEAR_CALL	Speculative and retired direct near calls.	
88H	FFH	BR_INST_EXEC.ALL_BRANCHES	Speculative and retired branches.	
89H	41H	BR_MISP_EXEC.NONTAKEN_CONDITIONAL	Not-taken mispredicted macro conditional branches.	
89H	81H	BR_MISP_EXEC.TAKEN_CONDITIONAL	Taken speculative and retired mispredicted conditional branches.	

Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
89H	84H	BR_MISP_EXEC.TAKEN_INDIRECT_JUMP_NON_CALL_RET	Taken speculative and retired mispredicted indirect branches excluding calls and returns.	
89H	88H	BR_MISP_EXEC.TAKEN_RETURN_NEAR	Taken speculative and retired mispredicted indirect branches that are returns.	
89H	90H	BR_MISP_EXEC.TAKEN_DIRECT_NEAR_CALL	Taken speculative and retired mispredicted direct near calls.	
89H	A0H	BR_MISP_EXEC.TAKEN_INDIRECT_NEAR_CALL	Taken speculative and retired mispredicted indirect near calls.	
89H	C1H	BR_MISP_EXEC.ALL_CONDITIONAL	Speculative and retired mispredicted conditional branches.	
89H	C4H	BR_MISP_EXEC.ALL_INDIRECT_JUMP_NON_CALL_RET	Speculative and retired mispredicted indirect branches excluding calls and returns.	
89H	D0H	BR_MISP_EXEC.ALL_NEAR_CALL	Speculative and retired mispredicted direct near calls.	
89H	FFH	BR_MISP_EXEC.ALL_BRANCHES	Speculative and retired mispredicted branches.	
9CH	01H	IDQ_UOPS_NOT_DELIVERED.CORE	Count issue pipeline slots where no uop was delivered from the front end to the back end when there is no back-end stall.	Use Cmask to qualify uop b/w.
A1H	01H	UOPS_DISPATCHED_PORT.PORT_0	Cycles which a Uop is dispatched on port 0.	
A1H	02H	UOPS_DISPATCHED_PORT.PORT_1	Cycles which a Uop is dispatched on port 1.	
A1H	0CH	UOPS_DISPATCHED_PORT.PORT_2	Cycles which a Uop is dispatched on port 2.	
A1H	30H	UOPS_DISPATCHED_PORT.PORT_3	Cycles which a Uop is dispatched on port 3.	
A1H	40H	UOPS_DISPATCHED_PORT.PORT_4	Cycles which a Uop is dispatched on port 4.	
A1H	80H	UOPS_DISPATCHED_PORT.PORT_5	Cycles which a Uop is dispatched on port 5.	
A2H	01H	RESOURCE_STALLS.ANY	Cycles Allocation is stalled due to Resource Related reason.	
A2H	02H	RESOURCE_STALLS.LB	Counts the cycles of stall due to lack of load buffers.	
A2H	04H	RESOURCE_STALLS.RS	Cycles stalled due to no eligible RS entry available.	
A2H	08H	RESOURCE_STALLS.SB	Cycles stalled due to no store buffers available (not including draining form sync).	
A2H	10H	RESOURCE_STALLS.ROB	Cycles stalled due to re-order buffer full.	
A2H	20H	RESOURCE_STALLS.FCSW	Cycles stalled due to writing the FPU control word.	
A3H	01H	CYCLE_ACTIVITY.CYCLES_L2_PENDING	Cycles with pending L2 miss loads. Set AnyThread to count per core.	
A3H	02H	CYCLE_ACTIVITY.CYCLES_L1D_PENDING	Cycles with pending L1 cache miss loads. Set AnyThread to count per core.	PMC2 only.
A3H	04H	CYCLE_ACTIVITY.CYCLES_NO_DISPATCH	Cycles of dispatch stalls. Set AnyThread to count per core.	PMC0-3 only.

Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
A3H	05H	CYCLE_ACTIVITY.STALL_CYCLES_L2_PENDING		PMC0-3 only.
A3H	06H	CYCLE_ACTIVITY.STALL_CYCLES_L1D_PENDING		PMC2 only.
A8H	01H	LSD.UOPS	Number of Uops delivered by the LSD.	
ABH	01H	DSB2MITE_SWITCHES.COUNT	Number of DSB to MITE switches.	
ABH	02H	DSB2MITE_SWITCHES.PENALTY_CYCLES	Cycles DSB to MITE switches caused delay.	
ACH	02H	DSB_FILL.OTHER_CANCEL	Cases of cancelling valid DSB fill not because of exceeding way limit.	
ACH	08H	DSB_FILL.EXCEED_DSB_LINES	DSB Fill encountered > 3 DSB lines.	
AEH	01H	ITLB.ITLB_FLUSH	Counts the number of ITLB flushes; includes 4k/2M/4M pages.	
B0H	01H	OFFCORE_REQUESTS.DEMAND_DATA_RD	Demand data read requests sent to uncore.	
B0H	04H	OFFCORE_REQUESTS.DEMAND_RFO	Demand RFO read requests sent to uncore, including regular RFOs, locks, ItoM.	
B0H	08H	OFFCORE_REQUESTS.ALL_DATA_RD	Data read requests sent to uncore (demand and prefetch).	
B1H	01H	UOPS_DISPATCHED.THREAD	Counts total number of uops to be dispatched per-thread each cycle. Set Cmask = 1, INV =1 to count stall cycles.	PMC0-3 only regardless HTT.
B1H	02H	UOPS_DISPATCHED.CORE	Counts total number of uops to be dispatched per-core each cycle.	Do not need to set ANY.
B2H	01H	OFFCORE_REQUESTS_BUFFER.SQ_FULL	Offcore requests buffer cannot take more entries for this thread core.	
B6H	01H	AGU_BYPASS_CANCEL.COUNT	Counts executed load operations with all the following traits: 1. Addressing of the format [base + offset], 2. The offset is between 1 and 2047, 3. The address specified in the base register is in one page and the address [base+offset] is in another page.	
B7H	01H	OFF_CORE_RESPONSE_0	See Section 18.3.4.5, "Off-core Response Performance Monitoring".	Requires MSR 01A6H.
BBH	01H	OFF_CORE_RESPONSE_1	See Section 18.3.4.5, "Off-core Response Performance Monitoring".	Requires MSR 01A7H.
BDH	01H	TLB_FLUSH.DTLB_THREAD	DTLB flush attempts of the thread-specific entries.	
BDH	20H	TLB_FLUSH.STLB_ANY	Count number of STLB flush attempts.	
BFH	05H	L1D_BLOCKS.BANK_CONFLICT_CYCLES	Cycles when dispatched loads are cancelled due to L1D bank conflicts with other load ports.	Cmask=1.
C0H	00H	INST_RETIRED.ANY_P	Number of instructions at retirement.	See Table 19-1.
C0H	01H	INST_RETIRED.PREC_DIST	Precise instruction retired event with HW to reduce effect of PEBS shadow in IP distribution.	PMC1 only; must quiesce other PMCs.
C1H	02H	OTHER_ASSISTS.ITLB_MISS_RETIRED	Instructions that experienced an ITLB miss.	

Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C1H	08H	OTHER_ASSISTS.AVX_STORE	Number of assists associated with 256-bit AVX store operations.	
C1H	10H	OTHER_ASSISTS.AVX_TO_SSE	Number of transitions from AVX-256 to legacy SSE when penalty applicable.	
C1H	20H	OTHER_ASSISTS.SSE_TO_AVX	Number of transitions from SSE to AVX-256 when penalty applicable.	
C2H	01H	UOPS_RETIRED.ALL	Counts the number of micro-ops retired, Use cmask=1 and invert to count active cycles or stalled cycles.	Supports PEBS.
C2H	02H	UOPS_RETIRED.RETIRE_SLOTS	Counts the number of retirement slots used each cycle.	Supports PEBS.
C3H	02H	MACHINE_CLEARS.MEMORY_ORDERING	Counts the number of machine clears due to memory order conflicts.	
C3H	04H	MACHINE_CLEARS.SMC	Counts the number of times that a program writes to a code section.	
C3H	20H	MACHINE_CLEARS.MASKMOV	Counts the number of executed AVX masked load operations that refer to an illegal address range with the mask bits set to 0.	
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Branch instructions at retirement.	See Table 19-1.
C4H	01H	BR_INST_RETIRED.CONDITIONAL	Counts the number of conditional branch instructions retired.	Supports PEBS.
C4H	02H	BR_INST_RETIRED.NEAR_CALL	Direct and indirect near call instructions retired.	Supports PEBS.
C4H	04H	BR_INST_RETIRED.ALL_BRANCHES	Counts the number of branch instructions retired.	Supports PEBS.
C4H	08H	BR_INST_RETIRED.NEAR_RETURN	Counts the number of near return instructions retired.	Supports PEBS.
C4H	10H	BR_INST_RETIRED.NOT_TAKEN	Counts the number of not taken branch instructions retired.	
C4H	20H	BR_INST_RETIRED.NEAR_TAKEN	Number of near taken branches retired.	Supports PEBS.
C4H	40H	BR_INST_RETIRED.FAR_BRANCH	Number of far branches retired.	
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted branch instructions at retirement.	See Table 19-1.
C5H	01H	BR_MISP_RETIRED.CONDITIONAL	Mispredicted conditional branch instructions retired.	Supports PEBS.
C5H	02H	BR_MISP_RETIRED.NEAR_CALL	Direct and indirect mispredicted near call instructions retired.	Supports PEBS.
C5H	04H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted macro branch instructions retired.	Supports PEBS.
C5H	10H	BR_MISP_RETIRED.NOT_TAKEN	Mispredicted not taken branch instructions retired.	Supports PEBS.
C5H	20H	BR_MISP_RETIRED.TAKEN	Mispredicted taken branch instructions retired.	Supports PEBS.
CAH	02H	FP_ASSIST.X87_OUTPUT	Number of X87 assists due to output value.	

Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
CAH	04H	FP_ASSIST.X87_INPUT	Number of X87 assists due to input value.	
CAH	08H	FP_ASSIST.SIMD_OUTPUT	Number of SIMD FP assists due to output values.	
CAH	10H	FP_ASSIST.SIMD_INPUT	Number of SIMD FP assists due to input values.	
CAH	1EH	FP_ASSIST.ANY	Cycles with any input/output SSE* or FP assists.	
CCH	20H	ROB_MISC_EVENTS.LBR_INSERTS	Count cases of saving new LBR records by hardware.	
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY	Randomly sampled loads whose latency is above a user defined threshold. A small fraction of the overall loads are sampled due to randomization. PMC3 only.	Specify threshold in MSR 3F6H.
CDH	02H	MEM_TRANS_RETIRED.PRECISE_STORE	Sample stores and collect precise store operation via PEBS record. PMC3 only.	See Section 18.3.4.4.3.
D0H	11H	MEM_UOPS_RETIRED.STLB_MISS_LOADS	Retired load uops that miss the STLB.	Supports PEBS. PMC0-3 only regardless HTT.
D0H	12H	MEM_UOPS_RETIRED.STLB_MISS_STORES	Retired store uops that miss the STLB.	Supports PEBS. PMC0-3 only regardless HTT.
D0H	21H	MEM_UOPS_RETIRED.LOCK_LOADS	Retired load uops with locked access.	Supports PEBS. PMC0-3 only regardless HTT.
D0H	41H	MEM_UOPS_RETIRED.SPLIT_LOADS	Retired load uops that split across a cacheline boundary.	Supports PEBS. PMC0-3 only regardless HTT.
D0H	42H	MEM_UOPS_RETIRED.SPLIT_STORES	Retired store uops that split across a cacheline boundary.	Supports PEBS. PMC0-3 only regardless HTT.
D0H	81H	MEM_UOPS_RETIRED.ALL_LOADS	All retired load uops.	Supports PEBS. PMC0-3 only regardless HTT.
D0H	82H	MEM_UOPS_RETIRED.ALL_STORES	All retired store uops.	Supports PEBS. PMC0-3 only regardless HTT.
D1H	01H	MEM_LOAD_UOPS_RETIRED.L1_HIT	Retired load uops with L1 cache hits as data sources.	Supports PEBS. PMC0-3 only regardless HTT.
D1H	02H	MEM_LOAD_UOPS_RETIRED.L2_HIT	Retired load uops with L2 cache hits as data sources.	Supports PEBS.
D1H	04H	MEM_LOAD_UOPS_RETIRED.LLC_HIT	Retired load uops which data sources were data hits in LLC without snoops required.	Supports PEBS.
D1H	20H	MEM_LOAD_UOPS_RETIRED.LLC_MISS	Retired load uops which data sources were data missed LLC (excluding unknown data source).	Supports PEBS.
D1H	40H	MEM_LOAD_UOPS_RETIRED.HIT_LFB	Retired load uops which data sources were load uops missed L1 but hit FB due to preceding miss to the same cache line with data not ready.	Supports PEBS.
D2H	01H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_MISS	Retired load uops whose data source was an on-package core cache LLC hit and cross-core snoop missed.	Supports PEBS.
D2H	02H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HIT	Retired load uops whose data source was an on-package LLC hit and cross-core snoop hits.	Supports PEBS.
D2H	04H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HITM	Retired load uops whose data source was an on-package core cache with HitM responses.	Supports PEBS.
D2H	08H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_NONE	Retired load uops whose data source was LLC hit with no snoop required.	Supports PEBS.

Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
E6H	01H	BACLEARS.ANY	Counts the number of times the front end is re-steered, mainly when the BPU cannot provide a correct prediction and this is corrected by other branch handling mechanisms at the front end.	
F0H	01H	L2_TRANS.DEMAND_DATA_RD	Demand Data Read requests that access L2 cache.	
F0H	02H	L2_TRANS.RFO	RFO requests that access L2 cache.	
F0H	04H	L2_TRANS.CODE_RD	L2 cache accesses when fetching instructions.	
F0H	08H	L2_TRANS.ALL_PF	L2 or LLC HW prefetches that access L2 cache.	Including rejects.
F0H	10H	L2_TRANS.L1D_WB	L1D writebacks that access L2 cache.	
F0H	20H	L2_TRANS.L2_FILL	L2 fill requests that access L2 cache.	
F0H	40H	L2_TRANS.L2_WB	L2 writebacks that access L2 cache.	
F0H	80H	L2_TRANS.ALL_REQUESTS	Transactions accessing L2 pipe.	
F1H	01H	L2_LINES_IN.I	L2 cache lines in I state filling L2.	Counting does not cover rejects.
F1H	02H	L2_LINES_IN.S	L2 cache lines in S state filling L2.	Counting does not cover rejects.
F1H	04H	L2_LINES_IN.E	L2 cache lines in E state filling L2.	Counting does not cover rejects.
F1H	07H	L2_LINES_IN.ALL	L2 cache lines filling L2.	Counting does not cover rejects.
F2H	01H	L2_LINES_OUT.DEMAND_CLEAN	Clean L2 cache lines evicted by demand.	
F2H	02H	L2_LINES_OUT.DEMAND_DIRTY	Dirty L2 cache lines evicted by demand.	
F2H	04H	L2_LINES_OUT.PF_CLEAN	Clean L2 cache lines evicted by L2 prefetch.	
F2H	08H	L2_LINES_OUT.PF_DIRTY	Dirty L2 cache lines evicted by L2 prefetch.	
F2H	0AH	L2_LINES_OUT.DIRTY_ALL	Dirty L2 cache lines filling the L2.	Counting does not cover rejects.
F4H	10H	SQ_MISC.SPLIT_LOCK	Split locks in SQ.	

Non-architecture performance monitoring events in the processor core that are applicable only to Intel processors with CPUID signature of DisplayFamily_DisplayModel 06_2AH are listed in Table 19-16.

Table 19-16. Performance Events applicable only to the Processor core for 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D2H	01H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_MISS	Retired load uops which data sources were LLC hit and cross-core snoop missed in on-pkg core cache.	Supports PEBS. PMC0-3 only regardless HTT.
D2H	02H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HIT	Retired load uops which data sources were LLC and cross-core snoop hits in on-pkg core cache.	Supports PEBS.
D2H	04H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HITM	Retired load uops which data sources were HitM responses from shared LLC.	Supports PEBS.
D2H	08H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_NONE	Retired load uops which data sources were hits in LLC without snoops required.	Supports PEBS.

Table 19-16. Performance Events applicable only to the Processor core for 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D4H	02H	MEM_LOAD_UOPS_MISC_RETIRED.LLC_MISS	Retired load uops with unknown information as data source in cache serviced the load.	Supports PEBS. PMC0-3 only regardless HTT.
B7H/BBH	01H	OFF_CORE_RESPONSE_N	Sub-events of OFF_CORE_RESPONSE_N (suffix N = 0, 1) programmed using MSR 01A6H/01A7H with values shown in the comment column.	
		OFFCORE_RESPONSE.ALL_CODE_RD.LLC_HIT_N		10003C0244H
		OFFCORE_RESPONSE.ALL_CODE_RD.LLC_HIT.NO_SNOOP_NEEDED_N		1003C0244H
		OFFCORE_RESPONSE.ALL_CODE_RD.LLC_HIT.SNOOP_MISS_N		2003C0244H
		OFFCORE_RESPONSE.ALL_CODE_RD.LLC_HIT.MISS_DRAM_N		300400244H
		OFFCORE_RESPONSE.ALL_DATA_RD.LLC_HIT.ANY_RESPONSE_N		3F803C0091H
		OFFCORE_RESPONSE.ALL_DATA_RD.LLC_MISS.DRAM_N		300400091H
		OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_HIT.ANY_RESPONSE_N		3F803C0240H
		OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_HIT.HIT_OTHER_CORE_NO_FWD_N		4003C0240H
		OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_HIT.HITM_OTHER_CORE_N		10003C0240H
		OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_HIT.NO_SNOOP_NEEDED_N		1003C0240H
		OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_HIT.SNOOP_MISS_N		2003C0240H
		OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_MISS.DRAM_N		300400240H

Non-architecture performance monitoring events in the processor core that are applicable only to Intel Xeon processor E5 family (and Intel Core i7-3930 processor) based on Intel microarchitecture code name Sandy Bridge, with CPUID signature of DisplayFamily_DisplayModel 06_2DH, are listed in Table 19-17.

Table 19-17. Performance Events Applicable only to the Processor Core of Intel® Xeon® Processor E5 Family

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
CDH	01H	MEM_TRANS_RETIRED.LOAD_LATENCY	Additional Configuration: Disable BL bypass and direct2core, and if the memory is remotely homed. The count is not reliable If the memory is locally homed.	
D1H	04H	MEM_LOAD_UOPS_RETIRED.LLC_HIT	Additional Configuration: Disable BL bypass. Supports PEBS.	

Table 19-17. Performance Events Applicable only to the Processor Core of Intel® Xeon® Processor E5 Family

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D1H	20H	MEM_LOAD_UOPS_RETIRED.LLC_MISS	Additional Configuration: Disable BL bypass and direct2core. Supports PEBS.	
D2H	01H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_MISS	Additional Configuration: Disable bypass. Supports PEBS.	
D2H	02H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HIT	Additional Configuration: Disable bypass. Supports PEBS.	
D2H	04H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HITM	Additional Configuration: Disable bypass. Supports PEBS.	
D2H	08H	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_NONE	Additional Configuration: Disable bypass. Supports PEBS.	
D3H	01H	MEM_LOAD_UOPS_LLC_MISS_RETIRED.LOCAL_DRAM	Retired load uops which data sources were data missed LLC but serviced by local DRAM. Supports PEBS.	Disable BL bypass and direct2core (see MSR 3C9H).
D3H	04H	MEM_LOAD_UOPS_LLC_MISS_RETIRED.REMOTE_DRAM	Retired load uops which data sources were data missed LLC but serviced by remote DRAM. Supports PEBS.	Disable BL bypass and direct2core (see MSR 3C9H).
B7H/BBH	01H	OFF_CORE_RESPONSE_N	Sub-events of OFF_CORE_RESPONSE_N (suffix N = 0, 1) programmed using MSR 01A6H/01A7H with values shown in the comment column.	
		OFFCORE_RESPONSE.DEMAND_CODE_RD.LLC_MISS.ANY_RESPONSE_N		3FFFC00004H

Model-specific performance monitoring events that are located in the uncore sub-system are implementation specific between different platforms using processors based on Intel microarchitecture code name Sandy Bridge. Processors with CPUID signature of DisplayFamily_DisplayModel 06_2AH support performance events listed in Table 19-18.

Table 19-18. Performance Events In the Processor Uncore for 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series

Event Num.[1]	Umask Value	Event Mask Mnemonic	Description	Comment
22H	01H	UNC_CBO_XSNP_RESPONSE.MISS	A snoop misses in some processor core.	Must combine with one of the umask values of 20H, 40H, 80H.
22H	02H	UNC_CBO_XSNP_RESPONSE.INVAL	A snoop invalidates a non-modified line in some processor core.	
22H	04H	UNC_CBO_XSNP_RESPONSE.HIT	A snoop hits a non-modified line in some processor core.	
22H	08H	UNC_CBO_XSNP_RESPONSE.HITM	A snoop hits a modified line in some processor core.	
22H	10H	UNC_CBO_XSNP_RESPONSE.INVAL_M	A snoop invalidates a modified line in some processor core.	
22H	20H	UNC_CBO_XSNP_RESPONSE.EXTERNAL_FILTER	Filter on cross-core snoops initiated by this Cbox due to external snoop request.	Must combine with at least one of 01H, 02H, 04H, 08H, 10H.
22H	40H	UNC_CBO_XSNP_RESPONSE.XCORE_FILTER	Filter on cross-core snoops initiated by this Cbox due to processor core memory request.	
22H	80H	UNC_CBO_XSNP_RESPONSE.EVICTION_FILTER	Filter on cross-core snoops initiated by this Cbox due to LLC eviction.	
34H	01H	UNC_CBO_CACHE_LOOKUP.M	LLC lookup request that access cache and found line in M-state.	Must combine with one of the umask values of 10H, 20H, 40H, 80H.
34H	02H	UNC_CBO_CACHE_LOOKUP.E	LLC lookup request that access cache and found line in E-state.	
34H	04H	UNC_CBO_CACHE_LOOKUP.S	LLC lookup request that access cache and found line in S-state.	
34H	08H	UNC_CBO_CACHE_LOOKUP.I	LLC lookup request that access cache and found line in I-state.	
34H	10H	UNC_CBO_CACHE_LOOKUP.READ_FILTER	Filter on processor core initiated cacheable read requests. Must combine with at least one of 01H, 02H, 04H, 08H.	
34H	20H	UNC_CBO_CACHE_LOOKUP.WRITE_FILTER	Filter on processor core initiated cacheable write requests. Must combine with at least one of 01H, 02H, 04H, 08H.	
34H	40H	UNC_CBO_CACHE_LOOKUP.EXTSNP_FILTER	Filter on external snoop requests. Must combine with at least one of 01H, 02H, 04H, 08H.	
34H	80H	UNC_CBO_CACHE_LOOKUP.ANY_REQUEST_FILTER	Filter on any IRQ or IPQ initiated requests including uncacheable, non-coherent requests. Must combine with at least one of 01H, 02H, 04H, 08H.	
80H	01H	UNC_ARB_TRK_OCCUPANCY.ALL	Counts cycles weighted by the number of requests waiting for data returning from the memory controller. Accounts for coherent and non-coherent requests initiated by IA cores, processor graphic units, or LLC.	Counter 0 only.
81H	01H	UNC_ARB_TRK_REQUEST.ALL	Counts the number of coherent and in-coherent requests initiated by IA cores, processor graphic units, or LLC.	
81H	20H	UNC_ARB_TRK_REQUEST.WRITES	Counts the number of allocated write entries, include full, partial, and LLC evictions.	
81H	80H	UNC_ARB_TRK_REQUEST.EVICTIONS	Counts the number of LLC evictions allocated.	

Table 19-18. Performance Events In the Processor Uncore for 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series (Contd.)

Event Num.[1]	Umask Value	Event Mask Mnemonic	Description	Comment
83H	01H	UNC_ARB_COH_TRK_OCCUPANCY.ALL	Cycles weighted by number of requests pending in Coherency Tracker.	Counter 0 only.
84H	01H	UNC_ARB_COH_TRK_REQUEST.ALL	Number of requests allocated in Coherency Tracker.	

NOTES:

1. The uncore events must be programmed using MSRs located in specific performance monitoring units in the uncore. UNC_CBO* events are supported using MSR_UNC_CBO* MSRs; UNC_ARB* events are supported using MSR_UNC_ARB*MSRs.

19.9 PERFORMANCE MONITORING EVENTS FOR INTEL® CORE™ I7 PROCESSOR FAMILY AND INTEL® XEON® PROCESSOR FAMILY

Processors based on the Intel microarchitecture code name Nehalem support the architectural and model-specific performance monitoring events listed in Table 19-1 and Table 19-19. The events in Table 19-19 generally applies to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following values: 06_1AH, 06_1EH, 06_1FH, and 06_2EH. However, Intel Xeon processors with CPUID signature of DisplayFamily_DisplayModel 06_2EH have a small number of events that are not supported in processors with CPUID signature 06_1AH, 06_1EH, and 06_1FH. These events are noted in the comment column.

In addition, these processors (CPUID signature of DisplayFamily_DisplayModel 06_1AH, 06_1EH, 06_1FH) also support the following model-specific, product-specific uncore performance monitoring events listed in Table 19-20.

Fixed counters in the core PMU support the architecture events defined in Table 19-2.

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
04H	07H	SB_DRAIN.ANY	Counts the number of store buffer drains.	
06H	04H	STORE_BLOCKS.AT_RET	Counts number of loads delayed with at-Retirement block code. The following loads need to be executed at retirement and wait for all senior stores on the same thread to be drained: load splitting across 4K boundary (page split), load accessing uncacheable (UC or WC) memory, load lock, and load with page table in UC or WC memory region.	
06H	08H	STORE_BLOCKS.L1D_BLOCK	Cacheable loads delayed with L1D block code.	
07H	01H	PARTIAL_ADDRESS_ALIAS	Counts false dependency due to partial address aliasing.	
08H	01H	DTLB_LOAD_MISSES.ANY	Counts all load misses that cause a page walk.	
08H	02H	DTLB_LOAD_MISSES.WALK_COMPLETED	Counts number of completed page walks due to load miss in the STLB.	
08H	10H	DTLB_LOAD_MISSES.STLB_HIT	Number of cache load STLB hits.	
08H	20H	DTLB_LOAD_MISSES.PDE_MISS	Number of DTLB cache load misses where the low part of the linear to physical address translation was missed.	
08H	80H	DTLB_LOAD_MISSES.LARGE_WALK_COMPLETED	Counts number of completed large page walks due to load miss in the STLB.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0BH	01H	MEM_INST_RETIRED.LOADS	Counts the number of instructions with an architecturally-visible load retired on the architected path.	
0BH	02H	MEM_INST_RETIRED.STORES	Counts the number of instructions with an architecturally-visible store retired on the architected path.	
0BH	10H	MEM_INST_RETIRED.LATENCY_ABOVE_THRESHOLD	Counts the number of instructions exceeding the latency specified with ld_lat facility.	In conjunction with ld_lat facility.
0CH	01H	MEM_STORE_RETIRED.DTLB_MISS	The event counts the number of retired stores that missed the DTLB. The DTLB miss is not counted if the store operation causes a fault. Does not counter prefetches. Counts both primary and secondary misses to the TLB.	
0EH	01H	UOPS_ISSUED.ANY	Counts the number of Uops issued by the Register Allocation Table to the Reservation Station, i.e. the UOPs issued from the front end to the back end.	
0EH	01H	UOPS_ISSUED.STALLED_CYCLES	Counts the number of cycles no Uops issued by the Register Allocation Table to the Reservation Station, i.e. the UOPs issued from the front end to the back end.	Set "invert=1, cmask = 1".
0EH	02H	UOPS_ISSUED.FUSED	Counts the number of fused Uops that were issued from the Register Allocation Table to the Reservation Station.	
0FH	01H	MEM_UNCORE_RETIRED.L3_DATA_MISS_UNKNOWN	Counts number of memory load instructions retired where the memory reference missed L3 and data source is unknown.	Available only for CPUID signature 06_2EH.
0FH	02H	MEM_UNCORE_RETIRED.OTHER_CORE_L2_HITM	Counts number of memory load instructions retired where the memory reference hit modified data in a sibling core residing on the same socket.	
0FH	08H	MEM_UNCORE_RETIRED.REMOTE_CACHE_LOCAL_HOME_HIT	Counts number of memory load instructions retired where the memory reference missed the L1, L2 and L3 caches and HIT in a remote socket's cache. Only counts locally homed lines.	
0FH	10H	MEM_UNCORE_RETIRED.REMOTE_DRAM	Counts number of memory load instructions retired where the memory reference missed the L1, L2 and L3 caches and was remotely homed. This includes both DRAM access and HITM in a remote socket's cache for remotely homed lines.	
0FH	20H	MEM_UNCORE_RETIRED.LOCAL_DRAM	Counts number of memory load instructions retired where the memory reference missed the L1, L2 and L3 caches and required a local socket memory reference. This includes locally homed cachelines that were in a modified state in another socket.	
0FH	80H	MEM_UNCORE_RETIRED.UNCACHEABLE	Counts number of memory load instructions retired where the memory reference missed the L1, L2 and L3 caches and to perform I/O.	Available only for CPUID signature 06_2EH.

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
10H	01H	FP_COMP_OPS_EXE.X87	Counts the number of FP Computational Uops Executed. The number of FADD, FSUB, FCOM, FMULs, integer MULs and IMULs, FDIVs, FPREMs, FSQRTS, integer DIVs, and IDIVs. This event does not distinguish an FADD used in the middle of a transcendental flow from a separate FADD instruction.	
10H	02H	FP_COMP_OPS_EXE.MMX	Counts number of MMX Uops executed.	
10H	04H	FP_COMP_OPS_EXE.SSE_FP	Counts number of SSE and SSE2 FP uops executed.	
10H	08H	FP_COMP_OPS_EXE.SSE2_INTEGER	Counts number of SSE2 integer uops executed.	
10H	10H	FP_COMP_OPS_EXE.SSE_FP_PACKED	Counts number of SSE FP packed uops executed.	
10H	20H	FP_COMP_OPS_EXE.SSE_FP_SCALAR	Counts number of SSE FP scalar uops executed.	
10H	40H	FP_COMP_OPS_EXE.SSE_SINGLE_PRECISION	Counts number of SSE* FP single precision uops executed.	
10H	80H	FP_COMP_OPS_EXE.SSE_DOUBLE_PRECISION	Counts number of SSE* FP double precision uops executed.	
12H	01H	SIMD_INT_128.PACKED_MPY	Counts number of 128 bit SIMD integer multiply operations.	
12H	02H	SIMD_INT_128.PACKED_SHIFT	Counts number of 128 bit SIMD integer shift operations.	
12H	04H	SIMD_INT_128.PACK	Counts number of 128 bit SIMD integer pack operations.	
12H	08H	SIMD_INT_128.UNPACK	Counts number of 128 bit SIMD integer unpack operations.	
12H	10H	SIMD_INT_128.PACKED_LOGICAL	Counts number of 128 bit SIMD integer logical operations.	
12H	20H	SIMD_INT_128.PACKED_ARITH	Counts number of 128 bit SIMD integer arithmetic operations.	
12H	40H	SIMD_INT_128.SHUFFLE_MOVE	Counts number of 128 bit SIMD integer shuffle and move operations.	
13H	01H	LOAD_DISPATCH.RS	Counts number of loads dispatched from the Reservation Station that bypass the Memory Order Buffer.	
13H	02H	LOAD_DISPATCH.RS_DELAYED	Counts the number of delayed RS dispatches at the stage latch. If an RS dispatch cannot bypass to LB, it has another chance to dispatch from the one-cycle delayed staging latch before it is written into the LB.	
13H	04H	LOAD_DISPATCH.MOB	Counts the number of loads dispatched from the Reservation Station to the Memory Order Buffer.	
13H	07H	LOAD_DISPATCH.ANY	Counts all loads dispatched from the Reservation Station.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
14H	01H	ARITH.CYCLES_DIV_BUSY	Counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE. Set 'edge =1, invert=1, cmask=1' to count the number of divides.	Count may be incorrect When SMT is on.
14H	02H	ARITH.MUL	Counts the number of multiply operations executed. This includes integer as well as floating point multiply operations but excludes DPPS mul and MPSAD.	Count may be incorrect When SMT is on.
17H	01H	INST_QUEUE_WRITES	Counts the number of instructions written into the instruction queue every cycle.	
18H	01H	INST_DECODED.DEC0	Counts number of instructions that require decoder 0 to be decoded. Usually, this means that the instruction maps to more than 1 uop.	
19H	01H	TWO_UOP_INSTS_DECODED	An instruction that generates two uops was decoded.	
1EH	01H	INST_QUEUE_WRITE_CYCLES	This event counts the number of cycles during which instructions are written to the instruction queue. Dividing this counter by the number of instructions written to the instruction queue (INST_QUEUE_WRITES) yields the average number of instructions decoded each cycle. If this number is less than four and the pipe stalls, this indicates that the decoder is failing to decode enough instructions per cycle to sustain the 4-wide pipeline.	If SSE* instructions that are 6 bytes or longer arrive one after another, then front end throughput may limit execution speed.
20H	01H	LSD_OVERFLOW	Counts number of loops that can't stream from the instruction queue.	
24H	01H	L2_RQSTS.LD_HIT	Counts number of loads that hit the L2 cache. L2 loads include both L1D demand misses as well as L1D prefetches. L2 loads can be rejected for various reasons. Only non rejected loads are counted.	
24H	02H	L2_RQSTS.LD_MISS	Counts the number of loads that miss the L2 cache. L2 loads include both L1D demand misses as well as L1D prefetches.	
24H	03H	L2_RQSTS.LOADS	Counts all L2 load requests. L2 loads include both L1D demand misses as well as L1D prefetches.	
24H	04H	L2_RQSTS.RFO_HIT	Counts the number of store RFO requests that hit the L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches. Count includes WC memory requests, where the data is not fetched but the permission to write the line is required.	
24H	08H	L2_RQSTS.RFO_MISS	Counts the number of store RFO requests that miss the L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
24H	0CH	L2_RQSTS.RFOS	Counts all L2 store RFO requests. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.	
24H	10H	L2_RQSTS.IFETCH_HIT	Counts number of instruction fetches that hit the L2 cache. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.	
24H	20H	L2_RQSTS.IFETCH_MISS	Counts number of instruction fetches that miss the L2 cache. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.	
24H	30H	L2_RQSTS.IFETCHES	Counts all instruction fetches. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.	
24H	40H	L2_RQSTS.PREFETCH_HIT	Counts L2 prefetch hits for both code and data.	
24H	80H	L2_RQSTS.PREFETCH_MISS	Counts L2 prefetch misses for both code and data.	
24H	C0H	L2_RQSTS.PREFETCHES	Counts all L2 prefetches for both code and data.	
24H	AAH	L2_RQSTS.MISS	Counts all L2 misses for both code and data.	
24H	FFH	L2_RQSTS.REFERENCES	Counts all L2 requests for both code and data.	
26H	01H	L2_DATA_RQSTS.DEMAND.I_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	02H	L2_DATA_RQSTS.DEMAND.S_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the S (shared) state. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	04H	L2_DATA_RQSTS.DEMAND.E_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the E (exclusive) state. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	08H	L2_DATA_RQSTS.DEMAND.M_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the M (modified) state. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	0FH	L2_DATA_RQSTS.DEMAND.MESI	Counts all L2 data demand requests. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	10H	L2_DATA_RQSTS.PREFETCH.I_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss.	
26H	20H	L2_DATA_RQSTS.PREFETCH.S_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the S (shared) state. A prefetch RFO will miss on an S state line, while a prefetch read will hit on an S state line.	
26H	40H	L2_DATA_RQSTS.PREFETCH.E_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the E (exclusive) state.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
26H	80H	L2_DATA_RQSTS.PREFETCH.M_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the M (modified) state.	
26H	F0H	L2_DATA_RQSTS.PREFETCH.MESI	Counts all L2 prefetch requests.	
26H	FFH	L2_DATA_RQSTS.ANY	Counts all L2 data requests.	
27H	01H	L2_WRITE.RFO.I_STATE	Counts number of L2 demand store RFO requests where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request.
27H	02H	L2_WRITE.RFO.S_STATE	Counts number of L2 store RFO requests where the cache line to be loaded is in the S (shared) state. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request.
27H	08H	L2_WRITE.RFO.M_STATE	Counts number of L2 store RFO requests where the cache line to be loaded is in the M (modified) state. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request.
27H	0EH	L2_WRITE.RFO.HIT	Counts number of L2 store RFO requests where the cache line to be loaded is in either the S, E or M states. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request.
27H	0FH	L2_WRITE.RFO.MESI	Counts all L2 store RFO requests. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request.
27H	10H	L2_WRITE.LOCK.I_STATE	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the I (invalid) state, for example, a cache miss.	
27H	20H	L2_WRITE.LOCK.S_STATE	Counts number of L2 lock RFO requests where the cache line to be loaded is in the S (shared) state.	
27H	40H	L2_WRITE.LOCK.E_STATE	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the E (exclusive) state.	
27H	80H	L2_WRITE.LOCK.M_STATE	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the M (modified) state.	
27H	E0H	L2_WRITE.LOCK.HIT	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in either the S, E, or M state.	
27H	F0H	L2_WRITE.LOCK.MESI	Counts all L2 demand lock RFO requests.	
28H	01H	L1D_WB_L2.I_STATE	Counts number of L1 writebacks to the L2 where the cache line to be written is in the I (invalid) state, i.e., a cache miss.	
28H	02H	L1D_WB_L2.S_STATE	Counts number of L1 writebacks to the L2 where the cache line to be written is in the S state.	
28H	04H	L1D_WB_L2.E_STATE	Counts number of L1 writebacks to the L2 where the cache line to be written is in the E (exclusive) state.	
28H	08H	L1D_WB_L2.M_STATE	Counts number of L1 writebacks to the L2 where the cache line to be written is in the M (modified) state.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
28H	0FH	L1D_WB_L2.MESI	Counts all L1 writebacks to the L2 .	
2EH	4FH	L3_LAT_CACHE.REFERENCE	This event counts requests originating from the core that reference a cache line in the last level cache. The event count includes speculative traffic but excludes cache line fills due to a L2 hardware-prefetch. Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.	See Table 19-1.
2EH	41H	L3_LAT_CACHE.MISS	This event counts each cache miss condition for references to the last level cache. The event count may include speculative traffic but excludes cache line fills due to L2 hardware-prefetches. Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.	See Table 19-1.
3CH	00H	CPU_CLK_UNHALTED.THREAD_P	Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling.	See Table 19-1.
3CH	01H	CPU_CLK_UNHALTED.REF_P	Increments at the frequency of TSC when not halted.	See Table 19-1.
40H	01H	L1D_CACHE_LD.I_STATE	Counts L1 data cache read requests where the cache line to be loaded is in the I (invalid) state, i.e. the read request missed the cache.	Counter 0, 1 only.
40H	02H	L1D_CACHE_LD.S_STATE	Counts L1 data cache read requests where the cache line to be loaded is in the S (shared) state.	Counter 0, 1 only.
40H	04H	L1D_CACHE_LD.E_STATE	Counts L1 data cache read requests where the cache line to be loaded is in the E (exclusive) state.	Counter 0, 1 only.
40H	08H	L1D_CACHE_LD.M_STATE	Counts L1 data cache read requests where the cache line to be loaded is in the M (modified) state.	Counter 0, 1 only.
40H	0FH	L1D_CACHE_LD.MESI	Counts L1 data cache read requests.	Counter 0, 1 only.
41H	02H	L1D_CACHE_ST.S_STATE	Counts L1 data cache store RFO requests where the cache line to be loaded is in the S (shared) state.	Counter 0, 1 only.
41H	04H	L1D_CACHE_ST.E_STATE	Counts L1 data cache store RFO requests where the cache line to be loaded is in the E (exclusive) state.	Counter 0, 1 only.
41H	08H	L1D_CACHE_ST.M_STATE	Counts L1 data cache store RFO requests where cache line to be loaded is in the M (modified) state.	Counter 0, 1 only.
42H	01H	L1D_CACHE_LOCK.HIT	Counts retired load locks that hit in the L1 data cache or hit in an already allocated fill buffer. The lock portion of the load lock transaction must hit in the L1D.	The initial load will pull the lock into the L1 data cache. Counter 0, 1 only.
42H	02H	L1D_CACHE_LOCK.S_STATE	Counts L1 data cache retired load locks that hit the target cache line in the shared state.	Counter 0, 1 only.
42H	04H	L1D_CACHE_LOCK.E_STATE	Counts L1 data cache retired load locks that hit the target cache line in the exclusive state.	Counter 0, 1 only.

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
42H	08H	L1D_CACHE_LOCK.M_STATE	Counts L1 data cache retired load locks that hit the target cache line in the modified state.	Counter 0, 1 only.
43H	01H	L1D_ALL_REF.ANY	Counts all references (uncached, speculated and retired) to the L1 data cache, including all loads and stores with any memory types. The event counts memory accesses only when they are actually performed. For example, a load blocked by unknown store address and later performed is only counted once.	The event does not include non-memory accesses, such as I/O accesses. Counter 0, 1 only.
43H	02H	L1D_ALL_REF.CACHEABLE	Counts all data reads and writes (speculated and retired) from cacheable memory, including locked operations.	Counter 0, 1 only.
49H	01H	DTLB_MISSES.ANY	Counts the number of misses in the STLB which causes a page walk.	
49H	02H	DTLB_MISSES.WALK_COMPLETED	Counts number of misses in the STLB which resulted in a completed page walk.	
49H	10H	DTLB_MISSES.STLB_HIT	Counts the number of DTLB first level misses that hit in the second level TLB. This event is only relevant if the core contains multiple DTLB levels.	
49H	20H	DTLB_MISSES.PDE_MISS	Number of DTLB misses caused by low part of address, includes references to 2M pages because 2M pages do not use the PDE.	
49H	80H	DTLB_MISSES.LARGE_WALK_COMPLETED	Counts number of misses in the STLB which resulted in a completed page walk for large pages.	
4CH	01H	LOAD_HIT_PRE	Counts load operations sent to the L1 data cache while a previous SSE prefetch instruction to the same cache line has started prefetching but has not yet finished.	
4EH	01H	L1D_PREFETCH.REQUESTS	Counts number of hardware prefetch requests dispatched out of the prefetch FIFO.	
4EH	02H	L1D_PREFETCH.MISS	Counts number of hardware prefetch requests that miss the L1D. There are two prefetchers in the L1D. A streamer, which predicts lines sequentially after this one should be fetched, and the IP prefetcher that remembers access patterns for the current instruction. The streamer prefetcher stops on an L1D hit, while the IP prefetcher does not.	
4EH	04H	L1D_PREFETCH.TRIGGERS	Counts number of prefetch requests triggered by the Finite State Machine and pushed into the prefetch FIFO. Some of the prefetch requests are dropped due to overwrites or competition between the IP index prefetcher and streamer prefetcher. The prefetch FIFO contains 4 entries.	
51H	01H	L1D.REPL	Counts the number of lines brought into the L1 data cache.	Counter 0, 1 only.
51H	02H	L1D.M_REPL	Counts the number of modified lines brought into the L1 data cache.	Counter 0, 1 only.
51H	04H	L1D.M_EVICT	Counts the number of modified lines evicted from the L1 data cache due to replacement.	Counter 0, 1 only.

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
51H	08H	L1D.M_SNOOP_EVICT	Counts the number of modified lines evicted from the L1 data cache due to snoop HITM intervention.	Counter 0, 1 only.
52H	01H	L1D_CACHE_PREFETCH_LOCK_FB_HIT	Counts the number of cacheable load lock speculated instructions accepted into the fill buffer.	
53H	01H	L1D_CACHE_LOCK_FB_HIT	Counts the number of cacheable load lock speculated or retired instructions accepted into the fill buffer.	
63H	01H	CACHE_LOCK_CYCLES.L1D_L2	Cycle count during which the L1D and L2 are locked. A lock is asserted when there is a locked memory access, due to uncacheable memory, a locked operation that spans two cache lines, or a page walk from an uncacheable page table.	Counter 0, 1 only. L1D and L2 locks have a very high performance penalty and it is highly recommended to avoid such accesses.
63H	02H	CACHE_LOCK_CYCLES.L1D	Counts the number of cycles that cacheline in the L1 data cache unit is locked.	Counter 0, 1 only.
6CH	01H	IO_TRANSACTIONS	Counts the number of completed I/O transactions.	
80H	01H	L1I.HITS	Counts all instruction fetches that hit the L1 instruction cache.	
80H	02H	L1I.MISSES	Counts all instruction fetches that miss the L1I cache. This includes instruction cache misses, streaming buffer misses, victim cache misses and uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.	
80H	03H	L1I.READS	Counts all instruction fetches, including uncacheable fetches that bypass the L1I.	
80H	04H	L1I.CYCLES_STALLED	Cycle counts for which an instruction fetch stalls due to a L1I cache miss, ITLB miss or ITLB fault.	
82H	01H	LARGE_ITLB.HIT	Counts number of large ITLB hits.	
85H	01H	ITLB_MISSES.ANY	Counts the number of misses in all levels of the ITLB which causes a page walk.	
85H	02H	ITLB_MISSES.WALK_COMPLETED	Counts number of misses in all levels of the ITLB which resulted in a completed page walk.	
87H	01H	ILD_STALL.LCP	Cycles Instruction Length Decoder stalls due to length changing prefixes: 66, 67 or REX.W (for Intel 64) instructions which change the length of the decoded instruction.	
87H	02H	ILD_STALL.MRU	Instruction Length Decoder stall cycles due to Brand Prediction Unit (PBU) Most Recently Used (MRU) bypass.	
87H	04H	ILD_STALL.IQ_FULL	Stall cycles due to a full instruction queue.	
87H	08H	ILD_STALL.REGEN	Counts the number of regen stalls.	
87H	0FH	ILD_STALL.ANY	Counts any cycles the Instruction Length Decoder is stalled.	
88H	01H	BR_INST_EXEC.COND	Counts the number of conditional near branch instructions executed, but not necessarily retired.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
88H	02H	BR_INST_EXEC.DIRECT	Counts all unconditional near branch instructions excluding calls and indirect branches.	
88H	04H	BR_INST_EXEC.INDIRECT_NON_CALL	Counts the number of executed indirect near branch instructions that are not calls.	
88H	07H	BR_INST_EXEC.NON_CALLS	Counts all non-call near branch instructions executed, but not necessarily retired.	
88H	08H	BR_INST_EXEC.RETURN_NEAR	Counts indirect near branches that have a return mnemonic.	
88H	10H	BR_INST_EXEC.DIRECT_NEAR_CALL	Counts unconditional near call branch instructions, excluding non-call branch, executed.	
88H	20H	BR_INST_EXEC.INDIRECT_NEAR_CALL	Counts indirect near calls, including both register and memory indirect, executed.	
88H	30H	BR_INST_EXEC.NEAR_CALLS	Counts all near call branches executed, but not necessarily retired.	
88H	40H	BR_INST_EXEC.TAKEN	Counts taken near branches executed, but not necessarily retired.	
88H	7FH	BR_INST_EXEC.ANY	Counts all near executed branches (not necessarily retired). This includes only instructions and not micro-op branches. Frequent branching is not necessarily a major performance issue. However frequent branch mispredictions may be a problem.	
89H	01H	BR_MISP_EXEC.COND	Counts the number of mispredicted conditional near branch instructions executed, but not necessarily retired.	
89H	02H	BR_MISP_EXEC.DIRECT	Counts mispredicted macro unconditional near branch instructions, excluding calls and indirect branches (should always be 0).	
89H	04H	BR_MISP_EXEC.INDIRECT_NON_CALL	Counts the number of executed mispredicted indirect near branch instructions that are not calls.	
89H	07H	BR_MISP_EXEC.NON_CALLS	Counts mispredicted non-call near branches executed, but not necessarily retired.	
89H	08H	BR_MISP_EXEC.RETURN_NEAR	Counts mispredicted indirect branches that have a rear return mnemonic.	
89H	10H	BR_MISP_EXEC.DIRECT_NEAR_CALL	Counts mispredicted non-indirect near calls executed, (should always be 0).	
89H	20H	BR_MISP_EXEC.INDIRECT_NEAR_CALL	Counts mispredicted indirect near calls executed, including both register and memory indirect.	
89H	30H	BR_MISP_EXEC.NEAR_CALLS	Counts all mispredicted near call branches executed, but not necessarily retired.	
89H	40H	BR_MISP_EXEC.TAKEN	Counts executed mispredicted near branches that are taken, but not necessarily retired.	
89H	7FH	BR_MISP_EXEC.ANY	Counts the number of mispredicted near branch instructions that were executed, but not necessarily retired.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
A2H	01H	RESOURCE_STALLS.ANY	Counts the number of Allocator resource related stalls. Includes register renaming buffer entries, memory buffer entries. In addition to resource related stalls, this event counts some other events. Includes stalls arising during branch misprediction recovery, such as if retirement of the mispredicted branch is delayed and stalls arising while store buffer is draining from synchronizing operations.	Does not include stalls due to SuperQ (off core) queue full, too many cache misses, etc.
A2H	02H	RESOURCE_STALLS.LOAD	Counts the cycles of stall due to lack of load buffer for load operation.	
A2H	04H	RESOURCE_STALLS.RS_FULL	This event counts the number of cycles when the number of instructions in the pipeline waiting for execution reaches the limit the processor can handle. A high count of this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, or instructions dependent upon instructions further down the pipeline that have yet to retire.	When RS is full, new instructions cannot enter the reservation station and start execution.
A2H	08H	RESOURCE_STALLS.STORE	This event counts the number of cycles that a resource related stall will occur due to the number of store instructions reaching the limit of the pipeline, (i.e. all store buffers are used). The stall ends when a store instruction commits its data to the cache or memory.	
A2H	10H	RESOURCE_STALLS.ROB_FULL	Counts the cycles of stall due to re-order buffer full.	
A2H	20H	RESOURCE_STALLS.FPCW	Counts the number of cycles while execution was stalled due to writing the floating-point unit (FPU) control word.	
A2H	40H	RESOURCE_STALLS.MXCSR	Stalls due to the MXCSR register rename occurring to close to a previous MXCSR rename. The MXCSR provides control and status for the MMX registers.	
A2H	80H	RESOURCE_STALLS.OTHER	Counts the number of cycles while execution was stalled due to other resource issues.	
A6H	01H	MACRO_INSTS.FUSIONS_DECODED	Counts the number of instructions decoded that are macro-fused but not necessarily executed or retired.	
A7H	01H	BACLEAR_FORCE_IQ	Counts number of times a BACLEAR was forced by the Instruction Queue. The IQ is also responsible for providing conditional branch prediction direction based on a static scheme and dynamic data provided by the L2 Branch Prediction Unit. If the conditional branch target is not found in the Target Array and the IQ predicts that the branch is taken, then the IQ will force the Branch Address Calculator to issue a BACLEAR. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline.	
A8H	01H	LSD.UOPS	Counts the number of micro-ops delivered by loop stream detector.	Use cmask=1 and invert to count cycles.
AEH	01H	ITLB_FLUSH	Counts the number of ITLB flushes.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
B0H	40H	OFFCORE_REQUESTS.L1D_WRITEBACK	Counts number of L1D writebacks to the uncore.	
B1H	01H	UOPS_EXECUTED.PORT0	Counts number of uops executed that were issued on port 0. Port 0 handles integer arithmetic, SIMD and FP add uops.	
B1H	02H	UOPS_EXECUTED.PORT1	Counts number of uops executed that were issued on port 1. Port 1 handles integer arithmetic, SIMD, integer shift, FP multiply and FP divide uops.	
B1H	04H	UOPS_EXECUTED.PORT2_CORE	Counts number of uops executed that were issued on port 2. Port 2 handles the load uops. This is a core count only and cannot be collected per thread.	
B1H	08H	UOPS_EXECUTED.PORT3_CORE	Counts number of uops executed that were issued on port 3. Port 3 handles store uops. This is a core count only and cannot be collected per thread.	
B1H	10H	UOPS_EXECUTED.PORT4_CORE	Counts number of uops executed that where issued on port 4. Port 4 handles the value to be stored for the store uops issued on port 3. This is a core count only and cannot be collected per thread.	
B1H	1FH	UOPS_EXECUTED.CORE_ACTIVE_CYCLES_NO_PORT5	Counts cycles when the uops executed were issued from any ports except port 5. Use Cmask=1 for active cycles; Cmask=0 for weighted cycles. Use CMask=1, Invert=1 to count P0-4 stalled cycles. Use Cmask=1, Edge=1, Invert=1 to count P0-4 stalls.	
B1H	20H	UOPS_EXECUTED.PORT5	Counts number of uops executed that where issued on port 5.	
B1H	3FH	UOPS_EXECUTED.CORE_ACTIVE_CYCLES	Counts cycles when the uops are executing. Use Cmask=1 for active cycles; Cmask=0 for weighted cycles. Use CMask=1, Invert=1 to count P0-4 stalled cycles. Use Cmask=1, Edge=1, Invert=1 to count P0-4 stalls.	
B1H	40H	UOPS_EXECUTED.PORT015	Counts number of uops executed that where issued on port 0, 1, or 5.	Use cmask=1, invert=1 to count stall cycles.
B1H	80H	UOPS_EXECUTED.PORT234	Counts number of uops executed that where issued on port 2, 3, or 4.	
B2H	01H	OFFCORE_REQUESTS_SQ_FULL	Counts number of cycles the SQ is full to handle off-core requests.	
B7H	01H	OFF_CORE_RESPONSE_0	See Section 18.3.1.1.3, "Off-core Response Performance Monitoring in the Processor Core".	Requires programming MSR 01A6H.
B8H	01H	SNOOP_RESPONSE.HIT	Counts HIT snoop response sent by this thread in response to a snoop request.	
B8H	02H	SNOOP_RESPONSE.HITE	Counts HIT E snoop response sent by this thread in response to a snoop request.	
B8H	04H	SNOOP_RESPONSE.HITM	Counts HIT M snoop response sent by this thread in response to a snoop request.	
BBH	01H	OFF_CORE_RESPONSE_1	See Section 18.6.3, "Performance Monitoring (Processors Based on Intel NetBurst® Microarchitecture)".	Requires programming MSR 01A7H.

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C0H	00H	INST_RETIRED.ANY_P	See Table 19-1. Notes: INST_RETIRED.ANY is counted by a designated fixed counter. INST_RETIRED.ANY_P is counted by a programmable counter and is an architectural performance event. Event is supported if CPUID.A.EBX[1] = 0.	Counting: Faulting executions of GETSEC/VM entry/VM Exit/MWait will not count as retired instructions.
C0H	02H	INST_RETIRED.X87	Counts the number of MMX instructions retired.	
C0H	04H	INST_RETIRED.MMX	Counts the number of floating point computational operations retired: floating point computational operations executed by the assist handler and sub-operations of complex floating point instructions like transcendental instructions.	
C2H	01H	UOPS_RETIRED.ANY	Counts the number of micro-ops retired, (macro-fused=1, micro-fused=2, others=1; maximum count of 8 per cycle). Most instructions are composed of one or two micro-ops. Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists.	Use cmask=1 and invert to count active cycles or stalled cycles.
C2H	02H	UOPS_RETIRED.RETIRE_SLOTS	Counts the number of retirement slots used each cycle.	
C2H	04H	UOPS_RETIRED.MACRO_FUSED	Counts number of macro-fused uops retired.	
C3H	01H	MACHINE_CLEARS.CYCLES	Counts the cycles machine clear is asserted.	
C3H	02H	MACHINE_CLEARS.MEM_ORDER	Counts the number of machine clears due to memory order conflicts.	
C3H	04H	MACHINE_CLEARS.SMC	Counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel 64 and IA-32 processors. The modified cache line is written back to the L2 and L3caches.	
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Branch instructions at retirement.	See Table 19-1.
C4H	01H	BR_INST_RETIRED.CONDITIONAL	Counts the number of conditional branch instructions retired.	
C4H	02H	BR_INST_RETIRED.NEAR_CALL	Counts the number of direct & indirect near unconditional calls retired.	
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted branch instructions at retirement.	See Table 19-1.
C5H	02H	BR_MISP_RETIRED.NEAR_CALL	Counts mispredicted direct & indirect near unconditional retired calls.	
C7H	01H	SSEX_UOPS_RETIRED.PACKED_SINGLE	Counts SIMD packed single-precision floating point Uops retired.	
C7H	02H	SSEX_UOPS_RETIRED.SCALAR_SINGLE	Counts SIMD scalar single-precision floating point Uops retired.	
C7H	04H	SSEX_UOPS_RETIRED.PACKED_DOUBLE	Counts SIMD packed double-precision floating point Uops retired.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C7H	08H	SSEX_UOPS_RETIRED.SCALAR_DOUBLE	Counts SIMD scalar double-precision floating point Uops retired.	
C7H	10H	SSEX_UOPS_RETIRED.VECTOR_INTEGER	Counts 128-bit SIMD vector integer Uops retired.	
C8H	20H	ITLB_MISS_RETIRED	Counts the number of retired instructions that missed the ITLB when the instruction was fetched.	
CBH	01H	MEM_LOAD_RETIRED.L1D_HIT	Counts number of retired loads that hit the L1 data cache.	
CBH	02H	MEM_LOAD_RETIRED.L2_HIT	Counts number of retired loads that hit the L2 data cache.	
CBH	04H	MEM_LOAD_RETIRED.L3_UNSHARED_HIT	Counts number of retired loads that hit their own, unshared lines in the L3 cache.	
CBH	08H	MEM_LOAD_RETIRED.OTHER_CORE_L2_HIT_HITM	Counts number of retired loads that hit in a sibling core's L2 (on die core). Since the L3 is inclusive of all cores on the package, this is an L3 hit. This counts both clean and modified hits.	
CBH	10H	MEM_LOAD_RETIRED.L3_MISS	Counts number of retired loads that miss the L3 cache. The load was satisfied by a remote socket, local memory or an IOH.	
CBH	40H	MEM_LOAD_RETIRED.HIT_LFB	Counts number of retired loads that miss the L1D and the address is located in an allocated line fill buffer and will soon be committed to cache. This is counting secondary L1D misses.	
CBH	80H	MEM_LOAD_RETIRED.DTLB_MISS	Counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault. This event counts loads from cacheable memory only. The event does not count loads by software prefetches. Counts both primary and secondary misses to the TLB.	
CCH	01H	FP_MMX_TRANS.TO_FP	Counts the first floating-point instruction following any MMX instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	
CCH	02H	FP_MMX_TRANS.TO_MMX	Counts the first MMX instruction following a floating-point instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	
CCH	03H	FP_MMX_TRANS.ANY	Counts all transitions from floating point to MMX instructions and from MMX instructions to floating point instructions. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	
D0H	01H	MACRO_INSTS.DECODED	Counts the number of instructions decoded, (but not necessarily executed or retired).	
D1H	02H	UOPS_DECODED.MS	Counts the number of Uops decoded by the Microcode Sequencer, MS. The MS delivers uops when the instruction is more than 4 uops long or a microcode assist is occurring.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D1H	04H	UOPS_DECODED.ESP_FOLDING	Counts number of stack pointer (ESP) instructions decoded: push, pop, call, ret, etc. ESP instructions do not generate a Uop to increment or decrement ESP. Instead, they update an ESP_Offset register that keeps track of the delta to the current value of the ESP register.	
D1H	08H	UOPS_DECODED.ESP_SYNC	Counts number of stack pointer (ESP) sync operations where an ESP instruction is corrected by adding the ESP offset register to the current value of the ESP register.	
D2H	01H	RAT_STALLS.FLAGS	Counts the number of cycles during which execution stalled due to several reasons, one of which is a partial flag register stall. A partial register stall may occur when two conditions are met: 1) an instruction modifies some, but not all, of the flags in the flag register and 2) the next instruction, which depends on flags, depends on flags that were not modified by this instruction.	
D2H	02H	RAT_STALLS.REGISTERS	This event counts the number of cycles instruction execution latency became longer than the defined latency because the instruction used a register that was partially written by previous instruction.	
D2H	04H	RAT_STALLS.ROB_READ_PORT	Counts the number of cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the out-of-order pipeline. Note that, at this stage in the pipeline, additional stalls may occur at the same cycle and prevent the stalled micro-ops from entering the pipe. In such a case, micro-ops retry entering the execution pipe in the next cycle and the ROB-read port stall is counted again.	
D2H	08H	RAT_STALLS.SCOREBOARD	Counts the cycles where we stall due to microarchitecturally required serialization. Microcode scoreboarding stalls.	
D2H	0FH	RAT_STALLS.ANY	Counts all Register Allocation Table stall cycles due to: Cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the execution pipe. Cycles when partial register stalls occurred. Cycles when flag stalls occurred. Cycles floating-point unit (FPU) status word stalls occurred. To count each of these conditions separately use the events: RAT_STALLS.ROB_READ_PORT, RAT_STALLS.PARTIAL, RAT_STALLS.FLAGS, and RAT_STALLS.FPSW.	
D4H	01H	SEG_RENAME_STALLS	Counts the number of stall cycles due to the lack of renaming resources for the ES, DS, FS, and GS segment registers. If a segment is renamed but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.	
D5H	01H	ES_REG_RENAMES	Counts the number of times the ES segment register is renamed.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
DBH	01H	UOP_UNFUSION	Counts unfusion events due to floating-point exception to a fused uop.	
E0H	01H	BR_INST_DECODED	Counts the number of branch instructions decoded.	
E5H	01H	BPU_MISSED_CALL_RET	Counts number of times the Branch Prediction Unit missed predicting a call or return branch.	
E6H	01H	BACLEAR.CLEAR	Counts the number of times the front end is resteered, mainly when the Branch Prediction Unit cannot provide a correct prediction and this is corrected by the Branch Address Calculator at the front end. This can occur if the code has many branches such that they cannot be consumed by the BPU. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline. The effect on total execution time depends on the surrounding code.	
E6H	02H	BACLEAR.BAD_TARGET	Counts number of Branch Address Calculator clears (BACLEAR) asserted due to conditional branch instructions in which there was a target hit but the direction was wrong. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline.	
E8H	01H	BPU_CLEARS.EARLY	Counts early (normal) Branch Prediction Unit clears: BPU predicted a taken branch after incorrectly assuming that it was not taken.	The BPU clear leads to 2 cycle bubble in the front end.
E8H	02H	BPU_CLEARS.LATE	Counts late Branch Prediction Unit clears due to Most Recently Used conflicts. The PBU clear leads to a 3 cycle bubble in the front end.	
F0H	01H	L2_TRANSACTIONS.LOAD	Counts L2 load operations due to HW prefetch or demand loads.	
F0H	02H	L2_TRANSACTIONS.RFO	Counts L2 RFO operations due to HW prefetch or demand RFOs.	
F0H	04H	L2_TRANSACTIONS.IFETCH	Counts L2 instruction fetch operations due to HW prefetch or demand ifetch.	
F0H	08H	L2_TRANSACTIONS.PREFETCH	Counts L2 prefetch operations.	
F0H	10H	L2_TRANSACTIONS.L1D_WB	Counts L1D writeback operations to the L2.	
F0H	20H	L2_TRANSACTIONS.FILL	Counts L2 cache line fill operations due to load, RFO, L1D writeback or prefetch.	
F0H	40H	L2_TRANSACTIONS.WB	Counts L2 writeback operations to the L3.	
F0H	80H	L2_TRANSACTIONS.ANY	Counts all L2 cache operations.	
F1H	02H	L2_LINES_IN.S_STATE	Counts the number of cache lines allocated in the L2 cache in the S (shared) state.	
F1H	04H	L2_LINES_IN.E_STATE	Counts the number of cache lines allocated in the L2 cache in the E (exclusive) state.	
F1H	07H	L2_LINES_IN.ANY	Counts the number of cache lines allocated in the L2 cache.	
F2H	01H	L2_LINES_OUT.DEMAND_CLEAN	Counts L2 clean cache lines evicted by a demand request.	

Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
F2H	02H	L2_LINES_OUT.DEMAND_DIRTY	Counts L2 dirty (modified) cache lines evicted by a demand request.	
F2H	04H	L2_LINES_OUT.PREFETCH_CLEAN	Counts L2 clean cache line evicted by a prefetch request.	
F2H	08H	L2_LINES_OUT.PREFETCH_DIRTY	Counts L2 modified cache line evicted by a prefetch request.	
F2H	0FH	L2_LINES_OUT.ANY	Counts all L2 cache lines evicted for any reason.	
F4H	10H	SQ_MISC.SPLIT_LOCK	Counts the number of SQ lock splits across a cache line.	
F6H	01H	SQ_FULL_STALL_CYCLES	Counts cycles the Super Queue is full. Neither of the threads on this core will be able to access the uncore.	
F7H	01H	FP_ASSIST.ALL	Counts the number of floating point operations executed that required micro-code assist intervention. Assists are required in the following cases: SSE instructions (denormal input when the DAZ flag is off or underflow result when the FTZ flag is off); x87 instructions (NaN or denormal are loaded to a register or used as input from memory, division by 0 or underflow output).	
F7H	02H	FP_ASSIST.OUTPUT	Counts number of floating point micro-code assist when the output value (destination register) is invalid.	
F7H	04H	FP_ASSIST.INPUT	Counts number of floating point micro-code assist when the input value (one of the source operands to an FP instruction) is invalid.	
FDH	01H	SIMD_INT_64.PACKED_MPY	Counts number of SID integer 64 bit packed multiply operations.	
FDH	02H	SIMD_INT_64.PACKED_SHIFT	Counts number of SID integer 64 bit packed shift operations.	
FDH	04H	SIMD_INT_64.PACK	Counts number of SID integer 64 bit pack operations.	
FDH	08H	SIMD_INT_64.UNPACK	Counts number of SID integer 64 bit unpack operations.	
FDH	10H	SIMD_INT_64.PACKED_LOGICAL	Counts number of SID integer 64 bit logical operations.	
FDH	20H	SIMD_INT_64.PACKED_ARITH	Counts number of SID integer 64 bit arithmetic operations.	
FDH	40H	SIMD_INT_64.SHUFFLE_MOVE	Counts number of SID integer 64 bit shift or move operations.	

Model-specific performance monitoring events that are located in the uncore sub-system are implementation specific between different platforms using processors based on Intel microarchitecture code name Nehalem. Processors with CPUID signature of DisplayFamily_DisplayModel 06_1AH, 06_1EH, and 06_1FH support performance events listed in Table 19-20.

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
00H	01H	UNC_GQ_CYCLES_FULL.READ_TRACKER	Uncore cycles Global Queue read tracker is full.	
00H	02H	UNC_GQ_CYCLES_FULL.WRITE_TRACKER	Uncore cycles Global Queue write tracker is full.	
00H	04H	UNC_GQ_CYCLES_FULL.PEER_PROBE_TRACKER	Uncore cycles Global Queue peer probe tracker is full. The peer probe tracker queue tracks snoops from the IOH and remote sockets.	
01H	01H	UNC_GQ_CYCLES_NOT_EMPTY.READ_TRACKER	Uncore cycles were Global Queue read tracker has at least one valid entry.	
01H	02H	UNC_GQ_CYCLES_NOT_EMPTY.WRITE_TRACKER	Uncore cycles were Global Queue write tracker has at least one valid entry.	
01H	04H	UNC_GQ_CYCLES_NOT_EMPTY.PEER_PROBE_TRACKER	Uncore cycles were Global Queue peer probe tracker has at least one valid entry. The peer probe tracker queue tracks IOH and remote socket snoops.	
03H	01H	UNC_GQ_ALLOC.READ_TRACKER	Counts the number of tread tracker allocate to deallocate entries. The GQ read tracker allocate to deallocate occupancy count is divided by the count to obtain the average read tracker latency.	
03H	02H	UNC_GQ_ALLOC.RT_L3_MISS	Counts the number GQ read tracker entries for which a full cache line read has missed the L3. The GQ read tracker L3 miss to fill occupancy count is divided by this count to obtain the average cache line read L3 miss latency. The latency represents the time after which the L3 has determined that the cache line has missed. The time between a GQ read tracker allocation and the L3 determining that the cache line has missed is the average L3 hit latency. The total L3 cache line read miss latency is the hit latency + L3 miss latency.	
03H	04H	UNC_GQ_ALLOC.RT_TO_L3_RESP	Counts the number of GQ read tracker entries that are allocated in the read tracker queue that hit or miss the L3. The GQ read tracker L3 hit occupancy count is divided by this count to obtain the average L3 hit latency.	
03H	08H	UNC_GQ_ALLOC.RT_TO_RTID_ACQUIRED	Counts the number of GQ read tracker entries that are allocated in the read tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ read tracker L3 miss to RTID acquired occupancy count is divided by this count to obtain the average latency for a read L3 miss to acquire an RTID.	
03H	10H	UNC_GQ_ALLOC.WT_TO_RTID_ACQUIRED	Counts the number of GQ write tracker entries that are allocated in the write tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ write tracker L3 miss to RTID occupancy count is divided by this count to obtain the average latency for a write L3 miss to acquire an RTID.	
03H	20H	UNC_GQ_ALLOC.WRITE_TRACKER	Counts the number of GQ write tracker entries that are allocated in the write tracker queue that miss the L3. The GQ write tracker occupancy count is divided by this count to obtain the average L3 write miss latency.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	40H	UNC_GQ_ALLOC.PEER_PROBE_TRACKER	Counts the number of GQ peer probe tracker (snoop) entries that are allocated in the peer probe tracker queue that miss the L3. The GQ peer probe occupancy count is divided by this count to obtain the average L3 peer probe miss latency.	
04H	01H	UNC_GQ_DATA.FROM_QPI	Cycles Global Queue Quickpath Interface input data port is busy importing data from the Quickpath Interface. Each cycle the input port can transfer 8 or 16 bytes of data.	
04H	02H	UNC_GQ_DATA.FROM_QMC	Cycles Global Queue Quickpath Memory Interface input data port is busy importing data from the Quickpath Memory Interface. Each cycle the input port can transfer 8 or 16 bytes of data.	
04H	04H	UNC_GQ_DATA.FROM_L3	Cycles GQ L3 input data port is busy importing data from the Last Level Cache. Each cycle the input port can transfer 32 bytes of data.	
04H	08H	UNC_GQ_DATA.FROM_CORES_02	Cycles GQ Core 0 and 2 input data port is busy importing data from processor cores 0 and 2. Each cycle the input port can transfer 32 bytes of data.	
04H	10H	UNC_GQ_DATA.FROM_CORES_13	Cycles GQ Core 1 and 3 input data port is busy importing data from processor cores 1 and 3. Each cycle the input port can transfer 32 bytes of data.	
05H	01H	UNC_GQ_DATA.TO_QPI_QMC	Cycles GQ QPI and QMC output data port is busy sending data to the Quickpath Interface or Quickpath Memory Interface. Each cycle the output port can transfer 32 bytes of data.	
05H	02H	UNC_GQ_DATA.TO_L3	Cycles GQ L3 output data port is busy sending data to the Last Level Cache. Each cycle the output port can transfer 32 bytes of data.	
05H	04H	UNC_GQ_DATA.TO_CORES	Cycles GQ Core output data port is busy sending data to the Cores. Each cycle the output port can transfer 32 bytes of data.	
06H	01H	UNC_SNP_RESP_TO_LOCAL_HOME.I_STATE	Number of snoop responses to the local home that L3 does not have the referenced cache line.	
06H	02H	UNC_SNP_RESP_TO_LOCAL_HOME.S_STATE	Number of snoop responses to the local home that L3 has the referenced line cached in the S state.	
06H	04H	UNC_SNP_RESP_TO_LOCAL_HOME.FWD_S_STATE	Number of responses to code or data read snoops to the local home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the local home in the S state.	
06H	08H	UNC_SNP_RESP_TO_LOCAL_HOME.FWD_I_STATE	Number of responses to read invalidate snoops to the local home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the local home in the M state.	
06H	10H	UNC_SNP_RESP_TO_LOCAL_HOME.CONFLICT	Number of conflict snoop responses sent to the local home.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
06H	20H	UNC_SNP_RESP_TO_LOCAL_HOME.WB	Number of responses to code or data read snoops to the local home that the L3 has the referenced line cached in the M state.	
07H	01H	UNC_SNP_RESP_TO_REMOTE_HOME.I_STATE	Number of snoop responses to a remote home that L3 does not have the referenced cache line.	
07H	02H	UNC_SNP_RESP_TO_REMOTE_HOME.S_STATE	Number of snoop responses to a remote home that L3 has the referenced line cached in the S state.	
07H	04H	UNC_SNP_RESP_TO_REMOTE_HOME.FWD_S_STATE	Number of responses to code or data read snoops to a remote home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the remote home in the S state.	
07H	08H	UNC_SNP_RESP_TO_REMOTE_HOME.FWD_I_STATE	Number of responses to read invalidate snoops to a remote home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the remote home in the M state.	
07H	10H	UNC_SNP_RESP_TO_REMOTE_HOME.CONFLICT	Number of conflict snoop responses sent to the local home.	
07H	20H	UNC_SNP_RESP_TO_REMOTE_HOME.WB	Number of responses to code or data read snoops to a remote home that the L3 has the referenced line cached in the M state.	
07H	24H	UNC_SNP_RESP_TO_REMOTE_HOME.HITM	Number of HITM snoop responses to a remote home.	
08H	01H	UNC_L3_HITS.READ	Number of code read, data read and RFO requests that hit in the L3.	
08H	02H	UNC_L3_HITS.WRITE	Number of writeback requests that hit in the L3. Writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.	
08H	04H	UNC_L3_HITS.PROBE	Number of snoops from IOH or remote sockets that hit in the L3.	
08H	03H	UNC_L3_HITS.ANY	Number of reads and writes that hit the L3.	
09H	01H	UNC_L3_MISS.READ	Number of code read, data read and RFO requests that miss the L3.	
09H	02H	UNC_L3_MISS.WRITE	Number of writeback requests that miss the L3. Should always be zero as writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.	
09H	04H	UNC_L3_MISS.PROBE	Number of snoops from IOH or remote sockets that miss the L3.	
09H	03H	UNC_L3_MISS.ANY	Number of reads and writes that miss the L3.	
0AH	01H	UNC_L3_LINES_IN.M_STATE	Counts the number of L3 lines allocated in M state. The only time a cache line is allocated in the M state is when the line was forwarded in M state is forwarded due to a Snoop Read Invalidate Own request.	
0AH	02H	UNC_L3_LINES_IN.E_STATE	Counts the number of L3 lines allocated in E state.	
0AH	04H	UNC_L3_LINES_IN.S_STATE	Counts the number of L3 lines allocated in S state.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0AH	08H	UNC_L3_LINES_IN.F_STATE	Counts the number of L3 lines allocated in F state.	
0AH	0FH	UNC_L3_LINES_IN.ANY	Counts the number of L3 lines allocated in any state.	
0BH	01H	UNC_L3_LINES_OUT.M_STATE	Counts the number of L3 lines victimized that were in the M state. When the victim cache line is in M state, the line is written to its home cache agent which can be either local or remote.	
0BH	02H	UNC_L3_LINES_OUT.E_STATE	Counts the number of L3 lines victimized that were in the E state.	
0BH	04H	UNC_L3_LINES_OUT.S_STATE	Counts the number of L3 lines victimized that were in the S state.	
0BH	08H	UNC_L3_LINES_OUT.I_STATE	Counts the number of L3 lines victimized that were in the I state.	
0BH	10H	UNC_L3_LINES_OUT.F_STATE	Counts the number of L3 lines victimized that were in the F state.	
0BH	1FH	UNC_L3_LINES_OUT.ANY	Counts the number of L3 lines victimized in any state.	
20H	01H	UNC_QHL_REQUESTS.IOH_READS	Counts number of Quickpath Home Logic read requests from the IOH.	
20H	02H	UNC_QHL_REQUESTS.IOH_WRITES	Counts number of Quickpath Home Logic write requests from the IOH.	
20H	04H	UNC_QHL_REQUESTS.REMOTE_READS	Counts number of Quickpath Home Logic read requests from a remote socket.	
20H	08H	UNC_QHL_REQUESTS.REMOTE_WRITES	Counts number of Quickpath Home Logic write requests from a remote socket.	
20H	10H	UNC_QHL_REQUESTS.LOCAL_READS	Counts number of Quickpath Home Logic read requests from the local socket.	
20H	20H	UNC_QHL_REQUESTS.LOCAL_WRITES	Counts number of Quickpath Home Logic write requests from the local socket.	
21H	01H	UNC_QHL_CYCLES_FULL.IOH	Counts uclk cycles all entries in the Quickpath Home Logic IOH are full.	
21H	02H	UNC_QHL_CYCLES_FULL.REMOTE	Counts uclk cycles all entries in the Quickpath Home Logic remote tracker are full.	
21H	04H	UNC_QHL_CYCLES_FULL.LOCAL	Counts uclk cycles all entries in the Quickpath Home Logic local tracker are full.	
22H	01H	UNC_QHL_CYCLES_NOT_EMPTY.IOH	Counts uclk cycles all entries in the Quickpath Home Logic IOH is busy.	
22H	02H	UNC_QHL_CYCLES_NOT_EMPTY.REMOTE	Counts uclk cycles all entries in the Quickpath Home Logic remote tracker is busy.	
22H	04H	UNC_QHL_CYCLES_NOT_EMPTY.LOCAL	Counts uclk cycles all entries in the Quickpath Home Logic local tracker is busy.	
23H	01H	UNC_QHL_OCCUPANCY.IOH	QHL IOH tracker allocate to deallocate read occupancy.	
23H	02H	UNC_QHL_OCCUPANCY.REMOTE	QHL remote tracker allocate to deallocate read occupancy.	
23H	04H	UNC_QHL_OCCUPANCY.LOCAL	QHL local tracker allocate to deallocate read occupancy.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
24H	02H	UNC_QHL_ADDRESS_CONFLICTS.2WAY	Counts number of QHL Active Address Table (AAT) entries that saw a max of 2 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates.	
24H	04H	UNC_QHL_ADDRESS_CONFLICTS.3WAY	Counts number of QHL Active Address Table (AAT) entries that saw a max of 3 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates.	
25H	01H	UNC_QHL_CONFLICT_CYCLES.IOH	Counts cycles the Quickpath Home Logic IOH Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
25H	02H	UNC_QHL_CONFLICT_CYCLES.REMOTE	Counts cycles the Quickpath Home Logic Remote Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
25H	04H	UNC_QHL_CONFLICT_CYCLES.LOCAL	Counts cycles the Quickpath Home Logic Local Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
26H	01H	UNC_QHL_TO_QMC_BYPASS	Counts number or requests to the Quickpath Memory Controller that bypass the Quickpath Home Logic. All local accesses can be bypassed. For remote requests, only read requests can be bypassed.	
27H	01H	UNC_QMC_NORMAL_FULL.READ.CH0	Uncore cycles all the entries in the DRAM channel 0 medium or low priority queue are occupied with read requests.	
27H	02H	UNC_QMC_NORMAL_FULL.READ.CH1	Uncore cycles all the entries in the DRAM channel 1 medium or low priority queue are occupied with read requests.	
27H	04H	UNC_QMC_NORMAL_FULL.READ.CH2	Uncore cycles all the entries in the DRAM channel 2 medium or low priority queue are occupied with read requests.	
27H	08H	UNC_QMC_NORMAL_FULL.WRITE.CH0	Uncore cycles all the entries in the DRAM channel 0 medium or low priority queue are occupied with write requests.	
27H	10H	UNC_QMC_NORMAL_FULL.WRITE.CH1	Counts cycles all the entries in the DRAM channel 1 medium or low priority queue are occupied with write requests.	
27H	20H	UNC_QMC_NORMAL_FULL.WRITE.CH2	Uncore cycles all the entries in the DRAM channel 2 medium or low priority queue are occupied with write requests.	
28H	01H	UNC_QMC_ISOC_FULL.READ.CH0	Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous read requests.	
28H	02H	UNC_QMC_ISOC_FULL.READ.CH1	Counts cycles all the entries in the DRAM channel 1high priority queue are occupied with isochronous read requests.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
28H	04H	UNC_QMC_ISOC_FULL.READ.CH2	Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous read requests.	
28H	08H	UNC_QMC_ISOC_FULL.WRITE.CH0	Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous write requests.	
28H	10H	UNC_QMC_ISOC_FULL.WRITE.CH1	Counts cycles all the entries in the DRAM channel 1 high priority queue are occupied with isochronous write requests.	
28H	20H	UNC_QMC_ISOC_FULL.WRITE.CH2	Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous write requests.	
29H	01H	UNC_QMC_BUSY.READ.CH0	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 0.	
29H	02H	UNC_QMC_BUSY.READ.CH1	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 1.	
29H	04H	UNC_QMC_BUSY.READ.CH2	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 2.	
29H	08H	UNC_QMC_BUSY.WRITE.CH0	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 0.	
29H	10H	UNC_QMC_BUSY.WRITE.CH1	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 1.	
29H	20H	UNC_QMC_BUSY.WRITE.CH2	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 2.	
2AH	01H	UNC_QMC_OCCUPANCY.CH0	IMC channel 0 normal read request occupancy.	
2AH	02H	UNC_QMC_OCCUPANCY.CH1	IMC channel 1 normal read request occupancy.	
2AH	04H	UNC_QMC_OCCUPANCY.CH2	IMC channel 2 normal read request occupancy.	
2BH	01H	UNC_QMC_ISSOC_OCCUPANCY.CH0	IMC channel 0 issoc read request occupancy.	
2BH	02H	UNC_QMC_ISSOC_OCCUPANCY.CH1	IMC channel 1 issoc read request occupancy.	
2BH	04H	UNC_QMC_ISSOC_OCCUPANCY.CH2	IMC channel 2 issoc read request occupancy.	
2BH	07H	UNC_QMC_ISSOC_READS.ANY	IMC issoc read request occupancy.	
2CH	01H	UNC_QMC_NORMAL_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 medium and low priority read requests. The QMC channel 0 normal read occupancy divided by this count provides the average QMC channel 0 read latency.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
2CH	02H	UNC_QMC_NORMAL_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 medium and low priority read requests. The QMC channel 1 normal read occupancy divided by this count provides the average QMC channel 1 read latency.	
2CH	04H	UNC_QMC_NORMAL_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 medium and low priority read requests. The QMC channel 2 normal read occupancy divided by this count provides the average QMC channel 2 read latency.	
2CH	07H	UNC_QMC_NORMAL_READS.ANY	Counts the number of Quickpath Memory Controller medium and low priority read requests. The QMC normal read occupancy divided by this count provides the average QMC read latency.	
2DH	01H	UNC_QMC_HIGH_PRIORITY_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 high priority isochronous read requests.	
2DH	02H	UNC_QMC_HIGH_PRIORITY_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 high priority isochronous read requests.	
2DH	04H	UNC_QMC_HIGH_PRIORITY_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 high priority isochronous read requests.	
2DH	07H	UNC_QMC_HIGH_PRIORITY_READS.ANY	Counts the number of Quickpath Memory Controller high priority isochronous read requests.	
2EH	01H	UNC_QMC_CRITICAL_PRIORITY_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 critical priority isochronous read requests.	
2EH	02H	UNC_QMC_CRITICAL_PRIORITY_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 critical priority isochronous read requests.	
2EH	04H	UNC_QMC_CRITICAL_PRIORITY_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 critical priority isochronous read requests.	
2EH	07H	UNC_QMC_CRITICAL_PRIORITY_READS.ANY	Counts the number of Quickpath Memory Controller critical priority isochronous read requests.	
2FH	01H	UNC_QMC_WRITES.FULL.CH0	Counts number of full cache line writes to DRAM channel 0.	
2FH	02H	UNC_QMC_WRITES.FULL.CH1	Counts number of full cache line writes to DRAM channel 1.	
2FH	04H	UNC_QMC_WRITES.FULL.CH2	Counts number of full cache line writes to DRAM channel 2.	
2FH	07H	UNC_QMC_WRITES.FULL.ANY	Counts number of full cache line writes to DRAM.	
2FH	08H	UNC_QMC_WRITES.PARTIAL.CH0	Counts number of partial cache line writes to DRAM channel 0.	
2FH	10H	UNC_QMC_WRITES.PARTIAL.CH1	Counts number of partial cache line writes to DRAM channel 1.	
2FH	20H	UNC_QMC_WRITES.PARTIAL.CH2	Counts number of partial cache line writes to DRAM channel 2.	
2FH	38H	UNC_QMC_WRITES.PARTIAL.ANY	Counts number of partial cache line writes to DRAM.	
30H	01H	UNC_QMC_CANCEL.CH0	Counts number of DRAM channel 0 cancel requests.	
30H	02H	UNC_QMC_CANCEL.CH1	Counts number of DRAM channel 1 cancel requests.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
30H	04H	UNC_QMC_CANCEL.CH2	Counts number of DRAM channel 2 cancel requests.	
30H	07H	UNC_QMC_CANCEL.ANY	Counts number of DRAM cancel requests.	
31H	01H	UNC_QMC_PRIORITY_UPDATES.CH0	Counts number of DRAM channel 0 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	02H	UNC_QMC_PRIORITY_UPDATES.CH1	Counts number of DRAM channel 1 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	04H	UNC_QMC_PRIORITY_UPDATES.CH2	Counts number of DRAM channel 2 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	07H	UNC_QMC_PRIORITY_UPDATES.ANY	Counts number of DRAM priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
33H	04H	UNC_QHL_FRC_ACK_CNFLTS.LOCAL	Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the local home.	
40H	01H	UNC_QPI_TX_STALLED_SINGLE_FLIT.HOME.LINK_0	Counts cycles the Quickpath outbound link 0 HOME virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	02H	UNC_QPI_TX_STALLED_SINGLE_FLIT.SNOOP.LINK_0	Counts cycles the Quickpath outbound link 0 SNOOP virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	04H	UNC_QPI_TX_STALLED_SINGLE_FLIT.NDR.LINK_0	Counts cycles the Quickpath outbound link 0 non-data response virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	08H	UNC_QPI_TX_STALLED_SINGLE_FLIT.HOME.LINK_1	Counts cycles the Quickpath outbound link 1 HOME virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
40H	10H	UNC_QPI_TX_STALLED_SINGLE_FLIT.SNOOP.LINK_1	Counts cycles the Quickpath outbound link 1 SNOOP virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	20H	UNC_QPI_TX_STALLED_SINGLE_FLIT.NDR.LINK_1	Counts cycles the Quickpath outbound link 1 non-data response virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	07H	UNC_QPI_TX_STALLED_SINGLE_FLIT.LINK_0	Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	38H	UNC_QPI_TX_STALLED_SINGLE_FLIT.LINK_1	Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	01H	UNC_QPI_TX_STALLED_MULTI_FLIT.DRS.LINK_0	Counts cycles the Quickpath outbound link 0 Data Response virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	02H	UNC_QPI_TX_STALLED_MULTI_FLIT.NCB.LINK_0	Counts cycles the Quickpath outbound link 0 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	04H	UNC_QPI_TX_STALLED_MULTI_FLIT.NCS.LINK_0	Counts cycles the Quickpath outbound link 0 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	08H	UNC_QPI_TX_STALLED_MULTI_FLIT.DRS.LINK_1	Counts cycles the Quickpath outbound link 1 Data Response virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	10H	UNC_QPI_TX_STALLED_MULTI_FLIT.NCB.LINK_1	Counts cycles the Quickpath outbound link 1 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
41H	20H	UNC_QPI_TX_STALLED_MULTI_FLIT.NCS.LINK_1	Counts cycles the Quickpath outbound link 1 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	07H	UNC_QPI_TX_STALLED_MULTI_FLIT.LINK_0	Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	38H	UNC_QPI_TX_STALLED_MULTI_FLIT.LINK_1	Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
42H	02H	UNC_QPI_TX_HEADER.BUSY.LINK_0	Number of cycles that the header buffer in the Quickpath Interface outbound link 0 is busy.	
42H	08H	UNC_QPI_TX_HEADER.BUSY.LINK_1	Number of cycles that the header buffer in the Quickpath Interface outbound link 1 is busy.	
43H	01H	UNC_QPI_RX_NO_PPT_CREDIT.STALLS.LINK_0	Number of cycles that snoop packets incoming to the Quickpath Interface link 0 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.	
43H	02H	UNC_QPI_RX_NO_PPT_CREDIT.STALLS.LINK_1	Number of cycles that snoop packets incoming to the Quickpath Interface link 1 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.	
60H	01H	UNC_DRAM_OPEN.CH0	Counts number of DRAM Channel 0 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	
60H	02H	UNC_DRAM_OPEN.CH1	Counts number of DRAM Channel 1 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	
60H	04H	UNC_DRAM_OPEN.CH2	Counts number of DRAM Channel 2 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	
61H	01H	UNC_DRAM_PAGE_CLOSE.CH0	DRAM channel 0 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	
61H	02H	UNC_DRAM_PAGE_CLOSE.CH1	DRAM channel 1 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	
61H	04H	UNC_DRAM_PAGE_CLOSE.CH2	DRAM channel 2 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
62H	01H	UNC_DRAM_PAGE_MISS.CH0	Counts the number of precharges (PRE) that were issued to DRAM channel 0 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
62H	02H	UNC_DRAM_PAGE_MISS.CH1	Counts the number of precharges (PRE) that were issued to DRAM channel 1 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
62H	04H	UNC_DRAM_PAGE_MISS.CH2	Counts the number of precharges (PRE) that were issued to DRAM channel 2 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
63H	01H	UNC_DRAM_READ_CAS.CH0	Counts the number of times a read CAS command was issued on DRAM channel 0.	
63H	02H	UNC_DRAM_READ_CAS.AUTO PRE_CH0	Counts the number of times a read CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.	
63H	04H	UNC_DRAM_READ_CAS.CH1	Counts the number of times a read CAS command was issued on DRAM channel 1.	
63H	08H	UNC_DRAM_READ_CAS.AUTO PRE_CH1	Counts the number of times a read CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.	
63H	10H	UNC_DRAM_READ_CAS.CH2	Counts the number of times a read CAS command was issued on DRAM channel 2.	
63H	20H	UNC_DRAM_READ_CAS.AUTO PRE_CH2	Counts the number of times a read CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.	
64H	01H	UNC_DRAM_WRITE_CAS.CH0	Counts the number of times a write CAS command was issued on DRAM channel 0.	
64H	02H	UNC_DRAM_WRITE_CAS.AUTO PRE_CH0	Counts the number of times a write CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.	
64H	04H	UNC_DRAM_WRITE_CAS.CH1	Counts the number of times a write CAS command was issued on DRAM channel 1.	
64H	08H	UNC_DRAM_WRITE_CAS.AUTO PRE_CH1	Counts the number of times a write CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.	
64H	10H	UNC_DRAM_WRITE_CAS.CH2	Counts the number of times a write CAS command was issued on DRAM channel 2.	

Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
64H	20H	UNC_DRAM_WRITE_CAS.AUTO PRE_CH2	Counts the number of times a write CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.	
65H	01H	UNC_DRAM_REFRESH.CH0	Counts number of DRAM channel 0 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
65H	02H	UNC_DRAM_REFRESH.CH1	Counts number of DRAM channel 1 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
65H	04H	UNC_DRAM_REFRESH.CH2	Counts number of DRAM channel 2 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
66H	01H	UNC_DRAM_PRE_ALL.CH0	Counts number of DRAM Channel 0 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	
66H	02H	UNC_DRAM_PRE_ALL.CH1	Counts number of DRAM Channel 1 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	
66H	04H	UNC_DRAM_PRE_ALL.CH2	Counts number of DRAM Channel 2 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	

Intel Xeon processors with CPUID signature of DisplayFamily_DisplayModel 06_2EH have a distinct uncore sub-system that is significantly different from the uncore found in processors with CPUID signature 06_1AH, 06_1EH, and 06_1FH. Model-specific performance monitoring events for its uncore will be available in future documentation.

19.10 PERFORMANCE MONITORING EVENTS FOR PROCESSORS BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE

Intel 64 processors based on Intel® microarchitecture code name Westmere support the architectural and model-specific performance monitoring events listed in Table 19-1 and Table 19-21. Table 19-21 applies to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following values: 06_25H, 06_2CH. In addition, these processors (CPUID signature of DisplayFamily_DisplayModel 06_25H, 06_2CH) also support the following model-specific, product-specific uncore performance monitoring events listed in Table 19-22. Fixed counters support the architecture events defined in Table 19-2.

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	02H	LOAD_BLOCK.OVERLAP_STORE	Loads that partially overlap an earlier store.	
04H	07H	SB_DRAIN.ANY	All Store buffer stall cycles.	
05H	02H	MISALIGN_MEMORY.STORE	All store referenced with misaligned address.	
06H	04H	STORE_BLOCKS.AT_RET	Counts number of loads delayed with at-Retirement block code. The following loads need to be executed at retirement and wait for all senior stores on the same thread to be drained: load splitting across 4K boundary (page split), load accessing uncacheable (UC or WC) memory, load lock, and load with page table in UC or WC memory region.	
06H	08H	STORE_BLOCKS.L1D_BLOCK	Cacheable loads delayed with L1D block code.	
07H	01H	PARTIAL_ADDRESS_ALIAS	Counts false dependency due to partial address aliasing.	
08H	01H	DTLB_LOAD_MISSES.ANY	Counts all load misses that cause a page walk.	
08H	02H	DTLB_LOAD_MISSES.WALK_COMPLETED	Counts number of completed page walks due to load miss in the STLB.	
08H	04H	DTLB_LOAD_MISSES.WALK_CYCLES	Cycles PMH is busy with a page walk due to a load miss in the STLB.	
08H	10H	DTLB_LOAD_MISSES.STLB_HIT	Number of cache load STLB hits.	
08H	20H	DTLB_LOAD_MISSES.PDE_MISS	Number of DTLB cache load misses where the low part of the linear to physical address translation was missed.	
0BH	01H	MEM_INST_RETIRED.LOADS	Counts the number of instructions with an architecturally-visible load retired on the architected path.	
0BH	02H	MEM_INST_RETIRED.STORES	Counts the number of instructions with an architecturally-visible store retired on the architected path.	
0BH	10H	MEM_INST_RETIRED.LATENCY_ABOVE_THRESHOLD	Counts the number of instructions exceeding the latency specified with ld_lat facility.	In conjunction with ld_lat facility.
0CH	01H	MEM_STORE_RETIRED.DTLB_MISS	The event counts the number of retired stores that missed the DTLB. The DTLB miss is not counted if the store operation causes a fault. Does not counter prefetches. Counts both primary and secondary misses to the TLB.	
0EH	01H	UOPS_ISSUED.ANY	Counts the number of Uops issued by the Register Allocation Table to the Reservation Station, i.e. the UOPs issued from the front end to the back end.	
0EH	01H	UOPS_ISSUED.STALLED_CYCLES	Counts the number of cycles no uops issued by the Register Allocation Table to the Reservation Station, i.e. the UOPs issued from the front end to the back end.	Set “invert=1, cmask = 1“.
0EH	02H	UOPS_ISSUED.FUSED	Counts the number of fused Uops that were issued from the Register Allocation Table to the Reservation Station.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0FH	01H	MEM_UNCORE_RETIRED.UNKNOWN_SOURCE	Load instructions retired with unknown LLC miss (Precise Event).	Applicable to one and two sockets.
0FH	02H	MEM_UNCORE_RETIRED.OHTER_CORE_L2_HIT	Load instructions retired that HIT modified data in sibling core (Precise Event).	Applicable to one and two sockets.
0FH	04H	MEM_UNCORE_RETIRED.REMOTE_HITM	Load instructions retired that HIT modified data in remote socket (Precise Event).	Applicable to two sockets only.
0FH	08H	MEM_UNCORE_RETIRED.LOCAL_DRAM_AND_REMOTE_CACHE_HIT	Load instructions retired local dram and remote cache HIT data sources (Precise Event).	Applicable to one and two sockets.
0FH	10H	MEM_UNCORE_RETIRED.REMOTE_DRAM	Load instructions retired remote DRAM and remote home-remote cache HITM (Precise Event).	Applicable to two sockets only.
0FH	20H	MEM_UNCORE_RETIRED.OTHER_LLC_MISS	Load instructions retired other LLC miss (Precise Event).	Applicable to two sockets only.
0FH	80H	MEM_UNCORE_RETIRED.UNCACHEABLE	Load instructions retired I/O (Precise Event).	Applicable to one and two sockets.
10H	01H	FP_COMP_OPS_EXE.X87	Counts the number of FP Computational Uops Executed. The number of FADD, FSUB, FCOM, FMULs, integer MULs and IMULs, FDIVs, FPREMs, FSQRTS, integer DIVs, and IDIVs. This event does not distinguish an FADD used in the middle of a transcendental flow from a separate FADD instruction.	
10H	02H	FP_COMP_OPS_EXE.MMX	Counts number of MMX Uops executed.	
10H	04H	FP_COMP_OPS_EXE.SSE_FP	Counts number of SSE and SSE2 FP uops executed.	
10H	08H	FP_COMP_OPS_EXE.SSE2_INTEGER	Counts number of SSE2 integer uops executed.	
10H	10H	FP_COMP_OPS_EXE.SSE_FP_PACKED	Counts number of SSE FP packed uops executed.	
10H	20H	FP_COMP_OPS_EXE.SSE_FP_SCALAR	Counts number of SSE FP scalar uops executed.	
10H	40H	FP_COMP_OPS_EXE.SSE_SINGLE_PRECISION	Counts number of SSE* FP single precision uops executed.	
10H	80H	FP_COMP_OPS_EXE.SSE_DOUBLE_PRECISION	Counts number of SSE* FP double precision uops executed.	
12H	01H	SIMD_INT_128.PACKED_MPY	Counts number of 128 bit SIMD integer multiply operations.	
12H	02H	SIMD_INT_128.PACKED_SHIFT	Counts number of 128 bit SIMD integer shift operations.	
12H	04H	SIMD_INT_128.PACK	Counts number of 128 bit SIMD integer pack operations.	
12H	08H	SIMD_INT_128.UNPACK	Counts number of 128 bit SIMD integer unpack operations.	
12H	10H	SIMD_INT_128.PACKED_LOGICAL	Counts number of 128 bit SIMD integer logical operations.	
12H	20H	SIMD_INT_128.PACKED_ARITH	Counts number of 128 bit SIMD integer arithmetic operations.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
12H	40H	SIMD_INT_128.SHUFFLE_MOVE	Counts number of 128 bit SIMD integer shuffle and move operations.	
13H	01H	LOAD_DISPATCH.RS	Counts number of loads dispatched from the Reservation Station that bypass the Memory Order Buffer.	
13H	02H	LOAD_DISPATCH.RS_DELAYED	Counts the number of delayed RS dispatches at the stage latch. If an RS dispatch cannot bypass to LB, it has another chance to dispatch from the one-cycle delayed staging latch before it is written into the LB.	
13H	04H	LOAD_DISPATCH.MOB	Counts the number of loads dispatched from the Reservation Station to the Memory Order Buffer.	
13H	07H	LOAD_DISPATCH.ANY	Counts all loads dispatched from the Reservation Station.	
14H	01H	ARITH.CYCLES_DIV_BUSY	Counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE. Set 'edge =1, invert=1, cmask=1' to count the number of divides.	Count may be incorrect When SMT is on.
14H	02H	ARITH.MUL	Counts the number of multiply operations executed. This includes integer as well as floating point multiply operations but excludes DPPS mul and MPSAD.	Count may be incorrect When SMT is on.
17H	01H	INST_QUEUE_WRITES	Counts the number of instructions written into the instruction queue every cycle.	
18H	01H	INST_DECODED.DEC0	Counts number of instructions that require decoder 0 to be decoded. Usually, this means that the instruction maps to more than 1 uop.	
19H	01H	TWO_UOP_INSTS_DECODED	An instruction that generates two uops was decoded.	
1EH	01H	INST_QUEUE_WRITE_CYCLES	This event counts the number of cycles during which instructions are written to the instruction queue. Dividing this counter by the number of instructions written to the instruction queue (INST_QUEUE_WRITES) yields the average number of instructions decoded each cycle. If this number is less than four and the pipe stalls, this indicates that the decoder is failing to decode enough instructions per cycle to sustain the 4-wide pipeline.	If SSE* instructions that are 6 bytes or longer arrive one after another, then front end throughput may limit execution speed.
20H	01H	LSD_OVERFLOW	Number of loops that cannot stream from the instruction queue.	
24H	01H	L2_RQSTS.LD_HIT	Counts number of loads that hit the L2 cache. L2 loads include both L1D demand misses as well as L1D prefetches. L2 loads can be rejected for various reasons. Only non rejected loads are counted.	
24H	02H	L2_RQSTS.LD_MISS	Counts the number of loads that miss the L2 cache. L2 loads include both L1D demand misses as well as L1D prefetches.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
24H	03H	L2_RQSTS.LOADS	Counts all L2 load requests. L2 loads include both L1D demand misses as well as L1D prefetches.	
24H	04H	L2_RQSTS.RFO_HIT	Counts the number of store RFO requests that hit the L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches. Count includes WC memory requests, where the data is not fetched but the permission to write the line is required.	
24H	08H	L2_RQSTS.RFO_MISS	Counts the number of store RFO requests that miss the L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.	
24H	0CH	L2_RQSTS.RFOS	Counts all L2 store RFO requests. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.	
24H	10H	L2_RQSTS.IFETCH_HIT	Counts number of instruction fetches that hit the L2 cache. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.	
24H	20H	L2_RQSTS.IFETCH_MISS	Counts number of instruction fetches that miss the L2 cache. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.	
24H	30H	L2_RQSTS.IFETCHES	Counts all instruction fetches. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.	
24H	40H	L2_RQSTS.PREFETCH_HIT	Counts L2 prefetch hits for both code and data.	
24H	80H	L2_RQSTS.PREFETCH_MISS	Counts L2 prefetch misses for both code and data.	
24H	C0H	L2_RQSTS.PREFETCHES	Counts all L2 prefetches for both code and data.	
24H	AAH	L2_RQSTS.MISS	Counts all L2 misses for both code and data.	
24H	FFH	L2_RQSTS.REFERENCES	Counts all L2 requests for both code and data.	
26H	01H	L2_DATA_RQSTS.DEMAND.I_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	02H	L2_DATA_RQSTS.DEMAND.S_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the S (shared) state. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	04H	L2_DATA_RQSTS.DEMAND.E_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the E (exclusive) state. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	08H	L2_DATA_RQSTS.DEMAND.M_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the M (modified) state. L2 demand loads are both L1D demand misses and L1D prefetches.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
26H	0FH	L2_DATA_RQSTS.DEMAND.MESI	Counts all L2 data demand requests. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	10H	L2_DATA_RQSTS.PREFETCH.I_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss.	
26H	20H	L2_DATA_RQSTS.PREFETCH.S_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the S (shared) state. A prefetch RFO will miss on an S state line, while a prefetch read will hit on an S state line.	
26H	40H	L2_DATA_RQSTS.PREFETCH.E_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the E (exclusive) state.	
26H	80H	L2_DATA_RQSTS.PREFETCH.M_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the M (modified) state.	
26H	F0H	L2_DATA_RQSTS.PREFETCH.MESI	Counts all L2 prefetch requests.	
26H	FFH	L2_DATA_RQSTS.ANY	Counts all L2 data requests.	
27H	01H	L2_WRITE.RFO.I_STATE	Counts number of L2 demand store RFO requests where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request.
27H	02H	L2_WRITE.RFO.S_STATE	Counts number of L2 store RFO requests where the cache line to be loaded is in the S (shared) state. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request.
27H	08H	L2_WRITE.RFO.M_STATE	Counts number of L2 store RFO requests where the cache line to be loaded is in the M (modified) state. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request.
27H	0EH	L2_WRITE.RFO.HIT	Counts number of L2 store RFO requests where the cache line to be loaded is in either the S, E or M states. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request.
27H	0FH	L2_WRITE.RFO.MESI	Counts all L2 store RFO requests. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request.
27H	10H	L2_WRITE.LOCK.I_STATE	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss.	
27H	20H	L2_WRITE.LOCK.S_STATE	Counts number of L2 lock RFO requests where the cache line to be loaded is in the S (shared) state.	
27H	40H	L2_WRITE.LOCK.E_STATE	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the E (exclusive) state.	
27H	80H	L2_WRITE.LOCK.M_STATE	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the M (modified) state.	
27H	E0H	L2_WRITE.LOCK.HIT	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in either the S, E, or M state.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
27H	F0H	L2_WRITE.LOCK.MESI	Counts all L2 demand lock RFO requests.	
28H	01H	L1D_WB_L2.I_STATE	Counts number of L1 writebacks to the L2 where the cache line to be written is in the I (invalid) state, i.e., a cache miss.	
28H	02H	L1D_WB_L2.S_STATE	Counts number of L1 writebacks to the L2 where the cache line to be written is in the S state.	
28H	04H	L1D_WB_L2.E_STATE	Counts number of L1 writebacks to the L2 where the cache line to be written is in the E (exclusive) state.	
28H	08H	L1D_WB_L2.M_STATE	Counts number of L1 writebacks to the L2 where the cache line to be written is in the M (modified) state.	
28H	0FH	L1D_WB_L2.MESI	Counts all L1 writebacks to the L2 .	
2EH	41H	L3_LAT_CACHE.MISS	Counts uncore Last Level Cache misses. Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.	See Table 19-1.
2EH	4FH	L3_LAT_CACHE.REFERENCE	Counts uncore Last Level Cache references. Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.	See Table 19-1.
3CH	00H	CPU_CLK_UNHALTED.THREAD_P	Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling.	See Table 19-1.
3CH	01H	CPU_CLK_UNHALTED.REF_P	Increments at the frequency of TSC when not halted.	See Table 19-1.
49H	01H	DTLB_MISSES.ANY	Counts the number of misses in the STLB which causes a page walk.	
49H	02H	DTLB_MISSES.WALK_COMPLETED	Counts number of misses in the STLB which resulted in a completed page walk.	
49H	04H	DTLB_MISSES.WALK_CYCLES	Counts cycles of page walk due to misses in the STLB.	
49H	10H	DTLB_MISSES.STLB_HIT	Counts the number of DTLB first level misses that hit in the second level TLB. This event is only relevant if the core contains multiple DTLB levels.	
49H	20H	DTLB_MISSES.PDE_MISS	Number of DTLB misses caused by low part of address, includes references to 2M pages because 2M pages do not use the PDE.	
49H	80H	DTLB_MISSES.LARGE_WALK_COMPLETED	Counts number of completed large page walks due to misses in the STLB.	
4CH	01H	LOAD_HIT_PRE	Counts load operations sent to the L1 data cache while a previous SSE prefetch instruction to the same cache line has started prefetching but has not yet finished.	Counter 0, 1 only.

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
4EH	01H	L1D_PREFETCH.REQUESTS	Counts number of hardware prefetch requests dispatched out of the prefetch FIFO.	Counter 0, 1 only.
4EH	02H	L1D_PREFETCH.MISS	Counts number of hardware prefetch requests that miss the L1D. There are two prefetchers in the L1D. A streamer, which predicts lines sequentially after this one should be fetched, and the IP prefetcher that remembers access patterns for the current instruction. The streamer prefetcher stops on an L1D hit, while the IP prefetcher does not.	Counter 0, 1 only.
4EH	04H	L1D_PREFETCH.TRIGGERS	Counts number of prefetch requests triggered by the Finite State Machine and pushed into the prefetch FIFO. Some of the prefetch requests are dropped due to overwrites or competition between the IP index prefetcher and streamer prefetcher. The prefetch FIFO contains 4 entries.	Counter 0, 1 only.
4FH	10H	EPT.WALK_CYCLES	Counts Extended Page walk cycles.	
51H	01H	L1D.REPL	Counts the number of lines brought into the L1 data cache.	Counter 0, 1 only.
51H	02H	L1D.M_REPL	Counts the number of modified lines brought into the L1 data cache.	Counter 0, 1 only.
51H	04H	L1D.M_EVICT	Counts the number of modified lines evicted from the L1 data cache due to replacement.	Counter 0, 1 only.
51H	08H	L1D.M_SNOOP_EVICT	Counts the number of modified lines evicted from the L1 data cache due to snoop HITM intervention.	Counter 0, 1 only.
52H	01H	L1D_CACHE_PREFETCH_LOCK_FB_HIT	Counts the number of cacheable load lock speculated instructions accepted into the fill buffer.	
60H	01H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND.READ_DATA	Counts weighted cycles of offcore demand data read requests. Does not include L2 prefetch requests.	Counter 0.
60H	02H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND.READ_CODE	Counts weighted cycles of offcore demand code read requests. Does not include L2 prefetch requests.	Counter 0.
60H	04H	OFFCORE_REQUESTS_OUTSTANDING.DEMAND.RFO	Counts weighted cycles of offcore demand RFO requests. Does not include L2 prefetch requests.	Counter 0.
60H	08H	OFFCORE_REQUESTS_OUTSTANDING.ANY.READ	Counts weighted cycles of offcore read requests of any kind. Include L2 prefetch requests.	Counter 0.
63H	01H	CACHE_LOCK_CYCLES.L1D_L2	Cycle count during which the L1D and L2 are locked. A lock is asserted when there is a locked memory access, due to uncacheable memory, a locked operation that spans two cache lines, or a page walk from an uncacheable page table. This event does not cause locks, it merely detects them.	Counter 0, 1 only. L1D and L2 locks have a very high performance penalty and it is highly recommended to avoid such accesses.
63H	02H	CACHE_LOCK_CYCLES.L1D	Counts the number of cycles that cacheline in the L1 data cache unit is locked.	Counter 0, 1 only.
6CH	01H	IO_TRANSACTIONS	Counts the number of completed I/O transactions.	
80H	01H	L1I.HITS	Counts all instruction fetches that hit the L1 instruction cache.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
80H	02H	L1I.MISSES	Counts all instruction fetches that miss the L1I cache. This includes instruction cache misses, streaming buffer misses, victim cache misses and uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.	
80H	03H	L1I.READS	Counts all instruction fetches, including uncacheable fetches that bypass the L1I.	
80H	04H	L1I.CYCLES_STALLED	Cycle counts for which an instruction fetch stalls due to a L1I cache miss, ITLB miss or ITLB fault.	
82H	01H	LARGE_ITLB.HIT	Counts number of large ITLB hits.	
85H	01H	ITLB_MISSES.ANY	Counts the number of misses in all levels of the ITLB which causes a page walk.	
85H	02H	ITLB_MISSES.WALK_COMPLETED	Counts number of misses in all levels of the ITLB which resulted in a completed page walk.	
85H	04H	ITLB_MISSES.WALK_CYCLES	Counts ITLB miss page walk cycles.	
85H	10H	ITLB_MISSES.STLB_HIT	Counts number of ITLB first level miss but second level hits.	
85H	80H	ITLB_MISSES.LARGE_WALK_COMPLETED	Counts number of completed large page walks due to misses in the STLB.	
87H	01H	ILD_STALL.LCP	Cycles Instruction Length Decoder stalls due to length changing prefixes: 66, 67 or REX.W (for Intel 64) instructions which change the length of the decoded instruction.	
87H	02H	ILD_STALL.MRU	Instruction Length Decoder stall cycles due to Brand Prediction Unit (PBU) Most Recently Used (MRU) bypass.	
87H	04H	ILD_STALL.IQ_FULL	Stall cycles due to a full instruction queue.	
87H	08H	ILD_STALL.REGEN	Counts the number of regen stalls.	
87H	0FH	ILD_STALL.ANY	Counts any cycles the Instruction Length Decoder is stalled.	
88H	01H	BR_INST_EXEC.COND	Counts the number of conditional near branch instructions executed, but not necessarily retired.	
88H	02H	BR_INST_EXEC.DIRECT	Counts all unconditional near branch instructions excluding calls and indirect branches.	
88H	04H	BR_INST_EXEC.INDIRECT_NON_CALL	Counts the number of executed indirect near branch instructions that are not calls.	
88H	07H	BR_INST_EXEC.NON_CALLS	Counts all non-call near branch instructions executed, but not necessarily retired.	
88H	08H	BR_INST_EXEC.RETURN_NEAR	Counts indirect near branches that have a return mnemonic.	
88H	10H	BR_INST_EXEC.DIRECT_NEAR_CALL	Counts unconditional near call branch instructions, excluding non-call branch, executed.	
88H	20H	BR_INST_EXEC.INDIRECT_NEAR_CALL	Counts indirect near calls, including both register and memory indirect, executed.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
88H	30H	BR_INST_EXEC.NEAR_CALLS	Counts all near call branches executed, but not necessarily retired.	
88H	40H	BR_INST_EXEC.TAKEN	Counts taken near branches executed, but not necessarily retired.	
88H	7FH	BR_INST_EXEC.ANY	Counts all near executed branches (not necessarily retired). This includes only instructions and not micro-op branches. Frequent branching is not necessarily a major performance issue. However frequent branch mispredictions may be a problem.	
89H	01H	BR_MISP_EXEC.COND	Counts the number of mispredicted conditional near branch instructions executed, but not necessarily retired.	
89H	02H	BR_MISP_EXEC.DIRECT	Counts mispredicted macro unconditional near branch instructions, excluding calls and indirect branches (should always be 0).	
89H	04H	BR_MISP_EXEC.INDIRECT_NON_CALL	Counts the number of executed mispredicted indirect near branch instructions that are not calls.	
89H	07H	BR_MISP_EXEC.NON_CALLS	Counts mispredicted non-call near branches executed, but not necessarily retired.	
89H	08H	BR_MISP_EXEC.RETURN_NEAR	Counts mispredicted indirect branches that have a rear return mnemonic.	
89H	10H	BR_MISP_EXEC.DIRECT_NEAR_CALL	Counts mispredicted non-indirect near calls executed, (should always be 0).	
89H	20H	BR_MISP_EXEC.INDIRECT_NEAR_CALL	Counts mispredicted indirect near calls executed, including both register and memory indirect.	
89H	30H	BR_MISP_EXEC.NEAR_CALLS	Counts all mispredicted near call branches executed, but not necessarily retired.	
89H	40H	BR_MISP_EXEC.TAKEN	Counts executed mispredicted near branches that are taken, but not necessarily retired.	
89H	7FH	BR_MISP_EXEC.ANY	Counts the number of mispredicted near branch instructions that were executed, but not necessarily retired.	
A2H	01H	RESOURCE_STALLS.ANY	Counts the number of Allocator resource related stalls. Includes register renaming buffer entries, memory buffer entries. In addition to resource related stalls, this event counts some other events. Includes stalls arising during branch misprediction recovery, such as if retirement of the mispredicted branch is delayed and stalls arising while store buffer is draining from synchronizing operations.	Does not include stalls due to SuperQ (off core) queue full, too many cache misses, etc.
A2H	02H	RESOURCE_STALLS.LOAD	Counts the cycles of stall due to lack of load buffer for load operation.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
A2H	04H	RESOURCE_STALLS.RS_FULL	This event counts the number of cycles when the number of instructions in the pipeline waiting for execution reaches the limit the processor can handle. A high count of this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, or instructions dependent upon instructions further down the pipeline that have yet to retire.	When RS is full, new instructions cannot enter the reservation station and start execution.
A2H	08H	RESOURCE_STALLS.STORE	This event counts the number of cycles that a resource related stall will occur due to the number of store instructions reaching the limit of the pipeline, (i.e. all store buffers are used). The stall ends when a store instruction commits its data to the cache or memory.	
A2H	10H	RESOURCE_STALLS.ROB_FULL	Counts the cycles of stall due to re-order buffer full.	
A2H	20H	RESOURCE_STALLS.FPCW	Counts the number of cycles while execution was stalled due to writing the floating-point unit (FPU) control word.	
A2H	40H	RESOURCE_STALLS.MXCSR	Stalls due to the MXCSR register rename occurring to close to a previous MXCSR rename. The MXCSR provides control and status for the MMX registers.	
A2H	80H	RESOURCE_STALLS.OTHER	Counts the number of cycles while execution was stalled due to other resource issues.	
A6H	01H	MACRO_INSTS.FUSIONS_DECODED	Counts the number of instructions decoded that are macro-fused but not necessarily executed or retired.	
A7H	01H	BACLEAR_FORCE_IQ	Counts number of times a BACLEAR was forced by the Instruction Queue. The IQ is also responsible for providing conditional branch prediction direction based on a static scheme and dynamic data provided by the L2 Branch Prediction Unit. If the conditional branch target is not found in the Target Array and the IQ predicts that the branch is taken, then the IQ will force the Branch Address Calculator to issue a BACLEAR. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline.	
A8H	01H	LSD.UOPS	Counts the number of micro-ops delivered by loop stream detector.	Use cmask=1 and invert to count cycles.
AEH	01H	ITLB_FLUSH	Counts the number of ITLB flushes.	
B0H	01H	OFFCORE_REQUESTS.DEMAND.READ_DATA	Counts number of offcore demand data read requests. Does not count L2 prefetch requests.	
B0H	02H	OFFCORE_REQUESTS.DEMAND.READ_CODE	Counts number of offcore demand code read requests. Does not count L2 prefetch requests.	
B0H	04H	OFFCORE_REQUESTS.DEMAND.RFO	Counts number of offcore demand RFO requests. Does not count L2 prefetch requests.	
B0H	08H	OFFCORE_REQUESTS.ANY.READ	Counts number of offcore read requests. Includes L2 prefetch requests.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
B0H	10H	OFFCORE_REQUESTS.ANY.RFO	Counts number of offcore RFO requests. Includes L2 prefetch requests.	
B0H	40H	OFFCORE_REQUESTS.L1D_WRITEBACK	Counts number of L1D writebacks to the uncore.	
B0H	80H	OFFCORE_REQUESTS.ANY	Counts all offcore requests.	
B1H	01H	UOPS_EXECUTED.PORT0	Counts number of uops executed that were issued on port 0. Port 0 handles integer arithmetic, SIMD and FP add uops.	
B1H	02H	UOPS_EXECUTED.PORT1	Counts number of uops executed that were issued on port 1. Port 1 handles integer arithmetic, SIMD, integer shift, FP multiply and FP divide uops.	
B1H	04H	UOPS_EXECUTED.PORT2_CORE	Counts number of uops executed that were issued on port 2. Port 2 handles the load uops. This is a core count only and cannot be collected per thread.	
B1H	08H	UOPS_EXECUTED.PORT3_CORE	Counts number of uops executed that were issued on port 3. Port 3 handles store uops. This is a core count only and cannot be collected per thread.	
B1H	10H	UOPS_EXECUTED.PORT4_CORE	Counts number of uops executed that where issued on port 4. Port 4 handles the value to be stored for the store uops issued on port 3. This is a core count only and cannot be collected per thread.	
B1H	1FH	UOPS_EXECUTED.CORE_ACTIVE_CYCLES_NO_PORT5	Counts number of cycles there are one or more uops being executed and were issued on ports 0-4. This is a core count only and cannot be collected per thread.	
B1H	20H	UOPS_EXECUTED.PORT5	Counts number of uops executed that where issued on port 5.	
B1H	3FH	UOPS_EXECUTED.CORE_ACTIVE_CYCLES	Counts number of cycles there are one or more uops being executed on any ports. This is a core count only and cannot be collected per thread.	
B1H	40H	UOPS_EXECUTED.PORT015	Counts number of uops executed that where issued on port 0, 1, or 5.	Use cmask=1, invert=1 to count stall cycles.
B1H	80H	UOPS_EXECUTED.PORT234	Counts number of uops executed that where issued on port 2, 3, or 4.	
B2H	01H	OFFCORE_REQUESTS_SQ_FULL	Counts number of cycles the SQ is full to handle off-core requests.	
B3H	01H	SNOOPQ_REQUESTS_OUTSTANDING.DATA	Counts weighted cycles of snoopq requests for data. Counter 0 only.	Use cmask=1 to count cycles not empty.
B3H	02H	SNOOPQ_REQUESTS_OUTSTANDING.INVALIDATE	Counts weighted cycles of snoopq invalidate requests. Counter 0 only.	Use cmask=1 to count cycles not empty.
B3H	04H	SNOOPQ_REQUESTS_OUTSTANDING.CODE	Counts weighted cycles of snoopq requests for code. Counter 0 only.	Use cmask=1 to count cycles not empty.
B4H	01H	SNOOPQ_REQUESTS.CODE	Counts the number of snoop code requests.	
B4H	02H	SNOOPQ_REQUESTS.DATA	Counts the number of snoop data requests.	
B4H	04H	SNOOPQ_REQUESTS.INVALIDATE	Counts the number of snoop invalidate requests.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
B7H	01H	OFF_CORE_RESPONSE_0	See Section 18.3.1.1.3, "Off-core Response Performance Monitoring in the Processor Core".	Requires programming MSR 01A6H.
B8H	01H	SNOOP_RESPONSE.HIT	Counts HIT snoop response sent by this thread in response to a snoop request.	
B8H	02H	SNOOP_RESPONSE.HITE	Counts HIT E snoop response sent by this thread in response to a snoop request.	
B8H	04H	SNOOP_RESPONSE.HITM	Counts HIT M snoop response sent by this thread in response to a snoop request.	
BBH	01H	OFF_CORE_RESPONSE_1	See Section 18.3.1.1.3, "Off-core Response Performance Monitoring in the Processor Core".	Use MSR 01A7H.
C0H	00H	INST_RETIRED.ANY_P	See Table 19-1. Notes: INST_RETIRED.ANY is counted by a designated fixed counter. INST_RETIRED.ANY_P is counted by a programmable counter and is an architectural performance event. Event is supported if CPUID.A.EBX[1] = 0.	Counting: Faulting executions of GETSEC/VM entry/VM Exit/MWait will not count as retired instructions.
C0H	02H	INST_RETIRED.X87	Counts the number of floating point computational operations retired: floating point computational operations executed by the assist handler and sub-operations of complex floating point instructions like transcendental instructions.	
C0H	04H	INST_RETIRED.MMX	Counts the number of retired: MMX instructions.	
C2H	01H	UOPS_RETIRED.ANY	Counts the number of micro-ops retired, (macro-fused=1, micro-fused=2, others=1; maximum count of 8 per cycle). Most instructions are composed of one or two micro-ops. Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists.	Use cmask=1 and invert to count active cycles or stalled cycles.
C2H	02H	UOPS_RETIRED.RETIRE_SLOTS	Counts the number of retirement slots used each cycle.	
C2H	04H	UOPS_RETIRED.MACRO_FUSED	Counts number of macro-fused uops retired.	
C3H	01H	MACHINE_CLEARS.CYCLES	Counts the cycles machine clear is asserted.	
C3H	02H	MACHINE_CLEARS.MEM_ORDER	Counts the number of machine clears due to memory order conflicts.	
C3H	04H	MACHINE_CLEARS.SMC	Counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel 64 and IA-32 processors. The modified cache line is written back to the L2 and L3caches.	
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Branch instructions at retirement.	See Table 19-1.
C4H	01H	BR_INST_RETIRED.CONDITIONAL	Counts the number of conditional branch instructions retired.	
C4H	02H	BR_INST_RETIRED.NEAR_CALL	Counts the number of direct & indirect near unconditional calls retired.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Mispredicted branch instructions at retirement.	See Table 19-1.
C5H	01H	BR_MISP_RETIRED.CONDITIONAL	Counts mispredicted conditional retired calls.	
C5H	02H	BR_MISP_RETIRED.NEAR_CALL	Counts mispredicted direct & indirect near unconditional retired calls.	
C5H	04H	BR_MISP_RETIRED.ALL_BRANCHES	Counts all mispredicted retired calls.	
C7H	01H	SSEX_UOPS_RETIRED.PACKED_SINGLE	Counts SIMD packed single-precision floating-point uops retired.	
C7H	02H	SSEX_UOPS_RETIRED.SCALAR_SINGLE	Counts SIMD scalar single-precision floating-point uops retired.	
C7H	04H	SSEX_UOPS_RETIRED.PACKED_DOUBLE	Counts SIMD packed double-precision floating-point uops retired.	
C7H	08H	SSEX_UOPS_RETIRED.SCALAR_DOUBLE	Counts SIMD scalar double-precision floating-point uops retired.	
C7H	10H	SSEX_UOPS_RETIRED.VECTOR_INTEGER	Counts 128-bit SIMD vector integer uops retired.	
C8H	20H	ITLB_MISS_RETIRED	Counts the number of retired instructions that missed the ITLB when the instruction was fetched.	
CBH	01H	MEM_LOAD_RETIRED.L1D_HIT	Counts number of retired loads that hit the L1 data cache.	
CBH	02H	MEM_LOAD_RETIRED.L2_HIT	Counts number of retired loads that hit the L2 data cache.	
CBH	04H	MEM_LOAD_RETIRED.L3_UNSHARED_HIT	Counts number of retired loads that hit their own, unshared lines in the L3 cache.	
CBH	08H	MEM_LOAD_RETIRED.OTHER_CORE_L2_HIT_HITM	Counts number of retired loads that hit in a sibling core's L2 (on die core). Since the L3 is inclusive of all cores on the package, this is an L3 hit. This counts both clean and modified hits.	
CBH	10H	MEM_LOAD_RETIRED.L3_MISS	Counts number of retired loads that miss the L3 cache. The load was satisfied by a remote socket, local memory or an IOH.	
CBH	40H	MEM_LOAD_RETIRED.HIT_LFB	Counts number of retired loads that miss the L1D and the address is located in an allocated line fill buffer and will soon be committed to cache. This is counting secondary L1D misses.	
CBH	80H	MEM_LOAD_RETIRED.DTLB_MISS	Counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault. This event counts loads from cacheable memory only. The event does not count loads by software prefetches. Counts both primary and secondary misses to the TLB.	
CCH	01H	FP_MMX_TRANS.TO_FP	Counts the first floating-point instruction following any MMX instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
CCH	02H	FP_MMX_TRANS.TO_MMX	Counts the first MMX instruction following a floating-point instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	
CCH	03H	FP_MMX_TRANS.ANY	Counts all transitions from floating point to MMX instructions and from MMX instructions to floating point instructions. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	
D0H	01H	MACRO_INSTS.DECODED	Counts the number of instructions decoded, (but not necessarily executed or retired).	
D1H	01H	UOPS_DECODED.STALL_CYCLES	Counts the cycles of decoder stalls. INV=1, Cmask=1.	
D1H	02H	UOPS_DECODED.MS	Counts the number of Uops decoded by the Microcode Sequencer, MS. The MS delivers uops when the instruction is more than 4 uops long or a microcode assist is occurring.	
D1H	04H	UOPS_DECODED.ESP_FOLDING	Counts number of stack pointer (ESP) instructions decoded: push, pop, call, ret, etc. ESP instructions do not generate a Uop to increment or decrement ESP. Instead, they update an ESP_Offset register that keeps track of the delta to the current value of the ESP register.	
D1H	08H	UOPS_DECODED.ESP_SYNC	Counts number of stack pointer (ESP) sync operations where an ESP instruction is corrected by adding the ESP offset register to the current value of the ESP register.	
D2H	01H	RAT_STALLS.FLAGS	Counts the number of cycles during which execution stalled due to several reasons, one of which is a partial flag register stall. A partial register stall may occur when two conditions are met: 1) an instruction modifies some, but not all, of the flags in the flag register and 2) the next instruction, which depends on flags, depends on flags that were not modified by this instruction.	
D2H	02H	RAT_STALLS.REGISTERS	This event counts the number of cycles instruction execution latency became longer than the defined latency because the instruction used a register that was partially written by previous instruction.	
D2H	04H	RAT_STALLS.ROB_READ_PORT	Counts the number of cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the out-of-order pipeline. Note that, at this stage in the pipeline, additional stalls may occur at the same cycle and prevent the stalled micro-ops from entering the pipe. In such a case, micro-ops retry entering the execution pipe in the next cycle and the ROB-read port stall is counted again.	
D2H	08H	RAT_STALLS.SCOREBOARD	Counts the cycles where we stall due to microarchitecturally required serialization. Microcode scoreboarding stalls.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D2H	0FH	RAT_STALLS.ANY	Counts all Register Allocation Table stall cycles due to: Cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the execution pipe, Cycles when partial register stalls occurred, Cycles when flag stalls occurred, Cycles floating-point unit (FPU) status word stalls occurred. To count each of these conditions separately use the events: RAT_STALLS.ROB_READ_PORT, RAT_STALLS.PARTIAL, RAT_STALLS.FLAGS, and RAT_STALLS.FPSW.	
D4H	01H	SEG_RENAME_STALLS	Counts the number of stall cycles due to the lack of renaming resources for the ES, DS, FS, and GS segment registers. If a segment is renamed but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.	
D5H	01H	ES_REG_RENAMES	Counts the number of times the ES segment register is renamed.	
DBH	01H	UOP_UNFUSION	Counts unfusion events due to floating point exception to a fused uop.	
E0H	01H	BR_INST_DECODED	Counts the number of branch instructions decoded.	
E5H	01H	BPU_MISSED_CALL_RET	Counts number of times the Branch Prediction Unit missed predicting a call or return branch.	
E6H	01H	BACLEAR.CLEAR	Counts the number of times the front end is resteered, mainly when the Branch Prediction Unit cannot provide a correct prediction and this is corrected by the Branch Address Calculator at the front end. This can occur if the code has many branches such that they cannot be consumed by the BPU. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline. The effect on total execution time depends on the surrounding code.	
E6H	02H	BACLEAR.BAD_TARGET	Counts number of Branch Address Calculator clears (BACLEAR) asserted due to conditional branch instructions in which there was a target hit but the direction was wrong. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline.	
E8H	01H	BPU_CLEARS.EARLY	Counts early (normal) Branch Prediction Unit clears: BPU predicted a taken branch after incorrectly assuming that it was not taken.	The BPU clear leads to 2 cycle bubble in the front end.
E8H	02H	BPU_CLEARS.LATE	Counts late Branch Prediction Unit clears due to Most Recently Used conflicts. The PBU clear leads to a 3 cycle bubble in the front end.	
ECH	01H	THREAD_ACTIVE	Counts cycles threads are active.	
F0H	01H	L2_TRANSACTIONS.LOAD	Counts L2 load operations due to HW prefetch or demand loads.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
F0H	02H	L2_TRANSACTIONS.RFO	Counts L2 RFO operations due to HW prefetch or demand RFOs.	
F0H	04H	L2_TRANSACTIONS.IFETCH	Counts L2 instruction fetch operations due to HW prefetch or demand ifetch.	
F0H	08H	L2_TRANSACTIONS.PREFETCH	Counts L2 prefetch operations.	
F0H	10H	L2_TRANSACTIONS.L1D_WB	Counts L1D writeback operations to the L2.	
F0H	20H	L2_TRANSACTIONS.FILL	Counts L2 cache line fill operations due to load, RFO, L1D writeback or prefetch.	
F0H	40H	L2_TRANSACTIONS.WB	Counts L2 writeback operations to the L3.	
F0H	80H	L2_TRANSACTIONS.ANY	Counts all L2 cache operations.	
F1H	02H	L2_LINES_IN.S_STATE	Counts the number of cache lines allocated in the L2 cache in the S (shared) state.	
F1H	04H	L2_LINES_IN.E_STATE	Counts the number of cache lines allocated in the L2 cache in the E (exclusive) state.	
F1H	07H	L2_LINES_IN.ANY	Counts the number of cache lines allocated in the L2 cache.	
F2H	01H	L2_LINES_OUT.DEMAND_CLEAN	Counts L2 clean cache lines evicted by a demand request.	
F2H	02H	L2_LINES_OUT.DEMAND_DIRTY	Counts L2 dirty (modified) cache lines evicted by a demand request.	
F2H	04H	L2_LINES_OUT.PREFETCH_CLEAN	Counts L2 clean cache line evicted by a prefetch request.	
F2H	08H	L2_LINES_OUT.PREFETCH_DIRTY	Counts L2 modified cache line evicted by a prefetch request.	
F2H	0FH	L2_LINES_OUT.ANY	Counts all L2 cache lines evicted for any reason.	
F4H	04H	SQ_MISC.LRU_HINTS	Counts number of Super Queue LRU hints sent to L3.	
F4H	10H	SQ_MISC.SPLIT_LOCK	Counts the number of SQ lock splits across a cache line.	
F6H	01H	SQ_FULL_STALL_CYCLES	Counts cycles the Super Queue is full. Neither of the threads on this core will be able to access the uncore.	
F7H	01H	FP_ASSIST.ALL	Counts the number of floating point operations executed that required micro-code assist intervention. Assists are required in the following cases: SSE instructions, (Denormal input when the DAZ flag is off or Underflow result when the FTZ flag is off): x87 instructions, (NaN or denormal are loaded to a register or used as input from memory, Division by 0 or Underflow output).	
F7H	02H	FP_ASSIST.OUTPUT	Counts number of floating point micro-code assist when the output value (destination register) is invalid.	
F7H	04H	FP_ASSIST.INPUT	Counts number of floating point micro-code assist when the input value (one of the source operands to an FP instruction) is invalid.	

Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
FDH	01H	SIMD_INT_64.PACKED_MPY	Counts number of SID integer 64 bit packed multiply operations.	
FDH	02H	SIMD_INT_64.PACKED_SHIFT	Counts number of SID integer 64 bit packed shift operations.	
FDH	04H	SIMD_INT_64.PACK	Counts number of SID integer 64 bit pack operations.	
FDH	08H	SIMD_INT_64.UNPACK	Counts number of SID integer 64 bit unpack operations.	
FDH	10H	SIMD_INT_64.PACKED_LOGICAL	Counts number of SID integer 64 bit logical operations.	
FDH	20H	SIMD_INT_64.PACKED_ARITH	Counts number of SID integer 64 bit arithmetic operations.	
FDH	40H	SIMD_INT_64.SHUFFLE_MOVE	Counts number of SID integer 64 bit shift or move operations.	

Model-specific performance monitoring events of the uncore sub-system for processors with CPUID signature of DisplayFamily_DisplayModel 06_25H, 06_2CH, and 06_1FH support performance events listed in Table 19-22.

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
00H	01H	UNC_GQ_CYCLES_FULL.READ_TRACKER	Uncore cycles Global Queue read tracker is full.	
00H	02H	UNC_GQ_CYCLES_FULL.WRITE_TRACKER	Uncore cycles Global Queue write tracker is full.	
00H	04H	UNC_GQ_CYCLES_FULL.PEER_PROBE_TRACKER	Uncore cycles Global Queue peer probe tracker is full. The peer probe tracker queue tracks snoops from the IOH and remote sockets.	
01H	01H	UNC_GQ_CYCLES_NOT_EMPTY.READ_TRACKER	Uncore cycles were Global Queue read tracker has at least one valid entry.	
01H	02H	UNC_GQ_CYCLES_NOT_EMPTY.WRITE_TRACKER	Uncore cycles were Global Queue write tracker has at least one valid entry.	
01H	04H	UNC_GQ_CYCLES_NOT_EMPTY.PEER_PROBE_TRACKER	Uncore cycles were Global Queue peer probe tracker has at least one valid entry. The peer probe tracker queue tracks IOH and remote socket snoops.	
02H	01H	UNC_GQ_OCCUPANCY.READ_TRACKER	Increments the number of queue entries (code read, data read, and RFOs) in the tread tracker. The GQ read tracker allocate to deallocate occupancy count is divided by the count to obtain the average read tracker latency.	
03H	01H	UNC_GQ_ALLOC.READ_TRACKER	Counts the number of tread tracker allocate to deallocate entries. The GQ read tracker allocate to deallocate occupancy count is divided by the count to obtain the average read tracker latency.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	02H	UNC_GQ_ALLOC.RT_L3_MISS	Counts the number GQ read tracker entries for which a full cache line read has missed the L3. The GQ read tracker L3 miss to fill occupancy count is divided by this count to obtain the average cache line read L3 miss latency. The latency represents the time after which the L3 has determined that the cache line has missed. The time between a GQ read tracker allocation and the L3 determining that the cache line has missed is the average L3 hit latency. The total L3 cache line read miss latency is the hit latency + L3 miss latency.	
03H	04H	UNC_GQ_ALLOC.RT_TO_L3_RESP	Counts the number of GQ read tracker entries that are allocated in the read tracker queue that hit or miss the L3. The GQ read tracker L3 hit occupancy count is divided by this count to obtain the average L3 hit latency.	
03H	08H	UNC_GQ_ALLOC.RT_TO_RTID_ACQUIRED	Counts the number of GQ read tracker entries that are allocated in the read tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ read tracker L3 miss to RTID acquired occupancy count is divided by this count to obtain the average latency for a read L3 miss to acquire an RTID.	
03H	10H	UNC_GQ_ALLOC.WT_TO_RTID_ACQUIRED	Counts the number of GQ write tracker entries that are allocated in the write tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ write tracker L3 miss to RTID occupancy count is divided by this count to obtain the average latency for a write L3 miss to acquire an RTID.	
03H	20H	UNC_GQ_ALLOC.WRITE_TRACKER	Counts the number of GQ write tracker entries that are allocated in the write tracker queue that miss the L3. The GQ write tracker occupancy count is divided by this count to obtain the average L3 write miss latency.	
03H	40H	UNC_GQ_ALLOC.PEER_PROBE_TRACKER	Counts the number of GQ peer probe tracker (snoop) entries that are allocated in the peer probe tracker queue that miss the L3. The GQ peer probe occupancy count is divided by this count to obtain the average L3 peer probe miss latency.	
04H	01H	UNC_GQ_DATA.FROM_QPI	Cycles Global Queue Quickpath Interface input data port is busy importing data from the Quickpath Interface. Each cycle the input port can transfer 8 or 16 bytes of data.	
04H	02H	UNC_GQ_DATA.FROM_QMC	Cycles Global Queue Quickpath Memory Interface input data port is busy importing data from the Quickpath Memory Interface. Each cycle the input port can transfer 8 or 16 bytes of data.	
04H	04H	UNC_GQ_DATA.FROM_L3	Cycles GQ L3 input data port is busy importing data from the Last Level Cache. Each cycle the input port can transfer 32 bytes of data.	
04H	08H	UNC_GQ_DATA.FROM_CORES_02	Cycles GQ Core 0 and 2 input data port is busy importing data from processor cores 0 and 2. Each cycle the input port can transfer 32 bytes of data.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
04H	10H	UNC_GQ_DATA.FROM_CORES_13	Cycles GQ Core 1 and 3 input data port is busy importing data from processor cores 1 and 3. Each cycle the input port can transfer 32 bytes of data.	
05H	01H	UNC_GQ_DATA.TO_QPI_QMC	Cycles GQ QPI and QMC output data port is busy sending data to the Quickpath Interface or Quickpath Memory Interface. Each cycle the output port can transfer 32 bytes of data.	
05H	02H	UNC_GQ_DATA.TO_L3	Cycles GQ L3 output data port is busy sending data to the Last Level Cache. Each cycle the output port can transfer 32 bytes of data.	
05H	04H	UNC_GQ_DATA.TO_CORES	Cycles GQ Core output data port is busy sending data to the Cores. Each cycle the output port can transfer 32 bytes of data.	
06H	01H	UNC_SNP_RESP_TO_LOCAL_HOME.I_STATE	Number of snoop responses to the local home that L3 does not have the referenced cache line.	
06H	02H	UNC_SNP_RESP_TO_LOCAL_HOME.S_STATE	Number of snoop responses to the local home that L3 has the referenced line cached in the S state.	
06H	04H	UNC_SNP_RESP_TO_LOCAL_HOME.FWD_S_STATE	Number of responses to code or data read snoops to the local home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the local home in the S state.	
06H	08H	UNC_SNP_RESP_TO_LOCAL_HOME.FWD_I_STATE	Number of responses to read invalidate snoops to the local home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the local home in the M state.	
06H	10H	UNC_SNP_RESP_TO_LOCAL_HOME.CONFLICT	Number of conflict snoop responses sent to the local home.	
06H	20H	UNC_SNP_RESP_TO_LOCAL_HOME.WB	Number of responses to code or data read snoops to the local home that the L3 has the referenced line cached in the M state.	
07H	01H	UNC_SNP_RESP_TO_REMOTE_HOME.I_STATE	Number of snoop responses to a remote home that L3 does not have the referenced cache line.	
07H	02H	UNC_SNP_RESP_TO_REMOTE_HOME.S_STATE	Number of snoop responses to a remote home that L3 has the referenced line cached in the S state.	
07H	04H	UNC_SNP_RESP_TO_REMOTE_HOME.FWD_S_STATE	Number of responses to code or data read snoops to a remote home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the remote home in the S state.	
07H	08H	UNC_SNP_RESP_TO_REMOTE_HOME.FWD_I_STATE	Number of responses to read invalidate snoops to a remote home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the remote home in the M state.	
07H	10H	UNC_SNP_RESP_TO_REMOTE_HOME.CONFLICT	Number of conflict snoop responses sent to the local home.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
07H	20H	UNC_SNP_RESP_TO_REMOTE_HOME.WB	Number of responses to code or data read snoops to a remote home that the L3 has the referenced line cached in the M state.	
07H	24H	UNC_SNP_RESP_TO_REMOTE_HOME.HITM	Number of HITM snoop responses to a remote home.	
08H	01H	UNC_L3_HITS.READ	Number of code read, data read and RFO requests that hit in the L3.	
08H	02H	UNC_L3_HITS.WRITE	Number of writeback requests that hit in the L3. Writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.	
08H	04H	UNC_L3_HITS.PROBE	Number of snoops from IOH or remote sockets that hit in the L3.	
08H	03H	UNC_L3_HITS.ANY	Number of reads and writes that hit the L3.	
09H	01H	UNC_L3_MISS.READ	Number of code read, data read and RFO requests that miss the L3.	
09H	02H	UNC_L3_MISS.WRITE	Number of writeback requests that miss the L3. Should always be zero as writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.	
09H	04H	UNC_L3_MISS.PROBE	Number of snoops from IOH or remote sockets that miss the L3.	
09H	03H	UNC_L3_MISS.ANY	Number of reads and writes that miss the L3.	
0AH	01H	UNC_L3_LINES_IN.M_STATE	Counts the number of L3 lines allocated in M state. The only time a cache line is allocated in the M state is when the line was forwarded in M state is forwarded due to a Snoop Read Invalidate Own request.	
0AH	02H	UNC_L3_LINES_IN.E_STATE	Counts the number of L3 lines allocated in E state.	
0AH	04H	UNC_L3_LINES_IN.S_STATE	Counts the number of L3 lines allocated in S state.	
0AH	08H	UNC_L3_LINES_IN.F_STATE	Counts the number of L3 lines allocated in F state.	
0AH	0FH	UNC_L3_LINES_IN.ANY	Counts the number of L3 lines allocated in any state.	
0BH	01H	UNC_L3_LINES_OUT.M_STATE	Counts the number of L3 lines victimized that were in the M state. When the victim cache line is in M state, the line is written to its home cache agent which can be either local or remote.	
0BH	02H	UNC_L3_LINES_OUT.E_STATE	Counts the number of L3 lines victimized that were in the E state.	
0BH	04H	UNC_L3_LINES_OUT.S_STATE	Counts the number of L3 lines victimized that were in the S state.	
0BH	08H	UNC_L3_LINES_OUT.I_STATE	Counts the number of L3 lines victimized that were in the I state.	
0BH	10H	UNC_L3_LINES_OUT.F_STATE	Counts the number of L3 lines victimized that were in the F state.	
0BH	1FH	UNC_L3_LINES_OUT.ANY	Counts the number of L3 lines victimized in any state.	
0CH	01H	UNC_GQ_SNOOP.GOTO_S	Counts the number of remote snoops that have requested a cache line be set to the S state.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0CH	02H	UNC_GQ_SNOOP.GOTO_I	Counts the number of remote snoops that have requested a cache line be set to the I state.	
0CH	04H	UNC_GQ_SNOOP.GOTO_S_HIT_E	Counts the number of remote snoops that have requested a cache line be set to the S state from E state.	Requires writing MSR 301H with mask = 2H.
0CH	04H	UNC_GQ_SNOOP.GOTO_S_HIT_F	Counts the number of remote snoops that have requested a cache line be set to the S state from F (forward) state.	Requires writing MSR 301H with mask = 8H.
0CH	04H	UNC_GQ_SNOOP.GOTO_S_HIT_M	Counts the number of remote snoops that have requested a cache line be set to the S state from M state.	Requires writing MSR 301H with mask = 1H.
0CH	04H	UNC_GQ_SNOOP.GOTO_S_HIT_S	Counts the number of remote snoops that have requested a cache line be set to the S state from S state.	Requires writing MSR 301H with mask = 4H.
0CH	08H	UNC_GQ_SNOOP.GOTO_I_HIT_E	Counts the number of remote snoops that have requested a cache line be set to the I state from E state.	Requires writing MSR 301H with mask = 2H.
0CH	08H	UNC_GQ_SNOOP.GOTO_I_HIT_F	Counts the number of remote snoops that have requested a cache line be set to the I state from F (forward) state.	Requires writing MSR 301H with mask = 8H.
0CH	08H	UNC_GQ_SNOOP.GOTO_I_HIT_M	Counts the number of remote snoops that have requested a cache line be set to the I state from M state.	Requires writing MSR 301H with mask = 1H.
0CH	08H	UNC_GQ_SNOOP.GOTO_I_HIT_S	Counts the number of remote snoops that have requested a cache line be set to the I state from S state.	Requires writing MSR 301H with mask = 4H.
20H	01H	UNC_QHL_REQUESTS.IOH_READS	Counts number of Quickpath Home Logic read requests from the IOH.	
20H	02H	UNC_QHL_REQUESTS.IOH_WRITES	Counts number of Quickpath Home Logic write requests from the IOH.	
20H	04H	UNC_QHL_REQUESTS.REMOTE_READS	Counts number of Quickpath Home Logic read requests from a remote socket.	
20H	08H	UNC_QHL_REQUESTS.REMOTE_WRITES	Counts number of Quickpath Home Logic write requests from a remote socket.	
20H	10H	UNC_QHL_REQUESTS.LOCAL_READS	Counts number of Quickpath Home Logic read requests from the local socket.	
20H	20H	UNC_QHL_REQUESTS.LOCAL_WRITES	Counts number of Quickpath Home Logic write requests from the local socket.	
21H	01H	UNC_QHL_CYCLES_FULL.IOH	Counts uclk cycles all entries in the Quickpath Home Logic IOH are full.	
21H	02H	UNC_QHL_CYCLES_FULL.REMOTE	Counts uclk cycles all entries in the Quickpath Home Logic remote tracker are full.	
21H	04H	UNC_QHL_CYCLES_FULL.LOCAL	Counts uclk cycles all entries in the Quickpath Home Logic local tracker are full.	
22H	01H	UNC_QHL_CYCLES_NOT_EMPTY.IOH	Counts uclk cycles all entries in the Quickpath Home Logic IOH is busy.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
22H	02H	UNC_QHL_CYCLES_NOT_EMPTY.REMOTE	Counts uclk cycles all entries in the Quickpath Home Logic remote tracker is busy.	
22H	04H	UNC_QHL_CYCLES_NOT_EMPTY.LOCAL	Counts uclk cycles all entries in the Quickpath Home Logic local tracker is busy.	
23H	01H	UNC_QHL_OCCUPANCY.IOH	QHL IOH tracker allocate to deallocate read occupancy.	
23H	02H	UNC_QHL_OCCUPANCY.REMOTE	QHL remote tracker allocate to deallocate read occupancy.	
23H	04H	UNC_QHL_OCCUPANCY.LOCAL	QHL local tracker allocate to deallocate read occupancy.	
24H	02H	UNC_QHL_ADDRESS_CONFLICTS.2WAY	Counts number of QHL Active Address Table (AAT) entries that saw a max of 2 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates.	
24H	04H	UNC_QHL_ADDRESS_CONFLICTS.3WAY	Counts number of QHL Active Address Table (AAT) entries that saw a max of 3 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates.	
25H	01H	UNC_QHL_CONFLICT_CYCLES.IOH	Counts cycles the Quickpath Home Logic IOH Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
25H	02H	UNC_QHL_CONFLICT_CYCLES.REMOTE	Counts cycles the Quickpath Home Logic Remote Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
25H	04H	UNC_QHL_CONFLICT_CYCLES.LOCAL	Counts cycles the Quickpath Home Logic Local Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
26H	01H	UNC_QHL_TO_QMC_BYPASS	Counts number or requests to the Quickpath Memory Controller that bypass the Quickpath Home Logic. All local accesses can be bypassed. For remote requests, only read requests can be bypassed.	
28H	01H	UNC_QMC_ISOC_FULL.READ.CH0	Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous read requests.	
28H	02H	UNC_QMC_ISOC_FULL.READ.CH1	Counts cycles all the entries in the DRAM channel 1high priority queue are occupied with isochronous read requests.	
28H	04H	UNC_QMC_ISOC_FULL.READ.CH2	Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous read requests.	
28H	08H	UNC_QMC_ISOC_FULL.WRITE.CH0	Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous write requests.	
28H	10H	UNC_QMC_ISOC_FULL.WRITE.CH1	Counts cycles all the entries in the DRAM channel 1 high priority queue are occupied with isochronous write requests.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
28H	20H	UNC_QMC_ISOC_FULL.WRITE.CH2	Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous write requests.	
29H	01H	UNC_QMC_BUSY.READ.CH0	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 0.	
29H	02H	UNC_QMC_BUSY.READ.CH1	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 1.	
29H	04H	UNC_QMC_BUSY.READ.CH2	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 2.	
29H	08H	UNC_QMC_BUSY.WRITE.CH0	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 0.	
29H	10H	UNC_QMC_BUSY.WRITE.CH1	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 1.	
29H	20H	UNC_QMC_BUSY.WRITE.CH2	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 2.	
2AH	01H	UNC_QMC_OCCUPANCY.CH0	IMC channel 0 normal read request occupancy.	
2AH	02H	UNC_QMC_OCCUPANCY.CH1	IMC channel 1 normal read request occupancy.	
2AH	04H	UNC_QMC_OCCUPANCY.CH2	IMC channel 2 normal read request occupancy.	
2AH	07H	UNC_QMC_OCCUPANCY.ANY	Normal read request occupancy for any channel.	
2BH	01H	UNC_QMC_ISSOC_OCCUPANCY.CH0	IMC channel 0 issoc read request occupancy.	
2BH	02H	UNC_QMC_ISSOC_OCCUPANCY.CH1	IMC channel 1 issoc read request occupancy.	
2BH	04H	UNC_QMC_ISSOC_OCCUPANCY.CH2	IMC channel 2 issoc read request occupancy.	
2BH	07H	UNC_QMC_ISSOC_READS.ANY	IMC issoc read request occupancy.	
2CH	01H	UNC_QMC_NORMAL_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 medium and low priority read requests. The QMC channel 0 normal read occupancy divided by this count provides the average QMC channel 0 read latency.	
2CH	02H	UNC_QMC_NORMAL_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 medium and low priority read requests. The QMC channel 1 normal read occupancy divided by this count provides the average QMC channel 1 read latency.	
2CH	04H	UNC_QMC_NORMAL_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 medium and low priority read requests. The QMC channel 2 normal read occupancy divided by this count provides the average QMC channel 2 read latency.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
2CH	07H	UNC_QMC_NORMAL_READS.ANY	Counts the number of Quickpath Memory Controller medium and low priority read requests. The QMC normal read occupancy divided by this count provides the average QMC read latency.	
2DH	01H	UNC_QMC_HIGH_PRIORITY_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 high priority isochronous read requests.	
2DH	02H	UNC_QMC_HIGH_PRIORITY_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 high priority isochronous read requests.	
2DH	04H	UNC_QMC_HIGH_PRIORITY_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 high priority isochronous read requests.	
2DH	07H	UNC_QMC_HIGH_PRIORITY_READS.ANY	Counts the number of Quickpath Memory Controller high priority isochronous read requests.	
2EH	01H	UNC_QMC_CRITICAL_PRIORITY_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 critical priority isochronous read requests.	
2EH	02H	UNC_QMC_CRITICAL_PRIORITY_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 critical priority isochronous read requests.	
2EH	04H	UNC_QMC_CRITICAL_PRIORITY_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 critical priority isochronous read requests.	
2EH	07H	UNC_QMC_CRITICAL_PRIORITY_READS.ANY	Counts the number of Quickpath Memory Controller critical priority isochronous read requests.	
2FH	01H	UNC_QMC_WRITES.FULL.CH0	Counts number of full cache line writes to DRAM channel 0.	
2FH	02H	UNC_QMC_WRITES.FULL.CH1	Counts number of full cache line writes to DRAM channel 1.	
2FH	04H	UNC_QMC_WRITES.FULL.CH2	Counts number of full cache line writes to DRAM channel 2.	
2FH	07H	UNC_QMC_WRITES.FULL.ANY	Counts number of full cache line writes to DRAM.	
2FH	08H	UNC_QMC_WRITES.PARTIAL.CH0	Counts number of partial cache line writes to DRAM channel 0.	
2FH	10H	UNC_QMC_WRITES.PARTIAL.CH1	Counts number of partial cache line writes to DRAM channel 1.	
2FH	20H	UNC_QMC_WRITES.PARTIAL.CH2	Counts number of partial cache line writes to DRAM channel 2.	
2FH	38H	UNC_QMC_WRITES.PARTIAL.ANY	Counts number of partial cache line writes to DRAM.	
30H	01H	UNC_QMC_CANCEL.CH0	Counts number of DRAM channel 0 cancel requests.	
30H	02H	UNC_QMC_CANCEL.CH1	Counts number of DRAM channel 1 cancel requests.	
30H	04H	UNC_QMC_CANCEL.CH2	Counts number of DRAM channel 2 cancel requests.	
30H	07H	UNC_QMC_CANCEL.ANY	Counts number of DRAM cancel requests.	
31H	01H	UNC_QMC_PRIORITY_UPDATES.CH0	Counts number of DRAM channel 0 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
31H	02H	UNC_QMC_PRIORITY_UPDATES.CH1	Counts number of DRAM channel 1 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	04H	UNC_QMC_PRIORITY_UPDATES.CH2	Counts number of DRAM channel 2 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	07H	UNC_QMC_PRIORITY_UPDATES.ANY	Counts number of DRAM priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
32H	01H	UNC_IMC_RETRY.CH0	Counts number of IMC DRAM channel 0 retries. DRAM retry only occurs when configured in RAS mode.	
32H	02H	UNC_IMC_RETRY.CH1	Counts number of IMC DRAM channel 1 retries. DRAM retry only occurs when configured in RAS mode.	
32H	04H	UNC_IMC_RETRY.CH2	Counts number of IMC DRAM channel 2 retries. DRAM retry only occurs when configured in RAS mode.	
32H	07H	UNC_IMC_RETRY.ANY	Counts number of IMC DRAM retries from any channel. DRAM retry only occurs when configured in RAS mode.	
33H	01H	UNC_QHL_FRC_ACK_CNFLTS.IOH	Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the IOH.	
33H	02H	UNC_QHL_FRC_ACK_CNFLTS.REMOTE	Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the remote home.	
33H	04H	UNC_QHL_FRC_ACK_CNFLTS.LOCAL	Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the local home.	
33H	07H	UNC_QHL_FRC_ACK_CNFLTS.ANY	Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic.	
34H	01H	UNC_QHL_SLEEPS.IOH_ORDER	Counts number of occurrences a request was put to sleep due to IOH ordering (write after read) conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	
34H	02H	UNC_QHL_SLEEPS.REMOTE_ORDER	Counts number of occurrences a request was put to sleep due to remote socket ordering (write after read) conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	
34H	04H	UNC_QHL_SLEEPS.LOCAL_ORDER	Counts number of occurrences a request was put to sleep due to local socket ordering (write after read) conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
34H	08H	UNC_QHL_SLEEPS.IOH_CONFLICT	Counts number of occurrences a request was put to sleep due to IOH address conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	
34H	10H	UNC_QHL_SLEEPS.REMOTE_CONFLICT	Counts number of occurrences a request was put to sleep due to remote socket address conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	
34H	20H	UNC_QHL_SLEEPS.LOCAL_CONFLICT	Counts number of occurrences a request was put to sleep due to local socket address conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	
35H	01H	UNC_ADDR_OPCODE_MATCH.IOH	Counts number of requests from the IOH, address/opcode of request is qualified by mask value written to MSR 396H. The following mask values are supported: 0: NONE 40000000_00000000H:RSPFWDI 40001A00_00000000H:RSPFWDS 40001D00_00000000H:RSPIWB	Match opcode/address by writing MSR 396H with mask supported mask value.
35H	02H	UNC_ADDR_OPCODE_MATCH.REMOTE	Counts number of requests from the remote socket, address/opcode of request is qualified by mask value written to MSR 396H. The following mask values are supported: 0: NONE 40000000_00000000H:RSPFWDI 40001A00_00000000H:RSPFWDS 40001D00_00000000H:RSPIWB	Match opcode/address by writing MSR 396H with mask supported mask value.
35H	04H	UNC_ADDR_OPCODE_MATCH.LOCAL	Counts number of requests from the local socket, address/opcode of request is qualified by mask value written to MSR 396H. The following mask values are supported: 0: NONE 40000000_00000000H:RSPFWDI 40001A00_00000000H:RSPFWDS 40001D00_00000000H:RSPIWB	Match opcode/address by writing MSR 396H with mask supported mask value.
40H	01H	UNC_QPI_TX_STALLED_SINGLE_FLIT.HOME.LINK_0	Counts cycles the Quickpath outbound link 0 HOME virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	02H	UNC_QPI_TX_STALLED_SINGLE_FLIT.SNOOP.LINK_0	Counts cycles the Quickpath outbound link 0 SNOOP virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
40H	04H	UNC_QPI_TX_STALLED_SINGLE_FLIT.NDR.LINK_0	Counts cycles the Quickpath outbound link 0 non-data response virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	08H	UNC_QPI_TX_STALLED_SINGLE_FLIT.HOME.LINK_1	Counts cycles the Quickpath outbound link 1 HOME virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	10H	UNC_QPI_TX_STALLED_SINGLE_FLIT.SNOOP.LINK_1	Counts cycles the Quickpath outbound link 1 SNOOP virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	20H	UNC_QPI_TX_STALLED_SINGLE_FLIT.NDR.LINK_1	Counts cycles the Quickpath outbound link 1 non-data response virtual channel is stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	07H	UNC_QPI_TX_STALLED_SINGLE_FLIT.LINK_0	Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	38H	UNC_QPI_TX_STALLED_SINGLE_FLIT.LINK_1	Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of a VNA and VN0 credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	01H	UNC_QPI_TX_STALLED_MULTI_FLIT.DRS.LINK_0	Counts cycles the Quickpath outbound link 0 Data Response virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	02H	UNC_QPI_TX_STALLED_MULTI_FLIT.NCB.LINK_0	Counts cycles the Quickpath outbound link 0 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	04H	UNC_QPI_TX_STALLED_MULTI_FLIT.NCS.LINK_0	Counts cycles the Quickpath outbound link 0 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
41H	08H	UNC_QPI_TX_STALLED_MULTI_FLIT.DRS.LINK_1	Counts cycles the Quickpath outbound link 1 Data Response virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	10H	UNC_QPI_TX_STALLED_MULTI_FLIT.NCB.LINK_1	Counts cycles the Quickpath outbound link 1 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	20H	UNC_QPI_TX_STALLED_MULTI_FLIT.NCS.LINK_1	Counts cycles the Quickpath outbound link 1 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	07H	UNC_QPI_TX_STALLED_MULTI_FLIT.LINK_0	Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	38H	UNC_QPI_TX_STALLED_MULTI_FLIT.LINK_1	Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of VNA and VN0 credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
42H	01H	UNC_QPI_TX_HEADER.FULL.LINK_0	Number of cycles that the header buffer in the Quickpath Interface outbound link 0 is full.	
42H	02H	UNC_QPI_TX_HEADER.BUSY.LINK_0	Number of cycles that the header buffer in the Quickpath Interface outbound link 0 is busy.	
42H	04H	UNC_QPI_TX_HEADER.FULL.LINK_1	Number of cycles that the header buffer in the Quickpath Interface outbound link 1 is full.	
42H	08H	UNC_QPI_TX_HEADER.BUSY.LINK_1	Number of cycles that the header buffer in the Quickpath Interface outbound link 1 is busy.	
43H	01H	UNC_QPI_RX_NO_PPT_CREDIT.STALLS.LINK_0	Number of cycles that snoop packets incoming to the Quickpath Interface link 0 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.	
43H	02H	UNC_QPI_RX_NO_PPT_CREDIT.STALLS.LINK_1	Number of cycles that snoop packets incoming to the Quickpath Interface link 1 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.	
60H	01H	UNC_DRAM_OPEN.CH0	Counts number of DRAM Channel 0 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
60H	02H	UNC_DRAM_OPEN.CH1	Counts number of DRAM Channel 1 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	
60H	04H	UNC_DRAM_OPEN.CH2	Counts number of DRAM Channel 2 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	
61H	01H	UNC_DRAM_PAGE_CLOSE.CH0	DRAM channel 0 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	
61H	02H	UNC_DRAM_PAGE_CLOSE.CH1	DRAM channel 1 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	
61H	04H	UNC_DRAM_PAGE_CLOSE.CH2	DRAM channel 2 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	
62H	01H	UNC_DRAM_PAGE_MISS.CH0	Counts the number of precharges (PRE) that were issued to DRAM channel 0 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
62H	02H	UNC_DRAM_PAGE_MISS.CH1	Counts the number of precharges (PRE) that were issued to DRAM channel 1 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
62H	04H	UNC_DRAM_PAGE_MISS.CH2	Counts the number of precharges (PRE) that were issued to DRAM channel 2 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
63H	01H	UNC_DRAM_READ_CAS.CH0	Counts the number of times a read CAS command was issued on DRAM channel 0.	
63H	02H	UNC_DRAM_READ_CAS.AUTOPRE_CH0	Counts the number of times a read CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.	
63H	04H	UNC_DRAM_READ_CAS.CH1	Counts the number of times a read CAS command was issued on DRAM channel 1.	
63H	08H	UNC_DRAM_READ_CAS.AUTOPRE_CH1	Counts the number of times a read CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.	
63H	10H	UNC_DRAM_READ_CAS.CH2	Counts the number of times a read CAS command was issued on DRAM channel 2.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
63H	20H	UNC_DRAM_READ_CAS.AUTO PRE_CH2	Counts the number of times a read CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.	
64H	01H	UNC_DRAM_WRITE_CAS.CH0	Counts the number of times a write CAS command was issued on DRAM channel 0.	
64H	02H	UNC_DRAM_WRITE_CAS.AUTO PRE_CH0	Counts the number of times a write CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.	
64H	04H	UNC_DRAM_WRITE_CAS.CH1	Counts the number of times a write CAS command was issued on DRAM channel 1.	
64H	08H	UNC_DRAM_WRITE_CAS.AUTO PRE_CH1	Counts the number of times a write CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.	
64H	10H	UNC_DRAM_WRITE_CAS.CH2	Counts the number of times a write CAS command was issued on DRAM channel 2.	
64H	20H	UNC_DRAM_WRITE_CAS.AUTO PRE_CH2	Counts the number of times a write CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.	
65H	01H	UNC_DRAM_REFRESH.CH0	Counts number of DRAM channel 0 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
65H	02H	UNC_DRAM_REFRESH.CH1	Counts number of DRAM channel 1 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
65H	04H	UNC_DRAM_REFRESH.CH2	Counts number of DRAM channel 2 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
66H	01H	UNC_DRAM_PRE_ALL.CH0	Counts number of DRAM Channel 0 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	
66H	02H	UNC_DRAM_PRE_ALL.CH1	Counts number of DRAM Channel 1 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	
66H	04H	UNC_DRAM_PRE_ALL.CH2	Counts number of DRAM Channel 2 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	
67H	01H	UNC_DRAM_THERMAL_THROT TLED	Uncore cycles DRAM was throttled due to its temperature being above the thermal throttling threshold.	
80H	01H	UNC_THERMAL_THROTTLING_ TEMP.CORE_0	Cycles that the PCU records that core 0 is above the thermal throttling threshold temperature.	

Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
80H	02H	UNC_THERMAL_THROTTLING_TEMP.CORE_1	Cycles that the PCU records that core 1 is above the thermal throttling threshold temperature.	
80H	04H	UNC_THERMAL_THROTTLING_TEMP.CORE_2	Cycles that the PCU records that core 2 is above the thermal throttling threshold temperature.	
80H	08H	UNC_THERMAL_THROTTLING_TEMP.CORE_3	Cycles that the PCU records that core 3 is above the thermal throttling threshold temperature.	
81H	01H	UNC_THERMAL_THROTTLED_TEMP.CORE_0	Cycles that the PCU records that core 0 is in the power throttled state due to core's temperature being above the thermal throttling threshold.	
81H	02H	UNC_THERMAL_THROTTLED_TEMP.CORE_1	Cycles that the PCU records that core 1 is in the power throttled state due to core's temperature being above the thermal throttling threshold.	
81H	04H	UNC_THERMAL_THROTTLED_TEMP.CORE_2	Cycles that the PCU records that core 2 is in the power throttled state due to core's temperature being above the thermal throttling threshold.	
81H	08H	UNC_THERMAL_THROTTLED_TEMP.CORE_3	Cycles that the PCU records that core 3 is in the power throttled state due to core's temperature being above the thermal throttling threshold.	
82H	01H	UNC_PROCHOT_ASSERTION	Number of system assertions of PROCHOT indicating the entire processor has exceeded the thermal limit.	
83H	01H	UNC_THERMAL_THROTTLING_PROCHOT.CORE_0	Cycles that the PCU records that core 0 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit.	
83H	02H	UNC_THERMAL_THROTTLING_PROCHOT.CORE_1	Cycles that the PCU records that core 1 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit.	
83H	04H	UNC_THERMAL_THROTTLING_PROCHOT.CORE_2	Cycles that the PCU records that core 2 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit.	
83H	08H	UNC_THERMAL_THROTTLING_PROCHOT.CORE_3	Cycles that the PCU records that core 3 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit.	
84H	01H	UNC_TURBO_MODE.CORE_0	Uncore cycles that core 0 is operating in turbo mode.	
84H	02H	UNC_TURBO_MODE.CORE_1	Uncore cycles that core 1 is operating in turbo mode.	
84H	04H	UNC_TURBO_MODE.CORE_2	Uncore cycles that core 2 is operating in turbo mode.	
84H	08H	UNC_TURBO_MODE.CORE_3	Uncore cycles that core 3 is operating in turbo mode.	
85H	02H	UNC_CYCLES_UNHALTED_L3_FLL_ENABLE	Uncore cycles that at least one core is unhalted and all L3 ways are enabled.	
86H	01H	UNC_CYCLES_UNHALTED_L3_FLL_DISABLE	Uncore cycles that at least one core is unhalted and all L3 ways are disabled.	

19.11 PERFORMANCE MONITORING EVENTS FOR INTEL® XEON® PROCESSOR 5200, 5400 SERIES AND INTEL® CORE™2 EXTREME PROCESSORS QX 9000 SERIES

Processors based on the Enhanced Intel Core microarchitecture support the architectural and model-specific performance monitoring events listed in Table 19-1 and Table 19-25. In addition, they also support the following model-specific performance monitoring events listed in Table 19-23. Fixed counters support the architecture events defined in Table 19-24.

Table 19-23. Performance Events for Processors Based on Enhanced Intel Core Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C0H	08H	INST_RETIRED.VM_HOST	Instruction retired while in VMX root operations.	
D2H	10H	RAT_STAALS.OTHER_SERIALIZATION_STALLS	This event counts the number of stalls due to other RAT resource serialization not counted by Umask value 0FH.	

19.12 PERFORMANCE MONITORING EVENTS FOR INTEL® XEON® PROCESSOR 3000, 3200, 5100, 5300 SERIES AND INTEL® CORE™2 DUO PROCESSORS

Processors based on the Intel® Core™ microarchitecture support architectural and model-specific performance monitoring events.

Fixed-function performance counters are introduced first on processors based on Intel Core microarchitecture. Table 19-24 lists pre-defined performance events that can be counted using fixed-function performance counters.

Table 19-24. Fixed-Function Performance Counter and Pre-defined Performance Events

Fixed-Function Performance Counter	Address	Event Mask Mnemonic	Description
MSR_PERF_FIXED_CTR0/IA32_PERF_FIXED_CTR0	309H	Inst_Retired.Any	This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers.
MSR_PERF_FIXED_CTR1/IA32_PERF_FIXED_CTR1	30AH	CPU_CLK_UNHALTED.CORE	This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios. The core frequency may change from time to time due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason this event may have a changing ratio with regards to time. When the core frequency is constant, this event can approximate elapsed time while the core was not in halt state.
MSR_PERF_FIXED_CTR2/IA32_PERF_FIXED_CTR2	30BH	CPU_CLK_UNHALTED.REF	This event counts the number of reference cycles when the core is not in a halt state and not in a TM stop-clock state. The core enters the halt state when it is running the HLT instruction or the MWAIT instruction.

Table 19-24. Fixed-Function Performance Counter and Pre-defined Performance Events (Contd.)

Fixed-Function Performance Counter	Address	Event Mask Mnemonic	Description
			This event is not affected by core frequency changes (e.g., P states) but counts at the same frequency as the time stamp counter. This event can approximate elapsed time while the core was not in halt state and not in a TM stop-clock state. This event has a constant ratio with the CPU_CLK_UNHALTED.BUS event.

Table 19-25 lists general-purpose model-specific performance monitoring events supported in processors based on Intel® Core™ microarchitecture. For convenience, Table 19-25 also includes architectural events and describes minor model-specific behavior where applicable. Software must use a general-purpose performance counter to count events listed in Table 19-25.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture

Event Num	Umask Value	Event Name	Definition	Description and Comment
03H	02H	LOAD_BLOCK.STA	Loads blocked by a preceding store with unknown address.	This event indicates that loads are blocked by preceding stores. A load is blocked when there is a preceding store to an address that is not yet calculated. The number of events is greater or equal to the number of load operations that were blocked. If the load and the store are always to different addresses, check why the memory disambiguation mechanism is not working. To avoid such blocks, increase the distance between the store and the following load so that the store address is known at the time the load is dispatched.
03H	04H	LOAD_BLOCK.STD	Loads blocked by a preceding store with unknown data.	This event indicates that loads are blocked by preceding stores. A load is blocked when there is a preceding store to the same address and the stored data value is not yet known. The number of events is greater or equal to the number of load operations that were blocked. To avoid such blocks, increase the distance between the store and the dependent load, so that the store data is known at the time the load is dispatched.
03H	08H	LOAD_BLOCK. OVERLAP_STORE	Loads that partially overlap an earlier store, or 4-Kbyte aliased with a previous store.	This event indicates that loads are blocked due to a variety of reasons. Some of the triggers for this event are when a load is blocked by a preceding store, in one of the following: ▪ Some of the loaded byte locations are written by the preceding store and some are not. ▪ The load is from bytes written by the preceding store, the store is aligned to its size and either: ▪ The load's data size is one or two bytes and it is not aligned to the store. ▪ The load's data size is of four or eight bytes and the load is misaligned.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
				▪ The load is from bytes written by the preceding store, the store is misaligned and the load is not aligned on the beginning of the store. ▪ The load is split over an eight byte boundary (excluding 16-byte loads). ▪ The load and store have the same offset relative to the beginning of different 4-KByte pages. This case is also called 4-KByte aliasing. ▪ In all these cases the load is blocked until after the blocking store retires and the stored data is committed to the cache hierarchy.
03H	10H	LOAD_BLOCK. UNTIL_RETIRE	Loads blocked until retirement.	This event indicates that load operations were blocked until retirement. The number of events is greater or equal to the number of load operations that were blocked. This includes mainly uncacheable loads and split loads (loads that cross the cache line boundary) but may include other cases where loads are blocked until retirement.
03H	20H	LOAD_BLOCK.L1D	Loads blocked by the L1 data cache.	This event indicates that loads are blocked due to one or more reasons. Some triggers for this event are: ▪ The number of L1 data cache misses exceeds the maximum number of outstanding misses supported by the processor. This includes misses generated as result of demand fetches, software prefetches or hardware prefetches. ▪ Cache line split loads. ▪ Partial reads, such as reads to un-cacheable memory, I/O instructions and more. ▪ A locked load operation is in progress. The number of events is greater or equal to the number of load operations that were blocked.
04H	01H	SB_DRAIN_ CYCLES	Cycles while stores are blocked due to store buffer drain.	This event counts every cycle during which the store buffer is draining. This includes: ▪ Serializing operations such as CPUID ▪ Synchronizing operations such as XCHG ▪ Interrupt acknowledgment ▪ Other conditions, such as cache flushing
04H	02H	STORE_BLOCK. ORDER	Cycles while store is waiting for a preceding store to be globally observed.	This event counts the total duration, in number of cycles, which stores are waiting for a preceding stored cache line to be observed by other cores. This situation happens as a result of the strong store ordering behavior, as defined in "Memory Ordering," Chapter 8, *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*. The stall may occur and be noticeable if there are many cases when a store either misses the L1 data cache or hits a cache line in the Shared state. If the store requires a bus transaction to read the cache line then the stall ends when snoop response for the bus transaction arrives.
04H	08H	STORE_BLOCK. SNOOP	A store is blocked due to a conflict with an external or internal snoop.	This event counts the number of cycles the store port was used for snooping the L1 data cache and a store was stalled by the snoop. The store is typically resubmitted one cycle later.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
06H	00H	SEGMENT_REG_ LOADS	Number of segment register loads.	This event counts the number of segment register load operations. Instructions that load new values into segment registers cause a penalty. This event indicates performance issues in 16-bit code. If this event occurs frequently, it may be useful to calculate the number of instructions retired per segment register load. If the resulting calculation is low (on average a small number of instructions are executed between segment register loads), then the code's segment register usage should be optimized. As a result of branch misprediction, this event is speculative and may include segment register loads that do not actually occur. However, most segment register loads are internally serialized and such speculative effects are minimized.
07H	00H	SSE_PRE_EXEC. NTA	Streaming SIMD Extensions (SSE) Prefetch NTA instructions executed.	This event counts the number of times the SSE instruction prefetchNTA is executed. This instruction prefetches the data to the L1 data cache.
07H	01H	SSE_PRE_EXEC.L1	Streaming SIMD Extensions (SSE) PrefetchT0 instructions executed.	This event counts the number of times the SSE instruction prefetchT0 is executed. This instruction prefetches the data to the L1 data cache and L2 cache.
07H	02H	SSE_PRE_EXEC.L2	Streaming SIMD Extensions (SSE) PrefetchT1 and PrefetchT2 instructions executed.	This event counts the number of times the SSE instructions prefetchT1 and prefetchT2 are executed. These instructions prefetch the data to the L2 cache.
07H	03H	SSE_PRE_ EXEC.STORES	Streaming SIMD Extensions (SSE) Weakly-ordered store instructions executed.	This event counts the number of times SSE non-temporal store instructions are executed.
08H	01H	DTLB_MISSES. ANY	Memory accesses that missed the DTLB.	This event counts the number of Data Table Lookaside Buffer (DTLB) misses. The count includes misses detected as a result of speculative accesses. Typically a high count for this event indicates that the code accesses a large number of data pages.
08H	02H	DTLB_MISSES .MISS_LD	DTLB misses due to load operations.	This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to load operations. This count includes misses detected as a result of speculative accesses.
08H	04H	DTLB_MISSES.L0_MISS_LD	L0 DTLB misses due to load operations.	This event counts the number of level 0 Data Table Lookaside Buffer (DTLB0) misses due to load operations. This count includes misses detected as a result of speculative accesses. Loads that miss that DTLB0 and hit the DTLB1 can incur two-cycle penalty.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
08H	08H	DTLB_MISSES. MISS_ST	TLB misses due to store operations.	This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to store operations. This count includes misses detected as a result of speculative accesses. Address translation for store operations is performed in the DTLB1.
09H	01H	MEMORY_ DISAMBIGUATION.RESET	Memory disambiguation reset cycles.	This event counts the number of cycles during which memory disambiguation misprediction occurs. As a result the execution pipeline is cleaned and execution of the mispredicted load instruction and all succeeding instructions restarts. This event occurs when the data address accessed by a load instruction, collides infrequently with preceding stores, but usually there is no collision. It happens rarely, and may have a penalty of about 20 cycles.
09H	02H	MEMORY_DISAMBIGUATIO N.SUCCESS	Number of loads successfully disambiguated.	This event counts the number of load operations that were successfully disambiguated. Loads are preceded by a store with an unknown address, but they are not blocked.
0CH	01H	PAGE_WALKS .COUNT	Number of page-walks executed.	This event counts the number of page-walks executed due to either a DTLB or ITLB miss. The page walk duration, PAGE_WALKS.CYCLES, divided by number of page walks is the average duration of a page walk. The average can hint whether most of the page-walks are satisfied by the caches or cause an L2 cache miss.
0CH	02H	PAGE_WALKS. CYCLES	Duration of page-walks in core cycles.	This event counts the duration of page-walks in core cycles. The paging mode in use typically affects the duration of page walks. Page walk duration divided by number of page walks is the average duration of page-walks. The average can hint at whether most of the page-walks are satisfied by the caches or cause an L2 cache miss.
10H	00H	FP_COMP_OPS _EXE	Floating point computational micro-ops executed.	This event counts the number of floating point computational micro-ops executed. Use IA32_PMC0 only.
11H	00H	FP_ASSIST	Floating point assists.	This event counts the number of floating point operations executed that required micro-code assist intervention. Assists are required in the following cases: ▪ Streaming SIMD Extensions (SSE) instructions: ▪ Denormal input when the DAZ (Denormals Are Zeros) flag is off ▪ Underflow result when the FTZ (Flush To Zero) flag is off ▪ X87 instructions: ▪ NaN or denormal are loaded to a register or used as input from memory ▪ Division by 0 ▪ Underflow output Use IA32_PMC1 only.
12H	00H	MUL	Multiply operations executed.	This event counts the number of multiply operations executed. This includes integer as well as floating point multiply operations. Use IA32_PMC1 only.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
13H	00H	DIV	Divide operations executed.	This event counts the number of divide operations executed. This includes integer divides, floating point divides and square-root operations executed. Use IA32_PMC1 only.
14H	00H	CYCLES_DIV _BUSY	Cycles the divider busy.	This event counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE. Use IA32_PMC0 only.
18H	00H	IDLE_DURING _DIV	Cycles the divider is busy and all other execution units are idle.	This event counts the number of cycles the divider is busy (with a divide or a square root operation) and no other execution unit or load operation is in progress. Load operations are assumed to hit the L1 data cache. This event considers only micro-ops dispatched after the divider started operating. Use IA32_PMC0 only.
19H	00H	DELAYED_ BYPASS.FP	Delayed bypass to FP operation.	This event counts the number of times floating point operations use data immediately after the data was generated by a non-floating point execution unit. Such cases result in one penalty cycle due to data bypass between the units. Use IA32_PMC1 only.
19H	01H	DELAYED_ BYPASS.SIMD	Delayed bypass to SIMD operation.	This event counts the number of times SIMD operations use data immediately after the data was generated by a non-SIMD execution unit. Such cases result in one penalty cycle due to data bypass between the units. Use IA32_PMC1 only.
19H	02H	DELAYED_ BYPASS.LOAD	Delayed bypass to load operation.	This event counts the number of delayed bypass penalty cycles that a load operation incurred. When load operations use data immediately after the data was generated by an integer execution unit, they may (pending on certain dynamic internal conditions) incur one penalty cycle due to delayed data bypass between the units. Use IA32_PMC1 only.
21H	See Table 18-61	L2_ADS.(Core)	Cycles L2 address bus is in use.	This event counts the number of cycles the L2 address bus is being used for accesses to the L2 cache or bus queue. It can count occurrences for this core or both cores.
23H	See Table 18-61	L2_DBUS_BUSY _RD.(Core)	Cycles the L2 transfers data to the core.	This event counts the number of cycles during which the L2 data bus is busy transferring data from the L2 cache to the core. It counts for all L1 cache misses (data and instruction) that hit the L2 cache. This event can count occurrences for this core or both cores.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
24H	Combined mask from Table 18-61 and Table 18-63	L2_LINES_IN. (Core, Prefetch)	L2 cache misses.	This event counts the number of cache lines allocated in the L2 cache. Cache lines are allocated in the L2 cache as a result of requests from the L1 data and instruction caches and the L2 hardware prefetchers to cache lines that are missing in the L2 cache. This event can count occurrences for this core or both cores. It can also count demand requests and L2 hardware prefetch requests together or separately.
25H	See Table 18-61	L2_M_LINES_IN. (Core)	L2 cache line modifications.	This event counts whenever a modified cache line is written back from the L1 data cache to the L2 cache. This event can count occurrences for this core or both cores.
26H	See Table 18-61 and Table 18-63	L2_LINES_OUT. (Core, Prefetch)	L2 cache lines evicted.	This event counts the number of L2 cache lines evicted. This event can count occurrences for this core or both cores. It can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.
27H	See Table 18-61 and Table 18-63	L2_M_LINES_OUT.(Core, Prefetch)	Modified lines evicted from the L2 cache.	This event counts the number of L2 modified cache lines evicted. These lines are written back to memory unless they also exist in a modified-state in one of the L1 data caches. This event can count occurrences for this core or both cores. It can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.
28H	Combined mask from Table 18-61 and Table 18-64	L2_IFETCH.(Core, Cache Line State)	L2 cacheable instruction fetch requests.	This event counts the number of instruction cache line requests from the IFU. It does not include fetch requests from uncacheable memory. It does not include ITLB miss accesses. This event can count occurrences for this core or both cores. It can also count accesses to cache lines at different MESI states.
29H	Combined mask from Table 18-61, Table 18-63, and Table 18-64	L2_LD.(Core, Prefetch, Cache Line State)	L2 cache reads.	This event counts L2 cache read requests coming from the L1 data cache and L2 prefetchers. The event can count occurrences: ▪ For this core or both cores. ▪ Due to demand requests and L2 hardware prefetch requests together or separately. ▪ Of accesses to cache lines at different MESI states.
2AH	See Table 18-61 and Table 18-64	L2_ST.(Core, Cache Line State)	L2 store requests.	This event counts all store operations that miss the L1 data cache and request the data from the L2 cache. The event can count occurrences for this core or both cores. It can also count accesses to cache lines at different MESI states.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
2BH	See Table 18-61 and Table 18-64	L2_LOCK.(Core, Cache Line State)	L2 locked accesses.	This event counts all locked accesses to cache lines that miss the L1 data cache. The event can count occurrences for this core or both cores. It can also count accesses to cache lines at different MESI states.
2EH	See Table 18-61, Table 18-63, and Table 18-64	L2_RQSTS.(Core, Prefetch, Cache Line State)	L2 cache requests.	This event counts all completed L2 cache requests. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, instruction fetches, and all L2 hardware prefetch requests. This event can count occurrences: ▪ For this core or both cores. ▪ Due to demand requests and L2 hardware prefetch requests together, or separately. ▪ Of accesses to cache lines at different MESI states.
2EH	41H	L2_RQSTS.SELF. DEMAND.I_STATE	L2 cache demand requests from this core that missed the L2.	This event counts all completed L2 cache demand requests from this core that miss the L2 cache. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches. This is an architectural performance event.
2EH	4FH	L2_RQSTS.SELF. DEMAND.MESI	L2 cache demand requests from this core.	This event counts all completed L2 cache demand requests from this core. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches. This is an architectural performance event.
30H	See Table 18-61, Table 18-63, and Table 18-64	L2_REJECT_BUSQ.(Core, Prefetch, Cache Line State)	Rejected L2 cache requests.	This event indicates that a pending L2 cache request that requires a bus transaction is delayed from moving to the bus queue. Some of the reasons for this event are: ▪ The bus queue is full. ▪ The bus queue already holds an entry for a cache line in the same set. The number of events is greater or equal to the number of requests that were rejected. ▪ For this core or both cores. ▪ Due to demand requests and L2 hardware prefetch requests together, or separately. ▪ Of accesses to cache lines at different MESI states.
32H	See Table 18-61	L2_NO_REQ.(Core)	Cycles no L2 cache requests are pending.	This event counts the number of cycles that no L2 cache requests were pending from a core. When using the BOTH_CORE modifier, the event counts only if none of the cores have a pending request. The event counts also when one core is halted and the other is not halted. The event can count occurrences for this core or both cores.
3AH	00H	EIST_TRANS	Number of Enhanced Intel SpeedStep Technology (EIST) transitions.	This event counts the number of transitions that include a frequency change, either with or without voltage change. This includes Enhanced Intel SpeedStep Technology (EIST) and TM2 transitions. The event is incremented only while the counting core is in C0 state. Since transitions to higher-numbered CxE states and TM2 transitions include a frequency change or voltage transition, the event is incremented accordingly.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
3BH	C0H	THERMAL_TRIP	Number of thermal trips.	This event counts the number of thermal trips. A thermal trip occurs whenever the processor temperature exceeds the thermal trip threshold temperature. Following a thermal trip, the processor automatically reduces frequency and voltage. The processor checks the temperature every millisecond and returns to normal when the temperature falls below the thermal trip threshold temperature.
3CH	00H	CPU_CLK_ UNHALTED. CORE_P	Core cycles when core is not halted.	This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios. The core frequency may change due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason, this event may have a changing ratio in regard to time. When the core frequency is constant, this event can give approximate elapsed time while the core not in halt state. This is an architectural performance event.
3CH	01H	CPU_CLK_ UNHALTED.BUS	Bus cycles when core is not halted.	This event counts the number of bus cycles while the core is not in the halt state. This event can give a measurement of the elapsed time while the core was not in the halt state. The core enters the halt state when it is running the HLT instruction. The event also has a constant ratio with CPU_CLK_UNHALTED.REF event, which is the maximum bus to processor frequency ratio. Non-halted bus cycles are a component in many key event ratios.
3CH	02H	CPU_CLK_ UNHALTED.NO _OTHER	Bus cycles when core is active and the other is halted.	This event counts the number of bus cycles during which the core remains non-halted and the other core on the processor is halted. This event can be used to determine the amount of parallelism exploited by an application or a system. Divide this event count by the bus frequency to determine the amount of time that only one core was in use.
40H	See Table 18-64	L1D_CACHE_LD. (Cache Line State)	L1 cacheable data reads.	This event counts the number of data reads from cacheable memory. Locked reads are not counted.
41H	See Table 18-64	L1D_CACHE_ST. (Cache Line State)	L1 cacheable data writes.	This event counts the number of data writes to cacheable memory. Locked writes are not counted.
42H	See Table 18-64	L1D_CACHE_ LOCK.(Cache Line State)	L1 data cacheable locked reads.	This event counts the number of locked data reads from cacheable memory.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
42H	10H	L1D_CACHE_ LOCK_DURATION	Duration of L1 data cacheable locked operation.	This event counts the number of cycles during which any cache line is locked by any locking instruction. Locking happens at retirement and therefore the event does not occur for instructions that are speculatively executed. Locking duration is shorter than locked instruction execution duration.
43H	01H	L1D_ALL_REF	All references to the L1 data cache.	This event counts all references to the L1 data cache, including all loads and stores with any memory types. The event counts memory accesses only when they are actually performed. For example, a load blocked by unknown store address and later performed is only counted once. The event includes non-cacheable accesses, such as I/O accesses.
43H	02H	L1D_ALL_ CACHE_REF	L1 Data cacheable reads and writes.	This event counts the number of data reads and writes from cacheable memory, including locked operations. This event is a sum of: ▪ L1D_CACHE_LD.MESI ▪ L1D_CACHE_ST.MESI ▪ L1D_CACHE_LOCK.MESI
45H	0FH	L1D_REPL	Cache lines allocated in the L1 data cache.	This event counts the number of lines brought into the L1 data cache.
46H	00H	L1D_M_REPL	Modified cache lines allocated in the L1 data cache.	This event counts the number of modified lines brought into the L1 data cache.
47H	00H	L1D_M_EVICT	Modified cache lines evicted from the L1 data cache.	This event counts the number of modified lines evicted from the L1 data cache, whether due to replacement or by snoop HITM intervention.
48H	00H	L1D_PEND_ MISS	Total number of outstanding L1 data cache misses at any cycle.	This event counts the number of outstanding L1 data cache misses at any cycle. An L1 data cache miss is outstanding from the cycle on which the miss is determined until the first chunk of data is available. This event counts: ▪ All cacheable demand requests. ▪ L1 data cache hardware prefetch requests. ▪ Requests to write through memory. ▪ Requests to write combine memory. Uncacheable requests are not counted. The count of this event divided by the number of L1 data cache misses, L1D_REPL, is the average duration in core cycles of an L1 data cache miss.
49H	01H	L1D_SPLIT.LOADS	Cache line split loads from the L1 data cache.	This event counts the number of load operations that span two cache lines. Such load operations are also called split loads. Split load operations are executed at retirement.
49H	02H	L1D_SPLIT. STORES	Cache line split stores to the L1 data cache.	This event counts the number of store operations that span two cache lines.
4BH	00H	SSE_PRE_ MISS.NTA	Streaming SIMD Extensions (SSE) Prefetch NTA instructions missing all cache levels.	This event counts the number of times the SSE instructions prefetchNTA were executed and missed all cache levels. Due to speculation an executed instruction might not retire. This instruction prefetches the data to the L1 data cache.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
4BH	01H	SSE_PRE_ MISS.L1	Streaming SIMD Extensions (SSE) PrefetchT0 instructions missing all cache levels.	This event counts the number of times the SSE instructions prefetchT0 were executed and missed all cache levels. Due to speculation executed instruction might not retire. The prefetchT0 instruction prefetches data to the L2 cache and L1 data cache.
4BH	02H	SSE_PRE_ MISS.L2	Streaming SIMD Extensions (SSE) PrefetchT1 and PrefetchT2 instructions missing all cache levels.	This event counts the number of times the SSE instructions prefetchT1 and prefetchT2 were executed and missed all cache levels. Due to speculation, an executed instruction might not retire. The prefetchT1 and PrefetchNT2 instructions prefetch data to the L2 cache.
4CH	00H	LOAD_HIT_PRE	Load operations conflicting with a software prefetch to the same address.	This event counts load operations sent to the L1 data cache while a previous Streaming SIMD Extensions (SSE) prefetch instruction to the same cache line has started prefetching but has not yet finished.
4EH	10H	L1D_PREFETCH. REQUESTS	L1 data cache prefetch requests.	This event counts the number of times the L1 data cache requested to prefetch a data cache line. Requests can be rejected when the L2 cache is busy and resubmitted later or lost. All requests are counted, including those that are rejected.
60H	See Table 18-61 and Table 18-62.	BUS_REQUEST_ OUTSTANDING. (Core and Bus Agents)	Outstanding cacheable data read bus requests duration.	This event counts the number of pending full cache line read transactions on the bus occurring in each cycle. A read transaction is pending from the cycle it is sent on the bus until the full cache line is received by the processor. The event counts only full-line cacheable read requests from either the L1 data cache or the L2 prefetchers. It does not count Read for Ownership transactions, instruction byte fetch transactions, or any other bus transaction.
61H	See Table 18-62.	BUS_BNR_DRV. (Bus Agents)	Number of Bus Not Ready signals asserted.	This event counts the number of Bus Not Ready (BNR) signals that the processor asserts on the bus to suspend additional bus requests by other bus agents. A bus agent asserts the BNR signal when the number of data and snoop transactions is close to the maximum that the bus can handle. To obtain the number of bus cycles during which the BNR signal is asserted, multiply the event count by two. While this signal is asserted, new transactions cannot be submitted on the bus. As a result, transaction latency may have higher impact on program performance.
62H	See Table 18-62.	BUS_DRDY_ CLOCKS.(Bus Agents)	Bus cycles when data is sent on the bus.	This event counts the number of bus cycles during which the DRDY (Data Ready) signal is asserted on the bus. The DRDY signal is asserted when data is sent on the bus. With the 'THIS_AGENT' mask this event counts the number of bus cycles during which this agent (the processor) writes data on the bus back to memory or to other bus agents. This includes all explicit and implicit data writebacks, as well as partial writes. With the 'ALL_AGENTS' mask, this event counts the number of bus cycles during which any bus agent sends data on the bus. This includes all data reads and writes on the bus.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
63H	See Table 18-61 and Table 18-62.	BUS_LOCK_ CLOCKS.(Core and Bus Agents)	Bus cycles when a LOCK signal asserted.	This event counts the number of bus cycles, during which the LOCK signal is asserted on the bus. A LOCK signal is asserted when there is a locked memory access, due to: ▪ Uncacheable memory. ▪ Locked operation that spans two cache lines. ▪ Page-walk from an uncacheable page table. Bus locks have a very high performance penalty and it is highly recommended to avoid such accesses.
64H	See Table 18-61.	BUS_DATA_ RCV.(Core)	Bus cycles while processor receives data.	This event counts the number of bus cycles during which the processor is busy receiving data.
65H	See Table 18-61 and Table 18-62.	BUS_TRANS_BRD.(Core and Bus Agents)	Burst read bus transactions.	This event counts the number of burst read transactions including: ▪ L1 data cache read misses (and L1 data cache hardware prefetches). ▪ L2 hardware prefetches by the DPL and L2 streamer. ▪ IFU read misses of cacheable lines. It does not include RFO transactions.
66H	See Table 18-61 and Table 18-62.	BUS_TRANS_RFO.(Core and Bus Agents)	RFO bus transactions.	This event counts the number of Read For Ownership (RFO) bus transactions, due to store operations that miss the L1 data cache and the L2 cache. It also counts RFO bus transactions due to locked operations.
67H	See Table 18-61 and Table 18-62.	BUS_TRANS_WB. (Core and Bus Agents)	Explicit writeback bus transactions.	This event counts all explicit writeback bus transactions due to dirty line evictions. It does not count implicit writebacks due to invalidation by a snoop request.
68H	See Table 18-61 and Table 18-62.	BUS_TRANS_ IFETCH.(Core and Bus Agents)	Instruction-fetch bus transactions.	This event counts all instruction fetch full cache line bus transactions.
69H	See Table 18-61 and Table 18-62.	BUS_TRANS_ INVAL.(Core and Bus Agents)	Invalidate bus transactions.	This event counts all invalidate transactions. Invalidate transactions are generated when: ▪ A store operation hits a shared line in the L2 cache. ▪ A full cache line write misses the L2 cache or hits a shared line in the L2 cache.
6AH	See Table 18-61 and Table 18-62.	BUS_TRANS_ PWR.(Core and Bus Agents)	Partial write bus transaction.	This event counts partial write bus transactions.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
6BH	See Table 18-61 and Table 18-62.	BUS_TRANS _P.(Core and Bus Agents)	Partial bus transactions.	This event counts all (read and write) partial bus transactions.
6CH	See Table 18-61 and Table 18-62.	BUS_TRANS_IO.(Core and Bus Agents)	IO bus transactions.	This event counts the number of completed I/O bus transactions as a result of IN and OUT instructions. The count does not include memory mapped IO.
6DH	See Table 18-61 and Table 18-62.	BUS_TRANS_ DEF.(Core and Bus Agents)	Deferred bus transactions.	This event counts the number of deferred transactions.
6EH	See Table 18-61 and Table 18-62.	BUS_TRANS_ BURST.(Core and Bus Agents)	Burst (full cache-line) bus transactions.	This event counts burst (full cache line) transactions including: ▪ Burst reads. ▪ RFOs. ▪ Explicit writebacks. ▪ Write combine lines.
6FH	See Table 18-61 and Table 18-62.	BUS_TRANS_ MEM.(Core and Bus Agents)	Memory bus transactions.	This event counts all memory bus transactions including: ▪ Burst transactions. ▪ Partial reads and writes - invalidate transactions. The BUS_TRANS_MEM count is the sum of BUS_TRANS_BURST, BUS_TRANS_P and BUS_TRANS_IVAL.
70H	See Table 18-61 and Table 18-62.	BUS_TRANS_ ANY.(Core and Bus Agents)	All bus transactions.	This event counts all bus transactions. This includes: ▪ Memory transactions. ▪ IO transactions (non memory-mapped). ▪ Deferred transaction completion. ▪ Other less frequent transactions, such as interrupts.
77H	See Table 18-61 and Table 18-65.	EXT_SNOOP. (Bus Agents, Snoop Response)	External snoops.	This event counts the snoop responses to bus transactions. Responses can be counted separately by type and by bus agent. With the 'THIS_AGENT' mask, the event counts snoop responses from this processor to bus transactions sent by this processor. With the 'ALL_AGENTS' mask the event counts all snoop responses seen on the bus.
78H	See Table 18-61 and Table 18-66.	CMP_SNOOP.(Core, Snoop Type)	L1 data cache snooped by other core.	This event counts the number of times the L1 data cache is snooped for a cache line that is needed by the other core in the same processor. The cache line is either missing in the L1 instruction or data caches of the other core, or is available for reading only and the other core wishes to write the cache line.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
				The snoop operation may change the cache line state. If the other core issued a read request that hit this core in E state, typically the state changes to S state in this core. If the other core issued a read for ownership request (due a write miss or hit to S state) that hits this core's cache line in E or S state, this typically results in invalidation of the cache line in this core. If the snoop hits a line in M state, the state is changed at a later opportunity. These snoops are performed through the L1 data cache store port. Therefore, frequent snoops may conflict with extensive stores to the L1 data cache, which may increase store latency and impact performance.
7AH	See Table 18-62.	BUS_HIT_DRV. (Bus Agents)	HIT signal asserted.	This event counts the number of bus cycles during which the processor drives the HIT# pin to signal HIT snoop response.
7BH	See Table 18-62.	BUS_HITM_DRV. (Bus Agents)	HITM signal asserted.	This event counts the number of bus cycles during which the processor drives the HITM# pin to signal HITM snoop response.
7DH	See Table 18-61.	BUSQ_EMPTY. (Core)	Bus queue empty.	This event counts the number of cycles during which the core did not have any pending transactions in the bus queue. It also counts when the core is halted and the other core is not halted. This event can count occurrences for this core or both cores.
7EH	See Table 18-61 and Table 18-62.	SNOOP_STALL_ DRV.(Core and Bus Agents)	Bus stalled for snoops.	This event counts the number of times that the bus snoop stall signal is asserted. To obtain the number of bus cycles during which snoops on the bus are prohibited, multiply the event count by two. During the snoop stall cycles, no new bus transactions requiring a snoop response can be initiated on the bus. A bus agent asserts a snoop stall signal if it cannot response to a snoop request within three bus cycles.
7FH	See Table 18-61.	BUS_IO_WAIT. (Core)	IO requests waiting in the bus queue.	This event counts the number of core cycles during which IO requests wait in the bus queue. With the SELF modifier this event counts IO requests per core. With the BOTH_CORE modifier, this event increments by one for any cycle for which there is a request from either core.
80H	00H	L1I_READS	Instruction fetches.	This event counts all instruction fetches, including uncacheable fetches that bypass the Instruction Fetch Unit (IFU).
81H	00H	L1I_MISSES	Instruction Fetch Unit misses.	This event counts all instruction fetches that miss the Instruction Fetch Unit (IFU) or produce memory requests. This includes uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.
82H	02H	ITLB.SMALL_MISS	ITLB small page misses.	This event counts the number of instruction fetches from small pages that miss the ITLB.
82H	10H	ITLB.LARGE_MISS	ITLB large page misses.	This event counts the number of instruction fetches from large pages that miss the ITLB.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
82H	40H	ITLB.FLUSH	ITLB flushes.	This event counts the number of ITLB flushes. This usually happens upon CR3 or CR0 writes, which are executed by the operating system during process switches.
82H	12H	ITLB.MISSES	ITLB misses.	This event counts the number of instruction fetches from either small or large pages that miss the ITLB.
83H	02H	INST_QUEUE.FULL	Cycles during which the instruction queue is full.	This event counts the number of cycles during which the instruction queue is full. In this situation, the core front end stops fetching more instructions. This is an indication of very long stalls in the back-end pipeline stages.
86H	00H	CYCLES_L1I_ MEM_STALLED	Cycles during which instruction fetches stalled.	This event counts the number of cycles for which an instruction fetch stalls, including stalls due to any of the following reasons: ▪ Instruction Fetch Unit cache misses. ▪ Instruction TLB misses. ▪ Instruction TLB faults.
87H	00H	ILD_STALL	Instruction Length Decoder stall cycles due to a length changing prefix.	This event counts the number of cycles during which the instruction length decoder uses the slow length decoder. Usually, instruction length decoding is done in one cycle. When the slow decoder is used, instruction decoding requires 6 cycles. The slow decoder is used in the following cases: ▪ Operand override prefix (66H) preceding an instruction with immediate data. ▪ Address override prefix (67H) preceding an instruction with a modr/m in real, big real, 16-bit protected or 32-bit protected modes. To avoid instruction length decoding stalls, generate code using imm8 or imm32 values instead of imm16 values. If you must use an imm16 value, store the value in a register using "mov reg, imm32" and use the register format of the instruction.
88H	00H	BR_INST_EXEC	Branch instructions executed.	This event counts all executed branches (not necessarily retired). This includes only instructions and not micro-op branches. Frequent branching is not necessarily a major performance issue. However frequent branch mispredictions may be a problem.
89H	00H	BR_MISSP_EXEC	Mispredicted branch instructions executed.	This event counts the number of mispredicted branch instructions that were executed.
8AH	00H	BR_BAC_ MISSP_EXEC	Branch instructions mispredicted at decoding.	This event counts the number of branch instructions that were mispredicted at decoding.
8BH	00H	BR_CND_EXEC	Conditional branch instructions executed.	This event counts the number of conditional branch instructions executed, but not necessarily retired.
8CH	00H	BR_CND_ MISSP_EXEC	Mispredicted conditional branch instructions executed.	This event counts the number of mispredicted conditional branch instructions that were executed.
8DH	00H	BR_IND_EXEC	Indirect branch instructions executed.	This event counts the number of indirect branch instructions that were executed.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
8EH	00H	BR_IND_MISSP _EXEC	Mispredicted indirect branch instructions executed.	This event counts the number of mispredicted indirect branch instructions that were executed.
8FH	00H	BR_RET_EXEC	RET instructions executed.	This event counts the number of RET instructions that were executed.
90H	00H	BR_RET_ MISSP_EXEC	Mispredicted RET instructions executed.	This event counts the number of mispredicted RET instructions that were executed.
91H	00H	BR_RET_BAC_ MISSP_EXEC	RET instructions executed mispredicted at decoding.	This event counts the number of RET instructions that were executed and were mispredicted at decoding.
92H	00H	BR_CALL_EXEC	CALL instructions executed.	This event counts the number of CALL instructions executed.
93H	00H	BR_CALL_ MISSP_EXEC	Mispredicted CALL instructions executed.	This event counts the number of mispredicted CALL instructions that were executed.
94H	00H	BR_IND_CALL_ EXEC	Indirect CALL instructions executed.	This event counts the number of indirect CALL instructions that were executed.
97H	00H	BR_TKN_ BUBBLE_1	Branch predicted taken with bubble 1.	The events BR_TKN_BUBBLE_1 and BR_TKN_BUBBLE_2 together count the number of times a taken branch prediction incurred a one-cycle penalty. The penalty incurs when: ▪ Too many taken branches are placed together. To avoid this, unroll loops and add a non-taken branch in the middle of the taken sequence. ▪ The branch target is unaligned. To avoid this, align the branch target.
98H	00H	BR_TKN_ BUBBLE_2	Branch predicted taken with bubble 2.	The events BR_TKN_BUBBLE_1 and BR_TKN_BUBBLE_2 together count the number of times a taken branch prediction incurred a one-cycle penalty. The penalty incurs when: ▪ Too many taken branches are placed together. To avoid this, unroll loops and add a non-taken branch in the middle of the taken sequence. ▪ The branch target is unaligned. To avoid this, align the branch target.
A0H	00H	RS_UOPS_ DISPATCHED	Micro-ops dispatched for execution.	This event counts the number of micro-ops dispatched for execution. Up to six micro-ops can be dispatched in each cycle.
A1H	01H	RS_UOPS_ DISPATCHED.PORT0	Cycles micro-ops dispatched for execution on port 0.	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Issue Ports are described in *Intel® 64 and IA-32 Architectures Optimization Reference Manual*. Use IA32_PMC0 only.
A1H	02H	RS_UOPS_ DISPATCHED.PORT1	Cycles micro-ops dispatched for execution on port 1.	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.
A1H	04H	RS_UOPS_ DISPATCHED.PORT2	Cycles micro-ops dispatched for execution on port 2.	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
A1H	08H	RS_UOPS_ DISPATCHED.PORT3	Cycles micro-ops dispatched for execution on port 3.	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.
A1H	10H	RS_UOPS_ DISPATCHED.PORT4	Cycles micro-ops dispatched for execution on port 4.	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.
A1H	20H	RS_UOPS_ DISPATCHED.PORT5	Cycles micro-ops dispatched for execution on port 5.	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.
AAH	01H	MACRO_INSTS. DECODED	Instructions decoded.	This event counts the number of instructions decoded (but not necessarily executed or retired).
AAH	08H	MACRO_INSTS. CISC_DECODED	CISC Instructions decoded.	This event counts the number of complex instructions decoded. Complex instructions usually have more than four micro-ops. Only one complex instruction can be decoded at a time.
ABH	01H	ESP.SYNCH	ESP register content synchron-ization.	This event counts the number of times that the ESP register is explicitly used in the address expression of a load or store operation, after it is implicitly used, for example by a push or a pop instruction. ESP synch micro-op uses resources from the rename pipe-stage and up to retirement. The expected ratio of this event divided by the number of ESP implicit changes is 0,2. If the ratio is higher, consider rearranging your code to avoid ESP synchronization events.
ABH	02H	ESP.ADDITIONS	ESP register automatic additions.	This event counts the number of ESP additions performed automatically by the decoder. A high count of this event is good, since each automatic addition performed by the decoder saves a micro-op from the execution units. To maximize the number of ESP additions performed automatically by the decoder, choose instructions that implicitly use the ESP, such as PUSH, POP, CALL, and RET instructions whenever possible.
B0H	00H	SIMD_UOPS_EXEC	SIMD micro-ops executed (excluding stores).	This event counts all the SIMD micro-ops executed. It does not count MOVQ and MOVD stores from register to memory.
B1H	00H	SIMD_SAT_UOP_ EXEC	SIMD saturated arithmetic micro-ops executed.	This event counts the number of SIMD saturated arithmetic micro-ops executed.
B3H	01H	SIMD_UOP_ TYPE_EXEC.MUL	SIMD packed multiply micro-ops executed.	This event counts the number of SIMD packed multiply micro-ops executed.
B3H	02H	SIMD_UOP_TYPE_EXEC.SHI FT	SIMD packed shift micro-ops executed.	This event counts the number of SIMD packed shift micro-ops executed.
B3H	04H	SIMD_UOP_TYPE_EXEC.PA CK	SIMD pack micro-ops executed.	This event counts the number of SIMD pack micro-ops executed.
B3H	08H	SIMD_UOP_TYPE_EXEC.UN PACK	SIMD unpack micro-ops executed.	This event counts the number of SIMD unpack micro-ops executed.
B3H	10H	SIMD_UOP_TYPE_EXEC.LO GICAL	SIMD packed logical micro-ops executed.	This event counts the number of SIMD packed logical micro-ops executed.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
B3H	20H	SIMD_UOP_TYPE_EXEC.ARITHMETIC	SIMD packed arithmetic micro-ops executed.	This event counts the number of SIMD packed arithmetic micro-ops executed.
C0H	00H	INST_RETIRED.ANY_P	Instructions retired.	This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers. INST_RETIRED.ANY_P is an architectural performance event.
C0H	01H	INST_RETIRED.LOADS	Instructions retired, which contain a load.	This event counts the number of instructions retired that contain a load operation.
C0H	02H	INST_RETIRED.STORES	Instructions retired, which contain a store.	This event counts the number of instructions retired that contain a store operation.
C0H	04H	INST_RETIRED.OTHER	Instructions retired, with no load or store operation.	This event counts the number of instructions retired that do not contain a load or a store operation.
C1H	01H	X87_OPS_RETIRED.FXCH	FXCH instructions retired.	This event counts the number of FXCH instructions retired. Modern compilers generate more efficient code and are less likely to use this instruction. If you obtain a high count for this event consider recompiling the code.
C1H	FEH	X87_OPS_RETIRED.ANY	Retired floating-point computational operations (precise event).	This event counts the number of floating-point computational operations retired. It counts: ▪ Floating point computational operations executed by the assist handler. ▪ Sub-operations of complex floating-point instructions like transcendental instructions. This event does not count: ▪ Floating-point computational operations that cause traps or assists. ▪ Floating-point loads and stores. When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.
C2H	01H	UOPS_RETIRED.LD_IND_BR	Fused load+op or load+indirect branch retired.	This event counts the number of retired micro-ops that fused a load with another operation. This includes: ▪ Fusion of a load and an arithmetic operation, such as with the following instruction: ADD EAX, [EBX] where the content of the memory location specified by EBX register is loaded, added to EXA register, and the result is stored in EAX. ▪ Fusion of a load and a branch in an indirect branch operation, such as with the following instructions: ▪ JMP [RDI+200] ▪ RET ▪ Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code is using the processor resources effectively.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
C2H	02H	UOPS_RETIRED. STD_STA	Fused store address + data retired.	This event counts the number of store address calculations that are fused with store data emission into one micro-op. Traditionally, each store operation required two micro-ops. This event counts fusion of retired micro-ops only. Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code is using the processor resources effectively.
C2H	04H	UOPS_RETIRED. MACRO_FUSION	Retired instruction pairs fused into one micro-op.	This event counts the number of times CMP or TEST instructions were fused with a conditional branch instruction into one micro-op. It counts fusion by retired micro-ops only. Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code uses the processor resources more effectively.
C2H	07H	UOPS_RETIRED. FUSED	Fused micro-ops retired.	This event counts the total number of retired fused micro-ops. The counts include the following fusion types: ▪ Fusion of load operation with an arithmetic operation or with an indirect branch (counted by event UOPS_RETIRED.LD_IND_BR) ▪ Fusion of store address and data (counted by event UOPS_RETIRED.STD_STA) ▪ Fusion of CMP or TEST instruction with a conditional branch instruction (counted by event UOPS_RETIRED.MACRO_FUSION) Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code is using the processor resources effectively.
C2H	08H	UOPS_RETIRED. NON_FUSED	Non-fused micro-ops retired.	This event counts the number of micro-ops retired that were not fused.
C2H	0FH	UOPS_RETIRED. ANY	Micro-ops retired.	This event counts the number of micro-ops retired. The processor decodes complex macro instructions into a sequence of simpler micro-ops. Most instructions are composed of one or two micro-ops. Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists. In some cases micro-op sequences are fused or whole instructions are fused into one micro-op. See other UOPS_RETIRED events for differentiating retired fused and non-fused micro-ops.
C3H	01H	MACHINE_ NUKES.SMC	Self-Modifying Code detected.	This event counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel 64 and IA-32 processors.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
C3H	04H	MACHINE_NUKES.MEM_ORDER	Execution pipeline restart due to memory ordering conflict or memory disambiguation misprediction.	This event counts the number of times the pipeline is restarted due to either multi-threaded memory ordering conflicts or memory disambiguation misprediction. A multi-threaded memory ordering conflict occurs when a store, which is executed in another core, hits a load that is executed out of order in this core but not yet retired. As a result, the load needs to be restarted to satisfy the memory ordering model. See Chapter 8, "Multiple-Processor Management" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*. To count memory disambiguation mispredictions, use the event MEMORY_DISAMBIGUATION.RESET.
C4H	00H	BR_INST_RETIRED.ANY	Retired branch instructions.	This event counts the number of branch instructions retired. This is an architectural performance event.
C4H	01H	BR_INST_RETIRED.PRED_NOT_TAKEN	Retired branch instructions that were predicted not-taken.	This event counts the number of branch instructions retired that were correctly predicted to be not-taken.
C4H	02H	BR_INST_RETIRED.MISPRED_NOT_TAKEN	Retired branch instructions that were mispredicted not-taken.	This event counts the number of branch instructions retired that were mispredicted and not-taken.
C4H	04H	BR_INST_RETIRED.PRED_TAKEN	Retired branch instructions that were predicted taken.	This event counts the number of branch instructions retired that were correctly predicted to be taken.
C4H	08H	BR_INST_RETIRED.MISPRED_TAKEN	Retired branch instructions that were mispredicted taken.	This event counts the number of branch instructions retired that were mispredicted and taken.
C4H	0CH	BR_INST_RETIRED.TAKEN	Retired taken branch instructions.	This event counts the number of branches retired that were taken.
C5H	00H	BR_INST_RETIRED.MISPRED	Retired mispredicted branch instructions. (precise event)	This event counts the number of retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor predicts that the branch would be taken, but it is not, or vice-versa. This is an architectural performance event.
C6H	01H	CYCLES_INT_MASKED	Cycles during which interrupts are disabled.	This event counts the number of cycles during which interrupts are disabled.
C6H	02H	CYCLES_INT_PENDING_AND_MASKED	Cycles during which interrupts are pending and disabled.	This event counts the number of cycles during which there are pending interrupts but interrupts are disabled.
C7H	01H	SIMD_INST_RETIRED.PACKED_SINGLE	Retired SSE packed-single instructions.	This event counts the number of SSE packed-single instructions retired.
C7H	02H	SIMD_INST_RETIRED.SCALAR_SINGLE	Retired SSE scalar-single instructions.	This event counts the number of SSE scalar-single instructions retired.
C7H	04H	SIMD_INST_RETIRED.PACKED_DOUBLE	Retired SSE2 packed-double instructions.	This event counts the number of SSE2 packed-double instructions retired.
C7H	08H	SIMD_INST_RETIRED.SCALAR_DOUBLE	Retired SSE2 scalar-double instructions.	This event counts the number of SSE2 scalar-double instructions retired.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
C7H	10H	SIMD_INST_ RETIRED.VECTOR	Retired SSE2 vector integer instructions.	This event counts the number of SSE2 vector integer instructions retired.
C7H	1FH	SIMD_INST_ RETIRED.ANY	Retired Streaming SIMD instructions (precise event).	This event counts the overall number of retired SIMD instructions that use XMM registers. To count each type of SIMD instruction separately, use the following events: ▪ SIMD_INST_RETIRED.PACKED_SINGLE ▪ SIMD_INST_RETIRED.SCALAR_SINGLE ▪ SIMD_INST_RETIRED.PACKED_DOUBLE ▪ SIMD_INST_RETIRED.SCALAR_DOUBLE ▪ and SIMD_INST_RETIRED.VECTOR When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.
C8H	00H	HW_INT_RCV	Hardware interrupts received.	This event counts the number of hardware interrupts received by the processor.
C9H	00H	ITLB_MISS_ RETIRED	Retired instructions that missed the ITLB.	This event counts the number of retired instructions that missed the ITLB when they were fetched.
CAH	01H	SIMD_COMP_ INST_RETIRED. PACKED_SINGLE	Retired computational SSE packed-single instructions.	This event counts the number of computational SSE packed-single instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide). Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	02H	SIMD_COMP_ INST_RETIRED. SCALAR_SINGLE	Retired computational SSE scalar-single instructions.	This event counts the number of computational SSE scalar-single instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide). Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	04H	SIMD_COMP_ INST_RETIRED. PACKED_DOUBLE	Retired computational SSE2 packed-double instructions.	This event counts the number of computational SSE2 packed-double instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide). Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	08H	SIMD_COMP_INST_RETIRE D.SCALAR_DOUBLE	Retired computational SSE2 scalar-double instructions.	This event counts the number of computational SSE2 scalar-double instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide). Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
CBH	01H	MEM_LOAD_ RETIRED.L1D _MISS	Retired loads that miss the L1 data cache (precise event).	This event counts the number of retired load operations that missed the L1 data cache. This includes loads from cache lines that are currently being fetched, due to a previous L1 data cache miss to the same cache line. This event counts loads from cacheable memory only. The event does not count loads by software prefetches. When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event. Use IA32_PMC0 only.
CBH	02H	MEM_LOAD_ RETIRED.L1D_ LINE_MISS	L1 data cache line missed by retired loads (precise event).	This event counts the number of load operations that miss the L1 data cache and send a request to the L2 cache to fetch the missing cache line. That is the missing cache line fetching has not yet started. The event count is equal to the number of cache lines fetched from the L2 cache by retired loads. This event counts loads from cacheable memory only. The event does not count loads by software prefetches. The event might not be counted if the load is blocked (see LOAD_BLOCK events). When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event. Use IA32_PMC0 only.
CBH	04H	MEM_LOAD_ RETIRED.L2_MISS	Retired loads that miss the L2 cache (precise event).	This event counts the number of retired load operations that missed the L2 cache. This event counts loads from cacheable memory only. It does not count loads by software prefetches. When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event. Use IA32_PMC0 only.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
CBH	08H	MEM_LOAD_ RETIRED.L2_LINE_MISS	L2 cache line missed by retired loads (precise event).	This event counts the number of load operations that miss the L2 cache and result in a bus request to fetch the missing cache line. That is the missing cache line fetching has not yet started. This event count is equal to the number of cache lines fetched from memory by retired loads. This event counts loads from cacheable memory only. The event does not count loads by software prefetches. The event might not be counted if the load is blocked (see LOAD_BLOCK events). When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event. Use IA32_PMC0 only.
CBH	10H	MEM_LOAD_ RETIRED.DTLB_ MISS	Retired loads that miss the DTLB (precise event).	This event counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault. This event counts loads from cacheable memory only. The event does not count loads by software prefetches. When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event. Use IA32_PMC0 only.
CCH	01H	FP_MMX_TRANS_TO_MMX	Transitions from Floating Point to MMX Instructions.	This event counts the first MMX instructions following a floating-point instruction. Use this event to estimate the penalties for the transitions between floating-point and MMX states.
CCH	02H	FP_MMX_TRANS_TO_FP	Transitions from MMX Instructions to Floating Point Instructions.	This event counts the first floating-point instructions following any MMX instruction. Use this event to estimate the penalties for the transitions between floating-point and MMX states.
CDH	00H	SIMD_ASSIST	SIMD assists invoked.	This event counts the number of SIMD assists invoked. SIMD assists are invoked when an EMMS instruction is executed, changing the MMX state in the floating point stack.
CEH	00H	SIMD_INSTR_ RETIRED	SIMD Instructions retired.	This event counts the number of retired SIMD instructions that use MMX registers.
CFH	00H	SIMD_SAT_INSTR_RETIRED	Saturated arithmetic instructions retired.	This event counts the number of saturated arithmetic SIMD instructions that retired.
D2H	01H	RAT_STALLS. ROB_READ_PORT	ROB read port stalls cycles.	This event counts the number of cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the out-of-order pipeline. Note that, at this stage in the pipeline, additional stalls may occur at the same cycle and prevent the stalled micro-ops from entering the pipe. In such a case, micro-ops retry entering the execution pipe in the next cycle and the ROB-read-port stall is counted again.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
D2H	02H	RAT_STALLS. PARTIAL_CYCLES	Partial register stall cycles.	This event counts the number of cycles instruction execution latency became longer than the defined latency because the instruction uses a register that was partially written by previous instructions.
D2H	04H	RAT_STALLS. FLAGS	Flag stall cycles.	This event counts the number of cycles during which execution stalled due to several reasons, one of which is a partial flag register stall. A partial register stall may occur when two conditions are met: ▪ An instruction modifies some, but not all, of the flags in the flag register. ▪ The next instruction, which depends on flags, depends on flags that were not modified by this instruction.
D2H	08H	RAT_STALLS. FPSW	FPU status word stall.	This event indicates that the FPU status word (FPSW) is written. To obtain the number of times the FPSW is written divide the event count by 2. The FPSW is written by instructions with long latency; a small count may indicate a high penalty.
D2H	0FH	RAT_STALLS. ANY	All RAT stall cycles.	This event counts the number of stall cycles due to conditions described by: ▪ RAT_STALLS.ROB_READ_PORT ▪ RAT_STALLS.PARTIAL ▪ RAT_STALLS.FLAGS ▪ RAT_STALLS.FPSW.
D4H	01H	SEG_RENAME_ STALLS.ES	Segment rename stalls - ES.	This event counts the number of stalls due to the lack of renaming resources for the ES segment register. If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.
D4H	02H	SEG_RENAME_ STALLS.DS	Segment rename stalls - DS.	This event counts the number of stalls due to the lack of renaming resources for the DS segment register. If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.
D4H	04H	SEG_RENAME_ STALLS.FS	Segment rename stalls - FS.	This event counts the number of stalls due to the lack of renaming resources for the FS segment register. If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.
D4H	08H	SEG_RENAME_ STALLS.GS	Segment rename stalls - GS.	This event counts the number of stalls due to the lack of renaming resources for the GS segment register. If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.
D4H	0FH	SEG_RENAME_ STALLS.ANY	Any (ES/DS/FS/GS) segment rename stall.	This event counts the number of stalls due to the lack of renaming resources for the ES, DS, FS, and GS segment registers. If a segment is renamed but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
D5H	01H	SEG_REG_ RENAMES.ES	Segment renames - ES.	This event counts the number of times the ES segment register is renamed.
D5H	02H	SEG_REG_ RENAMES.DS	Segment renames - DS.	This event counts the number of times the DS segment register is renamed.
D5H	04H	SEG_REG_ RENAMES.FS	Segment renames - FS.	This event counts the number of times the FS segment register is renamed.
D5H	08H	SEG_REG_ RENAMES.GS	Segment renames - GS.	This event counts the number of times the GS segment register is renamed.
D5H	0FH	SEG_REG_ RENAMES.ANY	Any (ES/DS/FS/GS) segment rename.	This event counts the number of times any of the four segment registers (ES/DS/FS/GS) is renamed.
DCH	01H	RESOURCE_ STALLS.ROB_FULL	Cycles during which the ROB full.	This event counts the number of cycles when the number of instructions in the pipeline waiting for retirement reaches the limit the processor can handle. A high count for this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, and other instructions that depend on these cannot execute until the former instructions complete execution). In this situation new instructions cannot enter the pipe and start execution.
DCH	02H	RESOURCE_ STALLS.RS_FULL	Cycles during which the RS full.	This event counts the number of cycles when the number of instructions in the pipeline waiting for execution reaches the limit the processor can handle. A high count of this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, and other instructions that depend on these cannot execute until the former instructions complete execution). In this situation new instructions cannot enter the pipe and start execution.
DCH	04	RESOURCE_ STALLS.LD_ST	Cycles during which the pipeline has exceeded load or store limit or waiting to commit all stores.	This event counts the number of cycles while resource-related stalls occur due to: ▪ The number of load instructions in the pipeline reached the limit the processor can handle. The stall ends when a loading instruction retires. ▪ The number of store instructions in the pipeline reached the limit the processor can handle. The stall ends when a storing instruction commits its data to the cache or memory. ▪ There is an instruction in the pipe that can be executed only when all previous stores complete and their data is committed in the caches or memory. For example, the SFENCE and MFENCE instructions require this behavior.
DCH	08H	RESOURCE_ STALLS.FPCW	Cycles stalled due to FPU control word write.	This event counts the number of cycles while execution was stalled due to writing the floating-point unit (FPU) control word.
DCH	10H	RESOURCE_ STALLS.BR_MISS_CLEAR	Cycles stalled due to branch misprediction.	This event counts the number of cycles after a branch misprediction is detected at execution until the branch and all older micro-ops retire. During this time new micro-ops cannot enter the out-of-order pipeline.

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Event Num	Umask Value	Event Name	Definition	Description and Comment
DCH	1FH	RESOURCE_ STALLS.ANY	Resource related stalls.	This event counts the number of cycles while resource-related stalls occurs for any conditions described by the following events: ▪ RESOURCE_STALLS.ROB_FULL ▪ RESOURCE_STALLS.RS_FULL ▪ RESOURCE_STALLS.LD_ST ▪ RESOURCE_STALLS.FPCW ▪ RESOURCE_STALLS.BR_MISS_CLEAR
E0H	00H	BR_INST_ DECODED	Branch instructions decoded.	This event counts the number of branch instructions decoded.
E4H	00H	BOGUS_BR	Bogus branches.	This event counts the number of byte sequences that were mistakenly detected as taken branch instructions. This results in a BACLEAR event. This occurs mainly after task switches.
E6H	00H	BACLEARS	BACLEARS asserted.	This event counts the number of times the front end is resteered, mainly when the BPU cannot provide a correct prediction and this is corrected by other branch handling mechanisms at the front and. This can occur if the code has many branches such that they cannot be consumed by the BPU. Each BACLEAR asserted costs approximately 7 cycles of instruction fetch. The effect on total execution time depends on the surrounding code.
F0H	00H	PREF_RQSTS_UP	Upward prefetches issued from DPL.	This event counts the number of upward prefetches issued from the Data Prefetch Logic (DPL) to the L2 cache. A prefetch request issued to the L2 cache cannot be cancelled and the requested cache line is fetched to the L2 cache.
F8H	00H	PREF_RQSTS_DN	Downward prefetches issued from DPL.	This event counts the number of downward prefetches issued from the Data Prefetch Logic (DPL) to the L2 cache. A prefetch request issued to the L2 cache cannot be cancelled and the requested cache line is fetched to the L2 cache.

19.13 PERFORMANCE MONITORING EVENTS FOR PROCESSORS BASED ON THE GOLDMONT PLUS MICROARCHITECTURE

Intel Atom processors based on the Goldmont Plus microarchitecture support the architectural performance monitoring events listed in Table 19-1 and fixed-function performance events using a fixed counter. They also support the following performance monitoring events listed in Table 19-27. These events apply to processors with CPUID signature of 06_7AH. In addition, processors based on the Goldmont Plus microarchitecture also support the events listed in Table 19-27 (see Section 19.14, "Performance Monitoring Events for Processors Based on the Goldmont Microarchitecture"). For an event listed in Table 19-27 that also appears in the model-specific tables of prior generations, Table 19-27 supersedes prior generation tables.

Performance monitoring event descriptions may refer to terminology described in Section B.2, "Intel® Xeon® processor 5500 Series," in Appendix B of the *Intel® 64 and IA-32 Architectures Optimization Reference Manual*.

In Goldmont Plus microarchitecture, performance monitoring events that support Processor Event Based Sampling (PEBS) and PEBS records that contain processor state information that are associated with at-retirement tagging are marked by "Precise Event".

Table 19-26. Performance Events for the Goldmont Plus Microarchitecture

Event Num.	Umask Value	Event Name	Description	Comment
00H	01H	INST_RETIRED.ANY	Counts the number of instructions that retire execution. For instructions that consist of multiple uops, this event counts the retirement of the last uop of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers. This event uses fixed counter 0. You cannot collect a PEBS record for this event.	Fixed Event, Precise Event, Not Reduced Skid
08H	02H	DTLB_LOAD_MISSES.WALK_COMPLETED_4K	Counts page walks completed due to demand data loads (including SW prefetches) whose address translations missed in all TLB levels and were mapped to 4K pages. The page walks can end with or without a page fault.	
08H	04H	DTLB_LOAD_MISSES.WALK_COMPLETED_2M_4M	Counts page walks completed due to demand data loads (including SW prefetches) whose address translations missed in all TLB levels and were mapped to 2M or 4M pages. The page walks can end with or without a page fault.	
08H	08H	DTLB_LOAD_MISSES.WALK_COMPLETED_1GB	Counts page walks completed due to demand data loads (including SW prefetches) whose address translations missed in all TLB levels and were mapped to 1GB pages. The page walks can end with or without a page fault.	
08H	10H	DTLB_LOAD_MISSES.WALK_PENDING	Counts once per cycle for each page walk occurring due to a load (demand data loads or SW prefetches). Includes cycles spent traversing the Extended Page Table (EPT). Average cycles per walk can be calculated by dividing by the number of walks.	
49H	02H	DTLB_STORE_MISSES.WALK_COMPLETED_4K	Counts page walks completed due to demand data stores whose address translations missed in the TLB and were mapped to 4K pages. The page walks can end with or without a page fault.	
49H	04H	DTLB_STORE_MISSES.WALK_COMPLETED_2M_4M	Counts page walks completed due to demand data stores whose address translations missed in the TLB and were mapped to 2M or 4M pages. The page walks can end with or without a page fault.	
49H	08H	DTLB_STORE_MISSES.WALK_COMPLETED_1GB	Counts page walks completed due to demand data stores whose address translations missed in the TLB and were mapped to 1GB pages. The page walks can end with or without a page fault.	
49H	10H	DTLB_STORE_MISSES.WALK_PENDING	Counts once per cycle for each page walk occurring due to a demand data store. Includes cycles spent traversing the Extended Page Table (EPT). Average cycles per walk can be calculated by dividing by the number of walks.	

Table 19-26. Performance Events for the Goldmont Plus Microarchitecture (Contd.)

Event Num.	Umask Value	Event Name	Description	Comment
4FH	10H	EPT.WALK_PENDING	Counts once per cycle for each page walk only while traversing the Extended Page Table (EPT), and does not count during the rest of the translation. The EPT is used for translating Guest-Physical Addresses to Physical Addresses for Virtual Machine Monitors (VMMs). Average cycles per walk can be calculated by dividing the count by number of walks.	
85H	02H	ITLB_MISSES.WALK_COMPLETED_4K	Counts page walks completed due to instruction fetches whose address translations missed in the TLB and were mapped to 4K pages. The page walks can end with or without a page fault.	
85H	04H	ITLB_MISSES.WALK_COMPLETED_2M_4M	Counts page walks completed due to instruction fetches whose address translations missed in the TLB and were mapped to 2M or 4M pages. The page walks can end with or without a page fault.	
85H	08H	ITLB_MISSES.WALK_COMPLETED_1GB	Counts page walks completed due to instruction fetches whose address translations missed in the TLB and were mapped to 1GB pages. The page walks can end with or without a page fault.	
85H	10H	ITLB_MISSES.WALK_PENDING	Counts once per cycle for each page walk occurring due to an instruction fetch. Includes cycles spent traversing the Extended Page Table (EPT). Average cycles per walk can be calculated by dividing by the number of walks.	
BDH	20H	TLB_FLUSHES.STLB_ANY	Counts STLB flushes. The TLBs are flushed on instructions like INVLPG and MOV to CR3.	
C3H	20H	MACHINE_CLEARS.PAGE_FAULT	Counts the number of times that the machines clears due to a page fault. Covers both I-side and D-side (Loads/Stores) page faults. A page fault occurs when either page is not present, or an access violation.	

19.14 PERFORMANCE MONITORING EVENTS FOR PROCESSORS BASED ON THE GOLDMONT MICROARCHITECTURE

Intel Atom processors based on the Goldmont microarchitecture support the architectural performance monitoring events listed in Table 19-1 and fixed-function performance events using a fixed counter. In addition, they also support the following model-specific performance monitoring events listed in Table 19-27. These events apply to processors with CPUID signatures of 06_5CH, 06_5FH, and 06_7AH.

Performance monitoring event descriptions may refer to terminology described in Section B.2, "Intel® Xeon® processor 5500 Series," in Appendix B of the *Intel® 64 and IA-32 Architectures Optimization Reference Manual*.

In Goldmont microarchitecture, performance monitoring events that support Processor Event Based Sampling (PEBS) and PEBS records that contain processor state information that are associated with at-retirement tagging are marked by "Precise Event".

Table 19-27. Performance Events for the Goldmont Microarchitecture

Event Num.	Umask Value	Event Name	Description	Comment
03H	10H	LD_BLOCKS.ALL_BLOCK	Counts anytime a load that retires is blocked for any reason.	Precise Event
03H	08H	LD_BLOCKS.UTLB_MISS	Counts loads blocked because they are unable to find their physical address in the micro TLB (UTLB).	Precise Event
03H	02H	LD_BLOCKS.STORE_FORWARD	Counts a load blocked from using a store forward because of an address/size mismatch; only one of the loads blocked from each store will be counted.	Precise Event

Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)

Event Num.	Umask Value	Event Name	Description	Comment
03H	01H	LD_BLOCKS.DATA_UNKNOWN	Counts a load blocked from using a store forward, but did not occur because the store data was not available at the right time. The forward might occur subsequently when the data is available.	Precise Event
03H	04H	LD_BLOCKS.4K_ALIAS	Counts loads that block because their address modulo 4K matches a pending store.	Precise Event
05H	01H	PAGE_WALKS.D_SIDE_CYCLES	Counts every core cycle when a Data-side (walks due to data operation) page walk is in progress.	
05H	02H	PAGE_WALKS.I_SIDE_CYCLES	Counts every core cycle when an Instruction-side (walks due to an instruction fetch) page walk is in progress.	
05H	03H	PAGE_WALKS.CYCLES	Counts every core cycle a page-walk is in progress due to either a data memory operation, or an instruction fetch.	
0EH	00H	UOPS_ISSUED.ANY	Counts uops issued by the front end and allocated into the back end of the machine. This event counts uops that retire as well as uops that were speculatively executed but didn't retire. The sort of speculative uops that might be counted includes, but is not limited to those uops issued in the shadow of a mispredicted branch, those uops that are inserted during an assist (such as for a denormal floating-point result), and (previously allocated) uops that might be canceled during a machine clear.	
13H	02H	MISALIGN_MEM_REF.LOAD_PAGE_SPLIT	Counts when a memory load of a uop that spans a page boundary (a split) is retired.	Precise Event
13H	04H	MISALIGN_MEM_REF.STORE_PAGE_SPLIT	Counts when a memory store of a uop that spans a page boundary (a split) is retired.	Precise Event
2EH	4FH	LONGEST_LAT_CACHE.REFERENCE	Counts memory requests originating from the core that reference a cache line in the L2 cache.	
2EH	41H	LONGEST_LAT_CACHE.MISS	Counts memory requests originating from the core that miss in the L2 cache.	
30H	00H	L2_REJECT_XQ.ALL	Counts the number of demand and prefetch transactions that the L2 XQ rejects due to a full or near full condition which likely indicates back pressure from the intra-die interconnect (IDI) fabric. The XQ may reject transactions from the L2Q (non-cacheable requests), L2 misses and L2 write-back victims.	
31H	00H	CORE_REJECT_L2Q.ALL	Counts the number of demand and L1 prefetcher requests rejected by the L2Q due to a full or nearly full condition which likely indicates back pressure from L2Q. It also counts requests that would have gone directly to the XQ, but are rejected due to a full or nearly full condition, indicating back pressure from the IDI link. The L2Q may also reject transactions from a core to ensure fairness between cores, or to delay a core's dirty eviction when the address conflicts with incoming external snoops.	
3CH	00H	CPU_CLK_UNHALTED.CORE_P	Core cycles when core is not halted. This event uses a programmable general purpose performance counter.	
3CH	01H	CPU_CLK_UNHALTED.REF	Reference cycles when core is not halted. This event uses a programmable general purpose performance counter.	
51H	01H	DL1.DIRTY_EVICTION	Counts when a modified (dirty) cache line is evicted from the data L1 cache and needs to be written back to memory. No count will occur if the evicted line is clean, and hence does not require a writeback.	

Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)

Event Num.	Umask Value	Event Name	Description	Comment
80H	01H	ICACHE.HIT	Counts requests to the Instruction Cache (ICache) for one or more bytes in an ICache Line and that cache line is in the Icache (hit). The event strives to count on a cache line basis, so that multiple accesses which hit in a single cache line count as one ICACHE.HIT. Specifically, the event counts when straight line code crosses the cache line boundary, or when a branch target is to a new line, and that cache line is in the ICache. This event counts differently than Intel processors based on the Silvermont microarchitecture.	
80H	02H	ICACHE.MISSES	Counts requests to the Instruction Cache (ICache) for one or more bytes in an ICache Line and that cache line is not in the Icache (miss). The event strives to count on a cache line basis, so that multiple accesses which miss in a single cache line count as one ICACHE.MISS. Specifically, the event counts when straight line code crosses the cache line boundary, or when a branch target is to a new line, and that cache line is not in the ICache. This event counts differently than Intel processors based on the Silvermont microarchitecture.	
80H	03H	ICACHE.ACCESSES	Counts requests to the Instruction Cache (ICache) for one or more bytes in an ICache Line. The event strives to count on a cache line basis, so that multiple fetches to a single cache line count as one ICACHE.ACCESS. Specifically, the event counts when accesses from straight line code crosses the cache line boundary, or when a branch target is to a new line. This event counts differently than Intel processors based on the Silvermont microarchitecture.	
81H	04H	ITLB.MISS	Counts the number of times the machine was unable to find a translation in the Instruction Translation Lookaside Buffer (ITLB) for a linear address of an instruction fetch. It counts when new translations are filled into the ITLB. The event is speculative in nature, but will not count translations (page walks) that are begun and not finished, or translations that are finished but not filled into the ITLB.	
86H	00H	FETCH_STALL.ALL	Counts cycles that fetch is stalled due to any reason. That is, the decoder queue is able to accept bytes, but the fetch unit is unable to provide bytes. This will include cycles due to an ITLB miss, ICache miss and other events.	
86H	01H	FETCH_STALL.ITLB_FILL_PENDING_CYCLES	Counts cycles that fetch is stalled due to an outstanding ITLB miss. That is, the decoder queue is able to accept bytes, but the fetch unit is unable to provide bytes due to an ITLB miss. Note: this event is not the same as page walk cycles to retrieve an instruction translation.	
86H	02H	FETCH_STALL.ICACHE_FILL_PENDING_CYCLES	Counts cycles that an ICache miss is outstanding, and instruction fetch is stalled. That is, the decoder queue is able to accept bytes, but the fetch unit is unable to provide bytes, while an Icache miss is outstanding. Note this event is not the same as cycles to retrieve an instruction due to an Icache miss. Rather, it is the part of the Instruction Cache (ICache) miss time where no bytes are available for the decoder.	

Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)

Event Num.	Umask Value	Event Name	Description	Comment
9CH	00H	UOPS_NOT_DELIVERED.ANY	This event is used to measure front-end inefficiencies, i.e., when the front end of the machine is not delivering uops to the back end and the back end has not stalled. This event can be used to identify if the machine is truly front-end bound. When this event occurs, it is an indication that the front end of the machine is operating at less than its theoretical peak performance. Background: We can think of the processor pipeline as being divided into 2 broader parts: the front end and the back end. The front end is responsible for fetching the instruction, decoding into uops in machine understandable format and putting them into a uop queue to be consumed by the back end. The back end then takes these uops and allocates the required resources. When all resources are ready, uops are executed. If the back end is not ready to accept uops from the front end, then we do not want to count these as front-end bottlenecks. However, whenever we have bottlenecks in the back end, we will have allocation unit stalls and eventually force the front end to wait until the back end is ready to receive more uops. This event counts only when the back end is requesting more micro-uops and the front end is not able to provide them. When 3 uops are requested and no uops are delivered, the event counts 3. When 3 are requested, and only 1 is delivered, the event counts 2. When only 2 are delivered, the event counts 1. Alternatively stated, the event will not count if 3 uops are delivered, or if the back end is stalled and not requesting any uops at all. Counts indicate missed opportunities for the front end to deliver a uop to the back end. Some examples of conditions that cause front-end efficiencies are: Icache misses, ITLB misses, and decoder restrictions that limit the front-end bandwidth. Known Issues: Some uops require multiple allocation slots. These uops will not be charged as a front end 'not delivered' opportunity, and will be regarded as a back-end problem. For example, the INC instruction has one uop that requires 2 issue slots. A stream of INC instructions will not count as UOPS_NOT_DELIVERED, even though only one instruction can be issued per clock. The low uop issue rate for a stream of INC instructions is considered to be a back-end issue.	
B7H	01H, 02H	OFFCORE_RESPONSE	Requires MSR_OFFCORE_RESP[0,1] to specify request type and response. (Duplicated for both MSRs.)	
C0H	00H	INST_RETIRED.ANY_P	Counts the number of instructions that retire execution. For instructions that consist of multiple uops, this event counts the retirement of the last uop of the instruction. The event continues counting during hardware interrupts, traps, and inside interrupt handlers. This is an architectural performance event. This event uses a programmable general purpose performance counter. *This event is a Precise Event: the EventingRIP field in the PEBS record is precise to the address of the instruction which caused the event. Note: Because PEBS records can be collected only on IA32_PMC0, only one event can use the PEBS facility at a time.	Precise Event
C2H	00H	UOPS_RETIRED.ANY	Counts uops which have retired.	Precise Event, Not Reduced Skid

Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)

Event Num.	Umask Value	Event Name	Description	Comment
C2H	01H	UOPS_RETIRED.MS	Counts uops retired that are from the complex flows issued by the micro-sequencer (MS). Counts both the uops from a micro-coded instruction, and the uops that might be generated from a micro-coded assist.	Precise Event, Not Reduced Skid
C2H	08H	UOPS_RETIRED.FPDIV	Counts the number of floating point divide uops retired.	Precise Event
C2H	10H	UOPS_RETIRED.IDIV	Counts the number of integer divide uops retired.	Precise Event
C3H	01H	MACHINE_CLEARS.SMC	Counts the number of times that the processor detects that a program is writing to a code section and has to perform a machine clear because of that modification. Self-modifying code (SMC) causes a severe penalty in all Intel architecture processors.	
C3H	02H	MACHINE_CLEARS.MEMORY_ORDERING	Counts machine clears due to memory ordering issues. This occurs when a snoop request happens and the machine is uncertain if memory ordering will be preserved as another core is in the process of modifying the data.	
C3H	04H	MACHINE_CLEARS.FP_ASSIST	Counts machine clears due to floating-point (FP) operations needing assists. For instance, if the result was a floating-point denormal, the hardware clears the pipeline and reissues uops to produce the correct IEEE compliant denormal result.	
C3H	08H	MACHINE_CLEARS.DISAMBIGUATION	Counts machine clears due to memory disambiguation. Memory disambiguation happens when a load which has been issued conflicts with a previous un-retired store in the pipeline whose address was not known at issue time, but is later resolved to be the same as the load address.	
C3H	00H	MACHINE_CLEARS.ALL	Counts machine clears for any reason.	
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Counts branch instructions retired for all branch types. This is an architectural performance event.	Precise Event
C4H	7EH	BR_INST_RETIRED.JCC	Counts retired Jcc (Jump on Conditional Code/Jump if Condition is Met) branch instructions retired, including both when the branch was taken and when it was not taken.	Precise Event
C4H	80H	BR_INST_RETIRED.ALL_TAKEN_BRANCHES	Counts the number of taken branch instructions retired.	Precise Event
C4H	FEH	BR_INST_RETIRED.TAKEN_JCC	Counts Jcc (Jump on Conditional Code/Jump if Condition is Met) branch instructions retired that were taken and does not count when the Jcc branch instruction were not taken.	Precise Event
C4H	F9H	BR_INST_RETIRED.CALL	Counts near CALL branch instructions retired.	Precise Event
C4H	FDH	BR_INST_RETIRED.REL_CALL	Counts near relative CALL branch instructions retired.	Precise Event
C4H	FBH	BR_INST_RETIRED.IND_CALL	Counts near indirect CALL branch instructions retired.	Precise Event
C4H	F7H	BR_INST_RETIRED.RETURN	Counts near return branch instructions retired.	Precise Event
C4H	EBH	BR_INST_RETIRED.NON_RETURN_IND	Counts near indirect call or near indirect jmp branch instructions retired.	Precise Event
C4H	BFH	BR_INST_RETIRED.FAR_BRANCH	Counts far branch instructions retired. This includes far jump, far call and return, and Interrupt call and return.	Precise Event
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Counts mispredicted branch instructions retired including all branch types.	Precise Event

Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)

Event Num.	Umask Value	Event Name	Description	Comment
C5H	7EH	BR_MISP_RETIRED.JCC	Counts mispredicted retired Jcc (Jump on Conditional Code/Jump if Condition is Met) branch instructions retired, including both when the branch was supposed to be taken and when it was not supposed to be taken (but the processor predicted the opposite condition).	Precise Event
C5H	FEH	BR_MISP_RETIRED.TAKEN_JCC	Counts mispredicted retired Jcc (Jump on Conditional Code/Jump if Condition is Met) branch instructions retired that were supposed to be taken but the processor predicted that it would not be taken.	Precise Event
C5H	FBH	BR_MISP_RETIRED.IND_CALL	Counts mispredicted near indirect CALL branch instructions retired, where the target address taken was not what the processor predicted.	Precise Event
C5H	F7H	BR_MISP_RETIRED.RETURN	Counts mispredicted near RET branch instructions retired, where the return address taken was not what the processor predicted.	Precise Event
C5H	EBH	BR_MISP_RETIRED.NON_RETURN_IND	Counts mispredicted branch instructions retired that were near indirect call or near indirect jmp, where the target address taken was not what the processor predicted.	Precise Event
CAH	01H	ISSUE_SLOTS_NOT_CONSUMED.RESOURCE_FULL	Counts the number of issue slots per core cycle that were not consumed because of a full resource in the back end. Including but not limited to resources include the Re-order Buffer (ROB), reservation stations (RS), load/store buffers, physical registers, or any other needed machine resource that is currently unavailable. Note that uops must be available for consumption in order for this event to fire. If a uop is not available (Instruction Queue is empty), this event will not count.	
CAH	02H	ISSUE_SLOTS_NOT_CONSUMED.RECOVERY	Counts the number of issue slots per core cycle that were not consumed by the back end because allocation is stalled waiting for a mispredicted jump to retire or other branch-like conditions (e.g. the event is relevant during certain microcode flows). Counts all issue slots blocked while within this window, including slots where uops were not available in the Instruction Queue.	
CAH	00H	ISSUE_SLOTS_NOT_CONSUMED.ANY	Counts the number of issue slots per core cycle that were not consumed by the back end due to either a full resource in the back end (RESOURCE_FULL), or due to the processor recovering from some event (RECOVERY).	
CBH	01H	HW_INTERRUPTS.RECEIVED	Counts hardware interrupts received by the processor.	
CBH	02H	HW_INTERRUPTS.MASKED	Counts the number of core cycles during which interrupts are masked (disabled). Increments by 1 each core cycle that EFLAGS.IF is 0, regardless of whether interrupts are pending or not.	
CBH	04H	HW_INTERRUPTS.PENDING_AND_MASKED	Counts core cycles during which there are pending interrupts, but interrupts are masked (EFLAGS.IF = 0).	
CDH	00H	CYCLES_DIV_BUSY.ALL	Counts core cycles if either divide unit is busy.	
CDH	01H	CYCLES_DIV_BUSY.IDIV	Counts core cycles if the integer divide unit is busy.	
CDH	02H	CYCLES_DIV_BUSY.FPDIV	Counts core cycles if the floating point divide unit is busy.	
D0H	81H	MEM_UOPS_RETIRED.ALL_LOADS	Counts the number of load uops retired.	Precise Event
D0H	82H	MEM_UOPS_RETIRED.ALL_STORES	Counts the number of store uops retired.	Precise Event

Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)

Event Num.	Umask Value	Event Name	Description	Comment
D0H	83H	MEM_UOPS_RETIRED.ALL	Counts the number of memory uops retired that are either a load or a store or both.	Precise Event
D0H	11H	MEM_UOPS_RETIRED.DTLB_MISS_LOADS	Counts load uops retired that caused a DTLB miss.	Precise Event
D0H	12H	MEM_UOPS_RETIRED.DTLB_MISS_STORES	Counts store uops retired that caused a DTLB miss.	Precise Event
D0H	13H	MEM_UOPS_RETIRED.DTLB_MISS	Counts uops retired that had a DTLB miss on load, store or either. Note that when two distinct memory operations to the same page miss the DTLB, only one of them will be recorded as a DTLB miss.	Precise Event
D0H	21H	MEM_UOPS_RETIRED.LOCK_LOADS	Counts locked memory uops retired. This includes 'regular' locks and bus locks. To specifically count bus locks only, see the offcore response event. A locked access is one with a lock prefix, or an exchange to memory.	Precise Event
D0H	41H	MEM_UOPS_RETIRED.SPLIT_LOADS	Counts load uops retired where the data requested spans a 64 byte cache line boundary.	Precise Event
D0H	42H	MEM_UOPS_RETIRED.SPLIT_STORES	Counts store uops retired where the data requested spans a 64 byte cache line boundary.	Precise Event
D0H	43H	MEM_UOPS_RETIRED.SPLIT	Counts memory uops retired where the data requested spans a 64 byte cache line boundary.	Precise Event
D1H	01H	MEM_LOAD_UOPS_RETIRED.L1_HIT	Counts load uops retired that hit the L1 data cache.	Precise Event
D1H	08H	MEM_LOAD_UOPS_RETIRED.L1_MISS	Counts load uops retired that miss the L1 data cache.	Precise Event
D1H	02H	MEM_LOAD_UOPS_RETIRED.L2_HIT	Counts load uops retired that hit in the L2 cache.	Precise Event
0xD1H	10H	MEM_LOAD_UOPS_RETIRED.L2_MISS	Counts load uops retired that miss in the L2 cache.	Precise Event
D1H	20H	MEM_LOAD_UOPS_RETIRED.HITM	Counts load uops retired where the cache line containing the data was in the modified state of another core or modules cache (HITM). More specifically, this means that when the load address was checked by other caching agents (typically another processor) in the system, one of those caching agents indicated that they had a dirty copy of the data. Loads that obtain a HITM response incur greater latency than most that is typical for a load. In addition, since HITM indicates that some other processor had this data in its cache, it implies that the data was shared between processors, or potentially was a lock or semaphore value. This event is useful for locating sharing, false sharing, and contended locks.	Precise Event

Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)

Event Num.	Umask Value	Event Name	Description	Comment
D1H	40H	MEM_LOAD_UOPS_RETIRED.WCB_HIT	Counts memory load uops retired where the data is retrieved from the WCB (or fill buffer), indicating that the load found its data while that data was in the process of being brought into the L1 cache. Typically a load will receive this indication when some other load or prefetch missed the L1 cache and was in the process of retrieving the cache line containing the data, but that process had not yet finished (and written the data back to the cache). For example, consider load X and Y, both referencing the same cache line that is not in the L1 cache. If load X misses cache first, it obtains and WCB (or fill buffer) begins the process of requesting the data. When load Y requests the data, it will either hit the WCB, or the L1 cache, depending on exactly what time the request to Y occurs.	Precise Event
D1H	80H	MEM_LOAD_UOPS_RETIRED.DRAM_HIT	Counts memory load uops retired where the data is retrieved from DRAM. Event is counted at retirement, so the speculative loads are ignored. A memory load can hit (or miss) the L1 cache, hit (or miss) the L2 cache, hit DRAM, hit in the WCB or receive a HITM response.	Precise Event
E6H	01H	BACLEARS.ALL	Counts the number of times a BACLEAR is signaled for any reason, including, but not limited to indirect branch/call, Jcc (Jump on Conditional Code/Jump if Condition is Met) branch, unconditional branch/call, and returns.	
E6H	08H	BACLEARS.RETURN	Counts BACLEARS on return instructions.	
E6H	10H	BACLEARS.COND	Counts BACLEARS on Jcc (Jump on Conditional Code/Jump if Condition is Met) branches.	
E7H	01H	MS_DECODED.MS_ENTRY	Counts the number of times the Microcode Sequencer (MS) starts a flow of uops from the MSROM. It does not count every time a uop is read from the MSROM. The most common case that this counts is when a micro-coded instruction is encountered by the front end of the machine. Other cases include when an instruction encounters a fault, trap, or microcode assist of any sort that initiates a flow of uops. The event will count MS startups for uops that are speculative, and subsequently cleared by branch mispredict or a machine clear.	
E9H	01H	DECODE_RESTRICTION.PREDECODE_WRONG	Counts the number of times the prediction (from the pre-decode cache) for instruction length is incorrect.	

19.15 PERFORMANCE MONITORING EVENTS FOR PROCESSORS BASED ON THE SILVERMONT MICROARCHITECTURE

Processors based on the Silvermont microarchitecture support the architectural performance monitoring events listed in Table 19-1 and fixed-function performance events using fixed counter. In addition, they also support the following model-specific performance monitoring events listed in Table 19-28. These processors have the CPUID signatures of 06_37H, 06_4AH, 06_4DH, 06_5AH, and 06_5DH.

Performance monitoring event descriptions may refer to terminology described in Section B.2, "Intel® Xeon® processor 5500 Series," in Appendix B of the *Intel® 64 and IA-32 Architectures Optimization Reference Manual*.

Table 19-28. Performance Events for Silvermont Microarchitecture

Event Num.	Umask Value	Event Name	Definition	Description and Comment
03H	01H	REHABQ.LD_BLOCK_ST_FORWARD	Loads blocked due to store forward restriction.	This event counts the number of retired loads that were prohibited from receiving forwarded data from the store because of address mismatch.
03H	02H	REHABQ.LD_BLOCK_STD_NOTREADY	Loads blocked due to store data not ready.	This event counts the cases where a forward was technically possible, but did not occur because the store data was not available at the right time.
03H	04H	REHABQ.ST_SPLITS	Store uops that split cache line boundary.	This event counts the number of retire stores that experienced cache line boundary splits.
03H	08H	REHABQ.LD_SPLITS	Load uops that split cache line boundary.	This event counts the number of retire loads that experienced cache line boundary splits.
03H	10H	REHABQ.LOCK	Uops with lock semantics.	This event counts the number of retired memory operations with lock semantics. These are either implicit locked instructions such as the XCHG instruction or instructions with an explicit LOCK prefix (F0H).
03H	20H	REHABQ.STA_FULL	Store address buffer full.	This event counts the number of retired stores that are delayed because there is not a store address buffer available.
03H	40H	REHABQ.ANY_LD	Any reissued load uops.	This event counts the number of load uops reissued from Rehabq.
03H	80H	REHABQ.ANY_ST	Any reissued store uops.	This event counts the number of store uops reissued from Rehabq.
04H	01H	MEM_UOPS_RETIRED.L1_MISS_LOADS	Loads retired that missed L1 data cache.	This event counts the number of load ops retired that miss in L1 Data cache. Note that prefetch misses will not be counted.
04H	02H	MEM_UOPS_RETIRED.L2_HIT_LOADS	Loads retired that hit L2.	This event counts the number of load micro-ops retired that hit L2.
04H	04H	MEM_UOPS_RETIRED.L2_MISS_LOADS	Loads retired that missed L2.	This event counts the number of load micro-ops retired that missed L2.
04H	08H	MEM_UOPS_RETIRED.DTLB_MISS_LOADS	Loads missed DTLB.	This event counts the number of load ops retired that had DTLB miss.
04H	10H	MEM_UOPS_RETIRED.UTLB_MISS	Loads missed UTLB.	This event counts the number of load ops retired that had UTLB miss.
04H	20H	MEM_UOPS_RETIRED.HITM	Cross core or cross module hitm.	This event counts the number of load ops retired that got data from the other core or from the other module.
04H	40H	MEM_UOPS_RETIRED.ALL_LOADS	All Loads.	This event counts the number of load ops retired.
04H	80H	MEM_UOP_RETIRED.ALL_STORES	All Stores.	This event counts the number of store ops retired.
05H	01H	PAGE_WALKS.D_SIDE_CYCLES	Duration of D-side page-walks in core cycles.	This event counts every cycle when a D-side (walks due to a load) page walk is in progress. Page walk duration divided by number of page walks is the average duration of page-walks. Edge trigger bit must be cleared. Set Edge to count the number of page walks.
05H	02H	PAGE_WALKS.I_SIDE_CYCLES	Duration of I-side page-walks in core cycles.	This event counts every cycle when an I-side (walks due to an instruction fetch) page walk is in progress. Page walk duration divided by number of page walks is the average duration of page-walks. Edge trigger bit must be cleared. Set Edge to count the number of page walks.

Table 19-28. Performance Events for Silvermont Microarchitecture

Event Num.	Umask Value	Event Name	Definition	Description and Comment
05H	03H	PAGE_WALKS.WALKS	Total number of page-walks that are completed (I-side and D-side).	This event counts when a data (D) page walk or an instruction (I) page walk is completed or started. Since a page walk implies a TLB miss, the number of TLB misses can be counted by counting the number of pagewalks. Edge trigger bit must be set. Clear Edge to count the number of cycles.
2EH	41H	LONGEST_LAT_CACHE.MISS	L2 cache request misses.	This event counts the total number of L2 cache references and the number of L2 cache misses respectively. L3 is not supported in Silvermont microarchitecture.
2EH	4FH	LONGEST_LAT_CACHE.REFERENCE	L2 cache requests from this core.	This event counts requests originating from the core that references a cache line in the L2 cache. L3 is not supported in Silvermont microarchitecture.
30H	00H	L2_REJECT_XQ.ALL	Counts the number of request from the L2 that were not accepted into the XQ.	This event counts the number of demand and prefetch transactions that the L2 XQ rejects due to a full or near full condition which likely indicates back pressure from the IDI link. The XQ may reject transactions from the L2Q (non-cacheable requests), BBS (L2 misses) and WOB (L2 write-back victims).
31H	00H	CORE_REJECT_L2Q.ALL	Counts the number of request that were not accepted into the L2Q because the L2Q is FULL.	This event counts the number of demand and L1 prefetcher requests rejected by the L2Q due to a full or nearly full condition which likely indicates back pressure from L2Q. It also counts requests that would have gone directly to the XQ, but are rejected due to a full or nearly full condition, indicating back pressure from the IDI link. The L2Q may also reject transactions from a core to insure fairness between cores, or to delay a core's dirty eviction when the address conflicts incoming external snoops. (Note that L2 prefetcher requests that are dropped are not counted by this event.).
3CH	00H	CPU_CLK_UNHALTED.CORE_P	Core cycles when core is not halted.	This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. In mobile systems the core frequency may change from time to time. For this reason this event may have a changing ratio with regards to time.
N/A	N/A	CPU_CLK_UNHALTED.CORE	Core cycles when core is not halted.	This uses the fixed counter 1 to count the same condition as CPU_CLK_UNHALTED.CORE_P does.
3CH	01H	CPU_CLK_UNHALTED.REF_P	Bus cycles when core is not halted.	This event counts the number of bus cycles that the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. In mobile systems the core frequency may change from time. This event is not affected by core frequency changes.
N/A	N/A	CPU_CLK_UNHALTED.REF_TSC	Reference cycles when core is not halted.	This event counts the number of reference cycles at a TSC rate that the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. In mobile systems the core frequency may change from time. This event is not affected by core frequency changes.
80H	01H	ICACHE.HIT	Instruction fetches from Icache.	This event counts all instruction fetches from the instruction cache.
80H	02H	ICACHE.MISSES	Icache miss.	This event counts all instruction fetches that miss the Instruction cache or produce memory requests. This includes uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.

Table 19-28. Performance Events for Silvermont Microarchitecture

Event Num.	Umask Value	Event Name	Definition	Description and Comment
80H	03H	ICACHE.ACCESSES	Instruction fetches.	This event counts all instruction fetches, including uncacheable fetches.
B7H	01H	OFFCORE_RESPONSE_0	See Section 18.5.2.2.	Requires MSR_OFFCORE_RESP0 to specify request type and response.
B7H	02H	OFFCORE_RESPONSE_1	See Section 18.5.2.2.	Requires MSR_OFFCORE_RESP1 to specify request type and response.
C0H	00H	INST_RETIRED.ANY_P	Instructions retired (PEBS supported with IA32_PMC0).	This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers.
N/A	N/A	INST_RETIRED.ANY	Instructions retired.	This uses the fixed counter 0 to count the same condition as INST_RETIRED.ANY_P does.
C2H	01H	UOPS_RETIRED.MS	MSROM micro-ops retired.	This event counts the number of micro-ops retired that were supplied from MSROM.
C2H	10H	UOPS_RETIRED.ALL	Micro-ops retired.	This event counts the number of micro-ops retired.
C3H	01H	MACHINE_CLEARS.SMC	Self-Modifying Code detected.	This event counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel® architecture processors.
C3H	02H	MACHINE_CLEARS.MEMORY_ORDERING	Stalls due to Memory ordering.	This event counts the number of times that pipeline was cleared due to memory ordering issues.
C3H	04H	MACHINE_CLEARS.FP_ASSIST	Stalls due to FP assists.	This event counts the number of times that pipeline stalled due to FP operations needing assists.
C3H	08H	MACHINE_CLEARS.ALL	Stalls due to any causes.	This event counts the number of times that pipeline stalled due to due to any causes (including SMC, MO, FP assist, etc.).
C4H	00H	BR_INST_RETIRED.ALL_BRANCHES	Retired branch instructions.	This event counts the number of branch instructions retired.
C4H	7EH	BR_INST_RETIRED.JCC	Retired branch instructions that were conditional jumps.	This event counts the number of branch instructions retired that were conditional jumps.
C4H	BFH	BR_INST_RETIRED.FAR_BRANCH	Retired far branch instructions.	This event counts the number of far branch instructions retired.
C4H	EBH	BR_INST_RETIRED.NON_RETURN_IND	Retired instructions of near indirect Jmp or call.	This event counts the number of branch instructions retired that were near indirect call or near indirect jmp.
C4H	F7H	BR_INST_RETIRED.RETURN	Retired near return instructions.	This event counts the number of near RET branch instructions retired.
C4H	F9H	BR_INST_RETIRED.CALL	Retired near call instructions.	This event counts the number of near CALL branch instructions retired.
C4H	FBH	BR_INST_RETIRED.IND_CALL	Retired near indirect call instructions.	This event counts the number of near indirect CALL branch instructions retired.
C4H	FDH	BR_INST_RETIRED.REL_CALL	Retired near relative call instructions.	This event counts the number of near relative CALL branch instructions retired.
C4H	FEH	BR_INST_RETIRED.TAKEN_JCC	Retired conditional jumps that were taken.	This event counts the number of branch instructions retired that were conditional jumps and taken.
C5H	00H	BR_MISP_RETIRED.ALL_BRANCHES	Retired mispredicted branch instructions.	This event counts the number of mispredicted branch instructions retired.

Table 19-28. Performance Events for Silvermont Microarchitecture

Event Num.	Umask Value	Event Name	Definition	Description and Comment
C5H	7EH	BR_MISP_RETIRED.JCC	Retired mispredicted conditional jumps.	This event counts the number of mispredicted branch instructions retired that were conditional jumps.
C5H	BFH	BR_MISP_RETIRED.FAR	Retired mispredicted far branch instructions.	This event counts the number of mispredicted far branch instructions retired.
C5H	EBH	BR_MISP_RETIRED.NON_RETURN_IND	Retired mispredicted instructions of near indirect Jmp or call.	This event counts the number of mispredicted branch instructions retired that were near indirect call or near indirect jmp.
C5H	F7H	BR_MISP_RETIRED.RETURN	Retired mispredicted near return instructions.	This event counts the number of mispredicted near RET branch instructions retired.
C5H	F9H	BR_MISP_RETIRED.CALL	Retired mispredicted near call instructions.	This event counts the number of mispredicted near CALL branch instructions retired.
C5H	FBH	BR_MISP_RETIRED.IND_CALL	Retired mispredicted near indirect call instructions.	This event counts the number of mispredicted near indirect CALL branch instructions retired.
C5H	FDH	BR_MISP_RETIRED.REL_CALL	Retired mispredicted near relative call instructions	This event counts the number of mispredicted near relative CALL branch instructions retired.
C5H	FEH	BR_MISP_RETIRED.TAKEN_JCC	Retired mispredicted conditional jumps that were taken.	This event counts the number of mispredicted branch instructions retired that were conditional jumps and taken.
CAH	01H	NO_ALLOC_CYCLES.ROB_FULL	Counts the number of cycles when no uops are allocated and the ROB is full (less than 2 entries available).	Counts the number of cycles when no uops are allocated and the ROB is full (less than 2 entries available).
CAH	20H	NO_ALLOC_CYCLES.RAT_STALL	Counts the number of cycles when no uops are allocated and a RATstall is asserted.	Counts the number of cycles when no uops are allocated and a RATstall is asserted.
CAH	3FH	NO_ALLOC_CYCLES.ALL	Front end not delivering.	This event counts the number of cycles when the front end does not provide any instructions to be allocated for any reason.
CAH	50H	NO_ALLOC_CYCLES.NOT_DELIVERED	Front end not delivering back end not stalled.	This event counts the number of cycles when the front end does not provide any instructions to be allocated but the back end is not stalled.
CBH	01H	RS_FULL_STALL.MEC	MEC RS full.	This event counts the number of cycles the allocation pipe line stalled due to the RS for the MEC cluster is full.
CBH	1FH	RS_FULL_STALL.ALL	Any RS full.	This event counts the number of cycles that the allocation pipe line stalled due to any one of the RS is full.
CDH	01H	CYCLES_DIV_BUSY.ANY	Divider Busy.	This event counts the number of cycles the divider is busy.
E6H	01H	BACLEARS.ALL	BACLEARS asserted for any branch.	This event counts the number of baclears for any type of branch.
E6H	08H	BACLEARS.RETURN	BACLEARS asserted for return branch.	This event counts the number of baclears for return branches.

Table 19-28. Performance Events for Silvermont Microarchitecture

Event Num.	Umask Value	Event Name	Definition	Description and Comment
E6H	10H	BACLEARS.COND	BACLEARS asserted for conditional branch.	This event counts the number of baclears for conditional branches.
E7H	01H	MS_DECODED.MS_ENTRY	MS Decode starts.	This event counts the number of times the MSROM starts a flow of UOPS.

19.15.1 Performance Monitoring Events for Processors Based on the Airmont Microarchitecture

Intel processors based on the Airmont microarchitecture support the same architectural and the model-specific performance monitoring events as processors based on the Silvermont microarchitecture. All of the events listed in Table 19-28 apply. These processors have the CPUID signatures that include 06_4CH.

19.16 PERFORMANCE MONITORING EVENTS FOR 45 NM AND 32 NM INTEL® ATOM™ PROCESSORS

45 nm and 32 nm processors based on the Intel® Atom™ microarchitecture support the architectural performance monitoring events listed in Table 19-1 and fixed-function performance events using fixed counter listed in Table 19-24. In addition, they also support the following model-specific performance monitoring events listed in Table 19-29.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
02H	81H	STORe_FORWARDS.GOOD	Good store forwards.	This event counts the number of times store data was forwarded directly to a load.
06H	00H	SEGMENT_REG_LOADS.ANY	Number of segment register loads.	This event counts the number of segment register load operations. Instructions that load new values into segment registers cause a penalty. This event indicates performance issues in 16-bit code. If this event occurs frequently, it may be useful to calculate the number of instructions retired per segment register load. If the resulting calculation is low (on average a small number of instructions are executed between segment register loads), then the code's segment register usage should be optimized. As a result of branch misprediction, this event is speculative and may include segment register loads that do not actually occur. However, most segment register loads are internally serialized and such speculative effects are minimized.
07H	01H	PREFETCH.PREFETCHT0	Streaming SIMD Extensions (SSE) PrefetchT0 instructions executed.	This event counts the number of times the SSE instruction prefetchT0 is executed. This instruction prefetches the data to the L1 data cache and L2 cache.
07H	06H	PREFETCH.SW_L2	Streaming SIMD Extensions (SSE) PrefetchT1 and PrefetchT2 instructions executed.	This event counts the number of times the SSE instructions prefetchT1 and prefetchT2 are executed. These instructions prefetch the data to the L2 cache.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
07H	08H	PREFETCH.PREFETCHNTA	Streaming SIMD Extensions (SSE) Prefetch NTA instructions executed.	This event counts the number of times the SSE instruction prefetchNTA is executed. This instruction prefetches the data to the L1 data cache.
08H	07H	DATA_TLB_MISSES.DTLB_MISS	Memory accesses that missed the DTLB.	This event counts the number of Data Table Lookaside Buffer (DTLB) misses. The count includes misses detected as a result of speculative accesses. Typically a high count for this event indicates that the code accesses a large number of data pages.
08H	05H	DATA_TLB_MISSES.DTLB_MISS_LD	DTLB misses due to load operations.	This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to load operations. This count includes misses detected as a result of speculative accesses.
08H	09H	DATA_TLB_MISSES.L0_DTLB_MISS_LD	L0_DTLB misses due to load operations.	This event counts the number of L0_DTLB misses due to load operations. This count includes misses detected as a result of speculative accesses.
08H	06H	DATA_TLB_MISSES.DTLB_MISS_ST	DTLB misses due to store operations.	This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to store operations. This count includes misses detected as a result of speculative accesses.
0CH	03H	PAGE_WALKS.WALKS	Number of page-walks executed.	This event counts the number of page-walks executed due to either a DTLB or ITLB miss. The page walk duration, PAGE_WALKS.CYCLES, divided by number of page walks is the average duration of a page walk. This can hint to whether most of the page-walks are satisfied by the caches or cause an L2 cache miss. Edge trigger bit must be set.
0CH	03H	PAGE_WALKS.CYCLES	Duration of page-walks in core cycles.	This event counts the duration of page-walks in core cycles. The paging mode in use typically affects the duration of page walks. Page walk duration divided by number of page walks is the average duration of page-walks. This can hint at whether most of the page-walks are satisfied by the caches or cause an L2 cache miss. Edge trigger bit must be cleared.
10H	01H	X87_COMP_OPS_EXE.ANY.S	Floating point computational micro-ops executed.	This event counts the number of x87 floating point computational micro-ops executed.
10H	81H	X87_COMP_OPS_EXE.ANY.AR	Floating point computational micro-ops retired.	This event counts the number of x87 floating point computational micro-ops retired.
11H	01H	FP_ASSIST	Floating point assists.	This event counts the number of floating point operations executed that required micro-code assist intervention. These assists are required in the following cases. X87 instructions: 1. NaN or denormal are loaded to a register or used as input from memory. 2. Division by 0. 3. Underflow output.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
11H	81H	FP_ASSIST.AR	Floating point assists.	This event counts the number of floating point operations executed that required micro-code assist intervention. These assists are required in the following cases. X87 instructions: 1. NaN or denormal are loaded to a register or used as input from memory. 2. Division by 0. 3. Underflow output.
12H	01H	MUL.S	Multiply operations executed.	This event counts the number of multiply operations executed. This includes integer as well as floating point multiply operations.
12H	81H	MUL.AR	Multiply operations retired.	This event counts the number of multiply operations retired. This includes integer as well as floating point multiply operations.
13H	01H	DIV.S	Divide operations executed.	This event counts the number of divide operations executed. This includes integer divides, floating point divides and square-root operations executed.
13H	81H	DIV.AR	Divide operations retired.	This event counts the number of divide operations retired. This includes integer divides, floating point divides and square-root operations executed.
14H	01H	CYCLES_DIV_BUSY	Cycles the driver is busy.	This event counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE.
21H	See Table 18-61	L2_ADS	Cycles L2 address bus is in use.	This event counts the number of cycles the L2 address bus is being used for accesses to the L2 cache or bus queue. This event can count occurrences for this core or both cores.
22H	See Table 18-61	L2_DBUS_BUSY	Cycles the L2 cache data bus is busy.	This event counts core cycles during which the L2 cache data bus is busy transferring data from the L2 cache to the core. It counts for all L1 cache misses (data and instruction) that hit the L2 cache. The count will increment by two for a full cache-line request.
24H	See Table 18-61 and Table 18-63	L2_LINES_IN	L2 cache misses.	This event counts the number of cache lines allocated in the L2 cache. Cache lines are allocated in the L2 cache as a result of requests from the L1 data and instruction caches and the L2 hardware prefetchers to cache lines that are missing in the L2 cache. This event can count occurrences for this core or both cores. This event can also count demand requests and L2 hardware prefetch requests together or separately.
25H	See Table 18-61	L2_M_LINES_IN	L2 cache line modifications.	This event counts whenever a modified cache line is written back from the L1 data cache to the L2 cache. This event can count occurrences for this core or both cores.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
26H	See Table 18-61 and Table 18-63	L2_LINES_OUT	L2 cache lines evicted.	This event counts the number of L2 cache lines evicted. This event can count occurrences for this core or both cores. This event can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.
27H	See Table 18-61 and Table 18-63	L2_M_LINES_OUT	Modified lines evicted from the L2 cache.	This event counts the number of L2 modified cache lines evicted. These lines are written back to memory unless they also exist in a shared-state in one of the L1 data caches. This event can count occurrences for this core or both cores. This event can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.
28H	See Table 18-61 and Table 18-64	L2_IFETCH	L2 cacheable instruction fetch requests.	This event counts the number of instruction cache line requests from the ICache. It does not include fetch requests from uncacheable memory. It does not include ITLB miss accesses. This event can count occurrences for this core or both cores. This event can also count accesses to cache lines at different MESI states.
29H	See Table 18-61, Table 18-63 and Table 18-64	L2_LD	L2 cache reads.	This event counts L2 cache read requests coming from the L1 data cache and L2 prefetchers. This event can count occurrences for this core or both cores. This event can count occurrences - for this core or both cores. - due to demand requests and L2 hardware prefetch requests together or separately. - of accesses to cache lines at different MESI states.
2AH	See Table 18-61 and Table 18-64	L2_ST	L2 store requests.	This event counts all store operations that miss the L1 data cache and request the data from the L2 cache. This event can count occurrences for this core or both cores. This event can also count accesses to cache lines at different MESI states.
2BH	See Table 18-61 and Table 18-64	L2_LOCK	L2 locked accesses.	This event counts all locked accesses to cache lines that miss the L1 data cache. This event can count occurrences for this core or both cores. This event can also count accesses to cache lines at different MESI states.
2EH	See Table 18-61, Table 18-63 and Table 18-64	L2_RQSTS	L2 cache requests.	This event counts all completed L2 cache requests. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, instruction fetches, and all L2 hardware prefetch requests. This event can count occurrences - for this core or both cores. - due to demand requests and L2 hardware prefetch requests together, or separately. - of accesses to cache lines at different MESI states.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
2EH	41H	L2_RQSTS.SELF.DEMAND.I_STATE	L2 cache demand requests from this core that missed the L2.	This event counts all completed L2 cache demand requests from this core that miss the L2 cache. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches. This is an architectural performance event.
2EH	4FH	L2_RQSTS.SELF.DEMAND.MESI	L2 cache demand requests from this core.	This event counts all completed L2 cache demand requests from this core. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches. This is an architectural performance event.
30H	See Table 18-61, Table 18-63 and Table 18-64	L2_REJECT_BUSQ	Rejected L2 cache requests.	This event indicates that a pending L2 cache request that requires a bus transaction is delayed from moving to the bus queue. Some of the reasons for this event are: - The bus queue is full. - The bus queue already holds an entry for a cache line in the same set. The number of events is greater or equal to the number of requests that were rejected. - For this core or both cores. - Due to demand requests and L2 hardware prefetch requests together, or separately. - Of accesses to cache lines at different MESI states.
32H	See Table 18-61	L2_NO_REQ	Cycles no L2 cache requests are pending.	This event counts the number of cycles that no L2 cache requests are pending.
3AH	00H	EIST_TRANS	Number of Enhanced Intel SpeedStep(R) Technology (EIST) transitions.	This event counts the number of Enhanced Intel SpeedStep(R) Technology (EIST) transitions that include a frequency change, either with or without VID change. This event is incremented only while the counting core is in C0 state. In situations where an EIST transition was caused by hardware as a result of CxE state transitions, those EIST transitions will also be registered in this event. Enhanced Intel Speedstep Technology transitions are commonly initiated by OS, but can be initiated by HW internally. For example: CxE states are C-states (C1,C2,C3...) which not only place the CPU into a sleep state by turning off the clock and other components, but also lower the voltage (which reduces the leakage power consumption). The same is true for thermal throttling transition which uses Enhanced Intel Speedstep Technology internally.
3BH	C0H	THERMAL_TRIP	Number of thermal trips.	This event counts the number of thermal trips. A thermal trip occurs whenever the processor temperature exceeds the thermal trip threshold temperature. Following a thermal trip, the processor automatically reduces frequency and voltage. The processor checks the temperature every millisecond, and returns to normal when the temperature falls below the thermal trip threshold temperature.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
3CH	00H	CPU_CLK_UNHALTED.CORE_P	Core cycles when core is not halted.	This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios. In mobile systems the core frequency may change from time to time. For this reason this event may have a changing ratio with regards to time. In systems with a constant core frequency, this event can give you a measurement of the elapsed time while the core was not in halt state by dividing the event count by the core frequency. -This is an architectural performance event. - The event CPU_CLK_UNHALTED.CORE_P is counted by a programmable counter. - The event CPU_CLK_UNHALTED.CORE is counted by a designated fixed counter, leaving the two programmable counters available for other events.
3CH	01H	CPU_CLK_UNHALTED.BUS	Bus cycles when core is not halted.	This event counts the number of bus cycles while the core is not in the halt state. This event can give you a measurement of the elapsed time while the core was not in the halt state, by dividing the event count by the bus frequency. The core enters the halt state when it is running the HLT instruction. The event also has a constant ratio with CPU_CLK_UNHALTED.REF event, which is the maximum bus to processor frequency ratio. Non-halted bus cycles are a component in many key event ratios.
3CH	02H	CPU_CLK_UNHALTED.NO_OTHER	Bus cycles when core is active and the other is halted.	This event counts the number of bus cycles during which the core remains non-halted, and the other core on the processor is halted. This event can be used to determine the amount of parallelism exploited by an application or a system. Divide this event count by the bus frequency to determine the amount of time that only one core was in use.
40H	21H	L1D_CACHE.LD	L1 Cacheable Data Reads.	This event counts the number of data reads from cacheable memory.
40H	22H	L1D_CACHE.ST	L1 Cacheable Data Writes.	This event counts the number of data writes to cacheable memory.
60H	See Table 18-61 and Table 18-62.	BUS_REQUEST_OUTSTANDING	Outstanding cacheable data read bus requests duration.	This event counts the number of pending full cache line read transactions on the bus occurring in each cycle. A read transaction is pending from the cycle it is sent on the bus until the full cache line is received by the processor. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
61H	See Table 18-62.	BUS_BNR_DRV	Number of Bus Not Ready signals asserted.	This event counts the number of Bus Not Ready (BNR) signals that the processor asserts on the bus to suspend additional bus requests by other bus agents. A bus agent asserts the BNR signal when the number of data and snoop transactions is close to the maximum that the bus can handle. While this signal is asserted, new transactions cannot be submitted on the bus. As a result, transaction latency may have higher impact on program performance. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
62H	See Table 18-62.	BUS_DRDY_CLOCKS	Bus cycles when data is sent on the bus.	This event counts the number of bus cycles during which the DRDY (Data Ready) signal is asserted on the bus. The DRDY signal is asserted when data is sent on the bus. This event counts the number of bus cycles during which this agent (the processor) writes data on the bus back to memory or to other bus agents. This includes all explicit and implicit data writebacks, as well as partial writes. Note: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
63H	See Table 18-61 and Table 18-62.	BUS_LOCK_CLOCKS	Bus cycles when a LOCK signal is asserted.	This event counts the number of bus cycles, during which the LOCK signal is asserted on the bus. A LOCK signal is asserted when there is a locked memory access, due to: - Uncacheable memory. - Locked operation that spans two cache lines. - Page-walk from an uncacheable page table. Bus locks have a very high performance penalty and it is highly recommended to avoid such accesses. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
64H	See Table 18-61.	BUS_DATA_RCV	Bus cycles while processor receives data.	This event counts the number of cycles during which the processor is busy receiving data. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
65H	See Table 18-61 and Table 18-62.	BUS_TRANS_BRD	Burst read bus transactions.	This event counts the number of burst read transactions including: - L1 data cache read misses (and L1 data cache hardware prefetches). - L2 hardware prefetches by the DPL and L2 streamer. - IFU read misses of cacheable lines. It does not include RFO transactions.
66H	See Table 18-61 and Table 18-62.	BUS_TRANS_RFO	RFO bus transactions.	This event counts the number of Read For Ownership (RFO) bus transactions, due to store operations that miss the L1 data cache and the L2 cache. This event also counts RFO bus transactions due to locked operations.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
67H	See Table 18-61 and Table 18-62.	BUS_TRANS_WB	Explicit writeback bus transactions.	This event counts all explicit writeback bus transactions due to dirty line evictions. It does not count implicit writebacks due to invalidation by a snoop request.
68H	See Table 18-61 and Table 18-62.	BUS_TRANS_IFETCH	Instruction-fetch bus transactions.	This event counts all instruction fetch full cache line bus transactions.
69H	See Table 18-61 and Table 18-62.	BUS_TRANS_INVAL	Invalidate bus transactions.	This event counts all invalidate transactions. Invalidate transactions are generated when: - A store operation hits a shared line in the L2 cache. - A full cache line write misses the L2 cache or hits a shared line in the L2 cache.
6AH	See Table 18-61 and Table 18-62.	BUS_TRANS_PWR	Partial write bus transaction.	This event counts partial write bus transactions.
6BH	See Table 18-61 and Table 18-62.	BUS_TRANS_P	Partial bus transactions.	This event counts all (read and write) partial bus transactions.
6CH	See Table 18-61 and Table 18-62.	BUS_TRANS_IO	IO bus transactions.	This event counts the number of completed I/O bus transactions as a result of IN and OUT instructions. The count does not include memory mapped IO.
6DH	See Table 18-61 and Table 18-62.	BUS_TRANS_DEF	Deferred bus transactions.	This event counts the number of deferred transactions.
6EH	See Table 18-61 and Table 18-62.	BUS_TRANS_BURST	Burst (full cache-line) bus transactions.	This event counts burst (full cache line) transactions including: - Burst reads. - RFOs. - Explicit writebacks. - Write combine lines.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
6FH	See Table 18-61 and Table 18-62.	BUS_TRANS_MEM	Memory bus transactions.	This event counts all memory bus transactions including: - Burst transactions. - Partial reads and writes. - Invalidate transactions. The BUS_TRANS_MEM count is the sum of BUS_TRANS_BURST, BUS_TRANS_P and BUS_TRANS_INVAL.
70H	See Table 18-61 and Table 18-62.	BUS_TRANS_ANY	All bus transactions.	This event counts all bus transactions. This includes: - Memory transactions. - IO transactions (non memory-mapped). - Deferred transaction completion. - Other less frequent transactions, such as interrupts.
77H	See Table 18-61 and Table 18-64.	EXT_SNOOP	External snoops.	This event counts the snoop responses to bus transactions. Responses can be counted separately by type and by bus agent. Note: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
7AH	See Table 18-62.	BUS_HIT_DRV	HIT signal asserted.	This event counts the number of bus cycles during which the processor drives the HIT# pin to signal HIT snoop response. Note: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
7BH	See Table 18-62.	BUS_HITM_DRV	HITM signal asserted.	This event counts the number of bus cycles during which the processor drives the HITM# pin to signal HITM snoop response. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
7DH	See Table 18-61.	BUSQ_EMPTY	Bus queue is empty.	This event counts the number of cycles during which the core did not have any pending transactions in the bus queue. Note: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
7EH	See Table 18-61 and Table 18-62.	SNOOP_STALL_DRV	Bus stalled for snoops.	This event counts the number of times that the bus snoop stall signal is asserted. During the snoop stall cycles no new bus transactions requiring a snoop response can be initiated on the bus. Note: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
7FH	See Table 18-61.	BUS_IO_WAIT	IO requests waiting in the bus queue.	This event counts the number of core cycles during which IO requests wait in the bus queue. This event counts IO requests from the core.
80H	03H	ICACHE.ACCESSES	Instruction fetches.	This event counts all instruction fetches, including uncacheable fetches.
80H	02H	ICACHE.MISSES	Icache miss.	This event counts all instruction fetches that miss the Instruction cache or produce memory requests. This includes uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.
82H	04H	ITLB.FLUSH	ITLB flushes.	This event counts the number of ITLB flushes.
82H	02H	ITLB.MISSES	ITLB misses.	This event counts the number of instruction fetches that miss the ITLB.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
AAH	02H	MACRO_INSTS.CISC_DECODED	CISC macro instructions decoded.	This event counts the number of complex instructions decoded, but not necessarily executed or retired. Only one complex instruction can be decoded at a time.
AAH	03H	MACRO_INSTS.ALL_DECODED	All Instructions decoded.	This event counts the number of instructions decoded.
B0H	00H	SIMD_UOPS_EXEC.S	SIMD micro-ops executed (excluding stores).	This event counts all the SIMD micro-ops executed. This event does not count MOVQ and MOVD stores from register to memory.
B0H	80H	SIMD_UOPS_EXEC.AR	SIMD micro-ops retired (excluding stores).	This event counts the number of SIMD saturated arithmetic micro-ops executed.
B1H	00H	SIMD_SAT_UOP_EXEC.S	SIMD saturated arithmetic micro-ops executed.	This event counts the number of SIMD saturated arithmetic micro-ops executed.
B1H	80H	SIMD_SAT_UOP_EXEC.AR	SIMD saturated arithmetic micro-ops retired.	This event counts the number of SIMD saturated arithmetic micro-ops retired.
B3H	01H	SIMD_UOP_TYPE_EXEC.MUL.S	SIMD packed multiply micro-ops executed.	This event counts the number of SIMD packed multiply micro-ops executed.
B3H	81H	SIMD_UOP_TYPE_EXEC.MUL.AR	SIMD packed multiply micro-ops retired.	This event counts the number of SIMD packed multiply micro-ops retired.
B3H	02H	SIMD_UOP_TYPE_EXEC.SHIFT.S	SIMD packed shift micro-ops executed.	This event counts the number of SIMD packed shift micro-ops executed.
B3H	82H	SIMD_UOP_TYPE_EXEC.SHIFT.AR	SIMD packed shift micro-ops retired.	This event counts the number of SIMD packed shift micro-ops retired.
B3H	04H	SIMD_UOP_TYPE_EXEC.PACK.S	SIMD pack micro-ops executed.	This event counts the number of SIMD pack micro-ops executed.
B3H	84H	SIMD_UOP_TYPE_EXEC.PACK.AR	SIMD pack micro-ops retired.	This event counts the number of SIMD pack micro-ops retired.
B3H	08H	SIMD_UOP_TYPE_EXEC.UNPACK.S	SIMD unpack micro-ops executed.	This event counts the number of SIMD unpack micro-ops executed.
B3H	88H	SIMD_UOP_TYPE_EXEC.UNPACK.AR	SIMD unpack micro-ops retired.	This event counts the number of SIMD unpack micro-ops retired.
B3H	10H	SIMD_UOP_TYPE_EXEC.LOGICAL.S	SIMD packed logical micro-ops executed.	This event counts the number of SIMD packed logical micro-ops executed.
B3H	90H	SIMD_UOP_TYPE_EXEC.LOGICAL.AR	SIMD packed logical micro-ops retired.	This event counts the number of SIMD packed logical micro-ops retired.
B3H	20H	SIMD_UOP_TYPE_EXEC.ARITHMETIC.S	SIMD packed arithmetic micro-ops executed.	This event counts the number of SIMD packed arithmetic micro-ops executed.
B3H	A0H	SIMD_UOP_TYPE_EXEC.ARITHMETIC.AR	SIMD packed arithmetic micro-ops retired.	This event counts the number of SIMD packed arithmetic micro-ops retired.
C0H	00H	INST_RETIRED.ANY_P	Instructions retired (precise event).	This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
N/A	00H	INST_RETIRED.ANY	Instructions retired.	This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers.
C2H	10H	UOPS_RETIRED.ANY	Micro-ops retired.	This event counts the number of micro-ops retired. The processor decodes complex macro instructions into a sequence of simpler micro-ops. Most instructions are composed of one or two micro-ops. Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists. In some cases micro-op sequences are fused or whole instructions are fused into one micro-op. See other UOPS_RETIRED events for differentiating retired fused and non-fused micro-ops.
C3H	01H	MACHINE_CLEARS.SMC	Self-Modifying Code detected.	This event counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel® architecture processors.
C4H	00H	BR_INST_RETIRED.ANY	Retired branch instructions.	This event counts the number of branch instructions retired. **This is an architectural performance event.**
C4H	01H	BR_INST_RETIRED.PRED_NOT_TAKEN	Retired branch instructions that were predicted not-taken.	This event counts the number of branch instructions retired that were correctly predicted to be not-taken.
C4H	02H	BR_INST_RETIRED.MISPRED_NOT_TAKEN	Retired branch instructions that were mispredicted not-taken.	This event counts the number of branch instructions retired that were mispredicted and not-taken.
C4H	04H	BR_INST_RETIRED.PRED_TAKEN	Retired branch instructions that were predicted taken.	This event counts the number of branch instructions retired that were correctly predicted to be taken.
C4H	08H	BR_INST_RETIRED.MISPRED_TAKEN	Retired branch instructions that were mispredicted taken.	This event counts the number of branch instructions retired that were mispredicted and taken.
C4H	0AH	BR_INST_RETIRED.MISPRED	Retired mispredicted branch instructions (precise event).	This event counts the number of retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor predicts that the branch would be taken, but it is not, or vice-versa. Mispredicted branches degrade the performance because the processor starts executing instructions along a wrong path it predicts. When the misprediction is discovered, all the instructions executed in the wrong path must be discarded, and the processor must start again on the correct path. Using the Profile-Guided Optimization (PGO) features of the Intel® C++ compiler may help reduce branch mispredictions. See the compiler documentation for more information on this feature.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
				To determine the branch misprediction ratio, divide the BR_INST_RETIRED.MISPRED event count by the number of BR_INST_RETIRED.ANY event count. To determine the number of mispredicted branches per instruction, divide the number of mispredicted branches by the INST_RETIRED.ANY event count. To measure the impact of the branch mispredictions use the event RESOURCE_STALLS.BR_MISS_CLEAR. Tips: - See the optimization guide for tips on reducing branch mispredictions. - PGO's purpose is to have straight line code for the most frequent execution paths, reducing branches taken and increasing the "basic block" size, possibly also reducing the code footprint or working-set.
C4H	0CH	BR_INST_RETIRED.TAKEN	Retired taken branch instructions.	This event counts the number of branches retired that were taken.
C4H	0FH	BR_INST_RETIRED.ANY1	Retired branch instructions.	This event counts the number of branch instructions retired that were mispredicted. This event is a duplicate of BR_INST_RETIRED.MISPRED.
C5H	00H	BR_INST_RETIRED.MISPRED	Retired mispredicted branch instructions (precise event).	This event counts the number of retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor predicts that the branch would be taken, but it is not, or vice-versa. Mispredicted branches degrade the performance because the processor starts executing instructions along a wrong path it predicts. When the misprediction is discovered, all the instructions executed in the wrong path must be discarded, and the processor must start again on the correct path. Using the Profile-Guided Optimization (PGO) features of the Intel® C++ compiler may help reduce branch mispredictions. See the compiler documentation for more information on this feature. To determine the branch misprediction ratio, divide the BR_INST_RETIRED.MISPRED event count by the number of BR_INST_RETIRED.ANY event count. To determine the number of mispredicted branches per instruction, divide the number of mispredicted branches by the INST_RETIRED.ANY event count. To measure the impact of the branch mispredictions use the event RESOURCE_STALLS.BR_MISS_CLEAR. Tips: - See the optimization guide for tips on reducing branch mispredictions. - PGO's purpose is to have straight line code for the most frequent execution paths, reducing branches taken and increasing the "basic block" size, possibly also reducing the code footprint or working-set.
C6H	01H	CYCLES_INT_MASKED.CYCLES_INT_MASKED	Cycles during which interrupts are disabled.	This event counts the number of cycles during which interrupts are disabled.
C6H	02H	CYCLES_INT_MASKED.CYCLES_INT_PENDING_AND_MASKED	Cycles during which interrupts are pending and disabled.	This event counts the number of cycles during which there are pending interrupts but interrupts are disabled.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
C7H	01H	SIMD_INST_RETIRED.PACKED_SINGLE	Retired Streaming SIMD Extensions (SSE) packed-single instructions.	This event counts the number of SSE packed-single instructions retired.
C7H	02H	SIMD_INST_RETIRED.SCALAR_SINGLE	Retired Streaming SIMD Extensions (SSE) scalar-single instructions.	This event counts the number of SSE scalar-single instructions retired.
C7H	04H	SIMD_INST_RETIRED.PACKED_DOUBLE	Retired Streaming SIMD Extensions 2 (SSE2) packed-double instructions.	This event counts the number of SSE2 packed-double instructions retired.
C7H	08H	SIMD_INST_RETIRED.SCALAR_DOUBLE	Retired Streaming SIMD Extensions 2 (SSE2) scalar-double instructions.	This event counts the number of SSE2 scalar-double instructions retired.
C7H	10H	SIMD_INST_RETIRED.VECTOR	Retired Streaming SIMD Extensions 2 (SSE2) vector instructions.	This event counts the number of SSE2 vector instructions retired.
C7H	1FH	SIMD_INST_RETIRED.ANY	Retired Streaming SIMD instructions.	This event counts the overall number of SIMD instructions retired. To count each type of SIMD instruction separately, use the following events: SIMD_INST_RETIRED.PACKED_SINGLE SIMD_INST_RETIRED.SCALAR_SINGLE SIMD_INST_RETIRED.PACKED_DOUBLE SIMD_INST_RETIRED.SCALAR_DOUBLE SIMD_INST_RETIRED.VECTOR.
C8H	00H	HW_INT_RCV	Hardware interrupts received.	This event counts the number of hardware interrupts received by the processor. This event will count twice for dual-pipe micro-ops.
CAH	01H	SIMD_COMP_INST_RETIRED.PACKED_SINGLE	Retired computational Streaming SIMD Extensions (SSE) packed-single instructions.	This event counts the number of computational SSE packed-single instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	02H	SIMD_COMP_INST_RETIRED.SCALAR_SINGLE	Retired computational Streaming SIMD Extensions (SSE) scalar-single instructions.	This event counts the number of computational SSE scalar-single instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	04H	SIMD_COMP_INST_RETIRED.PACKED_DOUBLE	Retired computational Streaming SIMD Extensions 2 (SSE2) packed-double instructions.	This event counts the number of computational SSE2 packed-double instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.

Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)

Event Num.	Umask Value	Event Name	Definition	Description and Comment
CAH	08H	SIMD_COMP_INST_RETIRED.SCALAR_DOUBLE	Retired computational Streaming SIMD Extensions 2 (SSE2) scalar-double instructions.	This event counts the number of computational SSE2 scalar-double instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CBH	01H	MEM_LOAD_RETIRED.L2_HIT	Retired loads that hit the L2 cache (precise event).	This event counts the number of retired load operations that missed the L1 data cache and hit the L2 cache.
CBH	02H	MEM_LOAD_RETIRED.L2_MISS	Retired loads that miss the L2 cache (precise event).	This event counts the number of retired load operations that missed the L2 cache.
CBH	04H	MEM_LOAD_RETIRED.DTLB_MISS	Retired loads that miss the DTLB (precise event).	This event counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault.
CDH	00H	SIMD_ASSIST	SIMD assists invoked.	This event counts the number of SIMD assists invoked. SIMD assists are invoked when an EMMS instruction is executed after MMX™ technology code has changed the MMX state in the floating point stack. For example, these assists are required in the following cases. Streaming SIMD Extensions (SSE) instructions: 1. Denormal input when the DAZ (Denormals Are Zeros) flag is off. 2. Underflow result when the FTZ (Flush To Zero) flag is off.
CEH	00H	SIMD_INSTR_RETIRED	SIMD Instructions retired.	This event counts the number of SIMD instructions that retired.
CFH	00H	SIMD_SAT_INSTR_RETIRED	Saturated arithmetic instructions retired.	This event counts the number of saturated arithmetic SIMD instructions that retired.
E0H	01H	BR_INST_DECODED	Branch instructions decoded.	This event counts the number of branch instructions decoded.
E4H	01H	BOGUS_BR	Bogus branches.	This event counts the number of byte sequences that were mistakenly detected as taken branch instructions. This results in a BACLEAR event and the BTB is flushed. This occurs mainly after task switches.
E6H	01H	BACLEARS.ANY	BACLEARS asserted.	This event counts the number of times the front end is redirected for a branch prediction, mainly when an early branch prediction is corrected by other branch handling mechanisms in the front end. This can occur if the code has many branches such that they cannot be consumed by the branch predictor. Each Baclear asserted costs approximately 7 cycles. The effect on total execution time depends on the surrounding code.

19.17 PERFORMANCE MONITORING EVENTS FOR INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Table 19-30 lists model-specific performance events for Intel® Core™ Duo processors. If a model-specific event requires qualification in core specificity, it is indicated in the comment column. Table 19-30 also applies to Intel® Core™ Solo processors; bits in the unit mask corresponding to core-specificity are reserved and should be 00B.

Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
03H	LD_Blocks	00H	Load operations delayed due to store buffer blocks. The preceding store may be blocked due to unknown address, unknown data, or conflict due to partial overlap between the load and store.	
04H	SD_Drains	00H	Cycles while draining store buffers.	
05H	Misalign_Mem_Ref	00H	Misaligned data memory references (MOB splits of loads and stores).	
06H	Seg_Reg_Loads	00H	Segment register loads.	
07H	SSE_PrefNta_Ret	00H	SSE software prefetch instruction PREFETCHNTA retired.	
07H	SSE_PrefT1_Ret	01H	SSE software prefetch instruction PREFETCHT1 retired.	
07H	SSE_PrefT2_Ret	02H	SSE software prefetch instruction PREFETCHT2 retired.	
07H	SSE_NTStores_Ret	03H	SSE streaming store instruction retired.	
10H	FP_Comps_Op_Exe	00H	FP computational Instruction executed. FADD, FSUB, FCOM, FMULs, MUL, IMUL, FDIVs, DIV, IDIV, FPREMs, FSQRT are included; but exclude FADD or FMUL used in the middle of a transcendental instruction.	
11H	FP_Assist	00H	FP exceptions experienced microcode assists.	IA32_PMC1 only.
12H	Mul	00H	Multiply operations (a speculative count, including FP and integer multiplies).	IA32_PMC1 only.
13H	Div	00H	Divide operations (a speculative count, including FP and integer divisions).	IA32_PMC1 only.
14H	Cycles_Div_Busy	00H	Cycles the divider is busy.	IA32_PMC0 only.
21H	L2_ADS	00H	L2 Address strobes.	Requires core-specificity.
22H	Dbus_Busy	00H	Core cycle during which data bus was busy (increments by 4).	Requires core-specificity.
23H	Dbus_Busy_Rd	00H	Cycles data bus is busy transferring data to a core (increments by 4).	Requires core-specificity.
24H	L2_Lines_In	00H	L2 cache lines allocated.	Requires core-specificity and HW prefetch qualification.
25H	L2_M_Lines_In	00H	L2 Modified-state cache lines allocated.	Requires core-specificity.
26H	L2_Lines_Out	00H	L2 cache lines evicted.	Requires core-specificity and HW prefetch qualification.
27H	L2_M_Lines_Out	00H	L2 Modified-state cache lines evicted.	

Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors (Contd.)

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
28H	L2_IFetch	Requires MESI qualification	L2 instruction fetches from instruction fetch unit (includes speculative fetches).	Requires core-specificity.
29H	L2_LD	Requires MESI qualification	L2 cache reads.	Requires core-specificity.
2AH	L2_ST	Requires MESI qualification	L2 cache writes (includes speculation).	Requires core-specificity.
2EH	L2_Rqsts	Requires MESI qualification	L2 cache reference requests.	Requires core-specificity, HW prefetch qualification.
30H	L2_Reject_Cycles	Requires MESI qualification	Cycles L2 is busy and rejecting new requests.	
32H	L2_No_Request_ Cycles	Requires MESI qualification	Cycles there is no request to access L2.	
3AH	EST_Trans_All	00H	Any Intel Enhanced SpeedStep(R) Technology transitions.	
3AH	EST_Trans_All	10H	Intel Enhanced SpeedStep Technology frequency transitions.	
3BH	Thermal_Trip	C0H	Duration in a thermal trip based on the current core clock.	Use edge trigger to count occurrence.
3CH	NonHlt_Ref_Cycles	01H	Non-halted bus cycles.	
3CH	Serial_Execution_ Cycles	02H	Non-halted bus cycles of this core executing code while the other core is halted.	
40H	DCache_Cache_LD	Requires MESI qualification	L1 cacheable data read operations.	
41H	DCache_Cache_ST	Requires MESI qualification	L1 cacheable data write operations.	
42H	DCache_Cache_ Lock	Requires MESI qualification	L1 cacheable lock read operations to invalid state.	
43H	Data_Mem_Ref	01H	L1 data read and writes of cacheable and non-cacheable types.	
44H	Data_Mem_Cache_ Ref	02H	L1 data cacheable read and write operations.	
45H	DCache_Repl	0FH	L1 data cache line replacements.	
46H	DCache_M_Repl	00H	L1 data M-state cache line allocated.	
47H	DCache_M_Evict	00H	L1 data M-state cache line evicted.	
48H	DCache_Pend_Miss	00H	Weighted cycles of L1 miss outstanding.	Use Cmask =1 to count duration.
49H	Dtlb_Miss	00H	Data references that missed TLB.	
4BH	SSE_PrefNta_Miss	00H	PREFETCHNTA missed all caches.	
4BH	SSE_PrefT1_Miss	01H	PREFETCHT1 missed all caches.	
4BH	SSE_PrefT2_Miss	02H	PREFETCHT2 missed all caches.	
4BH	SSE_NTStores_ Miss	03H	SSE streaming store instruction missed all caches.	
4FH	L1_Pref_Req	00H	L1 prefetch requests due to DCU cache misses.	May overcount if request re-submitted.

Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors (Contd.)

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
60H	Bus_Req_ Outstanding	00; Requires core-specificity, and agent specificity	Weighted cycles of cacheable bus data read requests. This event counts full-line read request from DCU or HW prefetcher, but not RFO, write, instruction fetches, or others.	Use Cmask =1 to count duration. Use Umask bit 12 to include HWP or exclude HWP separately.
61H	Bus_BNR_Clocks	00H	External bus cycles while BNR asserted.	
62H	Bus_DRDY_Clocks	00H	External bus cycles while DRDY asserted.	Requires agent specificity.
63H	Bus_Locks_Clocks	00H	External bus cycles while bus lock signal asserted.	Requires core specificity.
64H	Bus_Data_Rcv	40H	Number of data chunks received by this processor.	
65H	Bus_Trans_Brd	See comment.	Burst read bus transactions (data or code).	Requires core specificity.
66H	Bus_Trans_RFO	See comment.	Completed read for ownership (RFO) transactions.	Requires agent specificity. Requires core specificity. Each transaction counts its address strobe. Retried transaction may be counted more than once.
68H	Bus_Trans_Ifetch	See comment.	Completed instruction fetch transactions.	
69H	Bus_Trans_Inval	See comment.	Completed invalidate transactions.	
6AH	Bus_Trans_Pwr	See comment.	Completed partial write transactions.	
6BH	Bus_Trans_P	See comment.	Completed partial transactions (include partial read + partial write + line write).	
6CH	Bus_Trans_IO	See comment.	Completed I/O transactions (read and write).	
6DH	Bus_Trans_Def	20H	Completed defer transactions.	Requires core specificity. Retried transaction may be counted more than once.
67H	Bus_Trans_WB	C0H	Completed writeback transactions from DCU (does not include L2 writebacks).	Requires agent specificity. Each transaction counts its address strobe. Retried transaction may be counted more than once.
6EH	Bus_Trans_Burst	C0H	Completed burst transactions (full line transactions include reads, write, RFO, and writebacks).	
6FH	Bus_Trans_Mem	C0H	Completed memory transactions. This includes Bus_Trans_Burst + Bus_Trans_P+Bus_Trans_Inval.	
70H	Bus_Trans_Any	C0H	Any completed bus transactions.	
77H	Bus_Snoops	00H	Counts any snoop on the bus.	Requires MESI qualification. Requires agent specificity.
78H	DCU_Snoop_To_ Share	01H	DCU snoops to share-state L1 cache line due to L1 misses.	Requires core specificity.
7DH	Bus_Not_In_Use	00H	Number of cycles there is no transaction from the core.	Requires core specificity.
7EH	Bus_Snoop_Stall	00H	Number of bus cycles while bus snoop is stalled.	
80H	ICache_Reads	00H	Number of instruction fetches from ICache, streaming buffers (both cacheable and uncacheable fetches).	

Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors (Contd.)

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
81H	ICache_Misses	00H	Number of instruction fetch misses from ICache, streaming buffers.	
85H	ITLB_Misses	00H	Number of iITLB misses.	
86H	IFU_Mem_Stall	00H	Cycles IFU is stalled while waiting for data from memory.	
87H	ILD_Stall	00H	Number of instruction length decoder stalls (Counts number of LCP stalls).	
88H	Br_Inst_Exec	00H	Branch instruction executed (includes speculation).	
89H	Br_Missp_Exec	00H	Branch instructions executed and mispredicted at execution (includes branches that do not have prediction or mispredicted).	
8AH	Br_BAC_Missp_ Exec	00H	Branch instructions executed that were mispredicted at front end.	
8BH	Br_Cnd_Exec	00H	Conditional branch instructions executed.	
8CH	Br_Cnd_Missp_ Exec	00H	Conditional branch instructions executed that were mispredicted.	
8DH	Br_Ind_Exec	00H	Indirect branch instructions executed.	
8EH	Br_Ind_Missp_Exec	00H	Indirect branch instructions executed that were mispredicted.	
8FH	Br_Ret_Exec	00H	Return branch instructions executed.	
90H	Br_Ret_Missp_Exec	00H	Return branch instructions executed that were mispredicted.	
91H	Br_Ret_BAC_Missp_ Exec	00H	Return branch instructions executed that were mispredicted at the front end.	
92H	Br_Call_Exec	00H	Return call instructions executed.	
93H	Br_Call_Missp_Exec	00H	Return call instructions executed that were mispredicted.	
94H	Br_Ind_Call_Exec	00H	Indirect call branch instructions executed.	
A2H	Resource_Stall	00H	Cycles while there is a resource related stall (renaming, buffer entries) as seen by allocator.	
B0H	MMX_Instr_Exec	00H	Number of MMX instructions executed (does not include MOVQ and MOVD stores).	
B1H	SIMD_Int_Sat_Exec	00H	Number of SIMD Integer saturating instructions executed.	
B3H	SIMD_Int_Pmul_ Exec	01H	Number of SIMD Integer packed multiply instructions executed.	
B3H	SIMD_Int_Psft_Exec	02H	Number of SIMD Integer packed shift instructions executed.	
B3H	SIMD_Int_Pck_Exec	04H	Number of SIMD Integer pack operations instruction executed.	
B3H	SIMD_Int_Upck_ Exec	08H	Number of SIMD Integer unpack instructions executed.	
B3H	SIMD_Int_Plog_ Exec	10H	Number of SIMD Integer packed logical instructions executed.	
B3H	SIMD_Int_Pari_Exec	20H	Number of SIMD Integer packed arithmetic instructions executed.	

Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors (Contd.)

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
C0H	Instr_Ret	00H	Number of instruction retired (Macro fused instruction count as 2).	
C1H	FP_Comp_Instr_Ret	00H	Number of FP compute instructions retired (X87 instruction or instruction that contains X87 operations).	Use IA32_PMC0 only.
C2H	Uops_Ret	00H	Number of micro-ops retired (include fused uops).	
C3H	SMC_Detected	00H	Number of times self-modifying code condition detected.	
C4H	Br_Instr_Ret	00H	Number of branch instructions retired.	
C5H	Br_MisPred_Ret	00H	Number of mispredicted branch instructions retired.	
C6H	Cycles_Int_Masked	00H	Cycles while interrupt is disabled.	
C7H	Cycles_Int_Pedning_ Masked	00H	Cycles while interrupt is disabled and interrupts are pending.	
C8H	HW_Int_Rx	00H	Number of hardware interrupts received.	
C9H	Br_Taken_Ret	00H	Number of taken branch instruction retired.	
CAH	Br_MisPred_Taken_ Ret	00H	Number of taken and mispredicted branch instructions retired.	
CCH	MMX_FP_Trans	00H	Number of transitions from MMX to X87.	
CCH	FP_MMX_Trans	01H	Number of transitions from X87 to MMX.	
CDH	MMX_Assist	00H	Number of EMMS executed.	
CEH	MMX_Instr_Ret	00H	Number of MMX instruction retired.	
D0H	Instr_Decoded	00H	Number of instruction decoded.	
D7H	ESP_Uops	00H	Number of ESP folding instruction decoded.	
D8H	SIMD_FP_SP_Ret	00H	Number of SSE/SSE2 single precision instructions retired (packed and scalar).	
D8H	SIMD_FP_SP_S_ Ret	01H	Number of SSE/SSE2 scalar single precision instructions retired.	
D8H	SIMD_FP_DP_P_ Ret	02H	Number of SSE/SSE2 packed double precision instructions retired.	
D8H	SIMD_FP_DP_S_ Ret	03H	Number of SSE/SSE2 scalar double precision instructions retired.	
D8H	SIMD_Int_128_Ret	04H	Number of SSE2 128 bit integer instructions retired.	
D9H	SIMD_FP_SP_P_ Comp_Ret	00H	Number of SSE/SSE2 packed single precision compute instructions retired (does not include AND, OR, XOR).	
D9H	SIMD_FP_SP_S_ Comp_Ret	01H	Number of SSE/SSE2 scalar single precision compute instructions retired (does not include AND, OR, XOR).	
D9H	SIMD_FP_DP_P_ Comp_Ret	02H	Number of SSE/SSE2 packed double precision compute instructions retired (does not include AND, OR, XOR).	
D9H	SIMD_FP_DP_S_ Comp_Ret	03H	Number of SSE/SSE2 scalar double precision compute instructions retired (does not include AND, OR, XOR).	

Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors (Contd.)

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
DAH	Fused_Uops_Ret	00H	All fused uops retired.	
DAH	Fused_Ld_Uops_ Ret	01H	Fused load uops retired.	
DAH	Fused_St_Uops_Ret	02H	Fused store uops retired.	
DBH	Unfusion	00H	Number of unfusion events in the ROB (due to exception).	
E0H	Br_Instr_Decoded	00H	Branch instructions decoded.	
E2H	BTB_Misses	00H	Number of branches the BTB did not produce a prediction.	
E4H	Br_Bogus	00H	Number of bogus branches.	
E6H	BAClears	00H	Number of BAClears asserted.	
F0H	Pref_Rqsts_Up	00H	Number of hardware prefetch requests issued in forward streams.	
F8H	Pref_Rqsts_Dn	00H	Number of hardware prefetch requests issued in backward streams.	

19.18 PENTIUM® 4 AND INTEL® XEON® PROCESSOR PERFORMANCE MONITORING EVENTS

Tables 19-31, 19-32 and 19-33 list performance monitoring events that can be counted or sampled on processors based on Intel NetBurst® microarchitecture. Table 19-31 lists the non-retirement events, and Table 19-32 lists the at-retirement events. Tables 19-34, 19-35, and 19-36 describes three sets of parameters that are available for three of the at-retirement counting events defined in Table 19-32. Table 19-37 shows which of the non-retirement and at retirement events are logical processor specific (TS) (see Section 18.6.4.4, "Performance Monitoring Events") and which are non-logical processor specific (TI).

Some of the Pentium 4 and Intel Xeon processor performance monitoring events may be available only to specific models. The performance monitoring events listed in Tables 19-31 and 19-32 apply to processors with CPUID signature that matches family encoding 15, model encoding 0, 1, 2 3, 4, or 6. Table applies to processors with a CPUID signature that matches family encoding 15, model encoding 3, 4 or 6.

The functionality of performance monitoring events in Pentium 4 and Intel Xeon processors is also available when IA-32e mode is enabled.

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting

Event Name	Event Parameters	Parameter Value	Description
TC_deliver_mode			This event counts the duration (in clock cycles) of the operating modes of the trace cache and decode engine in the processor package. The mode is specified by one or more of the event mask bits.
	ESCR restrictions	MSR_TC_ESCR0 MSR_TC_ESCR1	
	Counter numbers per ESCR	ESCR0: 4, 5 ESCR1: 6, 7	
	ESCR Event Select	01H	ESCR[31:25]

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	ESCR Event Mask	Bit	ESCR[24:9]
		0: DD	Both logical processors are in deliver mode.
		1: DB	Logical processor 0 is in deliver mode and logical processor 1 is in build mode.
		2: DI	Logical processor 0 is in deliver mode and logical processor 1 is either halted, under a machine clear condition or transitioning to a long microcode flow.
		3: BD	Logical processor 0 is in build mode and logical processor 1 is in deliver mode.
		4: BB	Both logical processors are in build mode.
		5: BI	Logical processor 0 is in build mode and logical processor 1 is either halted, under a machine clear condition or transitioning to a long microcode flow.
		6: ID	Logical processor 0 is either halted, under a machine clear condition or transitioning to a long microcode flow. Logical processor 1 is in deliver mode.
		7: IB	Logical processor 0 is either halted, under a machine clear condition or transitioning to a long microcode flow. Logical processor 1 is in build mode.
	CCCR Select	01H	CCCR[15:13]
	Event Specific Notes		If only one logical processor is available from a physical processor package, the event mask should be interpreted as logical processor 1 is halted. Event mask bit 2 was previously known as "DELIVER", bit 5 was previously known as "BUILD".
BPU_fetch_ request			This event counts instruction fetch requests of specified request type by the Branch Prediction unit. Specify one or more mask bits to qualify the request type(s).
	ESCR restrictions	MSR_BPU_ESCR0 MSR_BPU_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	03H	ESCR[31:25]
	ESCR Event Mask	Bit 0: TCMISS	ESCR[24:9] Trace cache lookup miss
	CCCR Select	00H	CCCR[15:13]

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
ITLB_reference			This event counts translations using the Instruction Translation Look-aside Buffer (ITLB).
	ESCR restrictions	MSR_ITLB_ESCR0 MSR_ITLB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	18H	ESCR[31:25]
	ESCR Event Mask	 Bit 0: HIT 1: MISS 2: HIT_UC	ESCR[24:9] ITLB hit ITLB miss Uncacheable ITLB hit
	CCCR Select	03H	CCCR[15:13]
	Event Specific Notes		All page references regardless of the page size are looked up as actual 4-KByte pages. Use the page_walk_type event with the ITMISS mask for a more conservative count.
memory_cancel			This event counts the canceling of various type of request in the Data cache Address Control unit (DAC). Specify one or more mask bits to select the type of requests that are canceled.
	ESCR restrictions	MSR_DAC_ESCR0 MSR_DAC_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11	
	ESCR Event Select	02H	ESCR[31:25]
	ESCR Event Mask	 Bit 2: ST_RB_FULL 3: 64K_CONF	ESCR[24:9] Replayed because no store request buffer is available. Conflicts due to 64-KByte aliasing.
	CCCR Select	05H	CCCR[15:13]
	Event Specific Notes		All_CACHE_MISS includes uncacheable memory in count.
memory_ complete			This event counts the completion of a load split, store split, uncacheable (UC) split, or UC load. Specify one or more mask bits to select the operations to be counted.
	ESCR restrictions	MSR_SAAT_ESCR0 MSR_SAAT_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11	
	ESCR Event Select	08H	ESCR[31:25]

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	ESCR Event Mask	Bit 0: LSC 1: SSC	ESCR[24:9] Load split completed, excluding UC/WC loads. Any split stores completed.
	CCCR Select	02H	CCCR[15:13]
load_port_replay			This event counts replayed events at the load port. Specify one or more mask bits to select the cause of the replay.
	ESCR restrictions	MSR_SAAT_ESCR0 MSR_SAAT_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11	
	ESCR Event Select	04H	ESCR[31:25]
	ESCR Event Mask	Bit 1: SPLIT_LD	ESCR[24:9] Split load.
	CCCR Select	02H	CCCR[15:13]
	Event Specific Notes		Must use ESCR1 for at-retirement counting.
store_port_replay			This event counts replayed events at the store port. Specify one or more mask bits to select the cause of the replay.
	ESCR restrictions	MSR_SAAT_ESCR0 MSR_SAAT_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11	
	ESCR Event Select	05H	ESCR[31:25]
	ESCR Event Mask	Bit 1: SPLIT_ST	ESCR[24:9] Split store
	CCCR Select	02H	CCCR[15:13]
	Event Specific Notes		Must use ESCR1 for at-retirement counting.
MOB_load_replay			This event triggers if the memory order buffer (MOB) caused a load operation to be replayed. Specify one or more mask bits to select the cause of the replay.
	ESCR restrictions	MSR_MOB_ESCR0 MSR_MOB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	03H	ESCR[31:25]

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	ESCR Event Mask	Bit 1: NO_STA 3: NO_STD	ESCR[24:9] Replayed because of unknown store address. Replayed because of unknown store data.
		4: PARTIAL_DATA 5: UNALGN_ADDR	Replayed because of partially overlapped data access between the load and store operations. Replayed because the lower 4 bits of the linear address do not match between the load and store operations.
	CCCR Select	02H	CCCR[15:13]
page_walk_type			This event counts various types of page walks that the page miss handler (PMH) performs.
	ESCR restrictions	MSR_PMH_ESCR0 MSR_PMH_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	01H	ESCR[31:25]
	ESCR Event Mask	Bit 0: DTMISS 1: ITMISS	ESCR[24:9] Page walk for a data TLB miss (either load or store). Page walk for an instruction TLB miss.
	CCCR Select	04H	CCCR[15:13]
BSQ_cache_reference			This event counts cache references (2nd level cache or 3rd level cache) as seen by the bus unit. Specify one or more mask bit to select an access according to the access type (read type includes both load and RFO, write type includes writebacks and evictions) and the access result (hit, misses).
	ESCR restrictions	MSR_BSU_ESCR0 MSR_BSU_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	0CH	ESCR[31:25]

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
		Bit	ESCR[24:9]
		0: RD_2ndL_HITS	Read 2nd level cache hit Shared (includes load and RFO).
		1: RD_2ndL_HITE	Read 2nd level cache hit Exclusive (includes load and RFO).
		2: RD_2ndL_HITM	Read 2nd level cache hit Modified (includes load and RFO).
		3: RD_3rdL_HITS	Read 3rd level cache hit Shared (includes load and RFO).
		4: RD_3rdL_HITE	Read 3rd level cache hit Exclusive (includes load and RFO).
		5: RD_3rdL_HITM	Read 3rd level cache hit Modified (includes load and RFO).
	ESCR Event Mask	8: RD_2ndL_MISS	Read 2nd level cache miss (includes load and RFO).
		9: RD_3rdL_MISS	Read 3rd level cache miss (includes load and RFO).
		10: WR_2ndL_MISS	A Writeback lookup from DAC misses the 2nd level cache (unlikely to happen).
	CCCR Select	07H	CCCR[15:13]
	Event Specific Notes		1: The implementation of this event in current Pentium 4 and Xeon processors treats either a load operation or a request for ownership (RFO) request as a "read" type operation. 2: Currently this event causes both over and undercounting by as much as a factor of two due to an erratum. 3: It is possible for a transaction that is started as a prefetch to change the transaction's internal status, making it no longer a prefetch. or change the access result status (hit, miss) as seen by this event.
IOQ_allocation			This event counts the various types of transactions on the bus. A count is generated each time a transaction is allocated into the IOQ that matches the specified mask bits. An allocated entry can be a sector (64 bytes) or a chunks of 8 bytes. Requests are counted once per retry. The event mask bits constitute 4 bit fields. A transaction type is specified by interpreting the values of each bit field. Specify one or more event mask bits in a bit field to select the value of the bit field. Each field (bits 0-4 are one field) are independent of and can be ORed with the others. The request type field is further combined with bit 5 and 6 to form a binary expression. Bits 7 and 8 form a bit field to specify the memory type of the target address. Bits 13 and 14 form a bit field to specify the source agent of the request. Bit 15 affects read operation only. The event is triggered by evaluating the logical expression: (((Request type) OR Bit 5 OR Bit 6) OR (Memory type)) AND (Source agent).

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	ESCR restrictions	MSR_FSB_ESCR0, MSR_FSB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1; ESCR1: 2, 3	
	ESCR Event Select	03H	ESCR[31:25]
	ESCR Event Mask		ESCR[24:9]
		Bits	
		0-4 (single field)	Bus request type (use 00001 for invalid or default).
		5: ALL_READ	Count read entries.
		6: ALL_WRITE	Count write entries.
		7: MEM_UC	Count UC memory access entries.
		8: MEM_WC	Count WC memory access entries.
		9: MEM_WT	Count write-through (WT) memory access entries.
		10: MEM_WP	Count write-protected (WP) memory access entries.
		11: MEM_WB	Count WB memory access entries.
		13: OWN	Count all store requests driven by processor, as opposed to other processor or DMA.
		14: OTHER	Count all requests driven by other processors or DMA.
		15: PREFETCH	Include HW and SW prefetch requests in the count.
	CCCR Select	06H	CCCR[15:13]
	Event Specific Notes		1: If PREFETCH bit is cleared, sectors fetched using prefetch are excluded in the counts. If PREFETCH bit is set, all sectors or chunks read are counted. 2: Specify the edge trigger in CCCR to avoid double counting.
			3: The mapping of interpreted bit field values to transaction types may differ with different processor model implementations of the Pentium 4 processor family. Applications that program performance monitoring events should use CPUID to determine processor models when using this event. The logic equations that trigger the event are model-specific (see 4a and 4b below). 4a: For Pentium 4 and Xeon Processors starting with CPUID Model field encoding equal to 2 or greater, this event is triggered by evaluating the logical expression ((Request type) and (Bit 5 or Bit 6) and (Memory type) and (Source agent)). 4b: For Pentium 4 and Xeon Processors with CPUID Model field encoding less than 2, this event is triggered by evaluating the logical expression [((Request type) or Bit 5 or Bit 6) or (Memory type)] and (Source agent). Note that event mask bits for memory type are ignored if either ALL_READ or ALL_WRITE is specified. 5: This event is known to ignore CPL in early implementations of Pentium 4 and Xeon Processors. Both user requests and OS requests are included in the count. This behavior is fixed starting with Pentium 4 and Xeon Processors with CPUID signature F27H (Family 15, Model 2, Stepping 7).

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
			6: For write-through (WT) and write-protected (WP) memory types, this event counts reads as the number of 64-byte sectors. Writes are counted by individual chunks. 7: For uncacheable (UC) memory types, this event counts the number of 8-byte chunks allocated. 8: For Pentium 4 and Xeon Processors with CPUID Signature less than F27H, only MSR_FSB_ESCR0 is available.
IOQ_active_ entries			This event counts the number of entries (clipped at 15) in the IOQ that are active. An allocated entry can be a sector (64 bytes) or a chunks of 8 bytes. The event must be programmed in conjunction with IOQ_allocation. Specify one or more event mask bits to select the transactions that is counted.
	ESCR restrictions	MSR_FSB_ESCR1	
	Counter numbers per ESCR	ESCR1: 2, 3	
	ESCR Event Select	01AH	ESCR[30:25]
	ESCR Event Mask	Bits 0-4 (single field) 5: ALL_READ 6: ALL_WRITE 7: MEM_UC 8: MEM_WC 9: MEM_WT 10: MEM_WP 11: MEM_WB 13: OWN 14: OTHER 15: PREFETCH	ESCR[24:9] Bus request type (use 00001 for invalid or default). Count read entries. Count write entries. Count UC memory access entries. Count WC memory access entries. Count write-through (WT) memory access entries. Count write-protected (WP) memory access entries. Count WB memory access entries. Count all store requests driven by processor, as opposed to other processor or DMA. Count all requests driven by other processors or DMA. Include HW and SW prefetch requests in the count.
	CCCR Select	06H	CCCR[15:13]
	Event Specific Notes		1: Specified desired mask bits in ESCR0 and ESCR1. 2: See the ioq_allocation event for descriptions of the mask bits. 3: Edge triggering should not be used when counting cycles. 4: The mapping of interpreted bit field values to transaction types may differ across different processor model implementations of the Pentium 4 processor family. Applications that programs performance monitoring events should use the CPUID instruction to detect processor models when using this event. The logical expression that triggers this event as describe below: 5a:For Pentium 4 and Xeon Processors starting with CPUID MODEL field encoding equal to 2 or greater, this event is triggered by evaluating the logical expression ((Request type) and (Bit 5 or Bit 6) and (Memory type) and (Source agent)).

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
			5b:For Pentium 4 and Xeon Processors starting with CPUID MODEL field encoding less than 2, this event is triggered by evaluating the logical expression [((Request type) or Bit 5 or Bit 6) or (Memory type)] and (Source agent). Event mask bits for memory type are ignored if either ALL_READ or ALL_WRITE is specified. 5c: This event is known to ignore CPL in the current implementations of Pentium 4 and Xeon Processors Both user requests and OS requests are included in the count.
			6: An allocated entry can be a full line (64 bytes) or in individual chunks of 8 bytes.
FSB_data_ activity			This event increments once for each DRDY or DBSY event that occurs on the front side bus. The event allows selection of a specific DRDY or DBSY event.
	ESCR restrictions	MSR_FSB_ESCR0 MSR_FSB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	17H	ESCR[31:25]
	ESCR Event Mask		ESCR[24:9]
		Bit 0: DRDY_DRV	Count when this processor drives data onto the bus - includes writes and implicit writebacks. Asserted two processor clock cycles for partial writes and 4 processor clocks (usually in consecutive bus clocks) for full line writes.
		1: DRDY_OWN	Count when this processor reads data from the bus - includes loads and some PIC transactions. Asserted two processor clock cycles for partial reads and 4 processor clocks (usually in consecutive bus clocks) for full line reads. Count DRDY events that we drive. Count DRDY events sampled that we own.
		2: DRDY_OTHER	Count when data is on the bus but not being sampled by the processor. It may or may not be being driven by this processor. Asserted two processor clock cycles for partial transactions and 4 processor clocks (usually in consecutive bus clocks) for full line transactions.
		3: DBSY_DRV	Count when this processor reserves the bus for use in the next bus cycle in order to drive data. Asserted for two processor clock cycles for full line writes and not at all for partial line writes. May be asserted multiple times (in consecutive bus clocks) if we stall the bus waiting for a cache lock to complete.
		4: DBSY_OWN	Count when some agent reserves the bus for use in the next bus cycle to drive data that this processor will sample. Asserted for two processor clock cycles for full line writes and not at all for partial line writes. May be asserted multiple times (all one bus clock apart) if we stall the bus for some reason.

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
		5:DBSY_OTHER	Count when some agent reserves the bus for use in the next bus cycle to drive data that this processor will NOT sample. It may or may not be being driven by this processor. Asserted two processor clock cycles for partial transactions and 4 processor clocks (usually in consecutive bus clocks) for full line transactions.
	CCCR Select	06H	CCCR[15:13]
	Event Specific Notes		Specify edge trigger in the CCCR MSR to avoid double counting. DRDY_OWN and DRDY_OTHER are mutually exclusive; similarly for DBSY_OWN and DBSY_OTHER.
BSQ_allocation			This event counts allocations in the Bus Sequence Unit (BSQ) according to the specified mask bit encoding. The event mask bits consist of four sub-groups: ▪ Request type. ▪ Request length. ▪ Memory type. ▪ Sub-group consisting mostly of independent bits (bits 5, 6, 7, 8, 9, and 10). Specify an encoding for each sub-group.
	ESCR restrictions	MSR_BSU_ESCR0	
	Counter numbers per ESCR	ESCR0: 0, 1	
	ESCR Event Select	05H	ESCR[31:25]
	ESCR Event Mask	Bit	ESCR[24:9]
		0: REQ_TYPE0 1: REQ_TYPE1	Request type encoding (bit 0 and 1) are: 0 – Read (excludes read invalidate). 1 – Read invalidate. 2 – Write (other than writebacks). 3 – Writeback (evicted from cache). (public)
		2: REQ_LEN0 3: REQ_LEN1	Request length encoding (bit 2, 3) are: 0 – 0 chunks 1 – 1 chunks 3 – 8 chunks
		5: REQ_IO_TYPE	Request type is input or output.
		6: REQ_LOCK_ TYPE	Request type is bus lock.
		7: REQ_CACHE_ TYPE	Request type is cacheable.
		8: REQ_SPLIT_ TYPE	Request type is a bus 8-byte chunk split across 8-byte boundary.
		9: REQ_DEM_TYPE	Request type is a demand if set. Request type is HW.SW prefetch if 0.
		10: REQ_ORD_ TYPE	Request is an ordered type.

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
		11: MEM_TYPE0 12: MEM_TYPE1 13: MEM_TYPE2	Memory type encodings (bit 11-13) are: 0 – UC 1 – WC 4 – WT 5 – WP 6 – WB
	CCCR Select	07H	CCCR[15:13]
	Event Specific Notes		1: Specify edge trigger in CCCR to avoid double counting. 2: A writebacks to 3rd level cache from 2nd level cache counts as a separate entry, this is in additional to the entry allocated for a request to the bus. 3: A read request to WB memory type results in a request to the 64-byte sector, containing the target address, followed by a prefetch request to an adjacent sector. 4: For Pentium 4 and Xeon processors with CPUID model encoding value equals to 0 and 1, an allocated BSQ entry includes both the demand sector and prefetched 2nd sector. 5: An allocated BSQ entry for a data chunk is any request less than 64 bytes. 6a: This event may undercount for requests of split type transactions if the data address straddled across modulo-64 byte boundary. 6b: This event may undercount for requests of read request of 16-byte operands from WC or UC address. 6c: This event may undercount WC partial requests originated from store operands that are dwords.
bsq_active_ entries			This event represents the number of BSQ entries (clipped at 15) currently active (valid) which meet the subevent mask criteria during allocation in the BSQ. Active request entries are allocated on the BSQ until de-allocated. De-allocation of an entry does not necessarily imply the request is filled. This event must be programmed in conjunction with BSQ_allocation. Specify one or more event mask bits to select the transactions that is counted.
	ESCR restrictions	ESCR1	
	Counter numbers per ESCR	ESCR1: 2, 3	
	ESCR Event Select	06H	ESCR[30:25]
	ESCR Event Mask		ESCR[24:9]
	CCCR Select	07H	CCCR[15:13]
	Event Specific Notes		1: Specified desired mask bits in ESCR0 and ESCR1. 2: See the BSQ_allocation event for descriptions of the mask bits. 3: Edge triggering should not be used when counting cycles.
			4: This event can be used to estimate the latency of a transaction from allocation to de-allocation in the BSQ. The latency observed by BSQ_allocation includes the latency of FSB, plus additional overhead.

Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
			5: Additional overhead may include the time it takes to issue two requests (the sector by demand and the adjacent sector via prefetch). Since adjacent sector prefetches have lower priority that demand fetches, on a heavily used system there is a high probability that the adjacent sector prefetch will have to wait until the next bus arbitration. 6: For Pentium 4 and Xeon processors with CPUID model encoding value less than 3, this event is updated every clock. 7: For Pentium 4 and Xeon processors with CPUID model encoding value equals to 3 or 4, this event is updated every other clock.
SSE_input_assist			This event counts the number of times an assist is requested to handle problems with input operands for SSE/SSE2/SSE3 operations; most notably denormal source operands when the DAZ bit is not set. Set bit 15 of the event mask to use this event.
	ESCR restrictions	MSR_FIRM_ESCR0 MSR_FIRM_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11	
	ESCR Event Select	34H	ESCR[31:25]
	ESCR Event Mask	15: ALL	ESCR[24:9] Count assists for SSE/SSE2/SSE3 μops.
	CCCR Select	01H	CCCR[15:13]
	Event Specific Notes		1: Not all requests for assists are actually taken. This event is known to overcount in that it counts requests for assists from instructions on the non-retired path that do not incur a performance penalty. An assist is actually taken only for non-bogus μops. Any appreciable counts for this event are an indication that the DAZ or FTZ bit should be set and/or the source code should be changed to eliminate the condition. 2: Two common situations for an SSE/SSE2/SSE3 operation needing an assist are: (1) when a denormal constant is used as an input and the Denormals-Are-Zero (DAZ) mode is not set, (2) when the input operand uses the underflowed result of a previous SSE/SSE2/SSE3 operation and neither the DAZ nor Flush-To-Zero (FTZ) modes are set. 3: Enabling the DAZ mode prevents SSE/SSE2/SSE3 operations from needing assists in the first situation. Enabling the FTZ mode prevents SSE/SSE2/SSE3 operations from needing assists in the second situation.
packed_SP_uop			This event increments for each packed single-precision μop, specified through the event mask for detection.
	ESCR restrictions	MSR_FIRM_ESCR0 MSR_FIRM_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11

Table 19-32. Performance Monitoring Events For Intel NetBurst® Microarchitecture for At-Retirement Counting

Event Name	Event Parameters	Parameter Value	Description
front_end_event			This event counts the retirement of tagged μops, which are specified through the front-end tagging mechanism. The event mask specifies bogus or non-bogus μops.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	
	ESCR Event Select	08H	ESCR[31:25]
	ESCR Event Mask	 Bit 0: NBOGUS 1: BOGUS	ESCR[24:9] The marked μops are not bogus. The marked μops are bogus.
	CCCR Select	05H	CCCR[15:13]
	Can Support PEBS	Yes	
	Require Additional MSRs for tagging	Selected ESCRs and/or MSR_TC_PRECISE_EVENT	See list of metrics supported by Front_end tagging in Table A-3
execution_event			This event counts the retirement of tagged μops, which are specified through the execution tagging mechanism. The event mask allows from one to four types of μops to be specified as either bogus or non-bogus μops to be tagged.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	
	ESCR Event Select	0CH	ESCR[31:25]
	ESCR Event Mask	 Bit 0: NBOGUS0 1: NBOGUS1 2: NBOGUS2 3: NBOGUS3 4: BOGUS0 5: BOGUS1 6: BOGUS2 7: BOGUS3	ESCR[24:9] The marked μops are not bogus. The marked μops are not bogus. The marked μops are not bogus. The marked μops are not bogus. The marked μops are bogus. The marked μops are bogus. The marked μops are bogus. The marked μops are bogus.
	CCCR Select	05H	CCCR[15:13]
	Event Specific Notes		Each of the 4 slots to specify the bogus/non-bogus μops must be coordinated with the 4 TagValue bits in the ESCR (for example, NBOGUS0 must accompany a '1' in the lowest bit of the TagValue field in ESCR, NBOGUS1 must accompany a '1' in the next but lowest bit of the TagValue field).
	Can Support PEBS	Yes	

Table 19-32. Performance Monitoring Events For Intel NetBurst® Microarchitecture for At-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	Require Additional MSRs for tagging	An ESCR for an upstream event	See list of metrics supported by execution tagging in Table A-4.
replay_event			This event counts the retirement of tagged μops, which are specified through the replay tagging mechanism. The event mask specifies bogus or non-bogus μops.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	
	ESCR Event Select	09H	ESCR[31:25]
	ESCR Event Mask	 Bit 0: NBOGUS 1: BOGUS	ESCR[24:9] The marked μops are not bogus. The marked μops are bogus.
	CCCR Select	05H	CCCR[15:13]
	Event Specific Notes		Supports counting tagged μops with additional MSRs.
	Can Support PEBS	Yes	
	Require Additional MSRs for tagging	IA32_PEBS_ ENABLE MSR_PEBS_ MATRIX_VERT Selected ESCR	See list of metrics supported by replay tagging in Table A-5.
instr_retired			This event counts instructions that are retired during a clock cycle. Mask bits specify bogus or non-bogus (and whether they are tagged using the front-end tagging mechanism).
	ESCR restrictions	MSR_CRU_ESCR0 MSR_CRU_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	
	ESCR Event Select	02H	ESCR[31:25]
	ESCR Event Mask	 Bit 0: NBOGUSNTAG 1: NBOGUSTAG 2: BOGUSNTAG 3: BOGUSTAG	ESCR[24:9] Non-bogus instructions that are not tagged. Non-bogus instructions that are tagged. Bogus instructions that are not tagged. Bogus instructions that are tagged.
	CCCR Select	04H	CCCR[15:13]
	Event Specific Notes		1: The event count may vary depending on the microarchitectural states of the processor when the event detection is enabled. 2: The event may count more than once for some instructions with complex uop flows and were interrupted before retirement.

Table 19-32. Performance Monitoring Events For Intel NetBurst® Microarchitecture for At-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	Can Support PEBS	No	
uops_retired			This event counts μops that are retired during a clock cycle. Mask bits specify bogus or non-bogus.
	ESCR restrictions	MSR_CRU_ESCR0 MSR_CRU_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	
	ESCR Event Select	01H	ESCR[31:25]
	ESCR Event Mask	 Bit 0: NBOGUS 1: BOGUS	ESCR[24:9] The marked μops are not bogus. The marked μops are bogus.
	CCCR Select	04H	CCCR[15:13]
	Event Specific Notes		P6: EMON_UOPS_RETIRED
	Can Support PEBS	No	
uop_type			This event is used in conjunction with the front-end at-retirement mechanism to tag load and store μops.
	ESCR restrictions	MSR_RAT_ESCR0 MSR_RAT_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	
	ESCR Event Select	02H	ESCR[31:25]
	ESCR Event Mask	 Bit 1: TAGLOADS 2: TAGSTORES	ESCR[24:9] The μop is a load operation. The μop is a store operation.
	CCCR Select	02H	CCCR[15:13]
	Event Specific Notes		Setting the TAGLOADS and TAGSTORES mask bits does not cause a counter to increment. They are only used to tag uops.
	Can Support PEBS	No	
branch_retired			This event counts the retirement of a branch. Specify one or more mask bits to select any combination of taken, not-taken, predicted and mispredicted.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	See Table 18-70 for the addresses of the ESCR MSRs
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	The counter numbers associated with each ESCR are provided. The performance counters and corresponding CCCRs can be obtained from Table 18-70.
	ESCR Event Select	06H	ESCR[31:25]

Table 19-32. Performance Monitoring Events For Intel NetBurst® Microarchitecture for At-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	ESCR Event Mask	Bit 0: MMNP 1: MMNM 2: MMTP 3: MMTM	ESCR[24:9] Branch not-taken predicted Branch not-taken mispredicted Branch taken predicted Branch taken mispredicted
	CCCR Select	05H	CCCR[15:13]
	Event Specific Notes		P6: EMON_BR_INST_RETIRED
	Can Support PEBS	No	
mispred_branch_ retired			This event represents the retirement of mispredicted branch instructions.
	ESCR restrictions	MSR_CRU_ESCR0 MSR_CRU_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	
	ESCR Event Select	03H	ESCR[31:25]
	ESCR Event Mask	Bit 0: NBOGUS	ESCR[24:9] The retired instruction is not bogus.
	CCCR Select	04H	CCCR[15:13]
	Can Support PEBS	No	
x87_assist			This event counts the retirement of x87 instructions that required special handling. Specifies one or more event mask bits to select the type of assistance.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	
	ESCR Event Select	03H	ESCR[31:25]
	ESCR Event Mask	Bit 0: FPSU 1: FPSO 2: POAO 3: POAU 4: PREA	ESCR[24:9] Handle FP stack underflow. Handle FP stack overflow. Handle x87 output overflow. Handle x87 output underflow. Handle x87 input assist.
	CCCR Select	05H	CCCR[15:13]
	Can Support PEBS	No	

Table 19-32. Performance Monitoring Events For Intel NetBurst® Microarchitecture for At-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
machine_clear			This event increments according to the mask bit specified while the entire pipeline of the machine is cleared. Specify one of the mask bit to select the cause.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	
	ESCR Event Select	02H	ESCR[31:25]
	ESCR Event Mask	Bit 0: CLEAR 2: MOCLEAR 6: SMCLEAR	ESCR[24:9] Counts for a portion of the many cycles while the machine is cleared for any cause. Use Edge triggering for this bit only to get a count of occurrence versus a duration. Increments each time the machine is cleared due to memory ordering issues. Increments each time the machine is cleared due to self-modifying code issues.
	CCCR Select	05H	CCCR[15:13]
	Can Support PEBS	No	

Table 19-33. Intel NetBurst® Microarchitecture Model-Specific Performance Monitoring Events (For Model Encoding 3, 4 or 6)

Event Name	Event Parameters	Parameter Value	Description
instr_completed			This event counts instructions that have completed and retired during a clock cycle. Mask bits specify whether the instruction is bogus or non-bogus and whether they are:
	ESCR restrictions	MSR_CRU_ESCR0 MSR_CRU_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	
	ESCR Event Select	07H	ESCR[31:25]
	ESCR Event Mask	Bit 0: NBOGUS 1: BOGUS	ESCR[24:9] Non-bogus instructions Bogus instructions
	CCCR Select	04H	CCCR[15:13]
	Event Specific Notes		This metric differs from instr_retired, since it counts instructions completed, rather than the number of times that instructions started.
	Can Support PEBS	No	

Table 19-34. List of Metrics Available for Front_end Tagging (For Front_end Event Only)

Front-end metric[1]	MSR_ TC_PRECISE_EVENT MSR Bit field	Additional MSR	Event mask value for Front_end_event
memory_loads	None	Set TAGLOADS bit in ESCR corresponding to event Uop_Type.	NBOGUS
memory_stores	None	Set TAGSTORES bit in the ESCR corresponding to event Uop_Type.	NBOGUS

NOTES:

1. There may be some undercounting of front end events when there is an overflow or underflow of the floating point stack.

Table 19-35. List of Metrics Available for Execution Tagging (For Execution Event Only)

Execution metric	Upstream ESCR	TagValue in Upstream ESCR	Event mask value for execution_event
packed_SP_retired	Set ALL bit in event mask, TagUop bit in ESCR of packed_SP_uop.	1	NBOGUS0
packed_DP_retired	Set ALL bit in event mask, TagUop bit in ESCR of packed_DP_uop.	1	NBOGUS0
scalar_SP_retired	Set ALL bit in event mask, TagUop bit in ESCR of scalar_SP_uop.	1	NBOGUS0
scalar_DP_retired	Set ALL bit in event mask, TagUop bit in ESCR of scalar_DP_uop.	1	NBOGUS0
128_bit_MMX_retired	Set ALL bit in event mask, TagUop bit in ESCR of 128_bit_MMX_uop.	1	NBOGUS0
64_bit_MMX_retired	Set ALL bit in event mask, TagUop bit in ESCR of 64_bit_MMX_uop.	1	NBOGUS0
X87_FP_retired	Set ALL bit in event mask, TagUop bit in ESCR of x87_FP_uop.	1	NBOGUS0
X87_SIMD_memory_moves_retired	Set ALLP0, ALLP2 bits in event mask, TagUop bit in ESCR of X87_SIMD_ moves_uop.	1	NBOGUS0

Table 19-36. List of Metrics Available for Replay Tagging (For Replay Event Only)

Replay metric[1]	IA32_PEBS_ ENABLE Field to Set	MSR_PEBS_ MATRIX_VERT Bit Field to Set	Additional MSR/ Event	Event Mask Value for Replay_event
1stL_cache_load _miss_retired	Bit 0, Bit 24, Bit 25	Bit 0	None	NBOGUS
2ndL_cache_load _miss_retired[2]	Bit 1, Bit 24, Bit 25	Bit 0	None	NBOGUS
DTLB_load_miss _retired	Bit 2, Bit 24, Bit 25	Bit 0	None	NBOGUS
DTLB_store_miss _retired	Bit 2, Bit 24, Bit 25	Bit 1	None	NBOGUS
DTLB_all_miss _retired	Bit 2, Bit 24, Bit 25	Bit 0, Bit 1	None	NBOGUS
Tagged_mispred_ branch	Bit 15, Bit 16, Bit 24, Bit 25	Bit 4	None	NBOGUS

Table 19-36. List of Metrics Available for Replay Tagging (For Replay Event Only) (Contd.)

Replay metric[1]	IA32_PEBS_ ENABLE Field to Set	MSR_PEBS_ MATRIX_VERT Bit Field to Set	Additional MSR/ Event	Event Mask Value for Replay_event
MOB_load _replay_retired[3]	Bit 9, Bit 24, Bit 25	Bit 0	Select MOB_load_replay event and set PARTIAL_DATA and UNALGN_ADDR bit.	NBOGUS
split_load_retired	Bit 10, Bit 24, Bit 25	Bit 0	Select load_port_replay event with the MSR_SAAT_ESCR1 MSR and set the SPLIT_LD mask bit.	NBOGUS
split_store_retired	Bit 10, Bit 24, Bit 25	Bit 1	Select store_port_replay event with the MSR_SAAT_ESCR0 MSR and set the SPLIT_ST mask bit.	NBOGUS

NOTES:

1. Certain kinds of μops cannot be tagged. These include I/O operations, UC and locked accesses, returns, and far transfers.
2. 2nd-level misses retired does not count all 2nd-level misses. It only includes those references that are found to be misses by the fast detection logic and not those that are later found to be misses.
3. While there are several causes for a MOB replay, the event counted with this event mask setting is the case where the data from a load that would otherwise be forwarded is not an aligned subset of the data from a preceding store.

19.19 PERFORMANCE MONITORING EVENTS FOR INTEL® PENTIUM® M PROCESSORS

The Pentium M processor's performance monitoring events are based on monitoring events for the P6 family of processors. All of these performance events are model specific for the Pentium M processor and are not available in this form in other processors. Table 19-38 lists the performance monitoring events that were added in the Pentium M processor.

Table 19-38. Performance Monitoring Events on Intel® Pentium® M Processors

Name	Hex Values	Descriptions
Power Management		
EMON_EST_TRANS	58H	Number of Enhanced Intel SpeedStep technology transitions: Mask = 00H - All transitions Mask = 02H - Only Frequency transitions
EMON_THERMAL_TRIP	59H	Duration/Occurrences in thermal trip; to count number of thermal trips: bit 22 in PerfEvtSel0/1 needs to be set to enable edge detect.
BPU		
BR_INST_EXEC	88H	Branch instructions that were executed (not necessarily retired).
BR_MISSP_EXEC	89H	Branch instructions executed that were mispredicted at execution.
BR_BAC_MISSP_EXEC	8AH	Branch instructions executed that were mispredicted at front end (BAC).
BR_CND_EXEC	8BH	Conditional branch instructions that were executed.
BR_CND_MISSP_EXEC	8CH	Conditional branch instructions executed that were mispredicted.
BR_IND_EXEC	8DH	Indirect branch instructions executed.
BR_IND_MISSP_EXEC	8EH	Indirect branch instructions executed that were mispredicted.
BR_RET_EXEC	8FH	Return branch instructions executed.
BR_RET_MISSP_EXEC	90H	Return branch instructions executed that were mispredicted at execution.
BR_RET_BAC_MISSP_EXEC	91H	Return branch instructions executed that were mispredicted at front end (BAC).
BR_CALL_EXEC	92H	CALL instruction executed.
BR_CALL_MISSP_EXEC	93H	CALL instruction executed and miss predicted.
BR_IND_CALL_EXEC	94H	Indirect CALL instructions executed.
Decoder		
EMON_SIMD_INSTR_RETIRED	CEH	Number of retired MMX instructions.
EMON_SYNCH_UOPS	D3H	Sync micro-ops
EMON_ESP_UOPS	D7H	Total number of micro-ops
EMON_FUSED_UOPS_RET	DAH	Number of retired fused micro-ops: Mask = 0 - Fused micro-ops Mask = 1 - Only load+Op micro-ops Mask = 2 - Only std+sta micro-ops
EMON_UNFUSION	DBH	Number of unfusion events in the ROB, happened on a FP exception to a fused μop.
Prefetcher		
EMON_PREF_RQSTS_UP	F0H	Number of upward prefetches issued.
EMON_PREF_RQSTS_DN	F8H	Number of downward prefetches issued.

A number of P6 family processor performance monitoring events are modified for the Pentium M processor. Table 19-39 lists the performance monitoring events that were changed in the Pentium M processor, and differ from performance monitoring events for the P6 family of processors.

Table 19-39. Performance Monitoring Events Modified on Intel® Pentium® M Processors

Name	Hex Values	Descriptions	
CPU_CLK_UNHALTED	79H	Number of cycles during which the processor is not halted, and not in a thermal trip.	
EMON_SSE_SSE2_INST_ RETIRED	D8H	Streaming SIMD Extensions Instructions Retired: Mask = 0 – SSE packed single and scalar single Mask = 1 – SSE scalar-single Mask = 2 – SSE2 packed-double Mask = 3 – SSE2 scalar-double	
EMON_SSE_SSE2_COMP_INST_ RETIRED	D9H	Computational SSE Instructions Retired: Mask = 0 – SSE packed single Mask = 1 – SSE Scalar-single Mask = 2 – SSE2 packed-double Mask = 3 – SSE2 scalar-double	
L2_LD	29H	L2 data loads	Mask[0] = 1 – count I state lines Mask[1] = 1 – count S state lines Mask[2] = 1 – count E state lines Mask[3] = 1 – count M state lines Mask[5:4]: 00H – Excluding hardware-prefetched lines 01H - Hardware-prefetched lines only 02H/03H – All (HW-prefetched lines and non HW -- Prefetched lines)
L2_LINES_IN	24H	L2 lines allocated	
L2_LINES_OUT	26H	L2 lines evicted	
L2_M_LINES_OUT	27H	Lw M-state lines evicted	

19.20 P6 FAMILY PROCESSOR PERFORMANCE MONITORING EVENTS

Table 19-40 lists the events that can be counted with the performance monitoring counters and read with the RDPMC instruction for the P6 family processors. The unit column gives the microarchitecture or bus unit that produces the event; the event number column gives the hexadecimal number identifying the event; the mnemonic event name column gives the name of the event; the unit mask column gives the unit mask required (if any); the description column describes the event; and the comments column gives additional information about the event.

All of these performance events are model specific for the P6 family processors and are not available in this form in the Pentium 4 processors or the Pentium processors. Some events (such as those added in later generations of the P6 family processors) are only available in specific processors in the P6 family. All performance event encodings not listed in Table 19-40 are reserved and their use will result in undefined counter results.

See the end of the table for notes related to certain entries in the table.

Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
Data Cache Unit (DCU)	43H	DATA_MEM_REFS	00H	All loads from any memory type. All stores to any memory type. Each part of a split is counted separately. The internal logic counts not only memory loads and stores, but also internal retries. 80-bit floating-point accesses are double counted, since they are decomposed into a 16-bit exponent load and a 64-bit mantissa load. Memory accesses are only counted when they are actually performed (such as a load that gets squashed because a previous cache miss is outstanding to the same address, and which finally gets performed, is only counted once). Does not include I/O accesses, or other nonmemory accesses.	
	45H	DCU_LINES_IN	00H	Total lines allocated in DCU.	
	46H	DCU_M_LINES_IN	00H	Number of M state lines allocated in DCU.	
	47H	DCU_M_LINES_ OUT	00H	Number of M state lines evicted from DCU. This includes evictions via snoop HITM, intervention or replacement.	
	48H	DCU_MISS_ OUTSTANDING	00H	Weighted number of cycles while a DCU miss is outstanding, incremented by the number of outstanding cache misses at any particular time. Cacheable read requests only are considered. Uncacheable requests are excluded. Read-for-ownerships are counted, as well as line fills, invalidates, and stores.	An access that also misses the L2 is short-changed by 2 cycles (i.e., if counts N cycles, should be N+2 cycles). Subsequent loads to the same cache line will not result in any additional counts. Count value not precise, but still useful.
Instruction Fetch Unit (IFU)	80H	IFU_IFETCH	00H	Number of instruction fetches, both cacheable and noncacheable, including UC fetches.	
	81H	IFU_IFETCH_ MISS	00H	Number of instruction fetch misses All instruction fetches that do not hit the IFU (i.e., that produce memory requests). This includes UC accesses.	
	85H	ITLB_MISS	00H	Number of ITLB misses.	
	86H	IFU_MEM_STALL	00H	Number of cycles instruction fetch is stalled, for any reason. Includes IFU cache misses, ITLB misses, ITLB faults, and other minor stalls.	
	87H	ILD_STALL	00H	Number of cycles that the instruction length decoder is stalled.	
L2 Cache[1]	28H	L2_IFETCH	MESI 0FH	Number of L2 instruction fetches. This event indicates that a normal instruction fetch was received by the L2.	

Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
				The count includes only L2 cacheable instruction fetches; it does not include UC instruction fetches. It does not include ITLB miss accesses.	
	29H	L2_LD	MESI 0FH	Number of L2 data loads. This event indicates that a normal, unlocked, load memory access was received by the L2. It includes only L2 cacheable memory accesses; it does not include I/O accesses, other nonmemory accesses, or memory accesses such as UC/WT memory accesses. It does include L2 cacheable TLB miss memory accesses.	
	2AH	L2_ST	MESI 0FH	Number of L2 data stores. This event indicates that a normal, unlocked, store memory access was received by the L2. it indicates that the DCU sent a read-for-ownership request to the L2. It also includes Invalid to Modified requests sent by the DCU to the L2. It includes only L2 cacheable memory accesses; it does not include I/O accesses, other nonmemory accesses, or memory accesses such as UC/WT memory accesses. It includes TLB miss memory accesses.	
	24H	L2_LINES_IN	00H	Number of lines allocated in the L2.	
	26H	L2_LINES_OUT	00H	Number of lines removed from the L2 for any reason.	
	25H	L2_M_LINES_INM	00H	Number of modified lines allocated in the L2.	
	27H	L2_M_LINES_ OUTM	00H	Number of modified lines removed from the L2 for any reason.	
	2EH	L2_RQSTS	MESI 0FH	Total number of L2 requests.	
	21H	L2_ADS	00H	Number of L2 address strobes.	
	22H	L2_DBUS_BUSY	00H	Number of cycles during which the L2 cache data bus was busy.	
	23H	L2_DBUS_BUSY_ RD	00H	Number of cycles during which the data bus was busy transferring read data from L2 to the processor.	
External Bus Logic (EBL)[2]	62H	BUS_DRDY_ CLOCKS	00H (Self) 20H (Any)	Number of clocks during which DRDY# is asserted. Utilization of the external system data bus during data transfers.	Unit Mask = 00H counts bus clocks when the processor is driving DRDY#. Unit Mask = 20H counts in processor clocks when any agent is driving DRDY#.

Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
	63H	BUS_LOCK_ CLOCKS	00H (Self) 20H (Any)	Number of clocks during which LOCK# is asserted on the external system bus.[3]	Always counts in processor clocks.
	60H	BUS_REQ_ OUTSTANDING	00H (Self)	Number of bus requests outstanding. This counter is incremented by the number of cacheable read bus requests outstanding in any given cycle.	Counts only DCU full-line cacheable reads, not RFOs, writes, instruction fetches, or anything else. Counts "waiting for bus to complete" (last data chunk received).
	65H	BUS_TRAN_BRD	00H (Self) 20H (Any)	Number of burst read transactions.	
	66H	BUS_TRAN_RFO	00H (Self) 20H (Any)	Number of completed read for ownership transactions.	
	67H	BUS_TRANS_WB	00H (Self) 20H (Any)	Number of completed write back transactions.	
	68H	BUS_TRAN_ IFETCH	00H (Self) 20H (Any)	Number of completed instruction fetch transactions.	
	69H	BUS_TRAN_INVA L	00H (Self) 20H (Any)	Number of completed invalidate transactions.	
	6AH	BUS_TRAN_PWR	00H (Self) 20H (Any)	Number of completed partial write transactions.	
	6BH	BUS_TRANS_P	00H (Self) 20H (Any)	Number of completed partial transactions.	
	6CH	BUS_TRANS_IO	00H (Self) 20H (Any)	Number of completed I/O transactions.	
	6DH	BUS_TRAN_DEF	00H (Self) 20H (Any)	Number of completed deferred transactions.	

Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
	6EH	BUS_TRAN_ BURST	00H (Self) 20H (Any)	Number of completed burst transactions.	
	70H	BUS_TRAN_ANY	00H (Self) 20H (Any)	Number of all completed bus transactions. Address bus utilization can be calculated knowing the minimum address bus occupancy. Includes special cycles, etc.	
	6FH	BUS_TRAN_MEM	00H (Self) 20H (Any)	Number of completed memory transactions.	
	64H	BUS_DATA_RCV	00H (Self)	Number of bus clock cycles during which this processor is receiving data.	
	61H	BUS_BNR_DRV	00H (Self)	Number of bus clock cycles during which this processor is driving the BNR# pin.	
	7AH	BUS_HIT_DRV	00H (Self)	Number of bus clock cycles during which this processor is driving the HIT# pin.	Includes cycles due to snoop stalls. The event counts correctly, but BPM*i* (breakpoint monitor) pins function as follows based on the setting of the PC bits (bit 19 in the PerfEvtSel0 and PerfEvtSel1 registers): ▪ If the core-clock-to- bus-clock ratio is 2:1 or 3:1, and a PC bit is set, the BPM*i* pins will be asserted for a single clock when the counters overflow. ▪ If the PC bit is clear, the processor toggles the BPM*i* pins when the counter overflows. ▪ If the clock ratio is not 2:1 or 3:1, the BPM*i* pins will not function for these performance monitoring counter events.
	7BH	BUS_HITM_DRV	00H (Self)	Number of bus clock cycles during which this processor is driving the HITM# pin.	Includes cycles due to snoop stalls. The event counts correctly, but BPM*i* (breakpoint monitor) pins function as follows based on the setting of the PC bits (bit 19 in the PerfEvtSel0 and PerfEvtSel1 registers): ▪ If the core-clock-to- bus-clock ratio is 2:1 or 3:1, and a PC bit is set, the BPM*i* pins will be asserted for a single clock when the counters overflow.

Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
					▪ If the PC bit is clear, the processor toggles the BPM*i*pins when the counter overflows. ▪ If the clock ratio is not 2:1 or 3:1, the BPM*i* pins will not function for these performance monitoring counter events.
	7EH	BUS_SNOOP_ STALL	00H (Self)	Number of clock cycles during which the bus is snoop stalled.	
Floating-Point Unit	C1H	FLOPS	00H	Number of computational floating-point operations retired. Excludes floating-point computational operations that cause traps or assists. Includes floating-point computational operations executed by the assist handler. Includes internal sub-operations for complex floating-point instructions like transcendentals. Excludes floating-point loads and stores.	Counter 0 only.
	10H	FP_COMP_OPS_ EXE	00H	Number of computational floating-point operations executed. The number of FADD, FSUB, FCOM, FMULs, integer MULs and IMULs, FDIVs, FPREMs, FSQRTS, integer DIVs, and IDIVs. This number does not include the number of cycles, but the number of operations. This event does not distinguish an FADD used in the middle of a transcendental flow from a separate FADD instruction.	Counter 0 only.
	11H	FP_ASSIST	00H	Number of floating-point exception cases handled by microcode.	Counter 1 only. This event includes counts due to speculative execution.
	12H	MUL	00H	Number of multiplies. This count includes integer as well as FP multiplies and is speculative.	Counter 1 only.
	13H	DIV	00H	Number of divides. This count includes integer as well as FP divides and is speculative.	Counter 1 only.
	14H	CYCLES_DIV_ BUSY	00H	Number of cycles during which the divider is busy, and cannot accept new divides. This includes integer and FP divides, FPREM, FPSQRT, etc. and is speculative.	Counter 0 only.

Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
Memory Ordering	03H	LD_BLOCKS	00H	Number of load operations delayed due to store buffer blocks. Includes counts caused by preceding stores whose addresses are unknown, preceding stores whose addresses are known but whose data is unknown, and preceding stores that conflicts with the load but which incompletely overlap the load.	
	04H	SB_DRAINS	00H	Number of store buffer drain cycles. Incremented every cycle the store buffer is draining. Draining is caused by serializing operations like CPUID, synchronizing operations like XCHG, interrupt acknowledgment, as well as other conditions (such as cache flushing).	
	05H	MISALIGN_ MEM_REF	00H	Number of misaligned data memory references. Incremented by 1 every cycle, during which either the processor's load or store pipeline dispatches a misaligned μop. Counting is performed if it is the first or second half, or if it is blocked, squashed, or missed. In this context, misaligned means crossing a 64-bit boundary.	MISALIGN_MEM_ REF is only an approximation to the true number of misaligned memory references. The value returned is roughly proportional to the number of misaligned memory accesses (the size of the problem).
	07H	EMON_KNI_PREF _DISPATCHED	 00H 01H 02H 03H	Number of Streaming SIMD extensions prefetch/weakly-ordered instructions dispatched (speculative prefetches are included in counting): 0: prefetch NTA 1: prefetch T1 2: prefetch T2 3: weakly ordered stores	Counters 0 and 1. Pentium III processor only.
	4BH	EMON_KNI_PREF _MISS	 00H 01H 02H 03H	Number of prefetch/weakly-ordered instructions that miss all caches: 0: prefetch NTA 1: prefetch T1 2: prefetch T2 3: weakly ordered stores	Counters 0 and 1. Pentium III processor only.
Instruction Decoding and Retirement	C0H	INST_RETIRED	00H	Number of instructions retired.	A hardware interrupt received during/after the last iteration of the REP STOS flow causes the counter to undercount by 1 instruction.
					An SMI received while executing a HLT instruction will cause the performance counter to not count the RSM instruction and undercount by 1.

Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
	C2H	UOPS_RETIRED	00H	Number of μops retired.	
	D0H	INST_DECODED	00H	Number of instructions decoded.	
	D8H	EMON_KNI_INST_RETIRED	00H 01H	Number of Streaming SIMD extensions retired: 0: packed & scalar 1: scalar	Counters 0 and 1. Pentium III processor only.
	D9H	EMON_KNI_COMP_INST_RET	00H 01H	Number of Streaming SIMD extensions computation instructions retired: 0: packed and scalar 1: scalar	Counters 0 and 1. Pentium III processor only.
Interrupts	C8H	HW_INT_RX	00H	Number of hardware interrupts received.	
	C6H	CYCLES_INT_MASKED	00H	Number of processor cycles for which interrupts are disabled.	
	C7H	CYCLES_INT_PENDING_AND_MASKED	00H	Number of processor cycles for which interrupts are disabled and interrupts are pending.	
Branches	C4H	BR_INST_RETIRED	00H	Number of branch instructions retired.	
	C5H	BR_MISS_PRED_RETIRED	00H	Number of mispredicted branches retired.	
	C9H	BR_TAKEN_RETIRED	00H	Number of taken branches retired.	
	CAH	BR_MISS_PRED_TAKEN_RET	00H	Number of taken mispredictions branches retired.	
	E0H	BR_INST_DECODED	00H	Number of branch instructions decoded.	
	E2H	BTB_MISSES	00H	Number of branches for which the BTB did not produce a prediction.	
	E4H	BR_BOGUS	00H	Number of bogus branches.	
	E6H	BACLEARS	00H	Number of times BACLEAR is asserted. This is the number of times that a static branch prediction was made, in which the branch decoder decided to make a branch prediction because the BTB did not.	
Stalls	A2H	RESOURCE_STALLS	00H	Incremented by 1 during every cycle for which there is a resource related stall. Includes register renaming buffer entries, memory buffer entries.	

Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
				Does not include stalls due to bus queue full, too many cache misses, etc. In addition to resource related stalls, this event counts some other events. Includes stalls arising during branch misprediction recovery, such as if retirement of the mispredicted branch is delayed and stalls arising while store buffer is draining from synchronizing operations.	
	D2H	PARTIAL_RAT_ STALLS	00H	Number of cycles or events for partial stalls. This includes flag partial stalls.	
Segment Register Loads	06H	SEGMENT_REG_ LOADS	00H	Number of segment register loads.	
Clocks	79H	CPU_CLK_ UNHALTED	00H	Number of cycles during which the processor is not halted.	
MMX Unit	B0H	MMX_INSTR_ EXEC	00H	Number of MMX Instructions Executed.	Available in Intel Celeron, Pentium II and Pentium II Xeon processors only. Does not account for MOVQ and MOVD stores from register to memory.
	B1H	MMX_SAT_ INSTR_EXEC	00H	Number of MMX Saturating Instructions Executed.	Available in Pentium II and Pentium III processors only.
	B2H	MMX_UOPS_ EXEC	0FH	Number of MMX μops Executed.	Available in Pentium II and Pentium III processors only.
	B3H	MMX_INSTR_ TYPE_EXEC	01H 02H 04H 08H 10H 20H	MMX packed multiply instructions executed. MMX packed shift instructions executed. MMX pack operation instructions executed. MMX unpack operation instructions executed. MMX packed logical instructions executed. MMX packed arithmetic instructions executed.	Available in Pentium II and Pentium III processors only.
	CCH	FP_MMX_TRANS	00H 01H	Transitions from MMX instruction to floating-point instructions. Transitions from floating-point instructions to MMX instructions.	Available in Pentium II and Pentium III processors only.
	CDH	MMX_ASSIST	00H	Number of MMX Assists (that is, the number of EMMS instructions executed).	Available in Pentium II and Pentium III processors only.
	CEH	MMX_INSTR_RET	00H	Number of MMX Instructions Retired.	Available in Pentium II processors only.
Segment Register Renaming	D4H	SEG_RENAME_ STALLS		Number of Segment Register Renaming Stalls:	Available in Pentium II and Pentium III processors only.

Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
			02H	Segment register ES	
			04H	Segment register DS	
			08H	Segment register FS	
			0FH	Segment register FS	
				Segment registers ES + DS + FS + GS	
	D5H	SEG_REG_ RENAMES		Number of Segment Register Renames:	Available in Pentium II and Pentium III processors only.
			01H	Segment register ES	
			02H	Segment register DS	
			04H	Segment register FS	
			08H	Segment register FS	
			0FH	Segment registers ES + DS + FS + GS	
	D6H	RET_SEG_ RENAMES	00H	Number of segment register rename events retired.	Available in Pentium II and Pentium III processors only.

NOTES:

1. Several L2 cache events, where noted, can be further qualified using the Unit Mask (UMSK) field in the PerfEvtSel0 and PerfEvtSel1 registers. The lower 4 bits of the Unit Mask field are used in conjunction with L2 events to indicate the cache state or cache states involved.

   The P6 family processors identify cache states using the "MESI" protocol and consequently each bit in the Unit Mask field represents one of the four states: UMSK[3] = M (8H) state, UMSK[2] = E (4H) state, UMSK[1] = S (2H) state, and UMSK[0] = I (1H) state. UMSK[3:0] = MESI" (FH) should be used to collect data for all states; UMSK = 0H, for the applicable events, will result in nothing being counted.

2. All of the external bus logic (EBL) events, except where noted, can be further qualified using the Unit Mask (UMSK) field in the PerfEvtSel0 and PerfEvtSel1 registers.

   Bit 5 of the UMSK field is used in conjunction with the EBL events to indicate whether the processor should count transactions that are self- generated (UMSK[5] = 0) or transactions that result from any processor on the bus (UMSK[5] = 1).

3. L2 cache locks, so it is possible to have a zero count.

19.21 PENTIUM PROCESSOR PERFORMANCE MONITORING EVENTS

Table 19-41 lists the events that can be counted with the performance monitoring counters for the Pentium processor. The Event Number column gives the hexadecimal code that identifies the event and that is entered in the ES0 or ES1 (event select) fields of the CESR MSR. The Mnemonic Event Name column gives the name of the event, and the Description and Comments columns give detailed descriptions of the events. Most events can be counted with either counter 0 or counter 1; however, some events can only be counted with only counter 0 or only counter 1 (as noted).

NOTE

The events in the table that are shaded are implemented only in the Pentium processor with MMX technology.

Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters

Event Num.	Mnemonic Event Name	Description	Comments
00H	DATA_READ	Number of memory data reads (internal data cache hit and miss combined).	Split cycle reads are counted individually. Data Memory Reads that are part of TLB miss processing are not included. These events may occur at a maximum of two per clock. I/O is not included.
01H	DATA_WRITE	Number of memory data writes (internal data cache hit and miss combined); I/O not included.	Split cycle writes are counted individually. These events may occur at a maximum of two per clock. I/O is not included.
0H2	DATA_TLB_MISS	Number of misses to the data cache translation look-aside buffer.	
03H	DATA_READ_MISS	Number of memory read accesses that miss the internal data cache whether or not the access is cacheable or noncacheable.	Additional reads to the same cache line after the first BRDY# of the burst line fill is returned but before the final (fourth) BRDY# has been returned, will not cause the counter to be incremented additional times. Data accesses that are part of TLB miss processing are not included. Accesses directed to I/O space are not included.
04H	DATA WRITE MISS	Number of memory write accesses that miss the internal data cache whether or not the access is cacheable or noncacheable.	Data accesses that are part of TLB miss processing are not included. Accesses directed to I/O space are not included.
05H	WRITE_HIT_TO_ M-_OR_E-STATE_LINES	Number of write hits to exclusive or modified lines in the data cache.	These are the writes that may be held up if EWBE# is inactive. These events may occur a maximum of two per clock.
06H	DATA_CACHE_ LINES_ WRITTEN_BACK	Number of dirty lines (all) that are written back, regardless of the cause.	Replacements and internal and external snoops can all cause writeback and are counted.
07H	EXTERNAL_ SNOOPS	Number of accepted external snoops whether they hit in the code cache or data cache or neither.	Assertions of EADS# outside of the sampling interval are not counted, and no internal snoops are counted.
08H	EXTERNAL_DATA_ CACHE_SNOOP_ HITS	Number of external snoops to the data cache.	Snoop hits to a valid line in either the data cache, the data line fill buffer, or one of the write back buffers are all counted as hits.
09H	MEMORY ACCESSES IN BOTH PIPES	Number of data memory reads or writes that are paired in both pipes of the pipeline.	These accesses are not necessarily run in parallel due to cache misses, bank conflicts, etc.
0AH	BANK CONFLICTS	Number of actual bank conflicts.	
0BH	MISALIGNED DATA MEMORY OR I/O REFERENCES	Number of memory or I/O reads or writes that are misaligned.	A 2- or 4-byte access is misaligned when it crosses a 4-byte boundary; an 8-byte access is misaligned when it crosses an 8-byte boundary. Ten byte accesses are treated as two separate accesses of 8 and 2 bytes each.
0CH	CODE READ	Number of instruction reads; whether the read is cacheable or noncacheable.	Individual 8-byte noncacheable instruction reads are counted.
0DH	CODE TLB MISS	Number of instruction reads that miss the code TLB whether the read is cacheable or noncacheable.	Individual 8-byte noncacheable instruction reads are counted.
0EH	CODE CACHE MISS	Number of instruction reads that miss the internal code cache; whether the read is cacheable or noncacheable.	Individual 8-byte noncacheable instruction reads are counted.

Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
0FH	ANY SEGMENT REGISTER LOADED	Number of writes into any segment register in real or protected mode including the LDTR, GDTR, IDTR, and TR.	Segment loads are caused by explicit segment register load instructions, far control transfers, and task switches. Far control transfers and task switches causing a privilege level change will signal this event twice. Interrupts and exceptions may initiate a far control transfer.
10H	Reserved		
11H	Reserved		
12H	Branches	Number of taken and not taken branches, including: conditional branches, jumps, calls, returns, software interrupts, and interrupt returns.	Also counted as taken branches are serializing instructions, VERR and VERW instructions, some segment descriptor loads, hardware interrupts (including FLUSH#), and programmatic exceptions that invoke a trap or fault handler. The pipe is not necessarily flushed. The number of branches actually executed is measured, not the number of predicted branches.
13H	BTB_HITS	Number of BTB hits that occur.	Hits are counted only for those instructions that are actually executed.
14H	TAKEN_BRANCH_ OR_BTB_HIT	Number of taken branches or BTB hits that occur.	This event type is a logical OR of taken branches and BTB hits. It represents an event that may cause a hit in the BTB. Specifically, it is either a candidate for a space in the BTB or it is already in the BTB.
15H	PIPELINE FLUSHES	Number of pipeline flushes that occur Pipeline flushes are caused by BTB misses on taken branches, mispredictions, exceptions, interrupts, and some segment descriptor loads.	The counter will not be incremented for serializing instructions (serializing instructions cause the prefetch queue to be flushed but will not trigger the Pipeline Flushed event counter) and software interrupts (software interrupts do not flush the pipeline).
16H	INSTRUCTIONS_ EXECUTED	Number of instructions executed (up to two per clock).	Invocations of a fault handler are considered instructions. All hardware and software interrupts and exceptions will also cause the count to be incremented. Repeat prefixed string instructions will only increment this counter once despite the fact that the repeat loop executes the same instruction multiple times until the loop criteria is satisfied. This applies to all the Repeat string instruction prefixes (i.e., REP, REPE, REPZ, REPNE, and REPNZ). This counter will also only increment once per each HLT instruction executed regardless of how many cycles the processor remains in the HALT state.
17H	INSTRUCTIONS_ EXECUTED_ V PIPE	Number of instructions executed in the V_pipe. The event indicates the number of instructions that were paired.	This event is the same as the 16H event except it only counts the number of instructions actually executed in the V-pipe.
18H	BUS_CYCLE_ DURATION	Number of clocks while a bus cycle is in progress. This event measures bus use.	The count includes HLDA, AHOLD, and BOFF# clocks.
19H	WRITE_BUFFER_ FULL_STALL_ DURATION	Number of clocks while the pipeline is stalled due to full write buffers.	Full write buffers stall data memory read misses, data memory write misses, and data memory write hits to S-state lines. Stalls on I/O accesses are not included.

Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
1AH	WAITING_FOR_ DATA_MEMORY_ READ_STALL_ DURATION	Number of clocks while the pipeline is stalled while waiting for data memory reads.	Data TLB Miss processing is also included in the count. The pipeline stalls while a data memory read is in progress including attempts to read that are not bypassed while a line is being filled.
1BH	STALL ON WRITE TO AN E- OR M-STATE LINE	Number of stalls on writes to E- or M-state lines.	
1CH	LOCKED BUS CYCLE	Number of locked bus cycles that occur as the result of the LOCK prefix or LOCK instruction, page-table updates, and descriptor table updates.	Only the read portion of the locked read-modify-write is counted. Split locked cycles (SCYC active) count as two separate accesses. Cycles restarted due to BOFF# are not re-counted.
1DH	I/O READ OR WRITE CYCLE	Number of bus cycles directed to I/O space.	Misaligned I/O accesses will generate two bus cycles. Bus cycles restarted due to BOFF# are not re-counted.
1EH	NONCACHEABLE_ MEMORY_READS	Number of noncacheable instruction or data memory read bus cycles. The count includes read cycles caused by TLB misses, but does not include read cycles to I/O space.	Cycles restarted due to BOFF# are not re-counted.
1FH	PIPELINE_AGI_ STALLS	Number of address generation interlock (AGI) stalls. An AGI occurring in both the U- and V-pipelines in the same clock signals this event twice.	An AGI occurs when the instruction in the execute stage of either of U- or V-pipelines is writing to either the index or base address register of an instruction in the D2 (address generation) stage of either the U- or V- pipelines.
20H	Reserved		
21H	Reserved		
22H	FLOPS	Number of floating-point operations that occur.	Number of floating-point adds, subtracts, multiplies, divides, remainders, and square roots are counted. The transcendental instructions consist of multiple adds and multiplies and will signal this event multiple times. Instructions generating the divide-by-zero, negative square root, special operand, or stack exceptions will not be counted. Instructions generating all other floating-point exceptions will be counted. The integer multiply instructions and other instructions which use the x87 FPU will be counted.
23H	BREAKPOINT MATCH ON DR0 REGISTER	Number of matches on register DR0 breakpoint.	The counters is incremented regardless if the breakpoints are enabled or not. However, if breakpoints are not enabled, code breakpoint matches will not be checked for instructions executed in the V-pipe and will not cause this counter to be incremented. (They are checked on instruction executed in the U-pipe only when breakpoints are not enabled.) These events correspond to the signals driven on the BP[3:0] pins. Refer to Chapter 17, "Debug, Branch Profile, TSC, and Resource Monitoring Features" for more information.
24H	BREAKPOINT MATCH ON DR1 REGISTER	Number of matches on register DR1 breakpoint.	See comment for 23H event.

Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
25H	BREAKPOINT MATCH ON DR2 REGISTER	Number of matches on register DR2 breakpoint.	See comment for 23H event.
26H	BREAKPOINT MATCH ON DR3 REGISTER	Number of matches on register DR3 breakpoint.	See comment for 23H event.
27H	HARDWARE INTERRUPTS	Number of taken INTR and NMI interrupts.	
28H	DATA_READ_OR_ WRITE	Number of memory data reads and/or writes (internal data cache hit and miss combined).	Split cycle reads and writes are counted individually. Data Memory Reads that are part of TLB miss processing are not included. These events may occur at a maximum of two per clock. I/O is not included.
29H	DATA_READ_MISS OR_WRITE MISS	Number of memory read and/or write accesses that miss the internal data cache, whether or not the access is cacheable or noncacheable.	Additional reads to the same cache line after the first BRDY# of the burst line fill is returned but before the final (fourth) BRDY# has been returned, will not cause the counter to be incremented additional times. Data accesses that are part of TLB miss processing are not included. Accesses directed to I/O space are not included.
2AH	BUS_OWNERSHIP_ LATENCY (Counter 0)	The time from LRM bus ownership request to bus ownership granted (that is, the time from the earlier of a PBREQ (0), PHITM# or HITM# assertion to a PBGNT assertion)	The ratio of the 2AH events counted on counter 0 and counter 1 is the average stall time due to bus ownership conflict.
2AH	BUS OWNERSHIP TRANSFERS (Counter 1)	The number of buss ownership transfers (that is, the number of PBREQ (0) assertions	The ratio of the 2AH events counted on counter 0 and counter 1 is the average stall time due to bus ownership conflict.
2BH	MMX_ INSTRUCTIONS_ EXECUTED_ U-PIPE (Counter 0)	Number of MMX instructions executed in the U-pipe	
2BH	MMX_ INSTRUCTIONS_ EXECUTED_ V-PIPE (Counter 1)	Number of MMX instructions executed in the V-pipe	
2CH	CACHE_M-STATE_LINE_ SHARING (Counter 0)	Number of times a processor identified a hit to a modified line due to a memory access in the other processor (PHITM (0))	If the average memory latencies of the system are known, this event enables the user to count the Write Backs on PHITM(0) penalty and the Latency on Hit Modified(I) penalty.
2CH	CACHE_LINE_ SHARING (Counter 1)	Number of shared data lines in the L1 cache (PHIT (0))	
2DH	EMMS_ INSTRUCTIONS_ EXECUTED (Counter 0)	Number of EMMS instructions executed	

Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
2DH	TRANSITIONS_ BETWEEN_MMX_ AND_FP_ INSTRUCTIONS (Counter 1)	Number of transitions between MMX and floating-point instructions or vice versa An even count indicates the processor is in MMX state. an odd count indicates it is in FP state.	This event counts the first floating-point instruction following an MMX instruction or first MMX instruction following a floating-point instruction. The count may be used to estimate the penalty in transitions between floating-point state and MMX state.
2EH	BUS_UTILIZATION_ DUE_TO_ PROCESSOR_ ACTIVITY (Counter 0)	Number of clocks the bus is busy due to the processor's own activity (the bus activity that is caused by the processor)	
2EH	WRITES_TO_ NONCACHEABLE_ MEMORY (Counter 1)	Number of write accesses to noncacheable memory	The count includes write cycles caused by TLB misses and I/O write cycles. Cycles restarted due to BOFF# are not re-counted.
2FH	SATURATING_ MMX_ INSTRUCTIONS_ EXECUTED (Counter 0)	Number of saturating MMX instructions executed, independently of whether they actually saturated.	
2FH	SATURATIONS_ PERFORMED (Counter 1)	Number of MMX instructions that used saturating arithmetic when at least one of its results actually saturated	If an MMX instruction operating on 4 doublewords saturated in three out of the four results, the counter will be incremented by one only.
30H	NUMBER_OF_ CYCLES_NOT_IN_ HALT_STATE (Counter 0)	Number of cycles the processor is not idle due to HLT instruction	This event will enable the user to calculate "net CPI". Note that during the time that the processor is executing the HLT instruction, the Time-Stamp Counter is not disabled. Since this event is controlled by the Counter Controls CC0, CC1 it can be used to calculate the CPI at CPL=3, which the TSC cannot provide.
30H	DATA_CACHE_ TLB_MISS_ STALL_DURATION (Counter 1)	Number of clocks the pipeline is stalled due to a data cache translation look-aside buffer (TLB) miss	
31H	MMX_ INSTRUCTION_ DATA_READS (Counter 0)	Number of MMX instruction data reads	
31H	MMX_ INSTRUCTION_ DATA_READ_ MISSES (Counter 1)	Number of MMX instruction data read misses	
32H	FLOATING_POINT_S TALLS_DURATION (Counter 0)	Number of clocks while pipe is stalled due to a floating-point freeze	
32H	TAKEN_BRANCHES (Counter 1)	Number of taken branches	

Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
33H	D1_STARVATION_ AND_FIFO_IS_ EMPTY (Counter 0)	Number of times D1 stage cannot issue ANY instructions since the FIFO buffer is empty	The D1 stage can issue 0, 1, or 2 instructions per clock if those are available in an instructions FIFO buffer.
33H	D1_STARVATION_ AND_ONLY_ONE_ INSTRUCTION_IN_ FIFO (Counter 1)	Number of times the D1 stage issues a single instruction (since the FIFO buffer had just one instruction ready)	The D1 stage can issue 0, 1, or 2 instructions per clock if those are available in an instructions FIFO buffer. When combined with the previously defined events, Instruction Executed (16H) and Instruction Executed in the V-pipe (17H), this event enables the user to calculate the numbers of time pairing rules prevented issuing of two instructions.
34H	MMX_ INSTRUCTION_ DATA_WRITES (Counter 0)	Number of data writes caused by MMX instructions	
34H	MMX_ INSTRUCTION_ DATA_WRITE_ MISSES (Counter 1)	Number of data write misses caused by MMX instructions	
35H	PIPELINE_ FLUSHES_DUE_ TO_WRONG_ BRANCH_ PREDICTIONS (Counter 0)	Number of pipeline flushes due to wrong branch predictions resolved in either the E-stage or the WB-stage	The count includes any pipeline flush due to a branch that the pipeline did not follow correctly. It includes cases where a branch was not in the BTB, cases where a branch was in the BTB but was mispredicted, and cases where a branch was correctly predicted but to the wrong address. Branches are resolved in either the Execute stage (E-stage) or the Writeback stage (WB-stage). In the later case, the misprediction penalty is larger by one clock. The difference between the 35H event count in counter 0 and counter 1 is the number of E-stage resolved branches.
35H	PIPELINE_ FLUSHES_DUE_ TO_WRONG_ BRANCH_ PREDICTIONS_ RESOLVED_IN_ WB-STAGE (Counter 1)	Number of pipeline flushes due to wrong branch predictions resolved in the WB-stage	See note for event 35H (Counter 0).
36H	MISALIGNED_ DATA_MEMORY_ REFERENCE_ON_ MMX_ INSTRUCTIONS (Counter 0)	Number of misaligned data memory references when executing MMX instructions	
36H	PIPELINE_ ISTALL_FOR_MMX_ INSTRUCTION_ DATA_MEMORY_ READS (Counter 1)	Number clocks during pipeline stalls caused by waits form MMX instruction data memory reads	T3:

Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
37H	MISPREDICTED_ OR_ UNPREDICTED_ RETURNS (Counter 1)	Number of returns predicted incorrectly or not predicted at all	The count is the difference between the total number of executed returns and the number of returns that were correctly predicted. Only RET instructions are counted (for example, IRET instructions are not counted).
37H	PREDICTED_ RETURNS (Counter 1)	Number of predicted returns (whether they are predicted correctly and incorrectly	Only RET instructions are counted (for example, IRET instructions are not counted).
38H	MMX_MULTIPLY_ UNIT_INTERLOCK (Counter 0)	Number of clocks the pipe is stalled since the destination of previous MMX multiply instruction is not ready yet	The counter will not be incremented if there is another cause for a stall. For each occurrence of a multiply interlock, this event will be counted twice (if the stalled instruction comes on the next clock after the multiply) or by once (if the stalled instruction comes two clocks after the multiply).
38H	MOVD/MOVQ_ STORE_STALL_ DUE_TO_ PREVIOUS_MMX_ OPERATION (Counter 1)	Number of clocks a MOVD/MOVQ instruction store is stalled in D2 stage due to a previous MMX operation with a destination to be used in the store instruction.	
39H	RETURNS (Counter 0)	Number or returns executed.	Only RET instructions are counted; IRET instructions are not counted. Any exception taken on a RET instruction and any interrupt recognized by the processor on the instruction boundary prior to the execution of the RET instruction will also cause this counter to be incremented.
39H	Reserved		
3AH	BTB_FALSE_ ENTRIES (Counter 0)	Number of false entries in the Branch Target Buffer	False entries are causes for misprediction other than a wrong prediction.
3AH	BTB_MISS_ PREDICTION_ON_ NOT-TAKEN_ BRANCH (Counter 1)	Number of times the BTB predicted a not-taken branch as taken	
3BH	FULL_WRITE_ BUFFER_STALL_ DURATION_ WHILE_ EXECUTING_MMX_I NSTRUCTIONS (Counter 0)	Number of clocks while the pipeline is stalled due to full write buffers while executing MMX instructions	
3BH	STALL_ON_MMX_ INSTRUCTION_ WRITE_TO E-_OR_ M-STATE_LINE (Counter 1)	Number of clocks during stalls on MMX instructions writing to E- or M-state lines	

20.Updates to Chapter 24, Volume 3B

Change bars show changes to Chapter 24 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B:* System Programming Guide, Part 2.

Changes to this chapter: Various updates related to VMX and Intel Processor Trace interactions.

CHAPTER 24
VIRTUAL MACHINE CONTROL STRUCTURES

24.1 OVERVIEW

A logical processor uses **virtual-machine control data structures** (**VMCSs**) while it is in VMX operation. These manage transitions into and out of VMX non-root operation (VM entries and VM exits) as well as processor behavior in VMX non-root operation. This structure is manipulated by the new instructions VMCLEAR, VMPTRLD, VMREAD, and VMWRITE.

A VMM can use a different VMCS for each virtual machine that it supports. For a virtual machine with multiple logical processors (virtual processors), the VMM can use a different VMCS for each virtual processor.

A logical processor associates a region in memory with each VMCS. This region is called the **VMCS region**.[1] Software references a specific VMCS using the 64-bit physical address of the region (a **VMCS pointer**). VMCS pointers must be aligned on a 4-KByte boundary (bits 11:0 must be zero). These pointers must not set bits beyond the processor's physical-address width.[2,3]

A logical processor may maintain a number of VMCSs that are **active**. The processor may optimize VMX operation by maintaining the state of an active VMCS in memory, on the processor, or both. At any given time, at most one of the active VMCSs is the **current** VMCS. (This document frequently uses the term "the VMCS" to refer to the current VMCS.) The VMLAUNCH, VMREAD, VMRESUME, and VMWRITE instructions operate only on the current VMCS.

The following items describe how a logical processor determines which VMCSs are active and which is current:

- The memory operand of the VMPTRLD instruction is the address of a VMCS. After execution of the instruction, that VMCS is both active and current on the logical processor. Any other VMCS that had been active remains so, but no other VMCS is current.
- The VMCS link pointer field in the current VMCS (see Section 24.4.2) is itself the address of a VMCS. If VM entry is performed successfully with the 1-setting of the "VMCS shadowing" VM-execution control, the VMCS referenced by the VMCS link pointer field becomes active on the logical processor. The identity of the current VMCS does not change.
- The memory operand of the VMCLEAR instruction is also the address of a VMCS. After execution of the instruction, that VMCS is neither active nor current on the logical processor. If the VMCS had been current on the logical processor, the logical processor no longer has a current VMCS.

The VMPTRST instruction stores the address of the logical processor's current VMCS into a specified memory location (it stores the value FFFFFFFF_FFFFFFFFH if there is no current VMCS).

The **launch state** of a VMCS determines which VM-entry instruction should be used with that VMCS: the VMLAUNCH instruction requires a VMCS whose launch state is "clear"; the VMRESUME instruction requires a VMCS whose launch state is "launched". A logical processor maintains a VMCS's launch state in the corresponding VMCS region. The following items describe how a logical processor manages the launch state of a VMCS:

- If the launch state of the current VMCS is "clear", successful execution of the VMLAUNCH instruction changes the launch state to "launched".
- The memory operand of the VMCLEAR instruction is the address of a VMCS. After execution of the instruction, the launch state of that VMCS is "clear".
- There are no other ways to modify the launch state of a VMCS (it cannot be modified using VMWRITE) and there is no direct way to discover it (it cannot be read using VMREAD).

---

1. The amount of memory required for a VMCS region is at most 4 KBytes. The exact size is implementation specific and can be determined by consulting the VMX capability MSR IA32_VMX_BASIC to determine the size of the VMCS region (see Appendix A.1).
2. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.
3. If IA32_VMX_BASIC[48] is read as 1, these pointers must not set any bits in the range 63:32; see Appendix A.1.

Figure 24-1 illustrates the different states of a VMCS. It uses "X" to refer to the VMCS and "Y" to refer to any other VMCS. Thus: "VMPTRLD X" always makes X current and active; "VMPTRLD Y" always makes X not current (because it makes Y current); VMLAUNCH makes the launch state of X "launched" if X was current and its launch state was "clear"; and VMCLEAR X always makes X inactive and not current and makes its launch state "clear".

The figure does not illustrate operations that do not modify the VMCS state relative to these parameters (e.g., execution of VMPTRLD X when X is already current). Note that VMCLEAR X makes X "inactive, not current, and clear," even if X's current state is not defined (e.g., even if X has not yet been initialized). See Section 24.11.3.

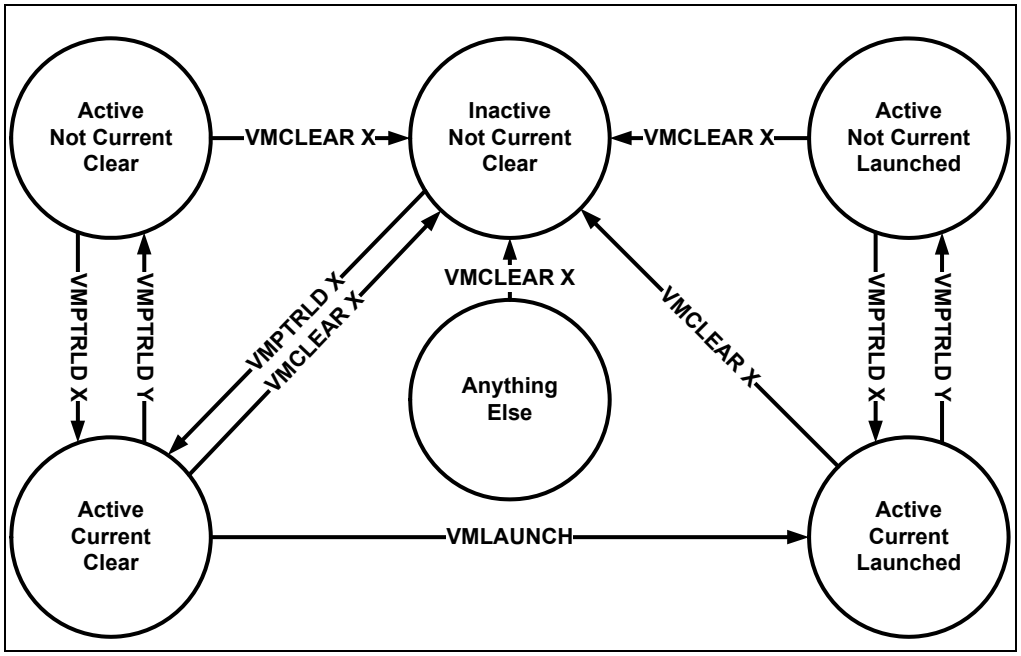

Figure 24-1. States of VMCS X

Because a shadow VMCS (see Section 24.10) cannot be used for VM entry, the launch state of a shadow VMCS is not meaningful. Figure 24-1 does not illustrate all the ways in which a shadow VMCS may be made active.

24.2 FORMAT OF THE VMCS REGION

A VMCS region comprises up to 4-KBytes.[1] The format of a VMCS region is given in Table 24-1.

Table 24-1. Format of the VMCS Region

Byte Offset	Contents
0	Bits 30:0: VMCS revision identifier Bit 31: shadow-VMCS indicator (see Section 24.10)
4	VMX-abort indicator
8	VMCS data (implementation-specific format)

The first 4 bytes of the VMCS region contain the **VMCS revision identifier** at bits 30:0.[2] Processors that maintain VMCS data in different formats (see below) use different VMCS revision identifiers. These identifiers enable soft-

1. The exact size is implementation specific and can be determined by consulting the VMX capability MSR IA32_VMX_BASIC to determine the size of the VMCS region (see Appendix A.1).

ware to avoid using a VMCS region formatted for one processor on a processor that uses a different format.[1] Bit 31 of this 4-byte region indicates whether the VMCS is a shadow VMCS (see Section 24.10).

Software should write the VMCS revision identifier to the VMCS region before using that region for a VMCS. The VMCS revision identifier is never written by the processor; VMPTRLD fails if its operand references a VMCS region whose VMCS revision identifier differs from that used by the processor. (VMPTRLD also fails if the shadow-VMCS indicator is 1 and the processor does not support the 1-setting of the "VMCS shadowing" VM-execution control; see Section 24.6.2) Software can discover the VMCS revision identifier that a processor uses by reading the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).

Software should clear or set the shadow-VMCS indicator depending on whether the VMCS is to be an ordinary VMCS or a shadow VMCS (see Section 24.10). VMPTRLD fails if the shadow-VMCS indicator is set and the processor does not support the 1-setting of the "VMCS shadowing" VM-execution control. Software can discover support for this setting by reading the VMX capability MSR IA32_VMX_PROCBASED_CTLS2 (see Appendix A.3.3).

The next 4 bytes of the VMCS region are used for the **VMX-abort indicator**. The contents of these bits do not control processor operation in any way. A logical processor writes a non-zero value into these bits if a VMX abort occurs (see Section 27.7). Software may also write into this field.

The remainder of the VMCS region is used for **VMCS data** (those parts of the VMCS that control VMX non-root operation and the VMX transitions). The format of these data is implementation-specific. VMCS data are discussed in Section 24.3 through Section 24.9. To ensure proper behavior in VMX operation, software should maintain the VMCS region and related structures (enumerated in Section 24.11.4) in writeback cacheable memory. Future implementations may allow or require a different memory type[2]. Software should consult the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).

24.3 ORGANIZATION OF VMCS DATA

The VMCS data are organized into six logical groups:

- **Guest-state area.** Processor state is saved into the guest-state area on VM exits and loaded from there on VM entries.
- **Host-state area.** Processor state is loaded from the host-state area on VM exits.
- **VM-execution control fields.** These fields control processor behavior in VMX non-root operation. They determine in part the causes of VM exits.
- **VM-exit control fields.** These fields control VM exits.
- **VM-entry control fields.** These fields control VM entries.
- **VM-exit information fields.** These fields receive information on VM exits and describe the cause and the nature of VM exits. On some processors, these fields are read-only.[3]

The VM-execution control fields, the VM-exit control fields, and the VM-entry control fields are sometimes referred to collectively as VMX controls.

---

2. Earlier versions of this manual specified that the VMCS revision identifier was a 32-bit field. For all processors produced prior to this change, bit 31 of the VMCS revision identifier was 0.

1. Logical processors that use the same VMCS revision identifier use the same size for VMCS regions.

2. Alternatively, software may map any of these regions or structures with the UC memory type. Doing so is strongly discouraged unless necessary as it will cause the performance of transitions using those structures to suffer significantly. In addition, the processor will continue to use the memory type reported in the VMX capability MSR IA32_VMX_BASIC with exceptions noted in Appendix A.1.

3. Software can discover whether these fields can be written by reading the VMX capability MSR IA32_VMX_MISC (see Appendix A.6).

24.4 GUEST-STATE AREA

This section describes fields contained in the guest-state area of the VMCS. As noted earlier, processor state is loaded from these fields on every VM entry (see Section 26.3.2) and stored into these fields on every VM exit (see Section 27.3).

24.4.1 Guest Register State

The following fields in the guest-state area correspond to processor registers:

- Control registers CR0, CR3, and CR4 (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- Debug register DR7 (64 bits; 32 bits on processors that do not support Intel 64 architecture).
- RSP, RIP, and RFLAGS (64 bits each; 32 bits on processors that do not support Intel 64 architecture).[1]
- The following fields for each of the registers CS, SS, DS, ES, FS, GS, LDTR, and TR:
  - Selector (16 bits).
  - Base address (64 bits; 32 bits on processors that do not support Intel 64 architecture). The base-address fields for CS, SS, DS, and ES have only 32 architecturally-defined bits; nevertheless, the corresponding VMCS fields have 64 bits on processors that support Intel 64 architecture.
  - Segment limit (32 bits). The limit field is always a measure in bytes.
  - Access rights (32 bits). The format of this field is given in Table 24-2 and detailed as follows:
    - The low 16 bits correspond to bits 23:8 of the upper 32 bits of a 64-bit segment descriptor. While bits 19:16 of code-segment and data-segment descriptors correspond to the upper 4 bits of the segment limit, the corresponding bits (bits 11:8) are reserved in this VMCS field.
    - Bit 16 indicates an **unusable segment**. Attempts to use such a segment fault except in 64-bit mode. In general, a segment register is unusable if it has been loaded with a null selector.[2]
    - Bits 31:17 are reserved.

Table 24-2. Format of Access Rights

Bit Position(s)	Field
3:0	Segment type
4	S — Descriptor type (0 = system; 1 = code or data)
6:5	DPL — Descriptor privilege level
7	P — Segment present
11:8	Reserved
12	AVL — Available for use by system software

1. This chapter uses the notation RAX, RIP, RSP, RFLAGS, etc. for processor registers because most processors that support VMX operation also support Intel 64 architecture. For processors that do not support Intel 64 architecture, this notation refers to the 32-bit forms of those registers (EAX, EIP, ESP, EFLAGS, etc.). In a few places, notation such as EAX is used to refer specifically to lower 32 bits of the indicated register.
2. There are a few exceptions to this statement. For example, a segment with a non-null selector may be unusable following a task switch that fails after its commit point; see "Interrupt 10—Invalid TSS Exception (#TS)" in Section 6.14, "Exception and Interrupt Handling in 64-bit Mode," of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*. In contrast, the TR register is usable after processor reset despite having a null selector; see Table 10-1 in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*.

Table 24-2. Format of Access Rights (Contd.)

Bit Position(s)	Field
13	Reserved (except for CS) L — 64-bit mode active (for CS only)
14	D/B — Default operation size (0 = 16-bit segment; 1 = 32-bit segment)
15	G — Granularity
16	Segment unusable (0 = usable; 1 = unusable)
31:17	Reserved

The base address, segment limit, and access rights compose the "hidden" part (or "descriptor cache") of each segment register. These data are included in the VMCS because it is possible for a segment register's descriptor cache to be inconsistent with the segment descriptor in memory (in the GDT or the LDT) referenced by the segment register's selector.

The value of the DPL field for SS is always equal to the logical processor's current privilege level (CPL).[1]

- The following fields for each of the registers GDTR and IDTR:
  - Base address (64 bits; 32 bits on processors that do not support Intel 64 architecture).
  - Limit (32 bits). The limit fields contain 32 bits even though these fields are specified as only 16 bits in the architecture.
- The following MSRs:
  - IA32_DEBUGCTL (64 bits)
  - IA32_SYSENTER_CS (32 bits)
  - IA32_SYSENTER_ESP and IA32_SYSENTER_EIP (64 bits; 32 bits on processors that do not support Intel 64 architecture)
  - IA32_PERF_GLOBAL_CTRL (64 bits). This field is supported only on processors that support the 1-setting of the "load IA32_PERF_GLOBAL_CTRL" VM-entry control.
  - IA32_PAT (64 bits). This field is supported only on processors that support either the 1-setting of the "load IA32_PAT" VM-entry control or that of the "save IA32_PAT" VM-exit control.
  - IA32_EFER (64 bits). This field is supported only on processors that support either the 1-setting of the "load IA32_EFER" VM-entry control or that of the "save IA32_EFER" VM-exit control.
  - IA32_BNDCFGS (64 bits). This field is supported only on processors that support either the 1-setting of the "load IA32_BNDCFGS" VM-entry control or that of the "clear IA32_BNDCFGS" VM-exit control.
- The register SMBASE (32 bits). This register contains the base address of the logical processor's SMRAM image.

24.4.2 Guest Non-Register State

In addition to the register state described in Section 24.4.1, the guest-state area includes the following fields that characterize guest state but which do not correspond to processor registers:

- **Activity state** (32 bits). This field identifies the logical processor's activity state. When a logical processor is executing instructions normally, it is in the **active state**. Execution of certain instructions and the occurrence of certain events may cause a logical processor to transition to an **inactive state** in which it ceases to execute instructions.

  The following activity states are defined:[2]

  - 0: **Active**. The logical processor is executing instructions normally.

1. In protected mode, CPL is also associated with the RPL field in the CS selector. However, the RPL fields are not meaningful in real-address mode or in virtual-8086 mode.

— 1: **HLT**. The logical processor is inactive because it executed the HLT instruction.

— 2: **Shutdown**. The logical processor is inactive because it incurred a **triple fault**[1] or some other serious error.

— 3: **Wait-for-SIPI**. The logical processor is inactive because it is waiting for a startup-IPI (SIPI).

Future processors may include support for other activity states. Software should read the VMX capability MSR IA32_VMX_MISC (see Appendix A.6) to determine what activity states are supported.

- **Interruptibility state** (32 bits). The IA-32 architecture includes features that permit certain events to be blocked for a period of time. This field contains information about such blocking. Details and the format of this field are given in Table 24-3.

Table 24-3. Format of Interruptibility State

Bit Position(s)	Bit Name	Notes
0	Blocking by STI	See the "STI—Set Interrupt Flag" section in Chapter 4 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B*. Execution of STI with RFLAGS.IF = 0 blocks interrupts (and, optionally, other events) for one instruction after its execution. Setting this bit indicates that this blocking is in effect.
1	Blocking by MOV SS	See the "MOV—Move a Value from the Stack" from Chapter 4 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B*, and "POP—Pop a Value from the Stack" from Chapter 4 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B*, and Section 6.8.3 in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*. Execution of a MOV to SS or a POP to SS blocks interrupts for one instruction after its execution. In addition, certain debug exceptions are inhibited between a MOV to SS or a POP to SS and a subsequent instruction. Setting this bit indicates that the blocking of all these events is in effect. This document uses the term "blocking by MOV SS," but it applies equally to POP SS.
2	Blocking by SMI	See Section 34.2. System-management interrupts (SMIs) are disabled while the processor is in system-management mode (SMM). Setting this bit indicates that blocking of SMIs is in effect.
3	Blocking by NMI	See Section 6.7.1 in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A* and Section 34.8. Delivery of a non-maskable interrupt (NMI) or a system-management interrupt (SMI) blocks subsequent NMIs until the next execution of IRET. See Section 25.3 for how this behavior of IRET may change in VMX non-root operation. Setting this bit indicates that blocking of NMIs is in effect. Clearing this bit does not imply that NMIs are not (temporarily) blocked for other reasons. If the "virtual NMIs" VM-execution control (see Section 24.6.1) is 1, this bit does not control the blocking of NMIs. Instead, it refers to "virtual-NMI blocking" (the fact that guest software is not ready for an NMI).
4	Enclave interruption	A VM exit saves this bit as 1 to indicate that the VM exit was incident to enclave mode.
31:5	Reserved	VM entry will fail if these bits are not 0. See Section 26.3.1.5.

- **Pending debug exceptions** (64 bits; 32 bits on processors that do not support Intel 64 architecture). IA-32 processors may recognize one or more debug exceptions without immediately delivering them.[2] This field contains information about such exceptions. This field is described in Table 24-4.

2. Execution of the MWAIT instruction may put a logical processor into an inactive state. However, this VMCS field never reflects this state. See Section 27.1.

1. A triple fault occurs when a logical processor encounters an exception while attempting to deliver a double fault.

Table 24-4. Format of Pending-Debug-Exceptions

Bit Position(s)	Bit Name	Notes
3:0	B3 – B0	When set, each of these bits indicates that the corresponding breakpoint condition was met. Any of these bits may be set even if the corresponding enabling bit in DR7 is not set.
11:4	Reserved	VM entry fails if these bits are not 0. See Section 26.3.1.5.
12	Enabled breakpoint	When set, this bit indicates that at least one data or I/O breakpoint was met and was enabled in DR7.
13	Reserved	VM entry fails if this bit is not 0. See Section 26.3.1.5.
14	BS	When set, this bit indicates that a debug exception would have been triggered by single-step execution mode.
15	Reserved	VM entry fails if this bit is not 0. See Section 26.3.1.5.
16	RTM	When set, this bit indicates that a debug exception (#DB) or a breakpoint exception (#BP) occurred inside an RTM region while advanced debugging of RTM transactional regions was enabled (see Section 16.3.7, "RTM-Enabled Debugger Support," of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1*).[1]
63:17	Reserved	VM entry fails if these bits are not 0. See Section 26.3.1.5. Bits 63:32 exist only on processors that support Intel 64 architecture.

NOTES:

1. In general, the format of this field matches that of DR6. However, DR6 **clears** bit 16 to indicate an RTM-related exception, while this field **sets** the bit to indicate that condition.

- **VMCS link pointer** (64 bits). If the "VMCS shadowing" VM-execution control is 1, the VMREAD and VMWRITE instructions access the VMCS referenced by this pointer (see Section 24.10). Otherwise, software should set this field to FFFFFFFF_FFFFFFFFH to avoid VM-entry failures (see Section 26.3.1.5).
- **VMX-preemption timer value** (32 bits). This field is supported only on processors that support the 1-setting of the "activate VMX-preemption timer" VM-execution control. This field contains the value that the VMX-preemption timer will use following the next VM entry with that setting. See Section 25.5.1 and Section 26.6.4.
- **Page-directory-pointer-table entries** (PDPTEs; 64 bits each). These four (4) fields (PDPTE0, PDPTE1, PDPTE2, and PDPTE3) are supported only on processors that support the 1-setting of the "enable EPT" VM-execution control. They correspond to the PDPTEs referenced by CR3 when PAE paging is in use (see Section 4.4 in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*). They are used only if the "enable EPT" VM-execution control is 1.
- **Guest interrupt status** (16 bits). This field is supported only on processors that support the 1-setting of the "virtual-interrupt delivery" VM-execution control. It characterizes part of the guest's virtual-APIC state and does not correspond to any processor or APIC registers. It comprises two 8-bit subfields:
  - **Requesting virtual interrupt (RVI)**. This is the low byte of the guest interrupt status. The processor treats this value as the vector of the highest priority virtual interrupt that is requesting service. (The value 0 implies that there is no such interrupt.)
  - **Servicing virtual interrupt (SVI)**. This is the high byte of the guest interrupt status. The processor treats this value as the vector of the highest priority virtual interrupt that is in service. (The value 0 implies that there is no such interrupt.)

---

2. For example, execution of a MOV to SS or a POP to SS may inhibit some debug exceptions for one instruction. See Section 6.8.3 of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*. In addition, certain events incident to an instruction (for example, an INIT signal) may take priority over debug traps generated by that instruction. See Table 6-2 in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*.

See Chapter 29 for more information on the use of this field.

- **PML index** (16 bits). This field is supported only on processors that support the 1-setting of the "enable PML" VM-execution control. It contains the logical index of the next entry in the page-modification log. Because the page-modification log comprises 512 entries, the PML index is typically a value in the range 0–511. Details of the page-modification log and use of the PML index are given in Section 28.2.5.

24.5 HOST-STATE AREA

This section describes fields contained in the host-state area of the VMCS. As noted earlier, processor state is loaded from these fields on every VM exit (see Section 27.5).

All fields in the host-state area correspond to processor registers:

- CR0, CR3, and CR4 (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- RSP and RIP (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- Selector fields (16 bits each) for the segment registers CS, SS, DS, ES, FS, GS, and TR. There is no field in the host-state area for the LDTR selector.
- Base-address fields for FS, GS, TR, GDTR, and IDTR (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- The following MSRs:
  - IA32_SYSENTER_CS (32 bits)
  - IA32_SYSENTER_ESP and IA32_SYSENTER_EIP (64 bits; 32 bits on processors that do not support Intel 64 architecture).
  - IA32_PERF_GLOBAL_CTRL (64 bits). This field is support

Table 24-6. Definitions of Primary Processor-Based VM-Execution Controls (Contd.)

Bit Position(s)	Name	Description
15	CR3-load exiting	In conjunction with the CR3-target controls (see Section 24.6.7), this control determines whether executions of MOV to CR3 cause VM exits. See Section 25.1.3. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.
16	CR3-store exiting	This control determines whether executions of MOV from CR3 cause VM exits. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.
19	CR8-load exiting	This control determines whether executions of MOV to CR8 cause VM exits.
20	CR8-store exiting	This control determines whether executions of MOV from CR8 cause VM exits.
21	Use TPR shadow	Setting this control to 1 enables TPR virtualization and other APIC-virtualization features. See Chapter 29.
22	NMI-window exiting	If this control is 1, a VM exit occurs at the beginning of any instruction if there is no virtual-NMI blocking (see Section 24.4.2).
23	MOV-DR exiting	This control determines whether executions of MOV DR cause VM exits.
24	Unconditional I/O exiting	This control determines whether executions of I/O instructions (IN, INS/INSB/INSW/INSD, OUT, and OUTS/OUTSB/OUTSW/OUTSD) cause VM exits.
25	Use I/O bitmaps	This control determines whether I/O bitmaps are used to restrict executions of I/O instructions (see Section 24.6.4 and Section 25.1.3). For this control, "0" means "do not use I/O bitmaps" and "1" means "use I/O bitmaps." If the I/O bitmaps are used, the setting of the "unconditional I/O exiting" control is ignored.
27	Monitor trap flag	If this control is 1, the monitor trap flag debugging feature is enabled. See Section 25.5.2.
28	Use MSR bitmaps	This control determines whether MSR bitmaps are used to control execution of the RDMSR and WRMSR instructions (see Section 24.6.9 and Section 25.1.3). For this control, "0" means "do not use MSR bitmaps" and "1" means "use MSR bitmaps." If the MSR bitmaps are not used, all executions of the RDMSR and WRMSR instructions cause VM exits.
29	MONITOR exiting	This control determines whether executions of MONITOR cause VM exits.
30	PAUSE exiting	This control determines whether executions of PAUSE cause VM exits.
31	Activate secondary controls	This control determines whether the secondary processor-based VM-execution controls are used. If this control is 0, the logical processor operates as if all the secondary processor-based VM-execution controls were also 0.

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs IA32_VMX_PROCBASED_CTLS and IA32_VMX_TRUE_PROCBASED_CTLS (see Appendix A.3.2) to determine how to set reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 26.2.1.1).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 1, 4–6, 8, 13–16, and 26. The VMX capability MSR IA32_VMX_PROCBASED_CTLS will always report that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR IA32_VMX_TRUE_PROCBASED_CTLS MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

Bit 31 of the primary processor-based VM-execution controls determines whether the secondary processor-based VM-execution controls are used. If that bit is 0, VM entry and VMX non-root operation function as if all the secondary processor-based VM-execution controls were 0. Processors that support only the 0-setting of bit 31 of the primary processor-based VM-execution controls do not support the secondary processor-based VM-execution controls.

Table 24-7 lists the secondary processor-based VM-execution controls. See Chapter 25 for more details of how these controls affect processor behavior in VMX non-root operation.

Table 24-7. Definitions of Secondary Processor-Based VM-Execution Controls

Bit Position(s)	Name	Description
0	Virtualize APIC accesses	If this control is 1, the logical processor treats specially accesses to the page with the APIC-access address. See Section 29.4.
1	Enable EPT	If this control is 1, extended page tables (EPT) are enabled. See Section 28.2.
2	Descriptor-table exiting	This control determines whether executions of LGDT, LIDT, LLDT, LTR, SGDT, SIDT, SLDT, and STR cause VM exits.
3	Enable RDTSCP	If this control is 0, any execution of RDTSCP causes an invalid-opcode exception (#UD).
4	Virtualize x2APIC mode	If this control is 1, the logical processor treats specially RDMSR and WRMSR to APIC MSRs (in the range 800H–8FFH). See Section 29.5.
5	Enable VPID	If this control is 1, cached translations of linear addresses are associated with a virtual-processor identifier (VPID). See Section 28.1.
6	WBINVD exiting	This control determines whether executions of WBINVD cause VM exits.
7	Unrestricted guest	This control determines whether guest software may run in unpaged protected mode or in real-address mode.
8	APIC-register virtualization	If this control is 1, the logical processor virtualizes certain APIC accesses. See Section 29.4 and Section 29.5.
9	Virtual-interrupt delivery	This controls enables the evaluation and delivery of pending virtual interrupts as well as the emulation of writes to the APIC registers that control interrupt prioritization.
10	PAUSE-loop exiting	This control determines whether a series of executions of PAUSE can cause a VM exit (see Section 24.6.13 and Section 25.1.3).
11	RDRAND exiting	This control determines whether executions of RDRAND cause VM exits.
12	Enable INVPCID	If this control is 0, any execution of INVPCID causes a #UD.
13	Enable VM functions	Setting this control to 1 enables use of the VMFUNC instruction in VMX non-root operation. See Section 25.5.5.
14	VMCS shadowing	If this control is 1, executions of VMREAD and VMWRITE in VMX non-root operation may access a shadow VMCS (instead of causing VM exits). See Section 24.10 and Section 30.3.
15	Enable ENCLS exiting	If this control is 1, executions of ENCLS consult the ENCLS-exiting bitmap to determine whether the instruction causes a VM exit. See Section 24.6.16 and Section 25.1.3.
16	RDSEED exiting	This control determines whether executions of RDSEED cause VM exits.
17	Enable PML	If this control is 1, an access to a guest-physical address that sets an EPT dirty bit first adds an entry to the page-modification log. See Section 28.2.5.
18	EPT-violation #VE	If this control is 1, EPT violations may cause virtualization exceptions (#VE) instead of VM exits. See Section 25.5.6.
19	Conceal VMX from PT	If this control is 1, Intel Processor Trace suppresses from PIPs an indication that the processor was in VMX non-root operation and omits a VMCS packet from any PSB+ produced in VMX non-root operation (see Chapter 35).
20	Enable XSAVES/XRSTORS	If this control is 0, any execution of XSAVES or XRSTORS causes a #UD.
22	Mode-based execute control for EPT	If this control is 1, EPT execute permissions are based on whether the linear address being accessed is supervisor mode or user mode. See Chapter 28.
25	Use TSC scaling	This control determines whether executions of RDTSC, executions of RDTSCP, and executions of RDMSR that read from the IA32_TIME_STAMP_COUNTER MSR return a value modified by the TSC multiplier field (see Section 24.6.5 and Section 25.3).

All other bits in this field are reserved to 0. Software should consult the VMX capability MSR IA32_VMX_PROCBASED_CTLS2 (see Appendix A.3.3) to determine which bits may be set to 1. Failure to clear reserved bits causes subsequent VM entries to fail (see Section 26.2.1.1).

24.6.3 Exception Bitmap

The **exception bitmap** is a 32-bit field that contains one bit for each exception. When an exception occurs, its vector is used to select a bit in this field. If the bit is 1, the exception causes a VM exit. If the bit is 0, the exception is delivered normally through the IDT, using the descriptor corresponding to the exception's vector.

Whether a page fault (exception with vector 14) causes a VM exit is determined by bit 14 in the exception bitmap as well as the error code produced by the page fault and two 32-bit fields in the VMCS (the **page-fault error-code mask** and **page-fault error-code match)**. See Section 25.2 for details.

24.6.4 I/O-Bitmap Addresses

The VM-execution control fields include the 64-bit physical addresses of **I/O bitmaps** A and B (each of which are 4 KBytes in size). I/O bitmap A contains one bit for each I/O port in the range 0000H through 7FFFH; I/O bitmap B contains bits for ports in the range 8000H through FFFFH.

A logical processor uses these bitmaps if and only if the "use I/O bitmaps" control is 1. If the bitmaps are used, execution of an I/O instruction causes a VM exit if any bit in the I/O bitmaps corresponding to a port it accesses is 1. See Section 25.1.3 for details. If the bitmaps are used, their addresses must be 4-KByte aligned.

24.6.5 Time-Stamp Counter Offset and Multiplier

The VM-execution control fields include a 64-bit **TSC-offset** field. If the "RDTSC exiting" control is 0 and the "use TSC offsetting" control is 1, this field controls executions of the RDTSC and RDTSCP instructions. It also controls executions of the RDMSR instruction that read from the IA32_TIME_STAMP_COUNTER MSR. For all of these, the value of the TSC offset is added to the value of the time-stamp counter, and the sum is returned to guest software in EDX:EAX.

Processors that support the 1-setting of the "use TSC scaling" control also support a 64-bit **TSC-multiplier** field. If this control is 1 (and the "RDTSC exiting" control is 0 and the "use TSC offsetting" control is 1), this field also affects the executions of the RDTSC, RDTSCP, and RDMSR instructions identified above. Specifically, the contents of the time-stamp counter is first multiplied by the TSC multiplier before adding the TSC offset.

See Chapter 27 for a detailed treatment of the behavior of RDTSC, RDTSCP, and RDMSR in VMX non-root operation.

24.6.6 Guest/Host Masks and Read Shadows for CR0 and CR4

VM-execution control fields include **guest/host masks** and **read shadows** for the CR0 and CR4 registers. These fields control executions of instructions that access those registers (including CLTS, LMSW, MOV CR, and SMSW). They are 64 bits on processors that support Intel 64 architecture and 32 bits on processors that do not.

In general, bits set to 1 in a guest/host mask correspond to bits "owned" by the host:

- Guest attempts to set them (using CLTS, LMSW, or MOV to CR) to values differing from the corresponding bits in the corresponding read shadow cause VM exits.
- Guest reads (using MOV from CR or SMSW) return values for these bits from the corresponding read shadow.

Bits cleared to 0 correspond to bits "owned" by the guest; guest attempts to modify them succeed and guest reads return values for these bits from the control register itself.

See Chapter 27 for details regarding how these fields affect VMX non-root operation.

24.6.7 CR3-Target Controls

The VM-execution control fields include a set of 4 **CR3-target values** and a **CR3-target count**. The CR3-target values each have 64 bits on processors that support Intel 64 architecture and 32 bits on processors that do not. The CR3-target count has 32 bits on all processors.

An execution of MOV to CR3 in VMX non-root operation does not cause a VM exit if its source operand matches one of these values. If the CR3-target count is *n*, only the first *n* CR3-target values are considered; if the CR3-target count is 0, MOV to CR3 always causes a VM exit

There are no limitations on the values that can be written for the CR3-target values. VM entry fails (see Section 26.2) if the CR3-target count is greater than 4.

Future processors may support a different number of CR3-target values. Software should read the VMX capability MSR IA32_VMX_MISC (see Appendix A.6) to determine the number of values supported.

24.6.8 Controls for APIC Virtualization

There are three mechanisms by which software accesses registers of the logical processor's local APIC:

- If the local APIC is in xAPIC mode, it can perform memory-mapped accesses to addresses in the 4-KByte page referenced by the physical address in the IA32_APIC_BASE MSR (see Section 10.4.4, "Local APIC Status and Location" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A* and *Intel® 64 Architecture Processor Topology Enumeration*).[1]
- If the local APIC is in x2APIC mode, it can accesses the local APIC's registers using the RDMSR and WRMSR instructions (see *Intel® 64 Architecture Processor Topology Enumeration*).
- In 64-bit mode, it can access the local APIC's task-priority register (TPR) using the MOV CR8 instruction.

There are five processor-based VM-execution controls (see Section 24.6.2) that control such accesses. There are "use TPR shadow", "virtualize APIC accesses", "virtualize x2APIC mode", "virtual-interrupt delivery", and "APIC-register virtualization". These controls interact with the following fields:

- **APIC-access address** (64 bits). This field contains the physical address of the 4-KByte **APIC-access page**. If the "virtualize APIC accesses" VM-execution control is 1, access to this page may cause VM exits or be virtualized by the processor. See Section 29.4.

  The APIC-access address exists only on processors that support the 1-setting of the "virtualize APIC accesses" VM-execution control.
- **Virtual-APIC address** (64 bits). This field contains the physical address of the 4-KByte **virtual-APIC page**. The processor uses the virtual-APIC page to virtualize certain accesses to APIC registers and to manage virtual interrupts; see Chapter 29.

  Depending on the setting of the controls indicated earlier, the virtual-APIC page may be accessed by the following operations:

  — The MOV CR8 instructions (see Section 29.3).

  — Accesses to the APIC-access page if, in addition, the "virtualize APIC accesses" VM-execution control is 1 (see Section 29.4).

  — The RDMSR and WRMSR instructions if, in addition, the value of ECX is in the range 800H–8FFH (indicating an APIC MSR) and the "virtualize x2APIC mode" VM-execution control is 1 (see Section 29.5).

  If the "use TPR shadow" VM-execution control is 1, VM entry ensures that the virtual-APIC address is 4-KByte aligned. The virtual-APIC address exists only on processors that support the 1-setting of the "use TPR shadow" VM-execution control.
- **TPR threshold** (32 bits). Bits 3:0 of this field determine the threshold below which bits 7:4 of VTPR (see Section 29.1.1) cannot fall. If the "virtual-interrupt delivery" VM-execution control is 0, a VM exit occurs after an operation (e.g., an execution of MOV to CR8) that reduces the value of those bits below the TPR threshold. See Section 29.1.2.

1. If the local APIC does not support x2APIC mode, it is always in xAPIC mode.

The TPR threshold exists only on processors that support the 1-setting of the "use TPR shadow" VM-execution control.

- **EOI-exit bitmap** (4 fields; 64 bits each). These fields are supported only on processors that support the 1-setting of the "virtual-interrupt delivery" VM-execution control. They are used to determine which virtualized writes to the APIC's EOI register cause VM exits:
  - EOI_EXIT0 contains bits for vectors from 0 (bit 0) to 63 (bit 63).
  - EOI_EXIT1 contains bits for vectors from 64 (bit 0) to 127 (bit 63).
  - EOI_EXIT2 contains bits for vectors from 128 (bit 0) to 191 (bit 63).
  - EOI_EXIT3 contains bits for vectors from 192 (bit 0) to 255 (bit 63).

  See Section 29.1.4 for more information on the use of this field.
- **Posted-interrupt notification vector** (16 bits). This field is supported only on processors that support the 1-setting of the "process posted interrupts" VM-execution control. Its low 8 bits contain the interrupt vector that is used to notify a logical processor that virtual interrupts have been posted. See Section 29.6 for more information on the use of this field.
- **Posted-interrupt descriptor address** (64 bits). This field is supported only on processors that support the 1-setting of the "process posted interrupts" VM-execution control. It is the physical address of a 64-byte aligned posted interrupt descriptor. See Section 29.6 for more information on the use of this field.

24.6.9 MSR-Bitmap Address

On processors that support the 1-setting of the "use MSR bitmaps" VM-execution control, the VM-execution control fields include the 64-bit physical address of four contiguous **MSR bitmaps**, which are each 1-KByte in size. This field does not exist on processors that do not support the 1-setting of that control. The four bitmaps are:

- **Read bitmap for low MSRs** (located at the MSR-bitmap address)**.** This contains one bit for each MSR address in the range 00000000H to 00001FFFH. The bit determines whether an execution of RDMSR applied to that MSR causes a VM exit.
- **Read bitmap for high MSRs** (located at the MSR-bitmap address plus 1024)**.** This contains one bit for each MSR address in the range C0000000H toC0001FFFH. The bit determines whether an execution of RDMSR applied to that MSR causes a VM exit.
- **Write bitmap for low MSRs** (located at the MSR-bitmap address plus 2048)**.** This contains one bit for each MSR address in the range 00000000H to 00001FFFH. The bit determines whether an execution of WRMSR applied to that MSR causes a VM exit.
- **Write bitmap for high MSRs** (located at the MSR-bitmap address plus 3072)**.** This contains one bit for each MSR address in the range C0000000H toC0001FFFH. The bit determines whether an execution of WRMSR applied to that MSR causes a VM exit.

A logical processor uses these bitmaps if and only if the "use MSR bitmaps" control is 1. If the bitmaps are used, an execution of RDMSR or WRMSR causes a VM exit if the value of RCX is in neither of the ranges covered by the bitmaps or if the appropriate bit in the MSR bitmaps (corresponding to the instruction and the RCX value) is 1. See Section 25.1.3 for details. If the bitmaps are used, their address must be 4-KByte aligned.

24.6.10 Executive-VMCS Pointer

The executive-VMCS pointer is a 64-bit field used in the dual-monitor treatment of system-management interrupts (SMIs) and system-management mode (SMM). SMM VM exits save this field as described in Section 34.15.2. VM entries that return from SMM use this field as described in Section 34.15.4.

24.6.11 Extended-Page-Table Pointer (EPTP)

The **extended-page-table pointer** (EPTP) contains the address of the base of EPT PML4 table (see Section 28.2.2), as well as other EPT configuration information. The format of this field is shown in Table 24-8.

Table 24-8. Format of Extended-Page-Table Pointer

Bit Position(s)	Field
2:0	EPT paging-structure memory type (see Section 28.2.6): 0 = Uncacheable (UC) 6 = Write-back (WB) Other values are reserved.[1]
5:3	This value is 1 less than the EPT page-walk length (see Section 28.2.2)
6	Setting this control to 1 enables accessed and dirty flags for EPT (see Section 28.2.4)[2]
11:7	Reserved
N–1:12	Bits N–1:12 of the physical address of the 4-KByte aligned EPT PML4 table[3]
63:N	Reserved

NOTES:

1. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine what EPT paging-structure memory types are supported.
2. Not all processors support accessed and dirty flags for EPT. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine whether the processor supports this feature.
3. N is the physical-address width supported by the logical processor. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

The EPTP exists only on processors that support the 1-setting of the "enable EPT" VM-execution control.

24.6.12 Virtual-Processor Identifier (VPID)

The **virtual-processor identifier** (VPID) is a 16-bit field. It exists only on processors that support the 1-setting of the "enable VPID" VM-execution control. See Section 28.1 for details regarding the use of this field.

24.6.13 Controls for PAUSE-Loop Exiting

On processors that support the 1-setting of the "PAUSE-loop exiting" VM-execution control, the VM-execution control fields include the following 32-bit fields:

- **PLE_Gap**. Software can configure this field as an upper bound on the amount of time between two successive executions of PAUSE in a loop.
- **PLE_Window**. Software can configure this field as an upper bound on the amount of time a guest is allowed to execute in a PAUSE loop.

These fields measure time based on a counter that runs at the same rate as the timestamp counter (TSC). See Section 25.1.3 for more details regarding PAUSE-loop exiting.

24.6.14 VM-Function Controls

The **VM-function controls** constitute a 64-bit vector that governs use of the VMFUNC instruction in VMX non-root operation. This field is supported only on processors that support the 1-settings of both the "activate secondary controls" primary processor-based VM-execution control and the "enable VM functions" secondary processor-based VM-execution control.

Table 24-9 lists the VM-function controls. See Section 25.5.5 for more details of how these controls affect processor behavior in VMX non-root operation.

Table 24-9. Definitions of VM-Function Controls

Bit Position(s)	Name	Description
0	EPTP switching	The EPTP-switching VM function changes the EPT pointer to a value chosen from the EPTP list. See Section 25.5.5.3.

All other bits in this field are reserved to 0. Software should consult the VMX capability MSR IA32_VMX_VMFUNC (see Appendix A.11) to determine which bits are reserved. Failure to clear reserved bits causes subsequent VM entries to fail (see Section 26.2.1.1).

Processors that support the 1-setting of the "EPTP switching" VM-function control also support a 64-bit field called the **EPTP-list address**. This field contains the physical address of the 4-KByte **EPTP list**. The EPTP list comprises 512 8-Byte entries (each an EPTP value) and is used by the EPTP-switching VM function (see Section 25.5.5.3).

24.6.15 VMCS Shadowing Bitmap Addresses

On processors that support the 1-setting of the "VMCS shadowing" VM-execution control, the VM-execution control fields include the 64-bit physical addresses of the **VMREAD bitmap** and the **VMWRITE bitmap**. Each bitmap is 4 KBytes in size and thus contains 32 KBits. The addresses are the **VMREAD-bitmap address** and the **VMWRITE-bitmap address**.

If the "VMCS shadowing" VM-execution control is 1, executions of VMREAD and VMWRITE may consult these bitmaps (see Section 24.10 and Section 30.3).

24.6.16 ENCLS-Exiting Bitmap

The **ENCLS-exiting bitmap** is a 64-bit field. If the "enable ENCLS exiting" VM-execution control is 1, execution of ENCLS causes a VM exit if the bit in this field corresponding to the value of EAX is 1. If the bit is 0, the instruction executes normally. See Section 25.1.3 for more information.

24.6.17 Control Field for Page-Modification Logging

The **PML address** is a 64-bit field. It is the 4-KByte aligned address of the **page-modification log**. The page-modification log consists of 512 64-bit entries. It is used for the page-modification logging feature. Details of the page-modification logging are given in Section 28.2.5.

If the "enable PML" VM-execution control is 1, VM entry ensures that the PML address is 4-KByte aligned. The PML address exists only on processors that support the 1-setting of the "enable PML" VM-execution control.

24.6.18 Controls for Virtualization Exceptions

On processors that support the 1-setting of the "EPT-violation #VE" VM-execution control, the VM-execution control fields include the following:

- **Virtualization-exception information address** (64 bits). This field contains the physical address of the **virtualization-exception information area**. When a logical processor encounters a virtualization exception, it saves virtualization-exception information at the virtualization-exception information address; see Section 25.5.6.2.

- **EPTP index** (16 bits). When an EPT violation causes a virtualization exception, the processor writes the value of this field to the virtualization-exception information area. The EPTP-switching VM function updates this field (see Section 25.5.5.3).

24.6.19 XSS-Exiting Bitmap

On processors that support the 1-setting of the "enable XSAVES/XRSTORS" VM-execution control, the VM-execution control fields include a 64-bit **XSS-exiting bitmap**. If the "enable XSAVES/XRSTORS" VM-execution control is 1, executions of XSAVES and XRSTORS may consult this bitmap (see Section 25.1.3 and Section 25.3).

24.7 VM-EXIT CONTROL FIELDS

The VM-exit control fields govern the behavior of VM exits. They are discussed in Section 24.7.1 and Section 24.7.2.

24.7.1 VM-Exit Controls

The **VM-exit controls** constitute a 32-bit vector that governs the basic operation of VM exits. Table 24-10 lists the controls supported. See Chapter 27 for complete details of how these controls affect VM exits.

Table 24-10. Definitions of VM-Exit Controls

Bit Position(s)	Name	Description
2	Save debug controls	This control determines whether DR7 and the IA32_DEBUGCTL MSR are saved on VM exit. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.
9	Host address-space size	On processors that support Intel 64 architecture, this control determines whether a logical processor is in 64-bit mode after the next VM exit. Its value is loaded into CS.L, IA32_EFER.LME, and IA32_EFER.LMA on every VM exit.[1] This control must be 0 on processors that do not support Intel 64 architecture.
12	Load IA32_PERF_GLOBAL_CTRL	This control determines whether the IA32_PERF_GLOBAL_CTRL MSR is loaded on VM exit.
15	Acknowledge interrupt on exit	This control affects VM exits due to external interrupts: ▪ If such a VM exit occurs and this control is 1, the logical processor acknowledges the interrupt controller, acquiring the interrupt's vector. The vector is stored in the VM-exit interruption-information field, which is marked valid. ▪ If such a VM exit occurs and this control is 0, the interrupt is not acknowledged and the VM-exit interruption-information field is marked invalid.
18	Save IA32_PAT	This control determines whether the IA32_PAT MSR is saved on VM exit.
19	Load IA32_PAT	This control determines whether the IA32_PAT MSR is loaded on VM exit.
20	Save IA32_EFER	This control determines whether the IA32_EFER MSR is saved on VM exit.
21	Load IA32_EFER	This control determines whether the IA32_EFER MSR is loaded on VM exit.
22	Save VMX-preemption timer value	This control determines whether the value of the VMX-preemption timer is saved on VM exit.
23	Clear IA32_BNDCFGS	This control determines whether the IA32_BNDCFGS MSR is cleared on VM exit.
24	Conceal VMX from PT	If this control is 1, Intel Processor Trace does not produce a paging information packet (PIP) on a VM exit or a VMCS packet on an SMM VM exit (see Chapter 35).

NOTES:

1. Since Intel 64 architecture specifies that IA32_EFER.LMA is always set to the logical-AND of CR0.PG and IA32_EFER.LME, and since CR0.PG is always 1 in VMX operation, IA32_EFER.LMA is always identical to IA32_EFER.LME in VMX operation.

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs IA32_VMX_EXIT_CTLS and IA32_VMX_TRUE_EXIT_CTLS (see Appendix A.4) to determine how it should set the reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 26.2.1.2).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 0–8, 10, 11, 13, 14, 16, and 17. The VMX capability MSR IA32_VMX_EXIT_CTLS always reports that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR IA32_VMX_TRUE_EXIT_CTLS MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

24.7.2 VM-Exit Controls for MSRs

A VMM may specify lists of MSRs to be stored and loaded on VM exits. The following VM-exit control fields determine how MSRs are stored on VM exits:

- **VM-exit MSR-store count** (32 bits). This field specifies the number of MSRs to be stored on VM exit. It is recommended that this count not exceed 512 bytes.[1] Otherwise, unpredictable processor behavior (including a machine check) may result during VM exit.
- **VM-exit MSR-store address** (64 bits). This field contains the physical address of the VM-exit MSR-store area. The area is a table of entries, 16 bytes per entry, where the number of entries is given by the VM-exit MSR-store count. The format of each entry is given in Table 24-11. If the VM-exit MSR-store count is not zero, the address must be 16-byte aligned.

Table 24-11. Format of an MSR Entry

Bit Position(s)	Contents
31:0	MSR index
63:32	Reserved
127:64	MSR data

See Section 27.4 for how this area is used on VM exits.

The following VM-exit control fields determine how MSRs are loaded on VM exits:

- **VM-exit MSR-load count** (32 bits). This field contains the number of MSRs to be loaded on VM exit. It is recommended that this count not exceed 512 bytes. Otherwise, unpredictable processor behavior (including a machine check) may result during VM exit.[2]
- **VM-exit MSR-load address** (64 bits). This field contains the physical address of the VM-exit MSR-load area. The area is a table of entries, 16 bytes per entry, where the number of entries is given by the VM-exit MSR-load count (see Table 24-11). If the VM-exit MSR-load count is not zero, the address must be 16-byte aligned.

See Section 27.6 for how this area is used on VM exits.

24.8 VM-ENTRY CONTROL FIELDS

The VM-entry control fields govern the behavior of VM entries. They are discussed in Sections 24.8.1 through 24.8.3.

1. Future implementations may allow more MSRs to be stored reliably. Software should consult the VMX capability MSR IA32_VMX_MISC to determine the number supported (see Appendix A.6).
2. Future implementations may allow more MSRs to be loaded reliably. Software should consult the VMX capability MSR IA32_VMX_MISC to determine the number supported (see Appendix A.6).

24.8.1 VM-Entry Controls

The **VM-entry controls** constitute a 32-bit vector that governs the basic operation of VM entries. Table 24-12 lists the controls supported. See Chapter 24 for how these controls affect VM entries.

Table 24-12. Definitions of VM-Entry Controls

Bit Position(s)	Name	Description
2	Load debug controls	This control determines whether DR7 and the IA32_DEBUGCTL MSR are loaded on VM entry. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.
9	IA-32e mode guest	On processors that support Intel 64 architecture, this control determines whether the logical processor is in IA-32e mode after VM entry. Its value is loaded into IA32_EFER.LMA as part of VM entry.[1] This control must be 0 on processors that do not support Intel 64 architecture.
10	Entry to SMM	This control determines whether the logical processor is in system-management mode (SMM) after VM entry. This control must be 0 for any VM entry from outside SMM.
11	Deactivate dual-monitor treatment	If set to 1, the default treatment of SMIs and SMM is in effect after the VM entry (see Section 34.15.7). This control must be 0 for any VM entry from outside SMM.
13	Load IA32_PERF_GLOBAL_CTRL	This control determines whether the IA32_PERF_GLOBAL_CTRL MSR is loaded on VM entry.
14	Load IA32_PAT	This control determines whether the IA32_PAT MSR is loaded on VM entry.
15	Load IA32_EFER	This control determines whether the IA32_EFER MSR is loaded on VM entry.
16	Load IA32_BNDCFGS	This control determines whether the IA32_BNDCFGS MSR is loaded on VM entry.
17	Conceal VMX from PT	If this control is 1, Intel Processor Trace does not produce a paging information packet (PIP) on a VM entry or a VMCS packet on a VM entry that returns from SMM (see Chapter 35).

NOTES:

1. Bit 5 of the IA32_VMX_MISC MSR is read as 1 on any logical processor that supports the 1-setting of the "unrestricted guest" VM-execution control. If it is read as 1, every VM exit stores the value of IA32_EFER.LMA into the "IA-32e mode guest" VM-entry control (see Section 27.2).

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs IA32_VMX_ENTRY_CTLS and IA32_VMX_TRUE_ENTRY_CTLS (see Appendix A.5) to determine how it should set the reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 26.2.1.3).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 0–8 and 12. The VMX capability MSR IA32_VMX_ENTRY_CTLS always reports that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR IA32_VMX_TRUE_ENTRY_CTLS MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

24.8.2 VM-Entry Controls for MSRs

A VMM may specify a list of MSRs to be loaded on VM entries. The following VM-entry control fields manage this functionality:

- **VM-entry MSR-load count** (32 bits). This field contains the number of MSRs to be loaded on VM entry. It is recommended that this count not exceed 512 bytes. Otherwise, unpredictable processor behavior (including a machine check) may result during VM entry.[1]

1. Future implementations may allow more MSRs to be loaded reliably. Software should consult the VMX capability MSR IA32_VMX_MISC to determine the number supported (see Appendix A.6).

- **VM-entry MSR-load address** (64 bits). This field contains the physical address of the VM-entry MSR-load area. The area is a table of entries, 16 bytes per entry, where the number of entries is given by the VM-entry MSR-load count. The format of entries is described in Table 24-11. If the VM-entry MSR-load count is not zero, the address must be 16-byte aligned.

See Section 26.4 for details of how this area is used on VM entries.

24.8.3 VM-Entry Controls for Event Injection

VM entry can be configured to conclude by delivering an event through the IDT (after all guest state and MSRs have been loaded). This process is called **event injection** and is controlled by the following three VM-entry control fields:

- **VM-entry interruption-information field** (32 bits). This field provides details about the event to be injected. Table 24-13 describes the field.

Table 24-13. Format of the VM-Entry Interruption-Information Field

Bit Position(s)	Content
7:0	Vector of interrupt or exception
10:8	Interruption type: 0: External interrupt 1: Reserved 2: Non-maskable interrupt (NMI) 3: Hardware exception 4: Software interrupt 5: Privileged software exception 6: Software exception 7: Other event
11	Deliver error code (0 = do not deliver; 1 = deliver)
30:12	Reserved
31	Valid

  - The **vector** (bits 7:0) determines which entry in the IDT is used or which other event is injected.
  - The **interruption type** (bits 10:8) determines details of how the injection is performed. In general, a VMM should use the type **hardware exception** for all exceptions other than breakpoint exceptions (#BP; generated by INT3) and overflow exceptions (#OF; generated by INTO); it should use the type **software exception** for #BP and #OF. The type **other event** is used for injection of events that are not delivered through the IDT.
  - For exceptions, the **deliver-error-code bit** (bit 11) determines whether delivery pushes an error code on the guest stack.
  - VM entry injects an event if and only if the **valid bit** (bit 31) is 1. The valid bit in this field is cleared on every VM exit (see Section 27.2).
- **VM-entry exception error code** (32 bits). This field is used if and only if the valid bit (bit 31) and the deliver-error-code bit (bit 11) are both set in the VM-entry interruption-information field.
- **VM-entry instruction length** (32 bits). For injection of events whose type is software interrupt, software exception, or privileged software exception, this field is used to determine the value of RIP that is pushed on the stack.

See Section 26.5 for details regarding the mechanics of event injection, including the use of the interruption type and the VM-entry instruction length.

VM exits clear the valid bit (bit 31) in the VM-entry interruption-information field.

24.9 VM-EXIT INFORMATION FIELDS

The VMCS contains a section of fields that contain information about the most recent VM exit.

On some processors, attempts to write to these fields with VMWRITE fail (see "VMWRITE—Write Field to Virtual-Machine Control Structure" in Chapter 30).[1]

24.9.1 Basic VM-Exit Information

The following VM-exit information fields provide basic information about a VM exit:

- **Exit reason** (32 bits). This field encodes the reason for the VM exit and has the structure given in Table 24-14.

Table 24-14. Format of Exit Reason

Bit Position(s)	Contents
15:0	Basic exit reason
26:16	Reserved (cleared to 0)
27	A VM exit saves this bit as 1 to indicate that the VM exit was incident to enclave mode.
28	Pending MTF VM exit
29	VM exit from VMX root operation
30	Reserved (cleared to 0)
31	VM-entry failure (0 = true VM exit; 1 = VM-entry failure)

  - — Bits 15:0 provide basic information about the cause of the VM exit (if bit 31 is clear) or of the VM-entry failure (if bit 31 is set). Appendix C enumerates the basic exit reasons.
  - — Bit 28 is set only by an SMM VM exit (see Section 34.15.2) that took priority over an MTF VM exit (see Section 25.5.2) that would have occurred had the SMM VM exit not occurred. See Section 34.15.2.3.
  - — Bit 29 is set if and only if the processor was in VMX root operation at the time the VM exit occurred. This can happen only for SMM VM exits. See Section 34.15.2.
  - — Because some VM-entry failures load processor state from the host-state area (see Section 26.7), software must be able to distinguish such cases from true VM exits. Bit 31 is used for that purpose.
- **Exit qualification** (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field contains additional information about the cause of VM exits due to the following: debug exceptions; page-fault exceptions; start-up IPIs (SIPIs); task switches; INVEPT; INVLPG;INVVPID; LGDT; LIDT; LLDT; LTR; SGDT; SIDT; SLDT; STR; VMCLEAR; VMPTRLD; VMPTRST; VMREAD; VMWRITE; VMXON; control-register accesses; MOV DR; I/O instructions; and MWAIT. The format of the field depends on the cause of the VM exit. See Section 27.2.1 for details.
- **Guest-linear address** (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field is used in the following cases:
  - — VM exits due to attempts to execute LMSW with a memory operand.
  - — VM exits due to attempts to execute INS or OUTS.
  - — VM exits due to system-management interrupts (SMIs) that arrive immediately after retirement of I/O instructions.
  - — Certain VM exits due to EPT violations

  See Section 27.2.1 and Section 34.15.2.3 for details of when and how this field is used.

1. Software can discover whether these fields can be written by reading the VMX capability MSR IA32_VMX_MISC (see Appendix A.6).

- **Guest-physical address** (64 bits). This field is used VM exits due to EPT violations and EPT misconfigurations. See Section 27.2.1 for details of when and how this field is used.

24.9.2 Information for VM Exits Due to Vectored Events

Event-specific information is provided for VM exits due to the following vectored events: exceptions (including those generated by the instructions INT3, INTO, BOUND, and UD); external interrupts that occur while the "acknowledge interrupt on exit" VM-exit control is 1; and non-maskable interrupts (NMIs). This information is provided in the following fields:

- **VM-exit interruption information** (32 bits). This field receives basic information associated with the event causing the VM exit. Table 24-15 describes this field.

Table 24-15. Format of the VM-Exit Interruption-Information Field

Bit Position(s)	Content
7:0	Vector of interrupt or exception
10:8	Interruption type: 0: External interrupt 1: Not used 2: Non-maskable interrupt (NMI) 3: Hardware exception 4 – 5: Not used 6: Software exception 7: Not used
11	Error code valid (0 = invalid; 1 = valid)
12	NMI unblocking due to IRET
30:13	Reserved (cleared to 0)
31	Valid

- **VM-exit interruption error code** (32 bits). For VM exits caused by hardware exceptions that would have delivered an error code on the stack, this field receives that error code.

Section 27.2.2 provides details of how these fields are saved on VM exits.

24.9.3 Information for VM Exits That Occur During Event Delivery

Additional information is provided for VM exits that occur during event delivery in VMX non-root operation.[1] This information is provided in the following fields:

- **IDT-vectoring information** (32 bits). This field receives basic information associated with the event that was being delivered when the VM exit occurred. Table 24-16 describes this field.

1. This includes cases in which the event delivery was caused by event injection as part of VM entry; see Section 26.5.1.2.

Table 24-16. Format of the IDT-Vectoring Information Field

Bit Position(s)	Content
7:0	Vector of interrupt or exception
10:8	Interruption type: 0: External interrupt 1: Not used 2: Non-maskable interrupt (NMI) 3: Hardware exception 4: Software interrupt 5: Privileged software exception 6: Software exception 7: Not used
11	Error code valid (0 = invalid; 1 = valid)
12	Undefined
30:13	Reserved (cleared to 0)
31	Valid

- **IDT-vectoring error code** (32 bits). For VM exits the occur during delivery of hardware exceptions that would have delivered an error code on the stack, this field receives that error code.

See Section 27.2.3 provides details of how these fields are saved on VM exits.

24.9.4 Information for VM Exits Due to Instruction Execution

The following fields are used for VM exits caused by attempts to execute certain instructions in VMX non-root operation:

- **VM-exit instruction length** (32 bits). For VM exits resulting from instruction execution, this field receives the length in bytes of the instruction whose execution led to the VM exit.[1] See Section 27.2.4 for details of when and how this field is used.
- **VM-exit instruction information** (32 bits). This field is used for VM exits due to attempts to execute INS, INVEPT, INVVPID, LIDT, LGDT, LLDT, LTR, OUTS, SIDT, SGDT, SLDT, STR, VMCLEAR, VMPTRLD, VMPTRST, VMREAD, VMWRITE, or VMXON.[2] The format of the field depends on the cause of the VM exit. See Section 27.2.4 for details.

The following fields (64 bits each; 32 bits on processors that do not support Intel 64 architecture) are used only for VM exits due to SMIs that arrive immediately after retirement of I/O instructions. They provide information about that I/O instruction:

- **I/O RCX**. The value of RCX before the I/O instruction started.
- **I/O RSI**. The value of RSI before the I/O instruction started.
- **I/O RDI**. The value of RDI before the I/O instruction started.
- **I/O RIP**. The value of RIP before the I/O instruction started (the RIP that addressed the I/O instruction).

24.9.5 VM-Instruction Error Field

The 32-bit **VM-instruction error field** does not provide information about the most recent VM exit. In fact, it is not modified on VM exits. Instead, it provides information about errors encountered by a non-faulting execution of one of the VMX instructions.

1. This field is also used for VM exits that occur during the delivery of a software interrupt or software exception.
2. Whether the processor provides this information on VM exits due to attempts to execute INS or OUTS can be determined by consulting the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).

24.10 VMCS TYPES: ORDINARY AND SHADOW

Every VMCS is either an **ordinary VMCS** or a **shadow VMCS**. A VMCS's type is determined by the shadow-VMCS indicator in the VMCS region (this is the value of bit 31 of the first 4 bytes of the VMCS region; see Table 24-1): 0 indicates an ordinary VMCS, while 1 indicates a shadow VMCS. Shadow VMCSs are supported only on processors that support the 1-setting of the "VMCS shadowing" VM-execution control (see Section 24.6.2).

A shadow VMCS differs from an ordinary VMCS in two ways:

- An ordinary VMCS can be used for VM entry but a shadow VMCS cannot. Attempts to perform VM entry when the current VMCS is a shadow VMCS fail (see Section 26.1).
- The VMREAD and VMWRITE instructions can be used in VMX non-root operation to access a shadow VMCS but not an ordinary VMCS. This fact results from the following:
  - If the "VMCS shadowing" VM-execution control is 0, execution of the VMREAD and VMWRITE instructions in VMX non-root operation always cause VM exits (see Section 25.1.3).
  - If the "VMCS shadowing" VM-execution control is 1, execution of the VMREAD and VMWRITE instructions in VMX non-root operation can access the VMCS referenced by the VMCS link pointer (see Section 30.3).
  - If the "VMCS shadowing" VM-execution control is 1, VM entry ensures that any VMCS referenced by the VMCS link pointer is a shadow VMCS (see Section 26.3.1.5).

In VMX root operation, both types of VMCSs can be accessed with the VMREAD and VMWRITE instructions.

Software should not modify the shadow-VMCS indicator in the VMCS region of a VMCS that is active. Doing so may cause the VMCS to become corrupted (see Section 24.11.1). Before modifying the shadow-VMCS indicator, software should execute VMCLEAR for the VMCS to ensure that it is not active.

24.11 SOFTWARE USE OF THE VMCS AND RELATED STRUCTURES

This section details guidelines that software should observe when using a VMCS and related structures. It also provides descriptions of consequences for failing to follow guidelines.

24.11.1 Software Use of Virtual-Machine Control Structures

To ensure proper processor behavior, software should observe certain guidelines when using an active VMCS.

No VMCS should ever be active on more than one logical processor. If a VMCS is to be "migrated" from one logical processor to another, the first logical processor should execute VMCLEAR for the VMCS (to make it inactive on that logical processor and to ensure that all VMCS data are in memory) before the other logical processor executes VMPTRLD for the VMCS (to make it active on the second logical processor).[1] A VMCS that is made active on more than one logical processor may become **corrupted** (see below).

Software should not modify the shadow-VMCS indicator (see Table 24-1) in the VMCS region of a VMCS that is active. Doing so may cause the VMCS to become corrupted. Before modifying the shadow-VMCS indicator, software should execute VMCLEAR for the VMCS to ensure that it is not active.

Software should use the VMREAD and VMWRITE instructions to access the different fields in the current VMCS (see Section 24.11.2). Software should never access or modify the VMCS data of an active VMCS using ordinary memory operations, in part because the format used to store the VMCS data is implementation-specific and not architecturally defined, and also because a logical processor may maintain some VMCS data of an active VMCS on the processor and not in the VMCS region. The following items detail some of the hazards of accessing VMCS data using ordinary memory operations:

- Any data read from a VMCS with an ordinary memory read does not reliably reflect the state of the VMCS. Results may vary from time to time or from logical processor to logical processor.

1. As noted in Section 24.1, execution of the VMPTRLD instruction makes a VMCS is active. In addition, VM entry makes active any shadow VMCS referenced by the VMCS link pointer in the current VMCS. If a shadow VMCS is made active by VM entry, it is necessary to execute VMCLEAR for that VMCS before allowing that VMCS to become active on another logical processor.

- Writing to a VMCS with an ordinary memory write is not guaranteed to have a deterministic effect on the VMCS. Doing so may cause the VMCS to become corrupted (see below).

(Software can avoid these hazards by removing any linear-address mappings to a VMCS region before executing a VMPTRLD for that region and by not remapping it until after executing VMCLEAR for that region.)

If a logical processor leaves VMX operation, any VMCSs active on that logical processor may be corrupted (see below). To prevent such corruption of a VMCS that may be used either after a return to VMX operation or on another logical processor, software should execute VMCLEAR for that VMCS before executing the VMXOFF instruction or removing power from the processor (e.g., as part of a transition to the S3 and S4 power states).

This section has identified operations that may cause a VMCS to become corrupted. These operations may cause the VMCS's data to become undefined. Behavior may be unpredictable if that VMCS used subsequently on any logical processor. The following items detail some hazards of VMCS corruption:

- VM entries may fail for unexplained reasons or may load undesired processor state.
- The processor may not correctly support VMX non-root operation as documented in Chapter 27 and may generate unexpected VM exits.
- VM exits may load undesired processor state, save incorrect state into the VMCS, or cause the logical processor to transition to a shutdown state.

24.11.2 VMREAD, VMWRITE, and Encodings of VMCS Fields

Every field of the VMCS is associated with a 32-bit value that is its **encoding**. The encoding is provided in an operand to VMREAD and VMWRITE when software wishes to read or write that field. These instructions fail if given, in 64-bit mode, an operand that sets an encoding bit beyond bit 32. See Chapter 30 for a description of these instructions.

The structure of the 32-bit encodings of the VMCS components is determined principally by the width of the fields and their function in the VMCS. See Table 24-17.

Table 24-17. Structure of VMCS Component Encoding

Bit Position(s)	Contents
0	Access type (0 = full; 1 = high); must be full for 16-bit, 32-bit, and natural-width fields
9:1	Index
11:10	Type: 0: control 1: VM-exit information 2: guest state 3: host state
12	Reserved (must be 0)
14:13	Width: 0: 16-bit 1: 64-bit 2: 32-bit 3: natural-width
31:15	Reserved (must be 0)

The following items detail the meaning of the bits in each encoding:

- **Field width.** Bits 14:13 encode the width of the field.
  - A value of 0 indicates a 16-bit field.
  - A value of 1 indicates a 64-bit field.

  - A value of 2 indicates a 32-bit field.
  - A value of 3 indicates a **natural-width** field. Such fields have 64 bits on processors that support Intel 64 architecture and 32 bits on processors that do not.

  Fields whose encodings use value 1 are specially treated to allow 32-bit software access to all 64 bits of the field. Such access is allowed by defining, for each such field, an encoding that allows direct access to the high 32 bits of the field. See below.
- **Field type.** Bits 11:10 encode the type of VMCS field: control, guest-state, host-state, or VM-exit information. (The last category also includes the VM-instruction error field.)
- **Index.** Bits 9:1 distinguish components with the same field width and type.
- **Access type.** Bit 0 must be 0 for all fields except for 64-bit fields (those with field-width 1; see above). A VMREAD or VMWRITE using an encoding with this bit cleared to 0 accesses the entire field. For a 64-bit field with field-width 1, a VMREAD or VMWRITE using an encoding with this bit set to 1 accesses only the high 32 bits of the field.

Appendix B gives the encodings of all fields in the VMCS.

The following describes the operation of VMREAD and VMWRITE based on processor mode, VMCS-field width, and access type:

- 16-bit fields:
  - A VMREAD returns the value of the field in bits 15:0 of the destination operand; other bits of the destination operand are cleared to 0.
  - A VMWRITE writes the value of bits 15:0 of the source operand into the VMCS field; other bits of the source operand are not used.
- 32-bit fields:
  - A VMREAD returns the value of the field in bits 31:0 of the destination operand; in 64-bit mode, bits 63:32 of the destination operand are cleared to 0.
  - A VMWRITE writes the value of bits 31:0 of the source operand into the VMCS field; in 64-bit mode, bits 63:32 of the source operand are not used.
- 64-bit fields and natural-width fields using the full access type outside IA-32e mode.
  - A VMREAD returns the value of bits 31:0 of the field in its destination operand; bits 63:32 of the field are ignored.
  - A VMWRITE writes the value of its source operand to bits 31:0 of the field and clears bits 63:32 of the field.
- 64-bit fields and natural-width fields using the full access type in 64-bit mode (only on processors that support Intel 64 architecture).
  - A VMREAD returns the value of the field in bits 63:0 of the destination operand
  - A VMWRITE writes the value of bits 63:0 of the source operand into the VMCS field.
- 64-bit fields using the high access type.
  - A VMREAD returns the value of bits 63:32 of the field in bits 31:0 of the destination operand; in 64-bit mode, bits 63:32 of the destination operand are cleared to 0.
  - A VMWRITE writes the value of bits 31:0 of the source operand to bits 63:32 of the field; in 64-bit mode, bits 63:32 of the source operand are not used.

Software seeking to read a 64-bit field outside IA-32e mode can use VMREAD with the full access type (reading bits 31:0 of the field) and VMREAD with the high access type (reading bits 63:32 of the field); the order of the two VMREAD executions is not important. Software seeking to modify a 64-bit field outside IA-32e mode should first use VMWRITE with the full access type (establishing bits 31:0 of the field while clearing bits 63:32) and then use VMWRITE with the high access type (establishing bits 63:32 of the field).

24.11.3 Initializing a VMCS

Software should initialize fields in a VMCS (using VMWRITE) before using the VMCS for VM entry. Failure to do so may result in unpredictable behavior; for example, a VM entry may fail for unexplained reasons, or a successful transition (VM entry or VM exit) may load processor state with unexpected values.

It is not necessary to initialize fields that the logical processor will not use. (For example, it is not necessary to unitize the MSR-bitmap address if the "use MSR bitmaps" VM-execution control is 0.)

A processor maintains some VMCS information that cannot be modified with the VMWRITE instruction; this includes a VMCS's launch state (see Section 24.1). Such information may be stored in the VMCS data portion of a VMCS region. Because the format of this information is implementation-specific, there is no way for software to know, when it first allocates a region of memory for use as a VMCS region, how the processor will determine this information from the contents of the memory region.

In addition to its other functions, the VMCLEAR instruction initializes any implementation-specific information in the VMCS region referenced by its operand. To avoid the uncertainties of implementation-specific behavior, software should execute VMCLEAR on a VMCS region before making the corresponding VMCS active with VMPTRLD for the first time. (Figure 24-1 illustrates how execution of VMCLEAR puts a VMCS into a well-defined state.)

The following software usage is consistent with these limitations:

- VMCLEAR should be executed for a VMCS before it is used for VM entry for the first time.
- VMLAUNCH should be used for the first VM entry using a VMCS after VMCLEAR has been executed for that VMCS.
- VMRESUME should be used for any subsequent VM entry using a VMCS (until the next execution of VMCLEAR for the VMCS).

It is expected that, in general, VMRESUME will have lower latency than VMLAUNCH. Since "migrating" a VMCS from one logical processor to another requires use of VMCLEAR (see Section 24.11.1), which sets the launch state of the VMCS to "clear", such migration requires the next VM entry to be performed using VMLAUNCH. Software developers can avoid the performance cost of increased VM-entry latency by avoiding unnecessary migration of a VMCS from one logical processor to another.

24.11.4 Software Access to Related Structures

In addition to data in the VMCS region itself, VMX non-root operation can be controlled by data structures that are referenced by pointers in a VMCS (for example, the I/O bitmaps). While the pointers to these data structures are parts of the VMCS, the data structures themselves are not. They are not accessible using VMREAD and VMWRITE but by ordinary memory writes.

Software should ensure that each such data structure is modified only when no logical processor with a current VMCS that references it is in VMX non-root operation. Doing otherwise may lead to unpredictable behavior (including behaviors identified in Section 24.11.1).

24.11.5 VMXON Region

Before executing VMXON, software allocates a region of memory (called the VMXON region)[1] that the logical processor uses to support VMX operation. The physical address of this region (the VMXON pointer) is provided in an operand to VMXON. The VMXON pointer is subject to the limitations that apply to VMCS pointers:

- The VMXON pointer must be 4-KByte aligned (bits 11:0 must be zero).
- The VMXON pointer must not set any bits beyond the processor's physical-address width.[2,3]

---

1. The amount of memory required for the VMXON region is the same as that required for a VMCS region. This size is implementation specific and can be determined by consulting the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).
2. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.
3. If IA32_VMX_BASIC[48] is read as 1, the VMXON pointer must not set any bits in the range 63:32; see Appendix A.1.

Before executing VMXON, software should write the VMCS revision identifier (see Section 24.2) to the VMXON region. (Specifically, it should write the 31-bit VMCS revision identifier to bits 30:0 of the first 4 bytes of the VMXON region; bit 31 should be cleared to 0.) It need not initialize the VMXON region in any other way. Software should use a separate region for each logical processor and should not access or modify the VMXON region of a logical processor between execution of VMXON and VMXOFF on that logical processor. Doing otherwise may lead to unpredictable behavior (including behaviors identified in Section 24.11.1).

21. Updates to Chapter 28, Volume 3C

Change bars show changes to Chapter 28 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C:* System Programming Guide, Part 3.

Change to chapter: Footnote update in Section 28.3.3.4 "Guidelines for Use of the INVEPT Instruction".

CHAPTER 28
VMX SUPPORT FOR ADDRESS TRANSLATION

The architecture for VMX operation includes two features that support address translation: virtual-processor identifiers (VPIDs) and the extended page-table mechanism (EPT). VPIDs are a mechanism for managing translations of linear addresses. EPT defines a layer of address translation that augments the translation of linear addresses.

Section 28.1 details the architecture of VPIDs. Section 28.2 provides the details of EPT. Section 28.3 explains how a logical processor may cache information from the paging structures, how it may use that cached information, and how software can managed the cached information.

28.1 VIRTUAL PROCESSOR IDENTIFIERS (VPIDS)

The original architecture for VMX operation required VMX transitions to flush the TLBs and paging-structure caches. This ensured that translations cached for the old linear-address space would not be used after the transition.

Virtual-processor identifiers (**VPIDs**) introduce to VMX operation a facility by which a logical processor may cache information for multiple linear-address spaces. When VPIDs are used, VMX transitions may retain cached information and the logical processor switches to a different linear-address space.

Section 28.3 details the mechanisms by which a logical processor manages information cached for multiple address spaces. A logical processor may tag some cached information with a 16-bit VPID. This section specifies how the current VPID is determined at any point in time:

- The current VPID is 0000H in the following situations:
  - Outside VMX operation. (This includes operation in system-management mode under the default treatment of SMIs and SMM with VMX operation; see Section 34.14.)
  - In VMX root operation.
  - In VMX non-root operation when the "enable VPID" VM-execution control is 0.
- If the logical processor is in VMX non-root operation and the "enable VPID" VM-execution control is 1, the current VPID is the value of the VPID VM-execution control field in the VMCS. (VM entry ensures that this value is never 0000H; see Section 26.2.1.1.)

VPIDs and PCIDs (see Section 4.10.1) can be used concurrently. When this is done, the processor associates cached information with both a VPID and a PCID. Such information is used only if the current VPID and PCID **both** match those associated with the cached information.

28.2 THE EXTENDED PAGE TABLE MECHANISM (EPT)

The extended page-table mechanism (**EPT**) is a feature that can be used to support the virtualization of physical memory. When EPT is in use, certain addresses that would normally be treated as physical addresses (and used to access memory) are instead treated as **guest-physical addresses**. Guest-physical addresses are translated by traversing a set of **EPT paging structures** to produce physical addresses that are used to access memory.

- Section 28.2.1 gives an overview of EPT.
- Section 28.2.2 describes operation of EPT-based address translation.
- Section 28.2.3 discusses VM exits that may be caused by EPT.
- Section 28.2.6 describes interactions between EPT and memory typing.

28.2.1 EPT Overview

EPT is used when the "enable EPT" VM-execution control is 1.[1] It translates the guest-physical addresses used in VMX non-root operation and those used by VM entry for event injection.

The translation from guest-physical addresses to physical addresses is determined by a set of **EPT paging structures**. The EPT paging structures are similar to those used to translate linear addresses while the processor is in IA-32e mode. Section 28.2.2 gives the details of the EPT paging structures.

If CR0.PG = 1, linear addresses are translated through paging structures referenced through control register CR3. While the "enable EPT" VM-execution control is 1, these are called **guest paging structures**. There are no guest paging structures if CR0.PG = 0.[1]

When the "enable EPT" VM-execution control is 1, the identity of **guest-physical addresses** depends on the value of CR0.PG:

- If CR0.PG = 0, each linear address is treated as a guest-physical address.
- If CR0.PG = 1, guest-physical addresses are those derived from the contents of control register CR3 and the guest paging structures. (This includes the values of the PDPTEs, which logical processors store in internal, non-architectural registers.) The latter includes (in page-table entries and in other paging-structure entries for which bit 7—PS—is 1) the addresses to which linear addresses are translated by the guest paging structures.

If CR0.PG = 1, the translation of a linear address to a physical address requires multiple translations of guest-physical addresses using EPT. Assume, for example, that CR4.PAE = CR4.PSE = 0. The translation of a 32-bit linear address then operates as follows:

- Bits 31:22 of the linear address select an entry in the guest page directory located at the guest-physical address in CR3. The guest-physical address of the guest page-directory entry (PDE) is translated through EPT to determine the guest PDE's physical address.
- Bits 21:12 of the linear address select an entry in the guest page table located at the guest-physical address in the guest PDE. The guest-physical address of the guest page-table entry (PTE) is translated through EPT to determine the guest PTE's physical address.
- Bits 11:0 of the linear address is the offset in the page frame located at the guest-physical address in the guest PTE. The guest-physical address determined by this offset is translated through EPT to determine the physical address to which the original linear address translates.

In addition to translating a guest-physical address to a physical address, EPT specifies the privileges that software is allowed when accessing the address. Attempts at disallowed accesses are called **EPT violations** and cause VM exits. See Section 28.2.3.

A processor uses EPT to translate guest-physical addresses only when those addresses are used to access memory. This principle implies the following:

- The MOV to CR3 instruction loads CR3 with a guest-physical address. Whether that address is translated through EPT depends on whether PAE paging is being used.[2]
  - If PAE paging is not being used, the instruction does not use that address to access memory and does **not** cause it to be translated through EPT. (If CR0.PG = 1, the address will be translated through EPT on the next memory accessing using a linear address.)
  - If PAE paging is being used, the instruction loads the four (4) page-directory-pointer-table entries (PDPTEs) from that address and it **does** cause the address to be translated through EPT.
- Section 4.4.1 identifies executions of MOV to CR0 and MOV to CR4 that load the PDPTEs from the guest-physical address in CR3. Such executions cause that address to be translated through EPT.
- The PDPTEs contain guest-physical addresses. The instructions that load the PDPTEs (see above) do not use those addresses to access memory and do **not** cause them to be translated through EPT. The address in a PDPTE will be translated through EPT on the next memory accessing using a linear address that uses that PDPTE.

---

1. "Enable EPT" is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, the logical processor operates as if the "enable EPT" VM-execution control were 0. See Section 24.6.2.

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, CR0.PG can be 0 in VMX non-root operation only if the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

2. A logical processor uses PAE paging if CR0.PG = 1, CR4.PAE = 1 and IA32_EFER.LMA = 0. See Section 4.4 in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*.

28.2.2 EPT Translation Mechanism

The EPT translation mechanism uses only bits 47:0 of each guest-physical address.[1] It uses a page-walk length of 4, meaning that at most 4 EPT paging-structure entries are accessed to translate a guest-physical address.[2]

These 48 bits are partitioned by the logical processor to traverse the EPT paging structures:

- A 4-KByte naturally aligned EPT PML4 table is located at the physical address specified in bits 51:12 of the extended-page-table pointer (EPTP), a VM-execution control field (see Table 24-8 in Section 24.6.11). An EPT PML4 table comprises 512 64-bit entries (EPT PML4Es). An EPT PML4E is selected using the physical address defined as follows:
  - Bits 63:52 are all 0.
  - Bits 51:12 are from the EPTP.
  - Bits 11:3 are bits 47:39 of the guest-physical address.
  - Bits 2:0 are all 0.

  Because an EPT PML4E is identified using bits 47:39 of the guest-physical address, it controls access to a 512-GByte region of the guest-physical-address space. The format of an EPT PML4E is given in Table 28-1.

Table 28-1. Format of an EPT PML4 Entry (PML4E) that References an EPT Page-Directory-Pointer Table

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 512-GByte region controlled by this entry
1	Write access; indicates whether writes are allowed from the 512-GByte region controlled by this entry
2	If the "mode-based execute control for EPT" VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 512-GByte region controlled by this entry If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 512-GByte region controlled by this entry
7:3	Reserved (must be 0)
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 512-GByte region controlled by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0
9	Ignored
10	Execute access for user-mode linear addresses. If the "mode-based execute control for EPT" VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 512-GByte region controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored
(N–1):12	Physical address of 4-KByte aligned EPT page-directory-pointer table referenced by this entry[1]
51:N	Reserved (must be 0)
63:52	Ignored

1. No processors supporting the Intel 64 architecture support more than 48 physical-address bits. Thus, no such processor can produce a guest-physical address with more than 48 bits. An attempt to use such an address causes a page fault. An attempt to load CR3 with such an address causes a general-protection fault. If PAE paging is being used, an attempt to load CR3 that would load a PDPTE with such an address causes a general-protection fault.
2. Future processors may include support for other EPT page-walk lengths. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine what EPT page-walk lengths are supported.

NOTES:

1. N is the physical-address width supported by the processor. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

- A 4-KByte naturally aligned EPT page-directory-pointer table is located at the physical address specified in bits 51:12 of the EPT PML4E. An EPT page-directory-pointer table comprises 512 64-bit entries (EPT PDPTEs). An EPT PDPTE is selected using the physical address defined as follows:
  - Bits 63:52 are all 0.
  - Bits 51:12 are from the EPT PML4E.
  - Bits 11:3 are bits 38:30 of the guest-physical address.
  - Bits 2:0 are all 0.

Because an EPT PDPTE is identified using bits 47:30 of the guest-physical address, it controls access to a 1-GByte region of the guest-physical-address space. Use of the EPT PDPTE depends on the value of bit 7 in that entry:[1]

- If bit 7 of the EPT PDPTE is 1, the EPT PDPTE maps a 1-GByte page. The final physical address is computed as follows:
  - Bits 63:52 are all 0.
  - Bits 51:30 are from the EPT PDPTE.
  - Bits 29:0 are from the original guest-physical address.

  The format of an EPT PDPTE that maps a 1-GByte page is given in Table 28-2.
- If bit 7 of the EPT PDPTE is 0, a 4-KByte naturally aligned EPT page directory is located at the physical address specified in bits 51:12 of the EPT PDPTE. The format of an EPT PDPTE that references an EPT page directory is given in Table 28-3.

1. Not all processors allow bit 7 of an EPT PDPTE to be set to 1. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine whether this is allowed.

Table 28-2. Format of an EPT Page-Directory-Pointer-Table Entry (PDPTE) that Maps a 1-GByte Page

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 1-GByte page referenced by this entry
1	Write access; indicates whether writes are allowed from the 1-GByte page referenced by this entry
2	If the "mode-based execute control for EPT" VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 1-GByte page controlled by this entry If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 1-GByte page controlled by this entry
5:3	EPT memory type for this 1-GByte page (see Section 28.2.6)
6	Ignore PAT memory type for this 1-GByte page (see Section 28.2.6)
7	Must be 1 (otherwise, this entry references an EPT page directory)
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 1-GByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0
9	If bit 6 of EPTP is 1, dirty flag for EPT; indicates whether software has written to the 1-GByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0
10	Execute access for user-mode linear addresses. If the "mode-based execute control for EPT" VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 1-GByte page controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored
29:12	Reserved (must be 0)
(N–1):30	Physical address of the 1-GByte page referenced by this entry[1]
51:N	Reserved (must be 0)
62:52	Ignored
63	Suppress #VE. If the "EPT-violation #VE" VM-execution control is 1, EPT violations caused by accesses to this page are convertible to virtualization exceptions only if this bit is 0 (see Section 25.5.6.1). If "EPT-violation #VE" VM-execution control is 0, this bit is ignored.

NOTES:

1. N is the physical-address width supported by the logical processor.

Table 28-3. Format of an EPT Page-Directory-Pointer-Table Entry (PDPTE) that References an EPT Page Directory

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 1-GByte region controlled by this entry
1	Write access; indicates whether writes are allowed from the 1-GByte region controlled by this entry
2	If the "mode-based execute control for EPT" VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 1-GByte region controlled by this entry If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 1-GByte region controlled by this entry
7:3	Reserved (must be 0)
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 1-GByte region controlled by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0
9	Ignored
10	Execute access for user-mode linear addresses. If the "mode-based execute control for EPT" VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 1-GByte region controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored
(N–1):12	Physical address of 4-KByte aligned EPT page directory referenced by this entry[1]
51:N	Reserved (must be 0)
63:52	Ignored

NOTES:

1. N is the physical-address width supported by the logical processor.

An EPT page-directory comprises 512 64-bit entries (PDEs). An EPT PDE is selected using the physical address defined as follows:

— Bits 63:52 are all 0.

— Bits 51:12 are from the EPT PDPTE.

— Bits 11:3 are bits 29:21 of the guest-physical address.

— Bits 2:0 are all 0.

Because an EPT PDE is identified using bits 47:21 of the guest-physical address, it controls access to a 2-MByte region of the guest-physical-address space. Use of the EPT PDE depends on the value of bit 7 in that entry:

- If bit 7 of the EPT PDE is 1, the EPT PDE maps a 2-MByte page. The final physical address is computed as follows:

  — Bits 63:52 are all 0.

  — Bits 51:21 are from the EPT PDE.

  — Bits 20:0 are from the original guest-physical address.

  The format of an EPT PDE that maps a 2-MByte page is given in Table 28-4.

- If bit 7 of the EPT PDE is 0, a 4-KByte naturally aligned EPT page table is located at the physical address specified in bits 51:12 of the EPT PDE. The format of an EPT PDE that references an EPT page table is given in Table 28-5.

  An EPT page table comprises 512 64-bit entries (PTEs). An EPT PTE is selected using a physical address defined as follows:

  — Bits 63:52 are all 0.

Table 28-4. Format of an EPT Page-Directory Entry (PDE) that Maps a 2-MByte Page

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 2-MByte page referenced by this entry
1	Write access; indicates whether writes are allowed from the 2-MByte page referenced by this entry
2	If the "mode-based execute control for EPT" VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 2-MByte page controlled by this entry If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 2-MByte page controlled by this entry
5:3	EPT memory type for this 2-MByte page (see Section 28.2.6)
6	Ignore PAT memory type for this 2-MByte page (see Section 28.2.6)
7	Must be 1 (otherwise, this entry references an EPT page table)
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 2-MByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0
9	If bit 6 of EPTP is 1, dirty flag for EPT; indicates whether software has written to the 2-MByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0
10	Execute access for user-mode linear addresses. If the "mode-based execute control for EPT" VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 2-MByte page controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored
20:12	Reserved (must be 0)
(N–1):21	Physical address of the 2-MByte page referenced by this entry[1]
51:N	Reserved (must be 0)
62:52	Ignored
63	Suppress #VE. If the "EPT-violation #VE" VM-execution control is 1, EPT violations caused by accesses to this page are convertible to virtualization exceptions only if this bit is 0 (see Section 25.5.6.1). If "EPT-violation #VE" VM-execution control is 0, this bit is ignored.

NOTES:

1. N is the physical-address width supported by the logical processor.

  - Bits 51:12 are from the EPT PDE.
  - Bits 11:3 are bits 20:12 of the guest-physical address.
  - Bits 2:0 are all 0.

- Because an EPT PTE is identified using bits 47:12 of the guest-physical address, every EPT PTE maps a 4-KByte page. The final physical address is computed as follows:
  - Bits 63:52 are all 0.
  - Bits 51:12 are from the EPT PTE.
  - Bits 11:0 are from the original guest-physical address.

  The format of an EPT PTE is given in Table 28-6.

An EPT paging-structure entry is **present** if any of bits 2:0 is 1; otherwise, the entry is **not present**. The processor ignores bits 62:3 and uses the entry neither to reference another EPT paging-structure entry nor to produce a physical address. A reference using a guest-physical address whose translation encounters an EPT paging-struc-

ture that is not present causes an EPT violation (see Section 28.2.3.2). (If the "EPT-violation #VE" VM-execution control is 1, the EPT violation is convertible to a virtualization exception only if bit 63 is 0; see Section 25.5.6.1. If the "EPT-violation #VE" VM-execution control is 0, this bit is ignored.)

Table 28-5. Format of an EPT Page-Directory Entry (PDE) that References an EPT Page Table

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 2-MByte region controlled by this entry
1	Write access; indicates whether writes are allowed from the 2-MByte region controlled by this entry
2	If the "mode-based execute control for EPT" VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 2-MByte region controlled by this entry If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 2-MByte region controlled by this entry
6:3	Reserved (must be 0)
7	Must be 0 (otherwise, this entry maps a 2-MByte page)
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 2-MByte region controlled by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0
9	Ignored
10	Execute access for user-mode linear addresses. If the "mode-based execute control for EPT" VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 2-MByte region controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored
(N–1):12	Physical address of 4-KByte aligned EPT page table referenced by this entry[1]
51:N	Reserved (must be 0)
63:52	Ignored

NOTES:

1. N is the physical-address width supported by the logical processor.

NOTE

If the "mode-based execute control for EPT" VM-execution control is 1, an EPT paging-structure entry is present if any of bits 2:0 **or bit 10** is 1. If bits 2:0 are all 0 but bit 10 is 1, the entry is used normally to reference another EPT paging-structure entry or to produce a physical address.

The discussion above describes how the EPT paging structures reference each other and how the logical processor traverses those structures when translating a guest-physical address. It does not cover all details of the translation process. Additional details are provided as follows:

- Situations in which the translation process may lead to VM exits (sometimes before the process completes) are described in Section 28.2.3.
- Interactions between the EPT translation mechanism and memory typing are described in Section 28.2.6.

Figure 28-1 gives a summary of the formats of the EPTP and the EPT paging-structure entries. For the EPT paging structure entries, it identifies separately the format of entries that map pages, those that reference other EPT paging structures, and those that do neither because they are not present; bits 2:0 and bit 7 are highlighted because they determine how a paging-structure entry is used. (Figure 28-1 does not comprehend the fact that, if the "mode-based execute control for EPT" VM-execution control is 1, an entry is present if any of bits 2:0 or bit 10 is 1.)

28.2.3 EPT-Induced VM Exits

Accesses using guest-physical addresses may cause VM exits due to EPT misconfigurations, EPT violations, and page-modification log-full events. An **EPT misconfiguration** occurs when, in the course of translating a guest-physical address, the logical processor encounters an EPT paging-structure entry that contains an unsupported value (see Section 28.2.3.1). An **EPT violation** occurs when there is no EPT misconfiguration but the EPT paging-structure entries disallow an access using the guest-physical address (see Section 28.2.3.2). A **page-modification log-full event** occurs when the logical processor determines a need to create a page-modification log entry and the current log is full (see Section 28.2.5).

Table 28-6. Format of an EPT Page-Table Entry that Maps a 4-KByte Page

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 4-KByte page referenced by this entry
1	Write access; indicates whether writes are allowed from the 4-KByte page referenced by this entry
2	If the "mode-based execute control for EPT" VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 4-KByte page controlled by this entry If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 4-KByte page controlled by this entry
5:3	EPT memory type for this 4-KByte page (see Section 28.2.6)
6	Ignore PAT memory type for this 4-KByte page (see Section 28.2.6)
7	Ignored
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 4-KByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0
9	If bit 6 of EPTP is 1, dirty flag for EPT; indicates whether software has written to the 4-KByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0
10	Execute access for user-mode linear addresses. If the "mode-based execute control for EPT" VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 4-KByte page controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored
(N–1):12	Physical address of the 4-KByte page referenced by this entry[1]
51:N	Reserved (must be 0)
62:52	Ignored
63	Suppress #VE. If the "EPT-violation #VE" VM-execution control is 1, EPT violations caused by accesses to this page are convertible to virtualization exceptions only if this bit is 0 (see Section 25.5.6.1). If "EPT-violation #VE" VM-execution control is 0, this bit is ignored.

NOTES:

1. N is the physical-address width supported by the logical processor.

These events occur only due to an attempt to access memory with a guest-physical address. Loading CR3 with a guest-physical address with the MOV to CR3 instruction can cause neither an EPT configuration nor an EPT violation until that address is used to access a paging structure.[1]

If the "EPT-violation #VE" VM-execution control is 1, certain EPT violations may cause virtualization exceptions instead of VM exits. See Section 25.5.6.1.

28.2.3.1 EPT Misconfigurations

An EPT misconfiguration occurs if translation of a guest-physical address encounters an EPT paging-structure that meets any of the following conditions:

- Bit 0 of the entry is clear (indicating that data reads are not allowed) and bit 1 is set (indicating that data writes are allowed).
- Either of the following if the processor does not support execute-only translations:
  - Bit 0 of the entry is clear (indicating that data reads are not allowed) and bit 2 is set (indicating that instruction fetches are allowed).[1]
  - The "mode-based execute control for EPT" VM-execution control is 1, bit 0 of the entry is clear (indicating that data reads are not allowed), and bit 10 is set (indicating that instruction fetches are allowed from user-mode linear addresses).

  Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP to determine whether execute-only translations are supported (see Appendix A.10).
- The entry is present (see Section 28.2.2) and one of the following holds:
  - A reserved bit is set. This includes the setting of a bit in the range 51:12 that is beyond the logical processor's physical-address width.[2] See Section 28.2.2 for details of which bits are reserved in which EPT paging-structure entries.
  - The entry is the last one used to translate a guest physical address (either an EPT PDE with bit 7 set to 1 or an EPT PTE) and the value of bits 5:3 (EPT memory type) is 2, 3, or 7 (these values are reserved).

EPT misconfigurations result when an EPT paging-structure entry is configured with settings reserved for future functionality. Software developers should be aware that such settings may be used in the future and that an EPT paging-structure entry that causes an EPT misconfiguration on one processor might not do so in the future.

28.2.3.2 EPT Violations

An EPT violation may occur during an access using a guest-physical address whose translation does not cause an EPT misconfiguration. An EPT violation occurs in any of the following situations:

- Translation of the guest-physical address encounters an EPT paging-structure entry that is not present (see Section 28.2.2).
- The access is a data read and, for any byte to be read, bit 0 (read access) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte. Reads by the logical processor of guest paging structures to translate a linear address are considered to be data reads.

---

1. If the logical processor is using PAE paging—because CR0.PG = CR4.PAE = 1 and IA32_EFER.LMA = 0—the MOV to CR3 instruction loads the PDPTEs from memory using the guest-physical address being loaded into CR3. In this case, therefore, the MOV to CR3 instruction may cause an EPT misconfiguration, an EPT violation, or a page-modification log-full event.

1. If the "mode-based execute control for EPT" VM-execution control is 1, setting bit 2 indicates that instruction fetches are allowed from supervisor-mode linear addresses.

2. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

Figure 28-1. Formats of EPTP and EPT Paging-Structure Entries

NOTES:

1. M is an abbreviation for MAXPHYADDR.
2. See Section 24.6.11 for details of the EPTP.
3. Execute access for user-mode linear addresses. If the "mode-based execute control for EPT" VM-execution control is 0, this bit is ignored.
4. Execute access. If the "mode-based execute control for EPT" VM-execution control is 1, this bit controls execute access for supervisor-mode linear addresses.
5. If the "mode-based execute control for EPT" VM-execution control is 1, an EPT paging-structure entry is present if any of bits 2:0 or bit 10 is 1. This table does not comprehend that fact.
6. Suppress #VE. If the "EPT-violation #VE" VM-execution control is 0, this bit is ignored.

- The access is a data write, for any byte to be written, bit 1 (write access) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte. Writes by the logical processor to guest paging structures to update accessed and dirty flags are considered to be data writes.

  If bit 6 of the EPT pointer (EPTP) is 1 (enabling accessed and dirty flags for EPT), processor accesses to guest paging-structure entries are treated as writes with regard to EPT violations. Thus, if bit 1 is clear in any of the

EPT paging-structure entries used to translate the guest-physical address of a guest paging-structure entry, an attempt to use that entry to translate a linear address causes an EPT violation.

(This does not apply to loads of the PDPTE registers by the MOV to CR instruction for PAE paging; see Section 4.4.1. Those loads of guest PDPTEs are treated as reads and do not cause EPT violations due to a guest-physical address not being writable.)

- The access is an instruction fetch and the EPT paging structures prevent execute access to any of the bytes being fetched. Whether this occurs depends upon the setting of the "mode-based execute control for EPT" VM-execution control:
  - — If the control is 0, an instruction fetch from a byte is prevented if bit 2 (execute access) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte.
  - — If the control is 1, an instruction fetch from a byte is prevented in either of the following cases:
    - Paging maps the linear address of the byte as a supervisor-mode address and bit 2 (execute access for supervisor-mode linear addresses) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte.

      Paging maps a linear address as a supervisor-mode address if the U/S flag (bit 2) is 0 in at least one of the paging-structure entries controlling the translation of the linear address.
    - Paging maps the linear address of the byte as a user-mode address and bit 10 (execute access for user-mode linear addresses) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte.

      Paging maps a linear address as a user-mode address if the U/S flag is 1 in all of the paging-structure entries controlling the translation of the linear address. If paging is disabled (CR0.PG = 0), every linear address is a user-mode address.

28.2.3.3 Prioritization of EPT Misconfigurations and EPT Violations

The translation of a linear address to a physical address requires one or more translations of guest-physical addresses using EPT (see Section 28.2.1). This section specifies the relative priority of EPT-induced VM exits with respect to each other and to other events that may be encountered when accessing memory using a linear address.

For an access to a guest-physical address, determination of whether an EPT misconfiguration or an EPT violation occurs is based on an iterative process:[1]

1. An EPT paging-structure entry is read (initially, this is an EPT PML4 entry):
   a. If the entry is not present (see Section 28.2.2), an EPT violation occurs.
   b. If the entry is present but its contents are not configured properly (see Section 28.2.3.1), an EPT misconfiguration occurs.
   c. If the entry is present and its contents are configured properly, operation depends on whether the entry references another EPT paging structure (whether it is an EPT PDE with bit 7 set to 1 or an EPT PTE):
      i) If the entry does reference another EPT paging structure, an entry from that structure is accessed; step 1 is executed for that other entry.
      ii) Otherwise, the entry is used to produce the ultimate physical address (the translation of the original guest-physical address); step 2 is executed.
2. Once the ultimate physical address is determined, the privileges determined by the EPT paging-structure entries are evaluated:
   a. If the access to the guest-physical address is not allowed by these privileges (see Section 28.2.3.2), an EPT violation occurs.
   b. If the access to the guest-physical address is allowed by these privileges, memory is accessed using the ultimate physical address.

If CR0.PG = 1, the translation of a linear address is also an iterative process, with the processor first accessing an entry in the guest paging structure referenced by the guest-physical address in CR3 (or, if PAE paging is in use, the

1. This is a simplification of the more detailed description given in Section 28.2.2.

guest-physical address in the appropriate PDPTE register), then accessing an entry in another guest paging structure referenced by the guest-physical address in the first guest paging-structure entry, etc. Each guest-physical address is itself translated using EPT and may cause an EPT-induced VM exit. The following items detail how page faults and EPT-induced VM exits are recognized during this iterative process:

1. An attempt is made to access a guest paging-structure entry with a guest-physical address (initially, the address in CR3 or PDPTE register).
   a. If the access fails because of an EPT misconfiguration or an EPT violation (see above), an EPT-induced VM exit occurs.
   b. If the access does not cause an EPT-induced VM exit, bit 0 (the present flag) of the entry is consulted:
      i) If the present flag is 0 or any reserved bit is set, a page fault occurs.
      ii) If the present flag is 1, no reserved bit is set, operation depends on whether the entry references another guest paging structure (whether it is a guest PDE with PS = 1 or a guest PTE):
         - If the entry does reference another guest paging structure, an entry from that structure is accessed; step 1 is executed for that other entry.
         - Otherwise, the entry is used to produce the ultimate guest-physical address (the translation of the original linear address); step 2 is executed.
2. Once the ultimate guest-physical address is determined, the privileges determined by the guest paging-structure entries are evaluated:
   a. If the access to the linear address is not allowed by these privileges (e.g., it was a write to a read-only page), a page fault occurs.
   b. If the access to the linear address is allowed by these privileges, an attempt is made to access memory at the ultimate guest-physical address:
      i) If the access fails because of an EPT misconfiguration or an EPT violation (see above), an EPT-induced VM exit occurs.
      ii) If the access does not cause an EPT-induced VM exit, memory is accessed using the ultimate physical address (the translation, using EPT, of the ultimate guest-physical address).

If CR0.PG = 0, a linear address is treated as a guest-physical address and is translated using EPT (see above). This process, if it completes without an EPT violation or EPT misconfiguration, produces a physical address and determines the privileges allowed by the EPT paging-structure entries. If these privileges do not allow the access to the physical address (see Section 28.2.3.2), an EPT violation occurs. Otherwise, memory is accessed using the physical address.

28.2.4 Accessed and Dirty Flags for EPT

The Intel 64 architecture supports **accessed and dirty flags** in ordinary paging-structure entries (see Section 4.8). Some processors also support corresponding flags in EPT paging-structure entries. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine whether the processor supports this feature.

Software can enable accessed and dirty flags for EPT using bit 6 of the extended-page-table pointer (EPTP), a VM-execution control field (see Table 24-8 in Section 24.6.11). If this bit is 1, the processor will set the accessed and dirty flags for EPT as described below. In addition, setting this flag causes processor accesses to guest paging-structure entries to be treated as writes (see below and Section 28.2.3.2).

For any EPT paging-structure entry that is used during guest-physical-address translation, bit 8 is the accessed flag. For a EPT paging-structure entry that maps a page (as opposed to referencing another EPT paging structure), bit 9 is the dirty flag.

Whenever the processor uses an EPT paging-structure entry as part of guest-physical-address translation, it sets the accessed flag in that entry (if it is not already set).

Whenever there is a write to a guest-physical address, the processor sets the dirty flag (if it is not already set) in the EPT paging-structure entry that identifies the final physical address for the guest-physical address (either an EPT PTE or an EPT paging-structure entry in which bit 7 is 1).

When accessed and dirty flags for EPT are enabled, processor accesses to guest paging-structure entries are treated as writes (see Section 28.2.3.2). Thus, such an access will cause the processor to set the dirty flag in the EPT paging-structure entry that identifies the final physical address of the guest paging-structure entry.

(This does not apply to loads of the PDPTE registers for PAE paging by the MOV to CR instruction; see Section 4.4.1. Those loads of guest PDPTEs are treated as reads and do not cause the processor to set the dirty flag in any EPT paging-structure entry.)

These flags are "sticky," meaning that, once set, the processor does not clear them; only software can clear them.

A processor may cache information from the EPT paging-structure entries in TLBs and paging-structure caches (see Section 28.3). This fact implies that, if software changes an accessed flag or a dirty flag from 1 to 0, the processor might not set the corresponding bit in memory on a subsequent access using an affected guest-physical address.

28.2.5 Page-Modification Logging

When accessed and dirty flags for EPT are enabled, software can track writes to guest-physical addresses using a feature called **page-modification logging**.

Software can enable page-modification logging by setting the "enable PML" VM-execution control (see Table 24-7 in Section 24.6.2). When this control is 1, the processor adds entries to the **page-modification log** as described below. The page-modification log is a 4-KByte region of memory located at the physical address in the PML address VM-execution control field. The page-modification log consists of 512 64-bit entries; the PML index VM-execution control field indicates the next entry to use.

Before allowing a guest-physical access, the processor may determine that it first needs to set an accessed or dirty flag for EPT (see Section 28.2.4). When this happens, the processor examines the PML index. If the PML index is not in the range 0–511, there is a **page-modification log-full event** and a VM exit occurs. In this case, the accessed or dirty flag is not set, and the guest-physical access that triggered the event does not occur.

If instead the PML index is in the range 0–511, the processor proceeds to update accessed or dirty flags for EPT as described in Section 28.2.4. If the processor updated a dirty flag for EPT (changing it from 0 to 1), it then operates as follows:

1. The guest-physical address of the access is written to the page-modification log. Specifically, the guest-physical address is written to physical address determined by adding 8 times the PML index to the PML address. Bits 11:0 of the value written are always 0 (the guest-physical address written is thus 4-KByte aligned).
2. The PML index is decremented by 1 (this may cause the value to transition from 0 to FFFFH).

Because the processor decrements the PML index with each log entry, the value may transition from 0 to FFFFH. At that point, no further logging will occur, as the processor will determine that the PML index is not in the range 0–511 and will generate a page-modification log-full event (see above).

28.2.6 EPT and Memory Typing

This section specifies how a logical processor determines the memory type use for a memory access while EPT is in use. (See Chapter 11, "Memory Cache Control" of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A* for details of memory typing in the Intel 64 architecture.) Section 28.2.6.1 explains how the memory type is determined for accesses to the EPT paging structures. Section 28.2.6.2 explains how the memory type is determined for an access using a guest-physical address that is translated using EPT.

28.2.6.1 Memory Type Used for Accessing EPT Paging Structures

This section explains how the memory type is determined for accesses to the EPT paging structures. The determination is based first on the value of bit 30 (cache disable—CD) in control register CR0:

- If CR0.CD = 0, the memory type used for any such reference is the EPT paging-structure memory type, which is specified in bits 2:0 of the extended-page-table pointer (EPTP), a VM-execution control field (see Section 24.6.11). A value of 0 indicates the uncacheable type (UC), while a value of 6 indicates the write-back type (WB). Other values are reserved.
- If CR0.CD = 1, the memory type used for any such reference is uncacheable (UC).

The MTRRs have no effect on the memory type used for an access to an EPT paging structure.

28.2.6.2 Memory Type Used for Translated Guest-Physical Addresses

The **effective memory type** of a memory access using a guest-physical address (an access that is translated using EPT) is the memory type that is used to access memory. The effective memory type is based on the value of bit 30 (cache disable—CD) in control register CR0; the **last** EPT paging-structure entry used to translate the guest-physical address (either an EPT PDE with bit 7 set to 1 or an EPT PTE); and the PAT memory type (see below):

- The **PAT memory type** depends on the value of CR0.PG:
  - If CR0.PG = 0, the PAT memory type is WB (writeback).[1]
  - If CR0.PG = 1, the PAT memory type is the memory type selected from the IA32_PAT MSR as specified in Section 11.12.3, "Selecting a Memory Type from the PAT".[2]
- The **EPT memory type** is specified in bits 5:3 of the last EPT paging-structure entry: 0 = UC; 1 = WC; 4 = WT; 5 = WP; and 6 = WB. Other values are reserved and cause EPT misconfigurations (see Section 28.2.3).
- If CR0.CD = 0, the effective memory type depends upon the value of bit 6 of the last EPT paging-structure entry:
  - If the value is 0, the effective memory type is the combination of the EPT memory type and the PAT memory type specified in Table 11-7 in Section 11.5.2.2, using the EPT memory type in place of the MTRR memory type.
  - If the value is 1, the memory type used for the access is the EPT memory type. The PAT memory type is ignored.
- If CR0.CD = 1, the effective memory type is UC.

The MTRRs have no effect on the memory type used for an access to a guest-physical address.

28.3 CACHING TRANSLATION INFORMATION

Processors supporting Intel® 64 and IA-32 architectures may accelerate the address-translation process by caching on the processor data from the structures in memory that control that process. Such caching is discussed in Section 4.10, "Caching Translation Information" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.* The current section describes how this caching interacts with the VMX architecture.

The VPID and EPT features of the architecture for VMX operation augment this caching architecture. EPT defines the guest-physical address space and defines translations to that address space (from the linear-address space) and from that address space (to the physical-address space). Both features control the ways in which a logical processor may create and use information cached from the paging structures.

Section 28.3.1 describes the different kinds of information that may be cached. Section 28.3.2 specifies when such information may be cached and how it may be used. Section 28.3.3 details how software can invalidate cached information.

28.3.1 Information That May Be Cached

Section 4.10, "Caching Translation Information" in *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A* identifies two kinds of translation-related information that may be cached by a logical

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, CR0.PG can be 0 in VMX non-root operation only if the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
2. Table 11-11 in Section 11.12.3, "Selecting a Memory Type from the PAT" illustrates how the PAT memory type is selected based on the values of the PAT, PCD, and PWT bits in a page-table entry (or page-directory entry with PS = 1). For accesses to a guest paging-structure entry X, the PAT memory type is selected from the table by using a value of 0 for the PAT bit with the values of PCD and PWT from the paging-structure entry Y that references X (or from CR3 if X is in the root paging structure). With PAE paging, the PAT memory type for accesses to the PDPTEs is WB.

processor: **translations**, which are mappings from linear page numbers to physical page frames, and **paging-structure caches**, which map the upper bits of a linear page number to information from the paging-structure entries used to translate linear addresses matching those upper bits.

The same kinds of information may be cached when VPIDs and EPT are in use. A logical processor may cache and use such information based on its function. Information with different functionality is identified as follows:

- **Linear mappings**.[1] There are two kinds:
  - Linear translations. Each of these is a mapping from a linear page number to the physical page frame to which it translates, along with information about access privileges and memory typing.
  - Linear paging-structure-cache entries. Each of these is a mapping from the upper portion of a linear address to the physical address of the paging structure used to translate the corresponding region of the linear-address space, along with information about access privileges. For example, bits 47:39 of a linear address would map to the address of the relevant page-directory-pointer table.

  Linear mappings do not contain information from any EPT paging structure.
- **Guest-physical mappings**.[2] There are two kinds:
  - Guest-physical translations. Each of these is a mapping from a guest-physical page number to the physical page frame to which it translates, along with information about access privileges and memory typing.
  - Guest-physical paging-structure-cache entries. Each of these is a mapping from the upper portion of a guest-physical address to the physical address of the EPT paging structure used to translate the corresponding region of the guest-physical address space, along with information about access privileges.

  The information in guest-physical mappings about access privileges and memory typing is derived from EPT paging structures.
- **Combined mappings**.[3] There are two kinds:
  - Combined translations. Each of these is a mapping from a linear page number to the physical page frame to which it translates, along with information about access privileges and memory typing.
  - Combined paging-structure-cache entries. Each of these is a mapping from the upper portion of a linear address to the physical address of the paging structure used to translate the corresponding region of the linear-address space, along with information about access privileges.

  The information in combined mappings about access privileges and memory typing is derived from both guest paging structures and EPT paging structures.

28.3.2 Creating and Using Cached Translation Information

The following items detail the creation of the mappings described in the previous section:[4]

- The following items describe the creation of mappings while EPT is not in use (including execution outside VMX non-root operation):
  - Linear mappings may be created. They are derived from the paging structures referenced (directly or indirectly) by the current value of CR3 and are associated with the current VPID and the current PCID.
  - No linear mappings are created with information derived from paging-structure entries that are not present (bit 0 is 0) or that set reserved bits. For example, if a PTE is not present, no linear mapping are created for any linear page number whose translation would use that PTE.
  - No guest-physical or combined mappings are created while EPT is not in use.
- The following items describe the creation of mappings while EPT is in use:

1. Earlier versions of this manual used the term "VPID-tagged" to identify linear mappings.
2. Earlier versions of this manual used the term "EPTP-tagged" to identify guest-physical mappings.
3. Earlier versions of this manual used the term "dual-tagged" to identify combined mappings.
4. This section associated cached information with the current VPID and PCID. If PCIDs are not supported or are not being used (e.g., because CR4.PCIDE = 0), all the information is implicitly associated with PCID 000H; see Section 4.10.1, "Process-Context Identifiers (PCIDs)," in *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*.

— Guest-physical mappings may be created. They are derived from the EPT paging structures referenced (directly or indirectly) by bits 51:12 of the current EPTP. These 40 bits contain the address of the EPT-PML4-table. (the notation **EP4TA** refers to those 40 bits). Newly created guest-physical mappings are associated with the current EP4TA.

— Combined mappings may be created. They are derived from the EPT paging structures referenced (directly or indirectly) by the current EP4TA. If CR0.PG = 1, they are also derived from the paging structures referenced (directly or indirectly) by the current value of CR3. They are associated with the current VPID, the current PCID, and the current EP4TA.[1] No combined paging-structure-cache entries are created if CR0.PG = 0.[2]

— No guest-physical mappings or combined mappings are created with information derived from EPT paging-structure entries that are not present (see Section 28.2.2) or that are misconfigured (see Section 28.2.3.1).

— No combined mappings are created with information derived from guest paging-structure entries that are not present or that set reserved bits.

— No linear mappings are created while EPT is in use.

The following items detail the use of the various mappings:

- If EPT is not in use (e.g., when outside VMX non-root operation), a logical processor may use cached mappings as follows:
  — For accesses using linear addresses, it may use linear mappings associated with the current VPID and the current PCID. It may also use global TLB entries (linear mappings) associated with the current VPID and any PCID.
  — No guest-physical or combined mappings are used while EPT is not in use.
- If EPT is in use, a logical processor may use cached mappings as follows:
  — For accesses using linear addresses, it may use combined mappings associated with the current VPID, the current PCID, and the current EP4TA. It may also use global TLB entries (combined mappings) associated with the current VPID, the current EP4TA, and any PCID.
  — For accesses using guest-physical addresses, it may use guest-physical mappings associated with the current EP4TA.
  — No linear mappings are used while EPT is in use.

28.3.3 Invalidating Cached Translation Information

Software modifications of paging structures (including EPT paging structures) may result in inconsistencies between those structures and the mappings cached by a logical processor. Certain operations invalidate information cached by a logical processor and can be used to eliminate such inconsistencies.

28.3.3.1 Operations that Invalidate Cached Mappings

The following operations invalidate cached mappings as indicated:

- Operations that architecturally invalidate entries in the TLBs or paging-structure caches independent of VMX operation (e.g., the INVLPG and INVPCID instructions) invalidate linear mappings and combined mappings.[3] They are required to do so only for the current VPID (but, for combined mappings, all EP4TAs). Linear

1. At any given time, a logical processor may be caching combined mappings for a VPID and a PCID that are associated with different EP4TAs. Similarly, it may be caching combined mappings for an EP4TA that are associated with different VPIDs and PCIDs.
2. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, CR0.PG can be 0 in VMX non-root operation only if the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
3. See Section 4.10.4, "Invalidation of TLBs and Paging-Structure Caches," in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A* for an enumeration of operations that architecturally invalidate entries in the TLBs and paging-structure caches independent of VMX operation.

mappings for the current VPID are invalidated even if EPT is in use.[1] Combined mappings for the current VPID are invalidated even if EPT is not in use.[2]

- An EPT violation invalidates any guest-physical mappings (associated with the current EP4TA) that would be used to translate the guest-physical address that caused the EPT violation. If that guest-physical address was the translation of a linear address, the EPT violation also invalidates any combined mappings for that linear address associated with the current PCID, the current VPID and the current EP4TA.
- If the "enable VPID" VM-execution control is 0, VM entries and VM exits invalidate linear mappings and combined mappings associated with VPID 0000H (for all PCIDs). Combined mappings for VPID 0000H are invalidated for all EP4TAs.
- Execution of the INVVPID instruction invalidates linear mappings and combined mappings. Invalidation is based on instruction operands, called the INVVPID type and the INVVPID descriptor. Four INVVPID types are currently defined:
  - **Individual-address.** If the INVVPID type is 0, the logical processor invalidates linear mappings and combined mappings associated with the VPID specified in the INVVPID descriptor and that would be used to translate the linear address specified in of the INVVPID descriptor. Linear mappings and combined mappings for that VPID and linear address are invalidated for all PCIDs and, for combined mappings, all EP4TAs. (The instruction may also invalidate mappings associated with other VPIDs and for other linear addresses.)
  - **Single-context.** If the INVVPID type is 1, the logical processor invalidates all linear mappings and combined mappings associated with the VPID specified in the INVVPID descriptor. Linear mappings and combined mappings for that VPID are invalidated for all PCIDs and, for combined mappings, all EP4TAs. (The instruction may also invalidate mappings associated with other VPIDs.)
  - **All-context.** If the INVVPID type is 2, the logical processor invalidates linear mappings and combined mappings associated with all VPIDs except VPID 0000H and with all PCIDs. (The instruction may also invalidate linear mappings with VPID 0000H.) Combined mappings are invalidated for all EP4TAs.
  - **Single-context-retaining-globals.** If the INVVPID type is 3, the logical processor invalidates linear mappings and combined mappings associated with the VPID specified in the INVVPID descriptor. Linear mappings and combined mappings for that VPID are invalidated for all PCIDs and, for combined mappings, all EP4TAs. The logical processor is **not** required to invalidate information that was used for **global** translations (although it may do so). See Section 4.10, "Caching Translation Information" for details regarding global translations. (The instruction may also invalidate mappings associated with other VPIDs.)

  See Chapter 30 for details of the INVVPID instruction. See Section 28.3.3.3 for guidelines regarding use of this instruction.
- Execution of the INVEPT instruction invalidates guest-physical mappings and combined mappings. Invalidation is based on instruction operands, called the INVEPT type and the INVEPT descriptor. Two INVEPT types are currently defined:
  - **Single-context.** If the INVEPT type is 1, the logical processor invalidates all guest-physical mappings and combined mappings associated with the EP4TA specified in the INVEPT descriptor. Combined mappings for that EP4TA are invalidated for all VPIDs and all PCIDs. (The instruction may invalidate mappings associated with other EP4TAs.)
  - **All-context.** If the INVEPT type is 2, the logical processor invalidates guest-physical mappings and combined mappings associated with all EP4TAs (and, for combined mappings, for all VPIDs and PCIDs).

  See Chapter 30 for details of the INVEPT instruction. See Section 28.3.3.4 for guidelines regarding use of this instruction.
- A power-up or a reset invalidates all linear mappings, guest-physical mappings, and combined mappings.

1. While no linear mappings are created while EPT is in use, a logical processor may retain, while EPT is in use, linear mappings (for the same VPID as the current one) there were created earlier, when EPT was not in use.
2. While no combined mappings are created while EPT is not in use, a logical processor may retain, while EPT is in not use, combined mappings (for the same VPID as the current one) there were created earlier, when EPT was in use.

28.3.3.2 Operations that Need Not Invalidate Cached Mappings

The following items detail cases of operations that are not required to invalidate certain cached mappings:

- Operations that architecturally invalidate entries in the TLBs or paging-structure caches independent of VMX operation are not required to invalidate any guest-physical mappings.
- The INVVPID instruction is not required to invalidate any guest-physical mappings.
- The INVEPT instruction is not required to invalidate any linear mappings.
- VMX transitions are not required to invalidate any guest-physical mappings. If the "enable VPID" VM-execution control is 1, VMX transitions are not required to invalidate any linear mappings or combined mappings.
- The VMXOFF and VMXON instructions are not required to invalidate any linear mappings, guest-physical mappings, or combined mappings.

A logical processor may invalidate any cached mappings at any time. For this reason, the operations identified above may invalidate the indicated mappings despite the fact that doing so is not required.

28.3.3.3 Guidelines for Use of the INVVPID Instruction

The need for VMM software to use the INVVPID instruction depends on how that software is virtualizing memory (e.g., see Section 32.3, "Memory Virtualization").

If EPT is not in use, it is likely that the VMM is virtualizing the guest paging structures. Such a VMM may configure the VMCS so that all or some of the operations that invalidate entries the TLBs and the paging-structure caches (e.g., the INVLPG instruction) cause VM exits. If VMM software is emulating these operations, it may be necessary to use the INVVPID instruction to ensure that the logical processor's TLBs and the paging-structure caches are appropriately invalidated.

Requirements of when software should use the INVVPID instruction depend on the specific algorithm being used for page-table virtualization. The following items provide guidelines for software developers:

- Emulation of the INVLPG instruction may require execution of the INVVPID instruction as follows:
  - The INVVPID type is individual-address (0).
  - The VPID in the INVVPID descriptor is the one assigned to the virtual processor whose execution is being emulated.
  - The linear address in the INVVPID descriptor is that of the operand of the INVLPG instruction being emulated.
- Some instructions invalidate all entries in the TLBs and paging-structure caches—except for global translations. An example is the MOV to CR3 instruction. (See Section 4.10, "Caching Translation Information" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A* for details regarding global translations.) Emulation of such an instruction may require execution of the INVVPID instruction as follows:
  - The INVVPID type is single-context-retaining-globals (3).
  - The VPID in the INVVPID descriptor is the one assigned to the virtual processor whose execution is being emulated.
- Some instructions invalidate all entries in the TLBs and paging-structure caches—including for global translations. An example is the MOV to CR4 instruction if the value of value of bit 4 (page global enable—PGE) is changing. Emulation of such an instruction may require execution of the INVVPID instruction as follows:
  - The INVVPID type is single-context (1).
  - The VPID in the INVVPID descriptor is the one assigned to the virtual processor whose execution is being emulated.

If EPT is not in use, the logical processor associates all mappings it creates with the current VPID, and it will use such mappings to translate linear addresses. For that reason, a VMM should not use the same VPID for different non-EPT guests that use different page tables. Doing so may result in one guest using translations that pertain to the other.

If EPT is in use, the instructions enumerated above might not be configured to cause VM exits and the VMM might not be emulating them. In that case, executions of the instructions by guest software properly invalidate the

required entries in the TLBs and paging-structure caches (see Section 28.3.3.1); execution of the INVVPID instruction is not required.

If EPT is in use, the logical processor associates all mappings it creates with the value of bits 51:12 of current EPTP. If a VMM uses different EPTP values for different guests, it may use the same VPID for those guests. Doing so cannot result in one guest using translations that pertain to the other.

The following guidelines apply more generally and are appropriate even if EPT is in use:

- As detailed in Section 29.4.5, an access to the APIC-access page might not cause an APIC-access VM exit if software does not properly invalidate information that may be cached from the paging structures. If, at one time, the current VPID on a logical processor was a non-zero value X, it is recommended that software use the INVVPID instruction with the "single-context" INVVPID type and with VPID X in the INVVPID descriptor before a VM entry on the same logical processor that establishes VPID X and either (a) the "virtualize APIC accesses" VM-execution control was changed from 0 to 1; or (b) the value of the APIC-access address was changed.
- Software can use the INVVPID instruction with the "all-context" INVVPID type immediately after execution of the VMXON instruction or immediately prior to execution of the VMXOFF instruction. Either prevents potentially undesired retention of information cached from paging structures between separate uses of VMX operation.

28.3.3.4 Guidelines for Use of the INVEPT Instruction

The following items provide guidelines for use of the INVEPT instruction to invalidate information cached from the EPT paging structures.

- Software should use the INVEPT instruction with the "single-context" INVEPT type after making any of the following changes to an EPT paging-structure entry (the INVEPT descriptor should contain an EPTP value that references — directly or indirectly — the modified EPT paging structure):
  - Changing any of the privilege bits 2:0 from 1 to 0.[1]
  - Changing the physical address in bits 51:12.
  - Clearing bit 8 (the accessed flag) if accessed and dirty flags for EPT will be enabled.
  - For an EPT PDPTE or an EPT PDE, changing bit 7 (which determines whether the entry maps a page).
  - For the **last** EPT paging-structure entry used to translate a guest-physical address (an EPT PDPTE with bit 7 set to 1, an EPT PDE with bit 7 set to 1, or an EPT PTE), changing either bits 5:3 or bit 6. (These bits determine the effective memory type of accesses using that EPT paging-structure entry; see Section 28.2.6.)
  - For the **last** EPT paging-structure entry used to translate a guest-physical address (an EPT PDPTE with bit 7 set to 1, an EPT PDE with bit 7 set to 1, or an EPT PTE), clearing bit 9 (the dirty flag) if accessed and dirty flags for EPT will be enabled.
- Software should use the INVEPT instruction with the "single-context" INVEPT type before a VM entry with an EPTP value X such that X[6] = 1 (accessed and dirty flags for EPT are enabled) if the logical processor had earlier been in VMX non-root operation with an EPTP value Y such that Y[6] = 0 (accessed and dirty flags for EPT are not enabled) and Y[51:12] = X[51:12].
- Software may use the INVEPT instruction after modifying a present EPT paging-structure entry (see Section 28.2.2) to change any of the privilege bits 2:0 from 0 to 1.[2] Failure to do so may cause an EPT violation that would not otherwise occur. Because an EPT violation invalidates any mappings that would be used by the access that caused the EPT violation (see Section 28.3.3.1), an EPT violation will not recur if the original access is performed again, even if the INVEPT instruction is not executed.
- Because a logical processor does not cache any information derived from EPT paging-structure entries that are not present (see Section 28.2.2) or misconfigured (see Section 28.2.3.1), it is not necessary to execute INVEPT following modification of an EPT paging-structure entry that had been not present or misconfigured.

---

1. If the "mode-based execute control for EPT" VM-execution control is 1, software should use the INVEPT instruction after changing privilege bit 10 from 1 to 0.
2. If the "mode-based execute control for EPT" VM-execution control is 1, software may use the INVEPT instruction after modifying a present EPT paging-structure entry to change privilege bit 10 from 0 to 1.

- As detailed in Section 29.4.5, an access to the APIC-access page might not cause an APIC-access VM exit if software does not properly invalidate information that may be cached from the EPT paging structures. If EPT was in use on a logical processor at one time with EPTP X, it is recommended that software use the INVEPT instruction with the "single-context" INVEPT type and with EPTP X in the INVEPT descriptor before a VM entry on the same logical processor that enables EPT with EPTP X and either (a) the "virtualize APIC accesses" VM-execution control was changed from 0 to 1; or (b) the value of the APIC-access address was changed.
- Software can use the INVEPT instruction with the "all-context" INVEPT type immediately after execution of the VMXON instruction or immediately prior to execution of the VMXOFF instruction. Either prevents potentially undesired retention of information cached from EPT paging structures between separate uses of VMX operation.

In a system containing more than one logical processor, software must account for the fact that information from an EPT paging-structure entry may be cached on logical processors other than the one that modifies that entry. The process of propagating the changes to a paging-structure entry is commonly referred to as "TLB shootdown." A discussion of TLB shootdown appears in Section 4.10.5, "Propagation of Paging-Structure Changes to Multiple Processors," in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*.

22.Updates to Chapter 35, Volume 3C

Change bars show changes to Chapter 35 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C:* System Programming Guide, Part 3.

Changes to this chapter: Various updates related to VMX and Intel Processor Trace interactions. Various minor corrections throughout chapter.

CHAPTER 35
INTEL® PROCESSOR TRACE

35.1 OVERVIEW

Intel® Processor Trace (**Intel PT**) is an extension of Intel® Architecture that captures information about software execution using dedicated hardware facilities that cause only minimal performance perturbation to the software being traced. This information is collected in **data packets**. The initial implementations of Intel PT offer **control flow tracing**, which generates a variety of packets to be processed by a software decoder. The packets include timing, program flow information (e.g. branch targets, branch taken/not taken indications) and program-induced mode related information (e.g. Intel TSX state transitions, CR3 changes). These packets may be buffered internally before being sent to the memory subsystem or other output mechanism available in the platform. Debug software can process the trace data and reconstruct the program flow.

Later generations include additional trace sources, including software trace instrumentation using PTWRITE, and Power Event tracing.

35.1.1 Features and Capabilities

Intel PT's control flow trace generates a variety of packets that, when combined with the binaries of a program by a post-processing tool, can be used to produce an exact execution trace. The packets record flow information such as instruction pointers (IP), indirect branch targets, and directions of conditional branches within contiguous code regions (basic blocks).

Intel PT can also be configured to log software-generated packets using PTWRITE, and packets describing processor power management events.

In addition, the packets record other contextual, timing, and bookkeeping information that enables both functional and performance debugging of applications. Intel PT has several control and filtering capabilities available to customize the tracing information collected and to append other processor state and timing information to enable debugging. For example, there are modes that allow packets to be filtered based on the current privilege level (CPL) or the value of CR3.

Configuration of the packet generation and filtering capabilities are programmed via a set of MSRs. The MSRs generally follow the naming convention of IA32_RTIT_*. The capability provided by these configuration MSRs are enumerated by CPUID, see Section 35.3. Details of the MSRs for configuring Intel PT are described in Section 35.2.7.

35.1.1.1 Packet Summary

After a tracing tool has enabled and configured the appropriate MSRs, the processor will collect and generate trace information in the following categories of packets (for more details on the packets, see Section 35.4):

- Packets about basic information on program execution; these include:
  - Packet Stream Boundary (**PSB**) packets: PSB packets act as 'heartbeats' that are generated at regular intervals (e.g., every 4K trace packet bytes). These packets allow the packet decoder to find the packet boundaries within the output data stream; a PSB packet should be the first packet that a decoder looks for when beginning to decode a trace.
  - Paging Information Packet (**PIP**): PIPs record modifications made to the CR3 register. This information, along with information from the operating system on the CR3 value of each process, allows the debugger to attribute linear addresses to their correct application source.
  - Time-Stamp Counter (**TSC**) packets: TSC packets aid in tracking wall-clock time, and contain some portion of the software-visible time-stamp counter.
  - Core Bus Ratio (**CBR**) packets: CBR packets contain the core:bus clock ratio.

  - Overflow (**OVF**) packets: OVF packets are sent when the processor experiences an internal buffer overflow, resulting in packets being dropped. This packet notifies the decoder of the loss and can help the decoder to respond to this situation.
- Packets about control flow information:
  - Taken Not-Taken (**TNT**) packets: TNT packets track the "direction" of direct conditional branches (taken or not taken).
  - Target IP (**TIP**) packets: TIP packets record the target IP of indirect branches, exceptions, interrupts, and other branches or events. These packets can contain the IP, although that IP value may be compressed by eliminating upper bytes that match the last IP. There are various types of TIP packets; they are covered in more detail in Section 35.4.2.2.
  - Flow Update Packets (**FUP**): FUPs provide the source IP addresses for asynchronous events (interrupt and exceptions), as well as other cases where the source address cannot be determined from the binary.
  - **MODE** packets: These packets provide the decoder with important processor execution information so that it can properly interpret the dis-assembled binary and trace log. MODE packets have a variety of formats that indicate details such as the execution mode (16-bit, 32-bit, or 64-bit).
- Packets inserted by software:
  - PTWRITE (PTW) packets: includes the value of the operand passed to the PTWRITE instruction (see "PTWRITE - Write Data to a Processor Trace Packet" in *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B*).
- Packets about processor power management events:
  - MWAIT packets: Indicate successful completion of an MWAIT operation to a C-state deeper than C0.0.
  - Power State Entry (PWRE) packets: Indicate entry to a C-state deeper than C0.0.
  - Power State Exit (PWRX) packets: Indicate exit from a C-state deeper than C0.0, returning to C0.
  - Execution Stopped (EXSTOP) packets: Indicate that software execution has stopped, due to events such as P-state change, C-state change, or thermal throttling.

35.2 INTEL® PROCESSOR TRACE OPERATIONAL MODEL

This section describes the overall Intel Processor Trace mechanism and the essential concepts relevant to how it operates.

35.2.1 Change of Flow Instruction (COFI) Tracing

A basic program block is a section of code where no jumps or branches occur. The instruction pointers (IPs) in this block of code need not be traced, as the processor will execute them from start to end without redirecting code flow. Instructions such as branches, and events such as exceptions or interrupts, can change the program flow. These instructions and events that change program flow are called Change of Flow Instructions (COFI). There are three categories of COFI:

- Direct transfer COFI.
- Indirect transfer COFI.
- Far transfer COFI.

The following subsections describe the COFI events that result in trace packet generation. Table 35-1 lists branch instruction by COFI types. For detailed description of specific instructions, see *Intel® 64 and IA-32 Architectures Software Developer's Manual*.

Table 35-1. COFI Type for Branch Instructions

COFI Type	Instructions
Conditional Branch	JA, JAE, JB, JBE, JC, JCXZ, JECXZ, JRCXZ, JE, JG, JGE, JL, JLE, JNA, JNAE, JNB, JNBE, JNC, JNE, JNG, JNGE, JNL, JNLE, JNO, JNP, JNS, JNZ, JO, JP, JPE, JPO, JS, JZ, LOOP, LOOPE, LOOPNE, LOOPNZ, LOOPZ

Table 35-1. COFI Type for Branch Instructions

COFI Type	Instructions
Unconditional Direct Branch	JMP (E9 xx, EB xx), CALL (E8 xx)
Indirect Branch	JMP (FF /4), CALL (FF /2)
Near Ret	RET (C3, C2 xx)
Far Transfers	INT3, INTn, INTO, IRET, IRETD, IRETQ, JMP (EA xx, FF /5), CALL (9A xx, FF /3), RET (CB, CA xx), SYSCALL, SYSRET, SYSENTER, SYSEXIT, VMLAUNCH, VMRESUME

35.2.1.1 Direct Transfer COFI

Direct Transfer COFI are relative branches. This means that their target is an IP whose offset from the current IP is embedded in the instruction bytes. It is not necessary to indicate target of these instructions in the trace output since it can be obtained through the source disassembly. Conditional branches need to indicate only whether the branch is taken or not. Unconditional branches do not need any recording in the trace output. There are two sub-categories:

- **Conditional Branch (Jcc, J*CXZ) and LOOP**

  To track this type of instruction, the processor encodes a single bit (taken or not taken — TNT) to indicate the program flow after the instruction.

  Jcc, J*CXZ, and LOOP can be traced with TNT bits. To improve the trace packet output efficiency, the processor will compact several TNT bits into a single packet.

- **Unconditional Direct Jumps**

  There is no trace output required for direct unconditional jumps (like JMP near relative or CALL near relative) since they can be directly inferred from the application assembly. Direct unconditional jumps do not generate a TNT bit or a Target IP packet, though TIP.PGD and TIP.PGE packets can be generated by unconditional direct jumps that toggle Intel PT enables (see Section 35.2.5).

35.2.1.2 Indirect Transfer COFI

Indirect transfer instructions involve updating the IP from a register or memory location. Since the register or memory contents can vary at any time during execution, there is no way to know the target of the indirect transfer until the register or memory contents are read. As a result, the disassembled code is not sufficient to determine the target of this type of COFI. Therefore, tracing hardware must send out the destination IP in the trace packet for debug software to determine the target address of the COFI. Note that this IP may be a linear or effective address (see Section 35.3.1.1).

An indirect transfer instruction generates a Target IP Packet (TIP) that contains the target address of the branch. There are two sub-categories:

- **Near JMP Indirect and Near Call Indirect**

  As previously mentioned, the target of an indirect COFI resides in the contents of either a register or memory location. Therefore, the processor must generate a packet that includes this target address to allow the decoder to determine the program flow.

- **Near RET**

  When a CALL instruction executes, it pushes onto the stack the address of the next instruction following the CALL. Upon completion of the call procedure, the RET instruction is often used to pop the return address off of the call stack and redirect code flow back to the instruction following the CALL.

  A RET instruction simply transfers program flow to the address it popped off the stack. Because a called procedure may change the return address on the stack before executing the RET instruction, debug software can be misled if it assumes that code flow will return to the instruction following the last CALL. Therefore, even for near RET, a Target IP Packet may be sent.

  — **RET Compression**

    A special case is applied if the target of the RET is consistent with what would be expected from tracking the CALL stack. If it is assured that the decoder has seen the corresponding CALL (with "corresponding" defined

as the CALL with matching stack depth), and the RET target is the instruction after that CALL, the RET target may be "compressed". In this case, only a single TNT bit of "taken" is generated instead of a Target IP Packet. To ensure that the decoder will not be confused in cases of RET compression, only RETs that correspond to CALLs which have been seen since the last PSB packet may be compressed in a given logical processor. For details, see "Indirect Transfer Compression for Returns (RET)" in Section 35.4.2.2.

35.2.1.3 Far Transfer COFI

All operations that change the instruction pointer and are not near jumps are "far transfers". This includes exceptions, interrupts, traps, TSX aborts, and instructions that do far transfers.

All far transfers will produce a Target IP (TIP) packet, which provides the destination IP address. For those far transfers that cannot be inferred from the binary source (e.g., asynchronous events such as exceptions and interrupts), the TIP will be preceded by a Flow Update packet (FUP), which provides the source IP address at which the event was taken. Table 35-23 indicates exactly which IP will be included in the FUP generated by a far transfer.

35.2.2 Software Trace Instrumentation with PTWRITE

PTWRITE provides a mechanism by which software can instrument the Intel PT trace. PTWRITE is a ring3-accessible instruction that can be passed to a register or memory variable, see "PTWRITE - Write Data to a Processor Trace Packet" in *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B* for details. The contents of that variable will be used as the payload for the PTW packet (see Table 35-40 "PTW Packet Definition"), inserted at the time of PTWRITE retirement, assuming PTWRITE is enabled and all other filtering conditions are met. Decode and analysis software will then be able to determine the meaning of the PTWRITE packet based on the IP of the associated PTWRITE instruction.

PTWRITE is enabled via IA32_RTIT_CTL.PTWEn[12] (see Table 35-6). Optionally, the user can use IA32_RTIT_CTL.FUPonPTW[5] to enable PTW packets to be followed by FUP packets containing the IP of the associated PTWRITE instruction.

35.2.3 Power Event Tracing

Power Event Trace is a capability that exposes core- and thread-level sleep state and power down transition information. When this capability is enabled, the trace will expose information about:

- Scenarios where software execution stops.
  - Due to sleep state entry, frequency change, or other powerdown.
  - Includes the IP, when in the tracing context.
- The requested and resolved hardware thread C-state.
  - Including indication of hardware autonomous C-state entry.
- The last and deepest core C-state achieved during a sleep session.
- The reason for C-state wake.

This information is in addition to the bus ratio (CBR) information provided by default after any powerdown, and the timing information (TSC, TMA, MTC, CYC) provided during or after a powerdown state.

Power Event Trace is enabled via IA32_RTIT_CTL.PwrEvtEn[4].

35.2.4 Trace Filtering

Intel Processor Trace provides filtering capabilities, by which the debug/profile tool can control what code is traced.

35.2.4.1 Filtering by Current Privilege Level (CPL)

Intel PT provides the ability to configure a logical processor to generate trace packets only when CPL = 0, when CPL > 0, or regardless of CPL.

CPL filtering ensures that no IPs or other architectural state information associated with the filtered CPL can be seen in the log. For example, if the processor is configured to trace only when CPL > 0, and software executes SYSCALL (changing the CPL to 0), the destination IP of the SYSCALL will be suppressed from the generated packet (see the discussion of TIP.PGD in Section 35.4.2.5).

It should be noted that CPL is always 0 in real-address mode and that CPL is always 3 in virtual-8086 mode. To trace code in these modes, filtering should be configured accordingly.

When software is executing in a non-enabled CPL, ContextEn is cleared. See Section 35.2.5.1 for details.

35.2.4.2 Filtering by CR3

Intel PT supports a CR3-filtering mechanism by which the generation of packets containing architectural states can be enabled or disabled based on the value of CR3. A debugger can use CR3 filtering to trace only a single application without context switching the state of the RTIT MSRs. For the reconstruction of traces from software with multiple threads, debug software may wish to context-switch for the state of the RTIT MSRs (if the operating system does not provide context-switch support) to separate the output for the different threads (see Section 35.3.5, “Context Switch Consideration”).

To trace for only a single CR3 value, software can write that value to the IA32_RTIT_CR3_MATCH MSR, and set IA32_RTIT_CTL.CR3Filter. When CR3 value does not match IA32_RTIT_CR3_MATCH and IA32_RTIT_CTL.CR3Filter is 1, ContextEn is forced to 0, and packets containing architectural states will not be generated. Some other packets can be generated when ContextEn is 0; see Section 35.2.5.3 for details. When CR3 does match IA32_RTIT_CR3_MATCH (or when IA32_RTIT_CTL.CR3Filter is 0), CR3 filtering does not force ContextEn to 0 (although it could be 0 due to other filters or modes).

CR3 matches IA32_RTIT_CR3_MATCH if the two registers are identical for bits 63:12, or 63:5 when in PAE paging mode; the lower 5 bits of CR3 and IA32_RTIT_CR3_MATCH are ignored. CR3 filtering is independent of the value of CR0.PG.

When CR3 filtering is in use, PIP packets may still be seen in the log if the processor is configured to trace when CPL = 0 (IA32_RTIT_CTL.OS = 1). If not, no PIP packets will be seen.

35.2.4.3 Filtering by IP

Trace packet generation with configurable filtering by IP is supported if CPUID.(EAX=14H, ECX=0):EBX[bit 2] = 1. Intel PT can be configured to enable the generation of packets containing architectural states only when the processor is executing code within certain IP ranges. If the IP is outside of these ranges, generation of some packets is blocked.

IP filtering is enabled using the ADDRn_CFG fields in the IA32_RTIT_CTL MSR (Section 35.2.7.2), where the digit 'n' is a zero-based number that selects which address range is being configured. Each ADDRn_CFG field configures the use of the register pair IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B (Section 35.2.7.5). IA32_RTIT_ADDRn_A defines the base and IA32_RTIT_ADDRn_B specifies the limit of the range in which tracing is enabled. Thus each range, referred to as the ADDRn range, is defined by [IA32_RTIT_ADDRn_A. IA32_RTIT_ADDRn_B]. There can be multiple such ranges, software can query CPUID (Section 35.3.1) for the number of ranges supported on a processor.

Default behavior (ADDRn_CFG=0) defines no IP filter range, meaning FilterEn is always set. In this case code at any IP can be traced, though other filters, such as CR3 or CPL, could limit tracing. When ADDRn_CFG is set to enable IP filtering (see Section 35.3.1), tracing will commence when a taken branch or event is seen whose target address is in the ADDRn range.

While inside a tracing region and with FilterEn is set, leaving the tracing region may only be detected once a taken branch or event with a target outside the range is retired. If an ADDRn range is entered or exited by executing the next sequential instruction, rather than by a control flow transfer, FilterEn may not toggle immediately. See Section 35.2.5.5 for more details on FilterEn.

Note that these address range base and limit values are inclusive, such that the range includes the first and last instruction whose first instruction byte is in the ADDRn range.

Depending upon processor implementation, IP filtering may be based on linear or effective address. This can cause different behavior between implementations if CSbase is not equal to zero or in real mode. See Section 35.3.1.1 for details. Software can query CPUID to determine filters are based on linear or effective address (Section 35.3.1).

Note that some packets, such as MTC (Section 35.3.7) and other timing packets, do not depend on FilterEn. For details on which packets depend on FilterEn, and hence are impacted by IP filtering, see Section 35.4.1.

TraceStop

The ADDRn ranges can also be configured to cause tracing to be disabled upon entry to the specified region. This is intended for cases where unexpected code is executed, and the user wishes to immediately stop generating packets in order to avoid overwriting previously written packets.

The TraceStop mechanism works much the same way that IP filtering does, and uses the same address comparison logic. The TraceStop region base and limit values are programmed into one or more ADDRn ranges, but IA32_RTIT_CTL.ADDRn_CFG is configured with the TraceStop encoding. Like FilterEn, TraceStop is detected when a taken branch or event lands in a TraceStop region.

Further, TraceStop requires that TriggerEn=1 at the beginning of the branch/event, and ContextEn=1 upon completion of the branch/event. When this happens, the CPU will set IA32_RTIT_STATUS.Stopped, thereby clearing TriggerEn and hence disabling packet generation. This may generate a TIP.PGD packet with the target IP of the branch or event that entered the TraceStop region. Finally, a TraceStop packet will be inserted, to indicate that the condition was hit.

If a TraceStop condition is encountered during buffer overflow (Section 35.3.8), it will not be dropped, but will instead be signaled once the overflow has resolved.

Note that a TraceStop event does not guarantee that all internally buffered packets are flushed out of internal buffers. To ensure that this has occurred, the user should clear TraceEn.

To resume tracing after a TraceStop event, the user must first disable Intel PT by clearing IA32_RTIT_CTL.TraceEn before the IA32_RTIT_STATUS.Stopped bit can be cleared. At this point Intel PT can be reconfigured, and tracing resumed.

Note that the IA32_RTIT_STATUS.Stopped bit can also be set using the ToPA STOP bit. See Section 35.2.6.2.

IP Filtering Example

The following table gives an example of IP filtering behavior. Assume that IA32_RTIT_ADDRn_A = the IP of RangeBase, and that IA32_RTIT_ADDRn_B = the IP of RangeLimit, while IA32_RTIT_CTL.ADDRn_CFG = 0x1 (enable ADDRn range as a FilterEn range).

Table 35-2. IP Filtering Packet Example

Code Flow	Packets

`Bar:`
`  jmp RangeBase // jump into filter range`
`RangeBase:`
`  jcc Foo // not taken`
`  add eax, 1`
`Foo:`
`  jmp RangeLimit+1 // jump out of filter range`
`RangeLimit:`
`  nop`
`  jcc Bar`
	TIP.PGE(RangeBase)
	TNT(0)
	TIP.PGD(RangeLimit+1)

IP Filtering and TraceStop

It is possible for the user to configure IP filter range(s) and TraceStop range(s) that overlap. In this case, code executing in the non-overlapping portion of either range will behave as would be expected from that range. Code executing in the overlapping range will get TraceStop behavior.

35.2.5 Packet Generation Enable Controls

Intel Processor Trace includes a variety of controls that determine whether a packet is generated. In general, most packets are sent only if Packet Enable (**PacketEn**) is set. PacketEn is an internal state maintained in hardware in

response to software configurable enable controls, PacketEn is not visible to software directly. The relationship of PacketEn to the software-visible controls in the configuration MSRs is described in this section.

35.2.5.1 Packet Enable (PacketEn)

When PacketEn is set, the processor is in the mode that Intel PT is monitoring and all packets can be generated to log what is being executed. PacketEn is composed of other states according to this relationship:

```
PacketEn ← TriggerEn AND ContextEn AND FilterEn AND BranchEn
```

These constituent controls are detailed in the following subsections.

PacketEn ultimately determines when the processor is tracing. When PacketEn is set, all control flow packets are enabled. When PacketEn is clear, no control flow packets are generated, though other packets (timing and bookkeeping packets) may still be sent. See Section 35.2.6 for details of PacketEn and packet generation.

Note that, on processors that do not support IP filtering (i.e., CPUID.(EAX=14H, ECX=0):EBX.IPFILT_WRSTPRSV[bit 2] = 0), FilterEn is treated as always set.

35.2.5.2 Trigger Enable (TriggerEn)

Trigger Enable (**TriggerEn**) is the primary indicator that trace packet generation is active. TriggerEn is set when IA32_RTIT_CTL.TraceEn is set, and cleared by any of the following conditions:

- TraceEn is cleared by software.
- A TraceStop condition is encountered and IA32_RTIT_STATUS.Stopped is set.
- IA32_RTIT_STATUS.Error is set due to an operational error (see Section 35.3.9).

Software can discover the current TriggerEn value by reading the IA32_RTIT_STATUS.TriggerEn bit. When TriggerEn is clear, tracing is inactive and no packets are generated.

35.2.5.3 Context Enable (ContextEn)

Context Enable (**ContextEn**) indicates whether the processor is in the state or mode that software configured hardware to trace. For example, if execution with CPL = 0 code is not being traced (IA32_RTIT_CTL.OS = 0), then ContextEn will be 0 when the processor is in CPL0.

Software can discover the current ContextEn value by reading the IA32_RTIT_STATUS.ContextEn bit. ContextEn is defined as follows:

```
ContextEn = !((IA32_RTIT_CTL.OS = 0 AND CPL = 0) OR
(IA32_RTIT_CTL.USER = 0 AND CPL > 0) OR (IS_IN_A_PRODUCTION_ENCLAVE[1]) OR
(IA32_RTIT_CTL.CR3Filter = 1 AND IA32_RTIT_CR3_MATCH does not match CR3)
```

If the clearing of ContextEn causes PacketEn to be cleared, a Packet Generation Disable (TIP.PGD) packet is generated, but its IP payload is suppressed. If the setting of ContextEn causes PacketEn to be set, a Packet Generation Enable (TIP.PGE) packet is generated.

When ContextEn is 0, control flow packets (TNT, FUP, TIP.*, MODE.*) are not generated, and no Linear Instruction Pointers (LIPs) are exposed. However, some packets, such as MTC and PSB (see Section 35.4.2.16 and Section 35.4.2.17), may still be generated while ContextEn is 0. For details of which packets are generated only when ContextEn is set, see Section 35.4.1.

The processor does not update ContextEn when TriggerEn = 0.

The value of ContextEn will toggle only when TriggerEn = 1.

35.2.5.4 Branch Enable (BranchEn)

This value is based purely on the IA32_RTIT_CTL.BranchEn value. If **BranchEn** is not set, then relevant COFI packets (TNT, TIP*, FUP, MODE.*) are suppressed. Other packets related to timing (TSC, TMA, MTC, CYC), as well

1. Trace packets generation is disabled in a production enclave, see Section 35.2.8.5. See *Intel® Software Guard Extensions Programming Reference* about differences between a production enclave and a debug enclave.

as PSB, will be generated normally regardless. Further, PIP and VMCS continue to be generated, as indicators of what software is running.

35.2.5.5 Filter Enable (FilterEn)

Filter Enable indicates that the Instruction Pointer (IP) is within the range of IPs that Intel PT is configured to watch. Software can get the state of Filter Enable by a RDMSR of IA32_RTIT_STATUS.FilterEn. For details on configuration and use of IP filtering, see Section 35.2.4.3.

On clearing of FilterEn that also clears PacketEn, a Packet Generation Disable (TIP.PGD) will be generated, but unlike the ContextEn case, the IP payload may not be suppressed. For direct, unconditional branches, as well as for indirect branches (including RETs), the PGD generated by leaving the tracing region and clearing FilterEn will contain the target IP. This means that IPs from outside the configured range can be exposed in the trace, as long as they are within context.

When FilterEn is 0, control flow packets are not generated (e.g., TNT, TIP). However, some packets, such as PIP, MTC, and PSB, may still be generated while FilterEn is clear. For details on packet enable dependencies, see Section 35.4.1.

After TraceEn is set, FilterEn is set to 1 at all times if there is no IP filter range configured by software (IA32_RTIT_CTL.ADDRn_CFG != 1, for all n), or if the processor does not support IP filtering (i.e., CPUID.(EAX=14H, ECX=0):EBX.IPFILT_WRSTPRSV[bit 2] = 0). FilterEn will toggle only when TraceEn=1 and ContextEn=1, and when at least one range is configured for IP filtering.

35.2.6 Trace Output

Intel PT output should be viewed independently from trace content and filtering mechanisms. The options available for trace output can vary across processor generations and platforms.

Trace output is written out using one of the following output schemes, as configured by the ToPA and FabricEn bit fields of IA32_RTIT_CTL (see Section 35.2.7.2):

- A single, contiguous region of physical address space.
- A collection of variable-sized regions of physical memory. These regions are linked together by tables of pointers to those regions, referred to as Table of Physical Addresses (**ToPA**). The trace output stores bypass the caches and the TLBs, but are not serializing. This is intended to minimize the performance impact of the output.
- A platform-specific trace transport subsystem.

Regardless of the output scheme chosen, Intel PT stores bypass the processor caches by default. This ensures that they don't consume precious cache space, but they do not have the serializing aspects associated with un-cacheable (UC) stores. Software should avoid using MTRRs to mark any portion of the Intel PT output region as UC, as this may override the behavior described above and force Intel PT stores to UC, thereby incurring severe performance impact.

There is no guarantee that a packet will be written to memory or other trace endpoint after some fixed number of cycles after a packet-producing instruction executes. The only way to assure that all packets generated have reached their endpoint is to clear TraceEn and follow that with a store, fence, or serializing instruction; doing so ensures that all buffered packets are flushed out of the processor.

35.2.6.1 Single Range Output

When IA32_RTIT_CTL.ToPA and IA32_RTIT_CTL.FabricEn bits are clear, trace packet output is sent to a single, contiguous memory (or MMIO if DRAM is not available) range defined by a base address in IA32_RTIT_OUTPUT_BASE (Section 35.2.7.7) and mask value in IA32_RTIT_OUTPUT_MASK_PTRS (Section 35.2.7.8). The current write pointer in this range is also stored in IA32_RTIT_OUTPUT_MASK_PTRS. This output range is circular, meaning that when the writes wrap around the end of the buffer they begin again at the base address.

This output method is best suited for cases where Intel PT output is either:

- Configured to be directed to a sufficiently large contiguous region of DRAM.

- Configured to go to an MMIO debug port, in order to route Intel PT output to a platform-specific trace endpoint (e.g., JTAG). In this scenario, a specific range of addresses is written in a circular manner, and SoC will intercept these writes and direct them to the proper device. Repeated writes to the same address do not overwrite each other, but are accumulated by the debugger, and hence no data is lost by the circular nature of the buffer.

The processor will determine the address to which to write the next trace packet output byte as follows:

```
OutputBase[63:0] ← IA32_RTIT_OUTPUT_BASE[63:0]
OutputMask[63:0] ← ZeroExtend64(IA32_RTIT_OUTPUT_MASK_PTRS[31:0])
OutputOffset[63:0] ← ZeroExtend64(IA32_RTIT_OUTPUT_MASK_PTRS[63:32])
trace_store_phys_addr ← (OutputBase & ~OutputMask) + (OutputOffset & OutputMask)
```

Single-Range Output Errors

If the output base and mask are not properly configured by software, an operational error (see Section 35.3.9) will be signaled, and tracing disabled. Error scenarios with single-range output are:

- Mask value is non-contiguous.

  IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTablePointer value has a 0 in a less significant bit position than the most significant bit containing a 1.

- Base address and Mask are mis-aligned, and have overlapping bits set.

  IA32_RTIT_OUTPUT_BASE && IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTableOffset > 0.

- Illegal Output Offset

  IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset is greater than the mask value (IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTableOffset).

Also note that errors can be signaled due to trace packet output overlapping with restricted memory, see Section 35.2.6.4.

35.2.6.2 Table of Physical Addresses (ToPA)

When IA32_RTIT_CTL.ToPA is set and IA32_RTIT_CTL.FabricEn is clear, the ToPA output mechanism is utilized. The ToPA mechanism uses a linked list of tables; see Figure 35-1 for an illustrative example. Each entry in the table contains some attribute bits, a pointer to an output region, and the size of the region. The last entry in the table may hold a pointer to the next table. This pointer can either point to the top of the current table (for circular array) or to the base of another table. The table size is not fixed, since the link to the next table can exist at any entry.

The processor treats the various output regions referenced by the ToPA table(s) as a unified buffer. This means that a single packet may span the boundary between one output region and the next.

The ToPA mechanism is controlled by three values maintained by the processor:

- **proc_trace_table_base.**
  This is the physical address of the base of the current ToPA table. When tracing is enabled, the processor loads this value from the IA32_RTIT_OUTPUT_BASE MSR. While tracing is enabled, the processor updates the IA32_RTIT_OUTPUT_BASE MSR with changes to proc_trace_table_base, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc_trace_table_base.

- **proc_trace_table_offset.**
  This indicates the entry of the current table that is currently in use. (This entry contains the address of the current output region.) When tracing is enabled, the processor loads this value from bits 31:7 (MaskOrTableOffset) of the IA32_RTIT_OUTPUT_MASK_PTRS. While tracing is enabled, the processor updates IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTableOffset with changes to proc_trace_table_offset, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc_trace_table_offset.

- **proc_trace_output_offset.**
  This a pointer into the current output region and indicates the location of the next write. When tracing is enabled, the processor loads this value from bits 63:32 (OutputOffset) of the IA32_RTIT_OUTPUT_MASK_PTRS. While tracing is enabled, the processor updates

IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset with changes to proc_trace_output_offset, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc_trace_output_offset.

Figure 35-1 provides an illustration (not to scale) of the table and associated pointers.

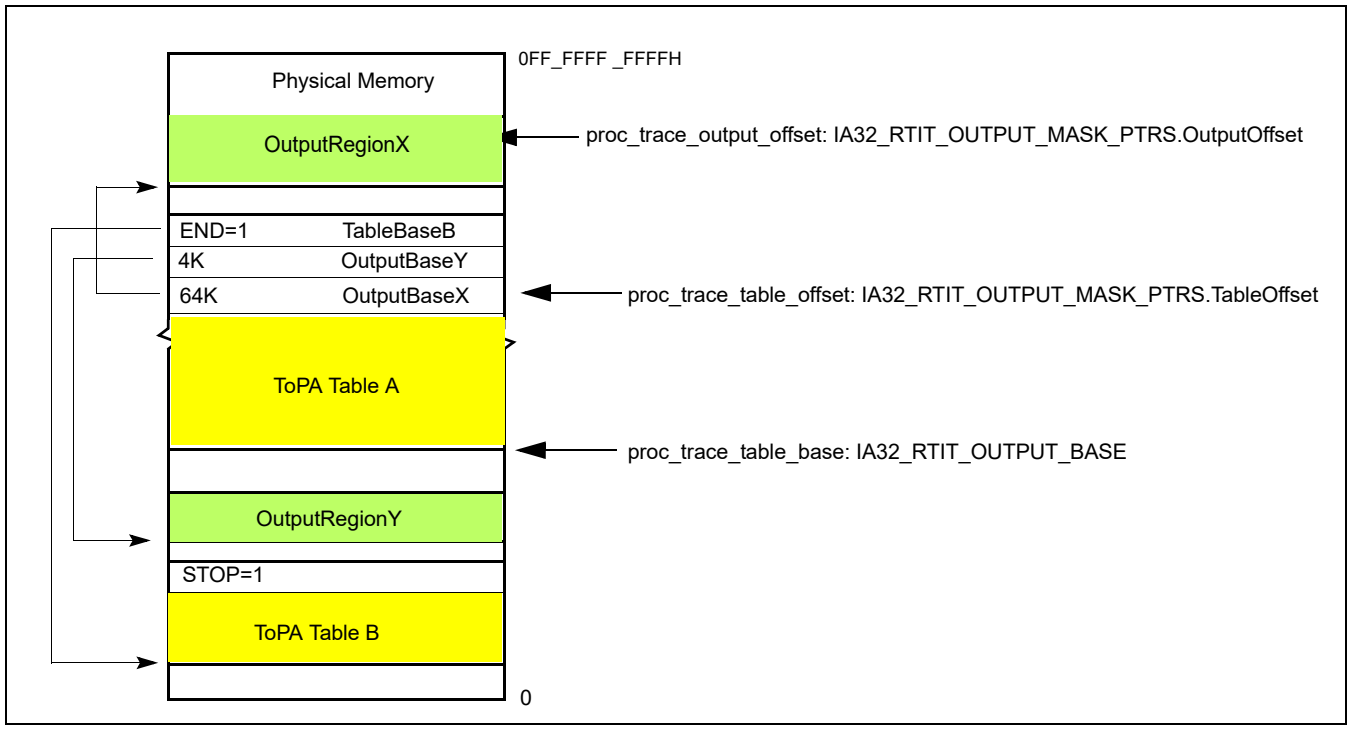

Figure 35-1. ToPA Memory Illustration

With the ToPA mechanism, the processor writes packets to the current output region (identified by proc_trace_table_base and the proc_trace_table_offset). The offset within that region to which the next byte will be written is identified by proc_trace_output_offset. When that region is filled with packet output (thus proc_trace_output_offset = RegionSize–1), proc_trace_table_offset is moved to the next ToPA entry, proc_trace_output_offset is set to 0, and packet writes begin filling the new output region specified by proc_trace_table_offset.

As packets are written out, each store derives its physical address as follows:

```
trace_store_phys_addr ← Base address from current ToPA table entry +
proc_trace_output_offset
```

Eventually, the regions represented by all entries in the table may become full, and the final entry of the table is reached. An entry can be identified as the final entry because it has either the END or STOP attribute. The END attribute indicates that the address in the entry does not point to another output region, but rather to another ToPA table. The STOP attribute indicates that tracing will be disabled once the corresponding region is filled. See Section 35.2.6.2 for details on STOP.

When an END entry is reached, the processor loads proc_trace_table_base with the base address held in this END entry, thereby moving the current table pointer to this new table. The proc_trace_table_offset is reset to 0, as is the proc_trace_output_offset, and packet writes will resume at the base address indicated in the first entry.

If the table has no STOP or END entry, and trace-packet generation remains enabled, eventually the maximum table size will be reached (proc_trace_table_offset = 01FFFFFH). In this case, the proc_trace_table_offset and proc_trace_output_offset are reset to 0 (wrapping back to the beginning of the current table) once the last output region is filled.

It is important to note that processor updates to the IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS MSRs are asynchronous to instruction execution. Thus, reads of these MSRs

while Intel PT is enabled may return stale values. Like all IA32_RTIT_* MSRs, the values of these MSRs should not be trusted or saved unless trace packet generation is first disabled by clearing IA32_RTIT_CTL.TraceEn. This ensures that he output MSR values account for all packets generated to that point, after which the output MSR values will be frozen until tracing resumes. [1]

The processor may cache internally any number of entries from the current table or from tables that it references (directly or indirectly). If tracing is enabled, the processor may ignore or delay detection of modifications to these tables. To ensure that table changes are detected by the processor in a predictable manner, software should clear TraceEn before modifying the current table (or tables that it references) and only then re-enable packet generation.

Single Output Region ToPA Implementation

The first processor generation to implement Intel PT supports only ToPA configurations with a single ToPA entry followed by an END entry that points back to the first entry (creating one circular output buffer). Such processors enumerate CPUID.(EAX=14H,ECX=0):ECX.MENTRY[bit 1] = 0 and CPUID.(EAX=14H,ECX=0):ECX.TOPAOUT[bit 0] = 1.

If CPUID.(EAX=14H,ECX=0):ECX.MENTRY[bit 1] = 0, ToPA tables can hold only one output entry, which must be followed by an END=1 entry which points back to the base of the table. Hence only one contiguous block can be used as output.

The lone output entry can have INT or STOP set, but nonetheless must be followed by an END entry as described above. Note that, if INT=1, the PMI will actually be delivered before the region is filled.

ToPA Table Entry Format

The format of ToPA table entries is shown in Figure 35-2. The size of the address field is determined by the processor's physical-address width (MAXPHYADDR) in bits, as reported in CPUID.80000008H:EAX[7:0].

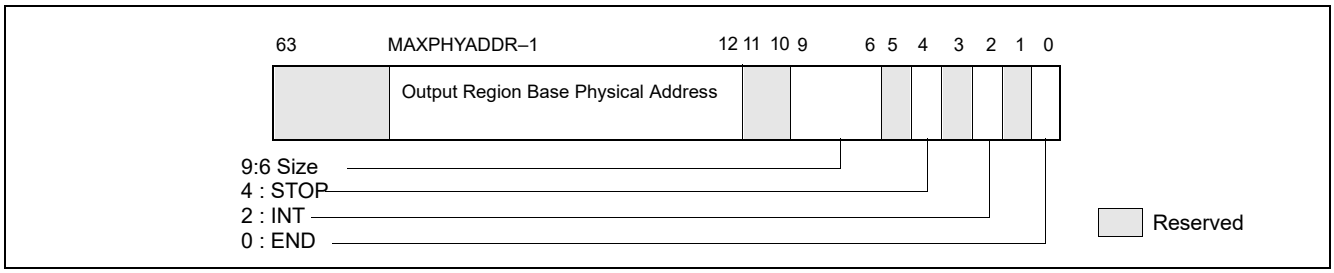

Figure 35-2. Layout of ToPA Table Entry

Table 35-3 describes the details of the ToPA table entry fields. If reserved bits are set to 1, an error is signaled.

Table 35-3. ToPA Table Entry Fields

ToPA Entry Field	Description
Output Region Base Physical Address	If END=0, this is the base physical address of the output region specified by this entry. Note that all regions must be aligned based on their size. Thus a 2M region must have bits 20:12 clear. If the region is not properly aligned, an operational error will be signaled when the entry is reached. If END=1, this is the 4K-aligned base physical address of the next ToPA table (which may be the base of the current table, or the first table in the linked list if a circular buffer is desired). If the processor supports only a single ToPA output region (see above), this address must be the value currently in the IA32_RTIT_OUTPUT_BASE MSR.
Size	Indicates the size of the associated output region. Encodings are: 0: 4K, 1: 8K, 2: 16K, 3: 32K, 4: 64K, 5: 128K, 6: 256K, 7: 512K, 8: 1M, 9: 2M, 10: 4M, 11: 8M, 12: 16M, 13: 32M, 14: 64M, 15: 128M This field is ignored if END=1.

1. Although WRMSR is a serializing instruction, the execution of WRMSR that forces packet writes by clearing TraceEn does not itself cause these writes to be globally observed.

Table 35-3. ToPA Table Entry Fields (Contd.)

ToPA Entry Field	Description
STOP	When the output region indicated by this entry is filled, software should disable packet generation. This will be accomplished by setting IA32_RTIT_STATUS.Stopped, which clears TriggerEn. This bit must be 0 if END=1; otherwise it is treated as reserved bit violation (see ToPA Errors).
INT	When the output region indicated by this entry is filled, signal Perfmon LVT interrupt. Note that if both INT and STOP are set in the same entry, the STOP will happen before the INT. Thus the interrupt handler should expect that the IA32_RTIT_STATUS.Stopped bit will be set, and will need to be reset before tracing can be resumed. This bit must be 0 if END=1; otherwise it is treated as reserved bit violation (see ToPA Errors).
END	If set, indicates that this is an END entry, and thus the address field points to a table base rather than an output region base. If END=1, INT and STOP must be set to 0; otherwise it is treated as reserved bit violation (see ToPA Errors). The Size field is ignored in this case. If the processor supports only a single ToPA output region (see above), END must be set in the second table entry.

ToPA STOP

Each ToPA entry has a STOP bit. If this bit is set, the processor will set the IA32_RTIT_STATUS.Stopped bit when the corresponding trace output region is filled. This will clear TriggerEn and thereby cease packet generation. See Section 35.2.7.4 for details on IA32_RTIT_STATUS.Stopped. This sequence is known as "ToPA Stop".

No TIP.PGD packet will be seen in the output when the ToPA stop occurs, since the disable happens only when the region is already full. When this occurs, output ceases after the last byte of the region is filled, which may mean that a packet is cut off in the middle. Any packets remaining in internal buffers are lost and cannot be recovered.

When ToPA stop occurs, the IA32_RTIT_OUTPUT_BASE MSR will hold the base address of the table whose entry had STOP=1. IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTableOffset will hold the index value for that entry, and the IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset should be set to the size of the region.

Note that this means the offset pointer is pointing to the next byte after the end of the region, a configuration that would produce an operational error if the configuration remained when tracing is re-enabled with IA32_RTIT_STATUS.Stopped cleared.

ToPA PMI

Each ToPA entry has an INT bit. If this bit is set, the processor will signal a performance-monitoring interrupt (PMI) when the corresponding trace output region is filled. This interrupt is not precise, and it is thus likely that writes to the next region will occur by the time the interrupt is taken.

The following steps should be taken to configure this interrupt:

1. Enable PMI via the LVT Performance Monitor register (at MMIO offset 340H in xAPIC mode; via MSR 834H in x2APIC mode). See *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B* for more details on this register. For ToPA PMI, set all fields to 0, save for the interrupt vector, which can be selected by software.
2. Set up an interrupt handler to service the interrupt vector that a ToPA PMI can raise.
3. Set the interrupt flag by executing STI.
4. Set the INT bit in the ToPA entry of interest and enable packet generation, using the ToPA output option. Thus, TraceEn=ToPA=1 in the IA32_RTIT_CTL MSR.

Once the INT region has been filled with packet output data, the interrupt will be signaled. This PMI can be distinguished from others by checking bit 55 (Trace_ToPA_PMI) of the IA32_PERF_GLOBAL_STATUS MSR (MSR 38EH). Once the ToPA PMI handler has serviced the relevant buffer, writing 1 to bit 55 of the MSR at 390H (IA32_GLOBAL_STATUS_RESET) clears IA32_PERF_GLOBAL_STATUS.Trace_ToPA_PMI.

Intel PT is not frozen on PMI, and thus the interrupt handler will be traced (though filtering can prevent this). The Freeze_Perfmon_on_PMI and Freeze_LBRs_on_PMI settings in IA32_DEBUGCTL will be applied on ToPA PMI just as on other PMIs, and hence Perfmon counters are frozen.

Assuming the PMI handler wishes to read any buffered packets for persistent output, or wishes to modify any Intel PT MSRs, software should first disable packet generation by clearing TraceEn. This ensures that all buffered packets are written to memory and avoids tracing of the PMI handler. The configuration MSRs can then be used to determine where tracing has stopped. If packet generation is disabled by the handler, it should then be manually re-enabled before the IRET if continued tracing is desired.

In rare cases, it may be possible to trigger a second ToPA PMI before the first is handled. This can happen if another ToPA region with INT=1 is filled before, or shortly after, the first PMI is taken, perhaps due to EFLAGS.IF being cleared for an extended period of time. This can manifest in two ways: either the second PMI is triggered before the first is taken, and hence only one PMI is taken, or the second is triggered after the first is taken, and thus will be taken when the handler for the first completes. Software can minimize the likelihood of the second case by clearing TraceEn at the beginning of the PMI handler. Further, it can detect such cases by then checking the Interrupt Request Register (IRR) for PMI pending, and checking the ToPA table base and off-set pointers (in IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS) to see if multiple entries with INT=1 have been filled.

ToPA PMI and Single Output Region ToPA Implementation

A processor that supports only a single ToPA output region implementation (such that only one output region is supported; see above) will attempt to signal a ToPA PMI interrupt before the output wraps and overwrites the top of the buffer. To support this functionality, the PMI handler should disable packet generation as soon as possible.

Due to PMI skid, it is possible that, in rare cases, the wrap will have occurred before the PMI is delivered. Software can avoid this by setting the STOP bit in the ToPA entry (see Table 35-3); this will disable tracing once the region is filled, and no wrap will occur. This approach has the downside of disabling packet generation so that some of the instructions that led up to the PMI will not be traced. If the PMI skid is significant enough to cause the region to fill and tracing to be disabled, the PMI handler will need to clear the IA32_RTIT_STATUS.Stopped indication before tracing can resume.

ToPA PMI and XSAVES/XRSTORS State Handling

In some cases the ToPA PMI may be taken after completion of an XSAVES instruction that switches Intel PT state, and in such cases any modification of Intel PT MSRs within the PMI handler will not persist when the saved Intel PT context is later restored with XRSTORS. To account for such a scenario, it is recommended that the Intel PT output configuration be modified by altering the ToPA tables themselves, rather than the Intel PT output MSRs.

Table 35-4 depicts a recommended PMI handler algorithm for managing multi-region ToPA output and handling ToPA PMIs that may arrive between XSAVES and XRSTORS. This algorithm is flexible to allow software to choose between adding entries to the current ToPA table, adding a new ToPA table, or using the current ToPA table as a circular buffer. It assumes that the ToPA entry that triggers the PMI is not the last entry in the table, which is the recommended treatment.

Table 35-4. Algorithm to Manage Intel PT ToPA PMI and XSAVES/XRSTORS

Pseudo Code Flow

```
IF (IA32_PERF_GLOBAL_STATUS.ToPA)
    Save IA32_RTIT_CTL value;
    IF ( IA32_RTIT_CTL.TraceEN )
        Disable Intel PT by clearing TraceEn;
    FI;
    IF ( there is space available to grow the current ToPA table )
        Add one or more ToPA entries after the last entry in the ToPA table;
        Point new ToPA entry address field(s) to new output region base(s);
    ELSE
        Modify an upcoming ToPA entry in the current table to have END=1;
        IF (output should transition to a new ToPA table )
            Point the address of the "END=1" entry of the current table to the new table base;
        ELSE
            /* Continue to use the current ToPA table, make a circular. */
            Point the address of the "END=1"l entry to the base of the current table;
            Modify the ToPA entry address fields for filled output regions to point to new, unused output regions;
            /* Filled regions are those with index in the range of 0 to (IA32_RTIT_MASK_PTRS.MaskOrTableOffset -1). */
        FI;
      FI;
      Restore saved IA32_RTIT_CTL.value;
FI;
```

ToPA Errors

When a malformed ToPA entry is found, an **operation error** results (see Section 35.3.9). A malformed entry can be any of the following:

1. **ToPA entry reserved bit violation**.
   This describes cases where a bit marked as reserved in Section 35.2.6.2 above is set to 1.
2. **ToPA alignment violation**.
   This includes cases where illegal ToPA entry base address bits are set to 1:
   a. ToPA table base address is not 4KB-aligned. The table base can be from a WRMSR to IA32_RTIT_OUTPUT_BASE, or from a ToPA entry with END=1.
   b. ToPA entry base address is not aligned to the ToPA entry size (e.g., a 2MB region with base address[20:12] not equal to 0).
   c. ToPA entry base address sets upper physical address bits not supported by the processor.
3. **Illegal ToPA Output Offset** (if IA32_RTIT_STATUS.Stopped=0).
   IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset is greater than or equal to the size of the current ToPA output region size.
4. **ToPA rules violations**.
   These are similar to ToPA entry reserved bit violations; they are cases when a ToPA entry is encountered with illegal field combinations. They include the following:
   a. Setting the STOP or INT bit on an entry with END=1.
   b. Setting the END bit in entry 0 of a ToPA table.
   c. On processors that support only a single ToPA entry (see above), two additional illegal settings apply:
      i) ToPA table entry 1 with END=0.
      ii) ToPA table entry 1 with base address not matching the table base.

In all cases, the error will be logged by setting IA32_RTIT_STATUS.Error, thereby disabling tracing when the problematic ToPA entry is reached (when proc_trace_table_offset points to the entry containing the error). Any packet bytes that are internally buffered when the error is detected may be lost.

Note that operational errors may also be signaled due to attempts to access restricted memory. See Section 35.2.6.4 for details.

A tracing software have a range of flexibility using ToPA to manage the interaction of Intel PT with application buffers, see Section 35.5.

35.2.6.3 Trace Transport Subsystem

When IA32_RTIT_CTL.FabricEn is set, the IA32_RTIT_CTL.ToPA bit is ignored, and trace output is written to the trace transport subsystem. The endpoints of this transport are platform-specific, and details of configuration options should refer to the specific platform documentation. The FabricEn bit is available to be set if CPUID(EAX=14H,ECX=0):EBX[bit 3] = 1.

35.2.6.4 Restricted Memory Access

Packet output cannot be directed to any regions of memory that are restricted by the platform. In particular, all memory accesses on behalf of packet output are checked against the SMRR regions. If there is any overlap with these regions, trace data collection will not function properly. Exact processor behavior is implementation-dependent; Table 35-5 summarizes several scenarios.

Table 35-5. Behavior on Restricted Memory Access

Scenario	Description
ToPA output region overlaps with SMRR	Stores to the restricted memory region will be dropped, and that packet data will be lost. Any attempt to read from that restricted region will return all 1s. The processor also may signal an error (Section 35.3.9) and disable tracing when the output pointer reaches the restricted region. If packet generation remains enabled, then packet output may continue once stores are no longer directed to restricted memory (on wrap, or if the output region is larger than the restricted memory region).
ToPA table overlaps with SMRR	The processor will signal an error (Section 35.3.9) and disable tracing when the ToPA read pointer (IA32_RTIT_OUTPUT_BASE + (proc_trace_table_offset « 3)) enters the restricted region.

It should also be noted that packet output should not be routed to the 4KB APIC MMIO region, as defined by the IA32_APIC_BASE MSR. For details about the APIC, refer to *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*. No error is signaled for this case.

Modifications to Restricted Memory Regions

It is recommended that software disable packet generation before modifying the SMRRs to change the scope of the SMRR regions. This is because the processor reserves the right to cache any number of ToPA table entries internally, after checking them against restricted memory ranges. Once cached, the entries will not be checked again, meaning one could potentially route packet output to a newly restricted region. Software can ensure that any cached entries are written to memory by clearing IA32_RTIT_CTL.TraceEn.

35.2.7 Enabling and Configuration MSRs

35.2.7.1 General Considerations

Trace packet generation is enabled and configured by a collection of model-specific registers (MSRs), which are detailed below. Some notes on the configuration MSR behavior:

- If Intel Processor Trace is not supported by the processor (see Section 35.3.1), RDMSR or WRMSR of the IA32_RTIT_* MSRs will cause #GP.
- A WRMSR to any of these configuration MSRs that begins and ends with IA32_RTIT_CTL.TraceEn set will #GP fault. Packet generation must be disabled before the configuration MSRs can be changed.

Note: Software may write the same value back to IA32_RTIT_CTL without #GP, even if TraceEn=1.

- All configuration MSRs for Intel PT are duplicated per logical processor
- For each configuration MSR, any MSR write that attempts to change bits marked reserved, or utilize encodings marked reserved, will cause a #GP fault.
- All configuration MSRs for Intel PT are cleared on a cold RESET.
  - If CPUID.(EAX=14H, ECX=0):EBX.IPFILT_WRSTPRSV[bit 2] = 1, only the TraceEn bit is cleared on warm RESET; though this may have the impact of clearing other bits in IA32_RTIT_STATUS. Other MSR values of the trace configuration MSRs are preserved on warm RESET.
- The semantics of MSR writes to trace configuration MSRs in this chapter generally apply to explicit WRMSR to these registers, using VM-exit or VM-entry MSR load list to these MSRs, XRSTORS with requested feature bit map including XSAVE map component of state_8 (corresponding to IA32_XSS[bit 8]), and the write to IA32_RTIT_CTL.TraceEn by XSAVES (Section 35.3.5.2).

35.2.7.2 IA32_RTIT_CTL MSR

IA32_RTIT_CTL, at address 570H, is the primary enable and control MSR for trace packet generation. Bit positions are listed in Table 35-6.

Table 35-6. IA32_RTIT_CTL MSR

Position	Bit Name	At Reset	Bit Description
0	TraceEn	0	If 1, enables tracing; else tracing is disabled. When this bit transitions from 1 to 0, all buffered packets are flushed out of internal buffers. A further store, fence, or architecturally serializing instruction may be required to ensure that packet data can be observed at the trace endpoint. See Section 35.2.7.3 for details of enabling and disabling packet generation. Note that the processor will clear this bit on #SMI (Section) and warm reset. Other MSR bits of IA32_RTIT_CTL (and other trace configuration MSRs) are not impacted by these events.
1	CYCEn	0	0: Disables CYC Packet (see Section 35.4.2.14). 1: Enables CYC Packet. This bit is reserved if CPUID.(EAX=14H, ECX=0):EBX.CPSB_CAM[bit 1] = 0.
2	OS	0	0: Packet generation is disabled when CPL = 0. 1: Packet generation may be enabled when CPL = 0.
3	User	0	0: Packet generation is disabled when CPL > 0. 1: Packet generation may be enabled when CPL > 0.
4	PwrEvtEn	0	0: Power Event Trace packets are disabled. 1: Power Event Trace packets are enabled (see Section 35.2.3, "Power Event Tracing").
5	FUPonPTW	0	0: PTW packets are not followed by FUPs. 1: PTW packets are followed by FUPs.
6	FabricEn	0	0: Trace output is directed to the memory subsystem, mechanism depends on IA32_RTIT_CTL.ToPA. 1: Trace output is directed to the trace transport subsystem, IA32_RTIT_CTL.ToPA is ignored. This bit is reserved if CPUID.(EAX=14H, ECX=0):ECX[bit 3] = 0.
7	CR3Filter	0	0: Disables CR3 filtering. 1: Enables CR3 filtering.

Table 35-6. IA32_RTIT_CTL MSR (Contd.)

Position	Bit Name	At Reset	Bit Description
8	ToPA	0	0: Single-range output scheme enabled if CPUID.(EAX=14H, ECX=0):ECX.SNGLRGNOUT[bit 2] = 1 and IA32_RTIT_CTL.FabricEn=0. 1: ToPA output scheme enabled (see Section 35.2.6.2) if CPUID.(EAX=14H, ECX=0):ECX.TOPA[bit 0] = 1, and IA32_RTIT_CTL.FabricEn=0. Note: WRMSR to IA32_RTIT_CTL that sets TraceEn but clears this bit and FabricEn would cause #GP, if CPUID.(EAX=14H, ECX=0):ECX.SNGLRGNOUT[bit 2] = 0. WRMSR to IA32_RTIT_CTL that sets this bit causes #GP, if CPUID.(EAX=14H, ECX=0):ECX.TOPA[bit 0] = 0.
9	MTCEn	0	0: Disables MTC Packet (see Section 35.4.2.16). 1: Enables MTC Packet. This bit is reserved if CPUID.(EAX=14H, ECX=0):EBX.MTC[bit 3] = 0.
10	TSCEn	0	0: Disable TSC packets. 1: Enable TSC packets (see Section 35.4.2.11).
11	DisRETC	0	0: Enable RET compression. 1: Disable RET compression (see Section 35.2.1.2).
12	PTWEn	0	0: PTWRITE packet generation disabled. 1: PTWRITE packet generation enabled (see Table 35-40 "PTW Packet Definition").
13	BranchEn	0	0: Disable COFI-based packets. 1: Enable COFI-based packets: FUP, TIP, TIP.PGE, TIP.PGD, TNT, MODE.Exec, MODE.TSX. see Section 35.2.6 for details on BranchEn.
17:14	MTCFreq	0	Defines MTC packet Frequency, which is based on the core crystal clock, or Always Running Timer (ART). MTC will be sent each time the selected ART bit toggles. The following Encodings are defined: 0: ART(0), 1: ART(1), 2: ART(2), 3: ART(3), 4: ART(4), 5: ART(5), 6: ART(6), 7: ART(7), 8: ART(8), 9: ART(9), 10: ART(10), 11: ART(11), 12: ART(12), 13: ART(13), 14: ART(14), 15: ART(15) Software must use CPUID to query the supported encodings in the processor, see Section 35.3.1. Use of unsupported encodings will result in a #GP fault. This field is reserved if CPUID.(EAX=14H, ECX=0):EBX.MTC[bit 3] = 0.
18	Reserved	0	Must be 0.
22:19	CycThresh	0	CYC packet threshold, see Section 35.3.6 for details. CYC packets will be sent with the first eligible packet after N cycles have passed since the last CYC packet. If CycThresh is 0 then N=0, otherwise N is defined as $2^{(CycThresh-1)}$. The following Encodings are defined: 0: 0, 1: 1, 2: 2, 3: 4, 4: 8, 5: 16, 6: 32, 7: 64, 8: 128, 9: 256, 10: 512, 11: 1024, 12: 2048, 13: 4096, 14: 8192, 15: 16384 Software must use CPUID to query the supported encodings in the processor, see Section 35.3.1. Use of unsupported encodings will result in a #GP fault. This field is reserved if CPUID.(EAX=14H, ECX=0):EBX.CPSB_CAM[bit 1] = 0.
23	Reserved	0	Must be 0.

Table 35-6. IA32_RTIT_CTL MSR (Contd.)

Position	Bit Name	At Reset	Bit Description
27:24	PSBFreq	0	Indicates the frequency of PSB packets. PSB packet frequency is based on the number of Intel PT packet bytes output, so this field allows the user to determine the increment of IA32_IA32_RTIT_STATUS.PacketByteCnt that should cause a PSB to be generated. Note that PSB insertion is not precise, but the average output bytes per PSB should approximate the SW selected period. The following Encodings are defined: 0: 2K, 1: 4K, 2: 8K, 3: 16K, 4: 32K, 5: 64K, 6: 128K, 7: 256K, 8: 512K, 9: 1M, 10: 2M, 11: 4M, 12: 8M, 13: 16M, 14: 32M, 15: 64M Software must use CPUID to query the supported encodings in the processor, see Section 35.3.1. Use of unsupported encodings will result in a #GP fault. This field is reserved if CPUID.(EAX=14H, ECX=0):EBX.CPSB_CAM[bit 1] = 0.
31:28	Reserved	0	Must be 0.
35:32	ADDR0_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR0_A/B based on the following encodings: 0: ADDR0 range unused. 1: The [IA32_RTIT_ADDR0_A..IA32_RTIT_ADDR0_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 35.2.4.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR0_A..IA32_RTIT_ADDR0_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See 4.2.8 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.(EAX=14H, ECX=1):EBX.RANGECNT[2:0] >= 0.
39:36	ADDR1_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR1_A/B based on the following encodings: 0: ADDR1 range unused. 1: The [IA32_RTIT_ADDR1_A..IA32_RTIT_ADDR1_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 35.2.4.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR1_A..IA32_RTIT_ADDR1_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See Section 35.4.2.10 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.(EAX=14H, ECX=1):EBX.RANGECNT[2:0] < 2.
43:40	ADDR2_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR2_A/B based on the following encodings: 0: ADDR2 range unused. 1: The [IA32_RTIT_ADDR2_A..IA32_RTIT_ADDR2_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 35.2.4.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR2_A..IA32_RTIT_ADDR2_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See Section 35.4.2.10 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.(EAX=14H, ECX=1):EBX.RANGECNT[2:0] < 3.

Table 35-6. IA32_RTIT_CTL MSR (Contd.)

Position	Bit Name	At Reset	Bit Description
47:44	ADDR3_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR3_A/B based on the following encodings: 0: ADDR3 range unused. 1: The [IA32_RTIT_ADDR3_A..IA32_RTIT_ADDR3_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 35.2.4.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR3_A..IA32_RTIT_ADDR3_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See Section 35.4.2.10 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.(EAX=14H, ECX=1):EBX.RANGECNT[2:0] < 4.
59:48	Reserved	0	Reserved only for future trace content enables, or address filtering configuration enables. Must be 0.
63:60	Reserved	0	Must be 0.

35.2.7.3 Enabling and Disabling Packet Generation with TraceEn

When TraceEn transitions from 0 to 1, Intel Processor Trace is enabled, and a series of packets may be generated. These packets help ensure that the decoder is aware of the state of the processor when the trace begins, and that it can keep track of any timing or state changes that may have occurred while packet generation was disabled. A full PSB+ (see Section 35.4.2.17) will be generated if IA32_RTIT_STATUS.PacketByteCnt=0, and may be generated in other cases as well. Otherwise, timing packets will be generated, including TSC, TMA, and CBR (see Section 35.4.2).

In addition to the packets discussed above, if and when PacketEn (Section 35.2.5.1) transitions from 0 to 1 (which may happen immediately, depending on filtering settings), a TIP.PGE packet (Section 35.4.2.3) will be generated.

When TraceEn is set, the processor may read ToPA entries from memory and cache them internally. For this reason, software should disable packet generation before making modifications to the ToPA tables (or changing the configuration of restricted memory regions). See Section 35.7 for more details of packets that may be generated with modifications to TraceEn.

Disabling Packet Generation

Clearing TraceEn causes any packet data buffered within the logical processor to be flushed out, after which the output MSRs (IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS) will have stable values. When output is directed to memory, a store, fence, or architecturally serializing instruction may be required to ensure that the packet data is globally observed. No special packets are generated by disabling packet generation, though a TIP.PGD may result if PacketEn=1 at the time of disable.

Other Writes to IA32_RTIT_CTL

Any attempt to modify IA32_RTIT_CTL while TraceEn is set will result in a general-protection fault (#GP) unless the same write also clears TraceEn. However, writes to IA32_RTIT_CTL that do not modify any bits will not cause a #GP, even if TraceEn remains set.

35.2.7.4 IA32_RTIT_STATUS MSR

The IA32_RTIT_STATUS MSR is readable and writable by software, but some bits (ContextEn, TriggerEn) are read-only and cannot be directly modified. The WRMSR instruction ignores these bits in the source operand (attempts to modify these bits are ignored and do not cause WRMSR to fault).

This MSR can only be written when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP). The processor does not modify the value of this MSR while TraceEn is 0 (software can modify it with WRMSR).

Table 35-7. IA32_RTIT_STATUS MSR

Position	Bit Name	At Reset	Bit Description
0	FilterEn	0	This bit is written by the processor, and indicates that tracing is allowed for the current IP, see Section 35.2.5.5. Writes are ignored.
1	ContextEn	0	The processor sets this bit to indicate that tracing is allowed for the current context. See Section 35.2.5.3. Writes are ignored.
2	TriggerEn	0	The processor sets this bit to indicate that tracing is enabled. See Section 35.2.5.2. Writes are ignored.
3	Reserved	0	Must be 0.
4	Error	0	The processor sets this bit to indicate that an operational error has been encountered. When this bit is set, TriggerEn is cleared to 0 and packet generation is disabled. For details, see "ToPA Errors" in Section 35.2.6.2. When TraceEn is cleared, software can write this bit. Once it is set, only software can clear it. It is not recommended that software ever set this bit, except in cases where it is restoring a prior saved state.
5	Stopped	0	The processor sets this bit to indicate that a ToPA Stop condition has been encountered. When this bit is set, TriggerEn is cleared to 0 and packet generation is disabled. For details, see "ToPA STOP" in Section 35.2.6.2. When TraceEn is cleared, software can write this bit. Once it is set, only software can clear it. It is not recommended that software ever set this bit, except in cases where it is restoring a prior saved state.
31:6	Reserved	0	Must be 0.
48:32	PacketByteCnt	0	This field is written by the processor, and holds a count of packet bytes that have been sent out. The processor also uses this field to determine when the next PSB packet should be inserted. Note that the processor may clear or modify this field at any time while IA32_RTIT_CTL.TraceEn=1. It will have a stable value when IA32_RTIT_CTL.TraceEn=0. See Section 35.4.2.17 for details.
63:49	Reserved	0	Must be 0.

35.2.7.5 IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B MSRs

The role of the IA32_RTIT_ADDRn_A/B register pairs, for each n, is determined by the corresponding ADDRn_CFG fields in IA32_RTIT_CTL (see Section 35.2.7.2). The number of these register pairs is enumerated by CPUID.(EAX=14H, ECX=1):EAX.RANGECNT[2:0].

- Processors that enumerate support for 1 range support:

  IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B
- Processors that enumerate support for 2 ranges support:

  IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B

  IA32_RTIT_ADDR1_A, IA32_RTIT_ADDR1_B
- Processors that enumerate support for 3 ranges support:

  IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B

  IA32_RTIT_ADDR1_A, IA32_RTIT_ADDR1_B

  IA32_RTIT_ADDR2_A, IA32_RTIT_ADDR2_B
- Processors that enumerate support for 4 ranges support:

  IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B

  IA32_RTIT_ADDR1_A, IA32_RTIT_ADDR1_B

  IA32_RTIT_ADDR2_A, IA32_RTIT_ADDR2_B

  IA32_RTIT_ADDR3_A, IA32_RTIT_ADDR3_B

Each register has a single 64-bit field that holds a linear address value. Writes must ensure that the address is in canonical form, otherwise a #GP fault will result.

35.2.7.6 IA32_RTIT_CR3_MATCH MSR

The IA32_RTIT_CR3_MATCH register is compared against CR3 when IA32_RTIT_CTL.CR3Filter is 1. Bits 63:5 hold the CR3 address value to match, bits 4:0 are reserved to 0. For more details on CR3 filtering and the treatment of this register, see Section 35.2.4.2.

This MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP). IA32_RTIT_CR3_MATCH[4:0] are reserved and must be 0; an attempt to set those bits using WRMSR causes a #GP.

35.2.7.7 IA32_RTIT_OUTPUT_BASE MSR

This MSR is used to configure the trace output destination, when output is directed to memory (IA32_RTIT_CTL.FabricEn = 0). The size of the address field is determined by the maximum physical address width (MAXPHYADDR), as reported by CPUID.80000008H:EAX[7:0].

When the ToPA output scheme is used, the processor may update this MSR when packet generation is enabled, and those updates are asynchronous to instruction execution. Therefore, the values in this MSR should be considered unreliable unless packet generation is disabled (IA32_RTIT_CTL.TraceEn = 0).

Accesses to this MSR are supported only if Intel PT output to memory is supported, hence when either CPUID.(EAX=14H, ECX=0):ECX[bit 0] or CPUID.(EAX=14H, ECX=0):ECX[bit 2] are set. Otherwise WRMSR or RDMSR cause a general-protection fault (#GP). If supported, this MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

Table 35-8. IA32_RTIT_OUTPUT_BASE MSR

Position	Bit Name	At Reset	Bit Description
6:0	Reserved	0	Must be 0.
MAXPHYADDR-1:7	BasePhysAddr	0	The base physical address. How this address is used depends on the value of IA32_RTIT_CTL.ToPA: 0: This is the base physical address of a single, contiguous physical output region. This could be mapped to DRAM or to MMIO, depending on the value. The base address should be aligned with the size of the region, such that none of the 1s in the mask value(Section 35.2.7.8) overlap with 1s in the base address. If the base is not aligned, an operational error will result (see Section 35.3.9). 1: The base physical address of the current ToPA table. The address must be 4K aligned. Writing an address in which bits 11:7 are non-zero will not cause a #GP, but an operational error will be signaled once TraceEn is set. See "ToPA Errors" in Section 35.2.6.2 as well as Section 35.3.9.
63:MAXPHYADDR	Reserved	0	Must be 0.

35.2.7.8 IA32_RTIT_OUTPUT_MASK_PTRS MSR

This MSR holds any mask or pointer values needed to indicate where the next byte of trace output should be written. The meaning of the values held in this MSR depend on whether the ToPA output mechanism is in use. See Section 35.2.6.2 for details.

The processor updates this MSR while when packet generation is enabled, and those updates are asynchronous to instruction execution. Therefore, the values in this MSR should be considered unreliable unless packet generation is disabled (IA32_RTIT_CTL.TraceEn = 0).

Accesses to this MSR are supported only if Intel PT output to memory is supported, hence when either CPUID.(EAX=14H, ECX=0):ECX[bit 0] or CPUID.(EAX=14H, ECX=0):ECX[bit 2] are set. Otherwise WRMSR or RDMSR cause a general-protection fault (#GP). If supported, this MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

Table 35-9. IA32_RTIT_OUTPUT_MASK_PTRS MSR

Position	Bit Name	At Reset	Bit Description
6:0	LowerMask	7FH	Forced to 1, writes are ignored.
31:7	MaskOrTableOffset	0	The use of this field depends on the value of IA32_RTIT_CTL.ToPA: 0: This field holds bits 31:7 of the mask value for the single, contiguous physical output region. The size of this field indicates that regions can be of size 128B up to 4GB. This value (combined with the lower 7 bits, which are reserved to 1) will be ANDed with the OutputOffset field to determine the next write address. All 1s in this field should be consecutive and starting at bit 7, otherwise the region will not be contiguous, and an operational error (Section 35.3.9) will be signaled when TraceEn is set. 1: This field holds bits 27:3 of the offset pointer into the current ToPA table. This value can be added to the IA32_RTIT_OUTPUT_BASE value to produce a pointer to the current ToPA table entry, which itself is a pointer to the current output region. In this scenario, the lower 7 reserved bits are ignored. This field supports tables up to 256 MBytes in size.

Table 35-9. IA32_RTIT_OUTPUT_MASK_PTRS MSR (Contd.)

Position	Bit Name	At Reset	Bit Description
63:32	OutputOffset	0	The use of this field depends on the value of IA32_RTIT_CTL.ToPA: 0: This is bits 31:0 of the offset pointer into the single, contiguous physical output region. This value will be added to the IA32_RTIT_OUTPUT_BASE value to form the physical address at which the next byte of packet output data will be written. This value must be less than or equal to the MaskOrTableOffset field, otherwise an operational error (Section 35.3.9) will be signaled when TraceEn is set. 1: This field holds bits 31:0 of the offset pointer into the current ToPA output region. This value will be added to the output region base field, found in the current ToPA table entry, to form the physical address at which the next byte of trace output data will be written. This value must be less than the ToPA entry size, otherwise an operational error (Section 35.3.9) will be signaled when TraceEn is set.

35.2.8 Interaction of Intel® Processor Trace and Other Processor Features

35.2.8.1 Intel® Transactional Synchronization Extensions (Intel® TSX)

The operation of Intel TSX is described in Chapter 14 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1*. For tracing purpose, packet generation does not distinguish between hardware lock elision (HLE) and restricted transactional memory (RTM), but speculative execution does have impacts on the trace output. Specifically, packets are generated as instructions complete, even for instructions in a transactional region that is later aborted. For this reason, debugging software will need indication of the beginning and end of a transactional region; this will allow software to understand when instructions are part of a transactional region and whether that region has been committed.

To enable this, TSX information is included in a MODE packet leaf. The mode bits in the leaf are:

- **InTX**: Set to 1 on an TSX transaction begin, and cleared on transaction commit or abort.
- **TXAbort**: Set to 1 only when InTX transitions from 1 to 0 on an abort. Cleared otherwise.

If BranchEn=1, this MODE packet will be sent each time the transaction status changes. See Table 35-10 for details.

Table 35-10. TSX Packet Scenarios

TSX Event	Instruction	Packets
Transaction Begin	Either XBEGIN or XACQUIRE lock (the latter if executed transactionally)	MODE(TXAbort=0, InTX=1), FUP(CurrentIP)
Transaction Commit	Either XEND or XRELEASE lock, if transactional execution ends. This happens only on the outermost commit	MODE(TXAbort=0, InTX=0), FUP(CurrentIP)
Transaction Abort	XABORT or other transactional abort	MODE(TXAbort=1, InTX=0), FUP(CurrentIP), TIP(TargetIP)
Other	One of the following: ▪ Nested XBEGIN or XACQUIRE lock ▪ An outer XACQUIRE lock that doesn't begin a transaction (InTX not set) ▪ Non-outermost XEND or XRELEASE lock	None. No change to TSX mode bits for these cases.

The CurrentIP listed above is the IP of the associated instruction. The TargetIP is the IP of the next instruction to be executed; for HLE, this is the XACQUIRE lock; for RTM, this is the fallback handler.

Intel PT stores are non-transactional, and thus packet writes are not rolled back on TSX abort.

35.2.8.2 TSX and IP Filtering

A complication with tracking transactions is handling transactions that start or end outside of the tracing region. Transactions can't span across a change in ContextEn, because CPL changes and CR3 changes each cause aborts. But a transaction can start within the IP filter region and end outside it.

To assist the decoder handling this situation, MODE.TSX packets can be sent even if FilterEn=0, though there will be no FUP attached. Instead, they will merely serve to indicate to the decoder when transactions are active and when they are not. When tracing resumes (due to PacketEn=1), the last MODE.TSX preceding the TIP.PGE will indicate the current transaction status.

35.2.8.3 System Management Mode (SMM)

SMM code has special privileges that non-SMM code does not have. Intel Processor Trace can be used to trace SMM code, but special care is taken to ensure that SMM handler context is not exposed in any non-SMM trace collection. Additionally, packet output from tracing non-SMM code cannot be written into memory space that is either protected by SMRR or used by the SMM handler.

SMM is entered via a system management interrupt (SMI). SMI delivery saves the value of IA32_RTIT_CTL.TraceEn into SMRAM and then clears it, thereby disabling packet generation.

The saving and clearing of IA32_RTIT_CTL.TraceEn ensures two things:

1. All internally buffered packet data is flushed before entering SMM (see Section 35.2.7.2).
2. Packet generation ceases before entering SMM, so any tracing that was configured outside SMM does not continue into SMM. No SMM instruction pointers or other state will be exposed in the non-SMM trace.

When the RSM instruction is executed to return from SMM, the TraceEn value that was saved by SMI delivery is restored, allowing tracing to be resumed. As is done any time packet generation is enabled, ContextEn is re-evaluated, based on the values of CPL, CR3, etc., established by RSM.

Like other interrupts, delivery of an SMI produces a FUP containing the IP of the next instruction to execute. By toggling TraceEn, SMI and RSM can produce TIP.PGD and TIP.PGE packets, respectively, indicating that tracing was disabled or re-enabled. See Table 35.7 for more information about packets entering and leaving SMM.

Although #SMI and RSM change CR3, PIP packets are not generated in these cases. With #SMI tracing is disabled before the CR3 change; with RSM TraceEn is restored after CR3 is written.

TraceEn must be cleared before executing RSM, otherwise it will cause a shutdown. Further, on processors that restrict use of Intel PT with LBRs (see Section 35.3.1.2), any RSM that results in enabling of both will cause a shutdown.

Intel PT can support tracing of System Transfer Monitor operating in SMM, see Section 35.6.

35.2.8.4 Virtual-Machine Extensions (VMX)

Initial implementations of Intel Processor Trace do not support tracing in VMX operation. Such processors indicate this by returning 0 for IA32_VMX_MISC[bit 14]. On these processors, execution of the VMXON instruction clears IA32_RTIT_CTL.TraceEn and any attempt to write IA32_RTIT_CTL in VMX operation causes a general-protection exception (#GP).

Processors that support Intel Processor Trace in VMX operation return 1 for IA32_VMX_MISC[bit 14]. Details of tracing in VMX operation are described in Section 35.5.

35.2.8.5 Intel Software Guard Extensions (SGX)

SGX provides an application with ability to instantiate a protective container (an enclave) with confidentiality and integrity (see *Intel® Software Guard Extensions Programming Reference*). On a processor with both Intel PT and SGX enabled, when executing code within a production enclave, no control flow packets are produced by Intel PT. Enclave entry will clear ContextEn, thereby blocking control flow packet generation. A TIP.PGD packet will be generated if PacketEn=1 at the time of the entry.

Upon enclave exit, ContextEn will no longer be forced to 0. If other enables are set at the time, a TIP.PGE may be generated to indicate that tracing is resumed.

During the enclave execution, Intel PT remains enabled, and periodic or timing packets such as PSB, TSC, MTC, or CBR can still be generated. No IPs or other architectural state will be exposed.

For packet generation examples on enclave entry or exit, see Section 35.7.

Debug Enclaves

SGX allows an enclave to be configured with relaxed protection of confidentiality for debug purposes, see *Intel® Software Guard Extensions Programming Reference*. In a debug enclave, Intel PT continues to function normally. Specifically, ContextEn is not impacted by enclave entry or exit. Hence the generation of ContextEn-dependent packets within a debug enclave is allowed.

35.2.8.6 SENTER/ENTERACCS and ACM

GETSEC[SENTER] and GETSEC[ENTERACCS] instructions clear TraceEn, and it is not restored when those instruction complete. SENTER also causes TraceEn to be cleared on other logical processors when they rendezvous and enter the SENTER sleep state. In these two cases, the disabling of packet generation is not guaranteed to flush internally buffered packets. Some packets may be dropped.

When executing an authenticated code module (ACM), packet generation is silently disabled during ACRAM setup. TraceEn will be cleared, but no TIP.PGD packet is generated. After completion of the module, the TraceEn value will be restored. There will be no TIP.PGE packet, but timing packets, like TSC and CBR, may be produced.

35.2.8.7 Intel® Memory Protection Extensions (Intel® MPX)

Bounds exceptions (#BR) caused by Intel MPX are treated like other exceptions, producing FUP and TIP packets that indicate the source and destination IPs.

35.3 CONFIGURATION AND PROGRAMMING GUIDELINE

35.3.1 Detection of Intel Processor Trace and Capability Enumeration

Processor support for Intel Processor Trace is indicated by CPUID.(EAX=07H,ECX=0H):EBX[bit 25] = 1. CPUID function 14H is dedicated to enumerate the resource and capability of processors that report CPUID.(EAX=07H,ECX=0H):EBX[bit 25] = 1. Different processor generations may have architecturally-defined variation in capabilities. Table 35-11 describes details of the enumerable capabilities that software must use across generations of processors that support Intel Processor Trace.

Table 35-11. CPUID Leaf 14H Enumeration of Intel Processor Trace Capabilities

CPUID.(EAX=14H,ECX=0)		Name	Description Behavior
Register	Bits		
EAX	31:0	Maximum valid sub-leaf Index	Specifies the index of the maximum valid sub-leaf for this CPUID leaf
EBX	0	CR3 Filtering Support	1: Indicates that IA32_RTIT_CTL.CR3Filter can be set to 1, and that IA32_RTIT_CR3_MATCH MSR can be accessed. See Section 35.2.7. 0: Indicates that writes that set IA32_RTIT_CTL.CR3Filter to 1, or any access to IA32_RTIT_CR3_MATCH, will #GP fault.
	1	Configurable PSB and Cycle-Accurate Mode Supported	1: (a) IA32_RTIT_CTL.PSBFreq can be set to a non-zero value, in order to select the preferred PSB frequency (see below for allowed values). (b) IA32_RTIT_STATUS.PacketByteCnt can be set to a non-zero value, and will be incremented by the processor when tracing to indicate progress towards the next PSB. If trace packet generation is enabled by setting TraceEn, a PSB will only be generated if PacketByteCnt=0. (c) IA32_RTIT_CTL.CYCEn can be set to 1 to enable Cycle-Accurate Mode. See Section 35.2.7. 0: (a) Any attempt to set IA32_RTIT_CTL.PSBFreq, to set IA32_RTIT_CTL.CYCEn, or write a non-zero value to IA32_RTIT_STATUS.PacketByteCnt any access to IA32_RTIT_CR3_MATCH, will #GP fault. (b) If trace packet generation is enabled by setting TraceEn, a PSB is always generated. (c) Any attempt to set IA32_RTIT_CTL.CYCEn will #GP fault.
	2	IP Filtering and TraceStop supported, and Preserve Intel PT MSRs across warm reset	1: (a) IA32_RTIT_CTL provides at one or more ADDRn_CFG field to configure the corresponding address range MSRs for IP Filtering or IP TraceStop. Each ADDRn_CFG field accepts a value in the range of 0:2 inclusive. The number of ADDRn_CFG fields is reported by CPUID.(EAX=14H, ECX=1):EAX.RANGECNT[2:0]. (b) At least one register pair IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B are provided to configure address ranges for IP filtering or IP TraceStop. (c) On warm reset, all Intel PT MSRs will retain their pre-reset values, though IA32_RTIT_CTL.TraceEn will be cleared. The Intel PT MSRs are listed in Section 35.2.7. 0: (a) An Attempt to write IA32_RTIT_CTL.ADDRn_CFG with non-zero encoding values will cause #GP. (b) Any access to IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B, will #GP fault. (c) On warm reset, all Intel PT MSRs will be cleared.
	3	MTC Supported	1: IA32_RTIT_CTL.MTCEn can be set to 1, and MTC packets will be generated. See Section 35.2.7. 0: An attempt to set IA32_RTIT_CTL.MTCEn or IA32_RTIT_CTL.MTCFreq to a non-zero value will #GP fault.
	4	PTWRITE Supported	1: Writes can set IA32_RTIT_CTL[12] (PTWEn) and IA32_RTIT_CTL[5] (FUPonPTW), and PTWRITE can generate packets. 0: Writes that set IA32_RTIT_CTL[12] or IA32_RTIT_CTL[5] will #GP, and PTWRITE will #UD fault.
	5	Power Event Trace Supported	1: Writes can set IA32_RTIT_CTL[4] (PwrEvtEn), enabling Power Event Trace packet generation. 0: Writes that set IA32_RTIT_CTL[4] will #GP.
	31:6	Reserved	

Table 35-11. CPUID Leaf 14H Enumeration of Intel Processor Trace Capabilities (Contd.)

CPUID.(EAX=14H,ECX=0)		Name	Description Behavior
Register	Bits		
ECX	0	ToPA Output Supported	1: Tracing can be enabled with IA32_RTIT_CTL.ToPA = 1, hence utilizing the ToPA output scheme (Section 35.2.6.2) IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS MSRs can be accessed. 0: Unless CPUID.(EAX=14H, ECX=0):ECX.SNGLRNGOUT[bit 2] = 1. writes to IA32_RTIT_OUTPUT_BASE or IA32_RTIT_OUTPUT_MASK_PTRS. MSRs will #GP fault.
	1	ToPA Tables Allow Multiple Output Entries	1: ToPA tables can hold any number of output entries, up to the maximum allowed by the MaskOrTableOffset field of IA32_RTIT_OUTPUT_MASK_PTRS. 0: ToPA tables can hold only one output entry, which must be followed by an END=1 entry which points back to the base of the table. Further, ToPA PMIs will be delivered before the region is filled. See ToPA PMI in Section 35.2.6.2. If there is more than one output entry before the END entry, or if the END entry has the wrong base address, an operational error will be signaled (see "ToPA Errors" in Section 35.2.6.2).
	2	Single-Range Output Supported	1: Enabling tracing (TraceEn=1) with IA32_RTIT_CTL.ToPA=0 is supported. 0: Unless CPUID.(EAX=14H, ECX=0):ECX.TOPAOUT[bit 0] = 1. writes to IA32_RTIT_OUTPUT_BASE or IA32_RTIT_OUTPUT_MASK_PTRS. MSRs will #GP fault.
	3	Output to Trace Transport Subsystem Supported	1: Setting IA32_RTIT_CTL.FabricEn to 1 is supported. 0: IA32_RTIT_CTL.FabricEn is reserved. Write 1 to IA32_RTIT_CTL.FabricEn will #GP fault.
	30:4	Reserved	
	31	IP Payloads are LIP	1: Generated packets which contain IP payloads have LIP values, which include the CS base component. 0: Generated packets which contain IP payloads have RIP values, which are the offset from CS base.
EDX	31:0	Reserved	

If CPUID.(EAX=14H, ECX=0):EAX reports a non-zero value, additional capabilities of Intel Processor Trace are described in the sub-leaves of CPUID leaf 14H.

Table 35-12. CPUID Leaf 14H, sub-leaf 1H Enumeration of Intel Processor Trace Capabilities

CPUID.(EAX=14H,ECX=1)		Name	Description Behavior
Register	Bits		
EAX	2:0	Number of Address Ranges	A non-zero value specifies the number ADDRn_CFG field supported in IA32_RTIT_CTL and the number of register pair IA32_RTIT_ADDRn_A/IA32_RTIT_ADDRn_B supported for IP filtering and IP TraceStop. **NOTE:** Currently, no processors support more than 4 address ranges.
	15:3	Reserved	
	31:16	Bitmap of supported MTC Period Encodings	The non-zero bit positions indicate the map of supported encoding values for the IA32_RTIT_CTL.MTCFreq field. This applies only if CPUID.(EAX=14H, ECX=0):EBX.MTC[bit 3] = 1 (MTC Packet generation is supported), otherwise the MTCFreq field is reserved to 0. Each bit position in this field represents 1 encoding value in the 4-bit MTCFreq field (ie, bit 0 is associated with encoding value 0). For each bit: 1: MTCFreq can be assigned the associated encoding value. 0: MTCFreq cannot be assigned to the associated encoding value. A write to IA32_RTIT_CTLMTCFreq with unsupported encoding will cause #GP fault.
EBX	15:0	Bitmap of supported Cycle Threshold values	The non-zero bit positions indicate the map of supported encoding for the IA32_RTIT_CTL.CycThresh field. This applies only if CPUID.(EAX=14H, ECX=0):EBX.CPSB_CAM[bit 1] = 1 (Cycle-Accurate Mode is Supported), otherwise the CycThresh field is reserved to 0. See Section 35.2.7. Each bit position in this field represents 1 encoding value in the 4-bit CycThresh field (ie, bit 0 is associated with encoding value 0). For each bit: 1: CycThresh can be assigned the associated encoding value. 0: CycThresh cannot be assigned to the associated encoding value. A write to CycThresh with unsupported encoding will cause #GP fault.
	31:16	Bitmap of supported Configurable PSB Frequency encoding	The non-zero bit positions indicate the map of supported encoding for the IA32_RTIT_CTL.PSBFreq field. This applies only if CPUID.(EAX=14H, ECX=0):EBX.CPSB_CAM[bit 1] = 1 (Configurable PSB is supported), otherwise the PSBFreq field is reserved to 0. See Section 35.2.7. Each bit position in this field represents 1 encoding value in the 4-bit PSBFreq field (ie, bit 0 is associated with encoding value 0). For each bit: 1: PSBFreq can be assigned the associated encoding value. 0: PSBFreq cannot be assigned to the associated encoding value. A write to PSBFreq with unsupported encoding will cause #GP fault.
ECX	31:0	Reserved	
EDX	31:0	Reserved	

35.3.1.1 Packet Decoding of RIP versus LIP

FUP, TIP, TIP.PGE, and TIP.PGE packets can contain an instruction pointer (IP) payload. On some processor generations, this payload will be an effective address (RIP), while on others this will be a linear address (LIP). In the former case, the payload is the offset from the current CS base address, while in the latter it is the sum of the offset and the CS base address (Note that in real mode, the CS base address is the value of CS<<4, while in protected mode the CS base address is the base linear address of the segment indicated by the CS register.). Which IP type is in use is indicated by enumeration (see CPUID.(EAX=14H, ECX=0):ECX.LIP[bit 31] in Table 35-11).

For software that executes while the CS base address is 0 (including all software executing in 64-bit mode), the difference is indistinguishable. A trace decoder must account for cases where the CS base address is not 0 and the resolved LIP will not be evident in a trace generated on a CPU that enumerates use of RIP. This is likely to cause problems when attempting to link the trace with the associated binaries.

Note that IP comparison logic, for IP filtering and TraceStop range calculation, is based on the same IP type as these IP packets. For processors that output RIP, the IP comparison mechanism is also based on RIP, and hence on those processors RIP values should be written to IA32_RTIT_ADDRn_[AB] MSRs. This can produce differing behavior if the same trace configuration setting is run on processors reporting different IP types, i.e. CPUID.(EAX=14H, ECX=0):ECX.LIP[bit 31]. Care should be taken to check CPUID when configuring IP filters.

35.3.1.2 Model Specific Capability Restrictions

Some processor generations impose restrictions that prevent use of LBRs/BTS/BTM/LERs when software has enabled tracing with Intel Processor Trace. On these processors, when TraceEn is set, updates of LBR, BTS, BTM, LERs are suspended but the states of the corresponding IA32_DEBUGCTL control fields remained unchanged as if it were still enabled. When TraceEn is cleared, the LBR array is reset, and LBR/BTS/BTM/LERs updates will resume. Further, reads of these registers will return 0, and writes will be dropped.

The list of MSRs whose updates/accesses are restricted follows.

- MSR_LASTBRANCH_x_TO_IP, MSR_LASTBRANCH_x_FROM_IP, MSR_LBR_INFO_x, MSR_LASTBRANCH_TOS
- MSR_LER_FROM_LIP, MSR_LER_TO_LIP
- MSR_LBR_SELECT

For processor with CPUID DisplayFamily_DisplayModel signature of 06_3DH, 06_47H, 06_4EH, 06_4FH, 06_56H and 06_5EH, the use of Intel PT and LBRs are mutually exclusive.

35.3.2 Enabling and Configuration of Trace Packet Generation

To configure trace packets, enable packet generation, and capture packets, software starts with using CPUID instruction to detect its feature flag, CPUID.(EAX=07H,ECX=0H):EBX[bit 25] = 1; followed by enumerating the capabilities described in Section 35.3.1.

Based on the capability queried from Section 35.3.1, software must configure a number of model-specific registers. This section describes programming considerations related to those MSRs.

35.3.2.1 Enabling Packet Generation

When configuring and enabling packet generation, the IA32_RTIT_CTL MSR should be written after any other Intel PT MSRs have been written, since writes to the other configuration MSRs cause a general-protection fault (#GP) if TraceEn = 1. If a prior trace collection context is not being restored, then software should first clear IA32_RTIT_STATUS. This is important since the Stopped, and Error fields are writable; clearing the MSR clears any values that may have persisted from prior trace packet collection contexts. See Section 35.2.7.2 for details of packets generated by setting TraceEn to 1.

If setting TraceEn to 1 causes an operational error (see Section 35.3.9), there may be a delay after the WRMSR completes before the error is signaled in the IA32_RTIT_STATUS MSR.

While packet generation is enabled, the values of some configuration MSRs (e.g., IA32_RTIT_STATUS and IA32_RTIT_OUTPUT_*) are transient, and reads may return values that are out of date. Only after packet generation is disabled (by clearing TraceEn) do reads of these MSRs return reliable values.

35.3.2.2 Disabling Packet Generation

After disabling packet generation by clearing IA32_RTIT_CTL, it is advisable to read the IA32_RTIT_STATUS MSR (Section 35.2.7.4):

- If the Error bit is set, an operational error was encountered, and the trace is most likely compromised. Software should check the source of the error (by examining the output MSR values), correct the source of the problem, and then attempt to gather the trace again. For details on operational errors, see Section 35.3.9. Software should clear IA32_RTIT_STATUS.Error before re-enabling packet generation.
- If the Stopped bit is set, software execution encountered an IP TraceStop (see Section 35.2.4.3) or the ToPA Stop condition (see "ToPA STOP" in Section 35.2.6.2) before packet generation was disabled.

35.3.3 Flushing Trace Output

Packets are first buffered internally and then written out asynchronously. To collect packet output for post-processing, a collector needs first to ensure that all packet data has been flushed from internal buffers. Software can ensure this by stopping packet generation by clearing IA32_RTIT_CTL.TraceEn (see "Disabling Packet Generation" in Section 35.2.7.2).

When software clears IA32_RTIT_CTL.TraceEn to flush out internally buffered packets, the logical processor issues an SFENCE operation which ensures that WC trace output stores will be ordered with respect to the next store, or serializing operation. A subsequent read from the same logical processor will see the flushed trace data, while a read from another logical processor should be preceded by a store, fence, or architecturally serializing operation on the tracing logical processor.

When the flush operations complete, the IA32_RTIT_OUTPUT_* MSR values indicate where the trace ended. While TraceEn is set, these MSRs may hold stale values. Further, if a ToPA region with INT=1 is filled, meaning a ToPA PMI has been triggered, IA32_PERF_GLOBAL_STATUS.Trace_ToPA_PMI[55] will be set by the time the flush completes.

35.3.4 Warm Reset

The MSRs software uses to program Intel Processor Trace are cleared after a power-on RESET (or cold RESET). On a warm RESET, the contents of those MSRs can retain their values from before the warm RESET with the exception that IA32_RTIT_CTL.TraceEn will be cleared (which may have the side effect of clearing some bits in IA32_RTIT_STATUS).

35.3.5 Context Switch Consideration

To facilitate construction of instruction execution traces at the granularity of a software process or thread context, software can save and restore the states of the trace configuration MSRs across the process or thread context switch boundary. The principle is the same as saving and restoring the typical architectural processor states across context switches.

35.3.5.1 Manual Trace Configuration Context Switch

The configuration can be saved and restored through a sequence of instructions of RDMSR, management of MSR content and WRMSR. To stop tracing and to ensure that all configuration MSRs contain stable values, software must clear IA32_RTIT_CTL.TraceEn before reading any other trace configuration MSRs. The recommended method for saving trace configuration context manually follows:

1. RDMSR IA32_RTIT_CTL, save value to memory
2. WRMSR IA32_RTIT_CTL with saved value from RDMSR above and TraceEn cleared
3. RDMSR all other configuration MSRs whose values had changed from previous saved value, save changed values to memory

When restoring the trace configuration context, IA32_RTIT_CTL should be restored last:

1. Read saved configuration MSR values, aside from IA32_RTIT_CTL, from memory, and restore them with WRMSR
2. Read saved IA32_RTIT_CTL value from memory, and restore with WRMSR.

35.3.5.2 Trace Configuration Context Switch Using XSAVES/XRSTORS

On processors whose XSAVE feature set supports XSAVES and XRSTORS, the Trace configuration state can be saved using XSAVES and restored by XRSTORS, in conjunction with the bit field associated with supervisory state component in IA32_XSS. See Chapter 13, "Managing State Using the XSAVE Feature Set" of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1*.

The layout of the trace configuration component state in the XSAVE area is shown in Table 35-13.[1]

Table 35-13. Memory Layout of the Trace Configuration State Component

Offset within Component Area	Field	Offset within Component Area	Field
0H	IA32_RTIT_CTL	08H	IA32_RTIT_OUTPUT_BASE
10H	IA32_RTIT_OUTPUT_MASK_PTRS	18H	IA32_RTIT_STATUS
20H	IA32_RTIT_CR3_MATCH	28H	IA32_RTIT_ADDR0_A
30H	IA32_RTIT_ADDR0_B	38H	IA32_RTIT_ADDR1_A
40H	IA32_RTIT_ADDR1_B	48H-End	Reserved

The IA32_XSS MSR is zero coming out of RESET. Once IA32_XSS[bit 8] is set, system software operating at CPL= 0 can use XSAVES/XRSTORS with the appropriate requested-feature bitmap (RFBM) to manage supervisor state components in the XSAVE map. See Chapter 13, "Managing State Using the XSAVE Feature Set" of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1*.

35.3.6 Cycle-Accurate Mode

Intel PT can be run in a cycle-accurate mode which enables CYC packets (see Section 35.4.2.14) that provide low-level information in the processor core clock domain. This cycle counter data in CYC packets can be used to compute IPC (Instructions Per Cycle), or to track wall-clock time on a fine-grain level.

To enable cycle-accurate mode packet generation, software should set IA32_RTIT_CTL.CYCEn=1. It is recommended that software also set TSCEn=1 anytime cycle-accurate mode is in use. With this, all CYC-eligible packets will be preceded by a CYC packet, the payload of which indicates the number of core clock cycles since the last CYC packet. In cases where multiple CYC-eligible packets are generated in a single cycle, only a single CYC will be generated before the CYC-eligible packets, otherwise each CYC-eligible packet will be preceded by its own CYC. The CYC-eligible packets are:

- TNT, TIP, TIP.PGE, TIP.PGD, MODE.EXEC, MODE.TSX, PIP, VMCS, OVF, MTC, TSC, PTWRITE, EXSTOP

TSC packets are generated when there is insufficient information to reconstruct wall-clock time, due to tracing being disabled (TriggerEn=0), or power down scenarios like a transition to a deep-sleep MWAIT C-state. In this case, the CYC that is generated along with the TSC will indicate the number of cycles actively tracing (those powered up, with TriggerEn=1) executed between the last CYC packet and the TSC packet. And hence the amount of time spent while tracing is inactive can be inferred from the difference in time between that expected based on the CYC value, and the actual time indicated by the TSC.

Additional CYC packets may be sent stand-alone, so that the processor can ensure that the decoder is aware of the number of cycles that have passed before the internal hardware counter wraps, or is reset due to other micro-architectural condition. There is no guarantee at what intervals these standalone CYC packets will be sent, except that they will be sent before the wrap occurs. An illustration is given below.

1. Table 35-13 documents support for the MSRs defining address ranges 0 and 1. Processors that provide XSAVE support for Intel Processor Trace support only those address ranges.

Example 35-1. An Illustrative CYC Packet Example

Time (cycles)	Instruction Snapshot	Generated Packets	Comment
x	call %eax	CYC(?), TIP	?Elapsed cycles from the previous CYC unknown
x + 2	call %ebx	CYC(2), TIP	1 byte CYC packet; 2 cycles elapsed from the previous CYC
x + 8	jnz Foo (not taken)	CYC(6)	1 byte CYC packet
x + 9	ret (compressed)		
x + 12	jnz Bar (taken)		
x + 16	ret (uncompressed)	TNT, CYC(8), TIP	1 byte CYC packet
x + 4111		CYC(4095)	2 byte CYC packet
x + 12305		CYC(8194)	3 byte CYC packet
x + 16332	mov cr3, %ebx	CYC(4027), PIP	2 byte CYC packet

35.3.6.1 Cycle Counter

The cycle counter is implemented in hardware (independent of the time stamp counter or performance monitoring counters), and is a simple incrementing counter that does not saturate, but rather wraps. The size of the counter is implementation specific.

The cycle counter is reset to zero any time that TriggerEn is cleared, and when a CYC packet is sent. The cycle counter will continue to count when ContextEn or FilterEn are cleared, and cycle packets will still be generated. It will not count during sleep states that result in Intel PT logic being powered-down, but will count up to the point where clocks are disabled, and resume counting once they are re-enabled.

35.3.6.2 Cycle Packet Semantics

Cycle-accurate mode adheres to the following protocol:

- All packets that precede a CYC packet represent instructions or events that took place before the CYC time.
- All packets that follow a CYC packet represent instructions or events that took place at the same time as, or after, the CYC time.
- The CYC-eligible packet that immediately follows a CYC packet represents an instruction or event that took place at the same time as the CYC time.

These items above give the decoder a means to apply CYC packets to a specific instruction in the assembly stream. Most packets represent a single instruction or event, and hence the CYC packet that precedes each of those packets represents the retirement time of that instruction or event. In the case of TNT packets, up to 6 conditional branches and/or compressed RETs may be contained in the packet. In this case, the preceding CYC packet provides the retirement time of the first branch in the packet. It is possible that multiple branches retired in the same cycle as that first branch in the TNT, but the protocol will not make that obvious. Also note that a MTC packet could be generated in the same cycle as the first JCC in the TNT packet. In this case, the CYC would precede both the MTC and the TNT, and apply to both.

Note that there are times when the cycle counter will stop counting, though cycle-accurate mode is enabled. After any such scenario, a CYC packet followed by TSC packet will be sent. See Section 35.8.3.2 to understand how to interpret the payload values

Multi-packet Instructions or Events

Some operations, such as interrupts or task switches, generate multiple packets. In these cases, multiple CYC packets may be sent for the operation, preceding each CYC-eligible packet in the operation. An example, using a task switch on a software interrupt, is shown below.

Example 35-2. An Example of CYC in the Presence of Multi-Packet Operations

Time (cycles)	Instruction Snapshot	Generated Packets
x	jnz Foo (not taken)	CYC(?),
x + 2	ret (compressed)	
x + 8	jnz Bar (taken)	
x + 9	jmp %eax	TNT, CYC(9), TIP
x + 12	jnz Bar (not taken)	CYC(3)
x + 32	int3 (task gate)	TNT, FUP, CYC(10), PIP, CYC(20), MODE.Exec, TIP

35.3.6.3 Cycle Thresholds

Software can opt to reduce the frequency of cycle packets, a trade-off to save bandwidth and intrusion at the expense of precision. This is done by utilizing a cycle threshold (see Section 35.2.7.2).

IA32_RTIT_CTL.CycThresh indicates to the processor the minimum number of cycles that must pass before the next CYC packet should be sent. If this value is 0, no threshold is used, and CYC packets can be sent every cycle in which a CYC-eligible packet is generated. If this value is greater than 0, the hardware will wait until the associated number of cycles have passed since the last CYC packet before sending another. CPUID provides the threshold options for CycThresh, see Section 35.3.1.

Note that the cycle threshold does not dictate how frequently a CYC packet will be posted, it merely assigns the maximum frequency. If the cycle threshold is 16, a CYC packet can be posted no more frequently than every 16 cycles. However, once that threshold of 16 cycles has passed, it still requires a new CYC-eligible packet to be generated before a CYC will be inserted. Table 35-14 illustrates the threshold behavior.

Table 35-14. An Illustrative CYC Packet Example

Time (cycles)	Instruction Snapshot	Threshold			
		0	16	32	64
x	jmp %eax	CYC, TIP	CYC, TIP	CYC, TIP	CYC, TIP
x + 9	call %ebx	CYC, TIP	TIP	TIP	TIP
x + 15	call %ecx	CYC, TIP	TIP	TIP	TIP
x + 30	jmp %edx	CYC, TIP	CYC, TIP	TIP	TIP
x + 38	mov cr3, %eax	CYC, PIP	PIP	CYC, PIP	PIP
x + 46	jmp [%eax]	CYC, TIP	CYC, TIP	TIP	TIP
x + 64	call %edx	CYC, TIP	CYC, TIP	TIP	CYC,TIP
x + 71	jmp %edx	CYC, TIP	TIP	CYC,TIP	TIP

35.3.7 Decoder Synchronization (PSB+)

The PSB packet (Section 35.4.2.17) serves as a synchronization point for a trace-packet decoder. It is a pattern in the trace log for which the decoder can quickly scan to align packet boundaries. No legal packet combination can result in such a byte sequence. As such, it serves as the starting point for packet decode. To decode a trace log properly, the decoder needs more than simply to be aligned: it needs to know some state and potentially some timing information as well. The decoder should never need to retain any information (e.g., LastIP, call stack, compound packet event) across a PSB; all compound packet events will be completed before a PSB, and any compression state will be reset.

When a PSB packet is generated, it is followed by a PSBEND packet (Section 35.4.2.18). One or more packets may be generated in between those two packets, and these inform the decoder of the current state of the processor. These packets, known collectively as PSB+, should be interpreted as "status only", since they do not imply any change of state at the time of the PSB, nor are they associated directly with any instruction or event. Thus, the

normal binding and ordering rules that apply to these packets outside of PSB+ can be ignored when these packets are between a PSB and PSBEND. They inform the decoder of the state of the processor at the time of the PSB.

PSB+ can include:

- Timestamp (TSC), if IA32_RTIT_CTL.TSCEn=1.
- Timestamp-MTC Align (TMA), if IA32_RTIT_CTL.TSCEn=1 && IA32_RTIT_CTL.MTCEn=1.
- Paging Info Packet (PIP), if ContextEn=1 and IA32_RTIT_CTL.OS=1. The non-root bit (NR) is set if the logical processor is in VMX non-root operation and the "conceal VMX from PT" VM-execution control is 0.
- VMCS packet, if either the logical is in VMX root operation or the logical processor is in VMX non-root operation and the "conceal VMX from PT" VM-execution control is 0.
- Core Bus Ratio (CBR).
- MODE.TSX, if ContextEn=1 and BranchEn = 1.
- MODE.Exec, if PacketEn=1.
- Flow Update Packet (FUP), if PacketEn=1.

PSB is generated only when TriggerEn=1; hence PSB+ has the same dependencies. The ordering of packets within PSB+ is not fixed. Timing packets such as CYC and MTC may be generated between PSB and PSBEND, and their meanings are the same as outside PSB+.

A PSB+ can be lost in some scenarios. If IA32_RTIT_STATUS.TriggerEn is cleared just as the PSB threshold is reached, the PSB+ may not be generated. TriggerEn can be cleared by a WRMSR that clears IA32_RTIT_CTL.TraceEn, a VM-exit that clears IA32_RTIT_CTL.TraceEn, an #SMI, or any time that either IA32_RTIT_STATUS.Stopped is set (e.g., by a TraceStop or ToPA stop condition) or IA32_RTIT_STATUS.Error is set (e.g., by an Intel PT output error).

Note that an overflow can occur during PSB+, and this could cause the PSBEND packet to be lost. For this reason, the OVF packet should also be viewed as terminating PSB+.

35.3.8 Internal Buffer Overflow

In the rare circumstances when new packets need to be generated but the processor's dedicated internal buffers are all full, an "internal buffer overflow" occurs. On such an overflow packet generation ceases (as packets would need to enter the processor's internal buffer) until the overflow resolves. Once resolved, packet generation resumes.

When the buffer overflow is cleared, an OVF packet (Section 35.4.2.16) is generated, and the processor ensures that packets which follow the OVF are not compressed (IP compression or RET compression) against packets that were lost.

If IA32_RTIT_CTL.BranchEn = 1, the OVF packet will be followed by a FUP if the overflow resolves while PacketEn=1. If the overflow resolves while PacketEn = 0 no packet is generated, but a TIP.PGE will naturally be generated later, once PacketEn = 1. The payload of the FUP or TIP.PGE will be the Current IP of the first instruction upon which tracing resumes after the overflow is cleared. If the overflow resolves while PacketEn=1, only timing packets may come between the OVF and the FUP. If the overflow resolves while PacketEn=0, any other packets that are not dependent on PacketEn may come between the OVF and the TIP.PGE.

35.3.8.1 Overflow Impact on Enables

The address comparisons to ADDRn ranges, for IP filtering and TraceStop (Section 35.2.4.3), continue during a buffer overflow, and TriggerEn, ContextEn, and FilterEn may change during a buffer overflow. Like other packets, however, any TIP.PGE or TIP.PGD packets that would have been generated will be lost. Further, IA32_RTIT_STATUS.PacketByteCnt will not increment, since it is only incremented when packets are generated.

If a TraceStop event occurs during the buffer overflow, IA32_RTIT_STATUS.Stopped will still be set, tracing will cease as a result. However, the TraceStop packet, and any TIP.PGD that result from the TraceStop, may be dropped.

35.3.8.2 Overflow Impact on Timing Packets

Any timing packets that are generated during a buffer overflow will be dropped. If only a few MTC packets are dropped, a decoder should be able to detect this by noticing that the time value in the first MTC packet after the buffer overflow incremented by more than one. If the buffer overflow lasted long enough that 256 MTC packets are lost (and thus the MTC packet 'wraps' its 8-bit CTC value), then the decoder may be unable to properly understand the trace. This is not an expected scenario. No CYC packets are generated during overflow, even if the cycle counter wraps.

Note that, if cycle-accurate mode is enabled, the OVF packet will generate a CYC packet. Because the cycle counter counts during overflows, this CYC packet can provide the duration of the overflow. However, there is a risk that the cycle counter wrapped during the overflow, which could render this CYC misleading.

35.3.9 Operational Errors

Errors are detected as a result of packet output configuration problems, which can include output alignment issues, ToPA reserved bit violations, or overlapping packet output with restricted memory. See "ToPA Errors" in Section 35.2.6.2 for details on ToPA errors, and Section 35.2.6.4 for details on restricted memory errors. Operational errors are only detected and signaled when TraceEn=1.

When an operational error is detected, tracing is disabled and the error is logged. Specifically, IA32_RTIT_STATUS.Error is set, which will cause IA32_RTIT_STATUS.TriggerEn to be 0. This will disable generation of all packets. Some causes of operational errors may lead to packet bytes being dropped.

It should be noted that the timing of error detection may not be predictable. Errors are signaled when the processor encounters the problematic configuration. This could be as soon as packet generation is enabled but could also be later when the problematic entry or field needs to be used.

Once an error is signaled, software should disable packet generation by clearing TraceEn, diagnose and fix the error condition, and clear IA32_RTIT_STATUS.Error. At this point, packet generation can be re-enabled.

35.4 TRACE PACKETS AND DATA TYPES

This section details the data packets generated by Intel Processor Trace. It is useful for developers writing the interpretation code that will decode the data packets and apply it to the traced source code.

35.4.1 Packet Relationships and Ordering

This section introduces the concept of packet "binding", which involves determining the IP in a binary disassembly at which the change indicated by a given packet applies. Some packets have the associated IP as the payload (FUP, TIP), while for others the decoder need only search for the next instance of a particular instruction (or instructions) to bind the packet (TNT). However, in many cases, the decoder will need to consider the relationship between packets, and to use this packet context to determine how to bind the packet.

Section 35.4.2 below provides detailed descriptions of the packets, including how packets bind to IPs in the disassembly, to other packets, or to nothing at all. Many packets listed are simple to bind, because they are generated in only a few scenarios. Those that require more consideration are typically part of "compound packet events", such as interrupts, exceptions, and some instructions, where multiple packets are generated by a single operation (instruction or event). These compound packet events frequently begin with a FUP to indicate the source address (if it is not clear from the disassembly), and are concluded by a TIP or TIP.PGD packet that indicates the destination address (if one is provided). In this scenario, the FUP is said to be "coupled" with the TIP packet.

Other packets could be in between the coupled FUP and TIP packet. Timing packets, such as TSC, MTC, CYC, or CBR, could arrive at any time, and hence could intercede in a compound packet event. If an operation changes CR3 or the processor's mode of execution, a state update packet (i.e., PIP or MODE) is generated. The state changes indicated by these intermediate packets should be applied at the IP of the TIP* packet. A summary of compound packet events is provided in Table 35-15; see Section 35.4.2 for more per-packet details and Section 35.7 for more detailed packet generation examples.

Table 35-15. Compound Packet Event Summary

Event Type	Beginning	Middle	End	Comment
Unconditional, uncompressed control-flow transfer	FUP or none	Any combination of PIP, VMCS, MODE.Exec, or none	TIP or TIP.PGD	FUP only for asynchronous events. Order of middle packets may vary. PIP/VMCS/MODE only if the operation modifies the state tracked by these respective packets.
TSX Update	MODE.TSX, and (FUP or none)	None	TIP, TIP.PGD, or none	FUP TIP/TIP.PGD only for TSX abort cases.
Overflow	OVF	PSB, PSBEND, or none	FUP or TIP.PGE	FUP if overflow resolves while ContextEn=1, else TIP.PGE.

35.4.2 Packet Definitions

The following description of packet definitions are in tabular format. Figure 35-3 explains how to interpret them. Packet bits listed as "RSVD" are not guaranteed to be 0.

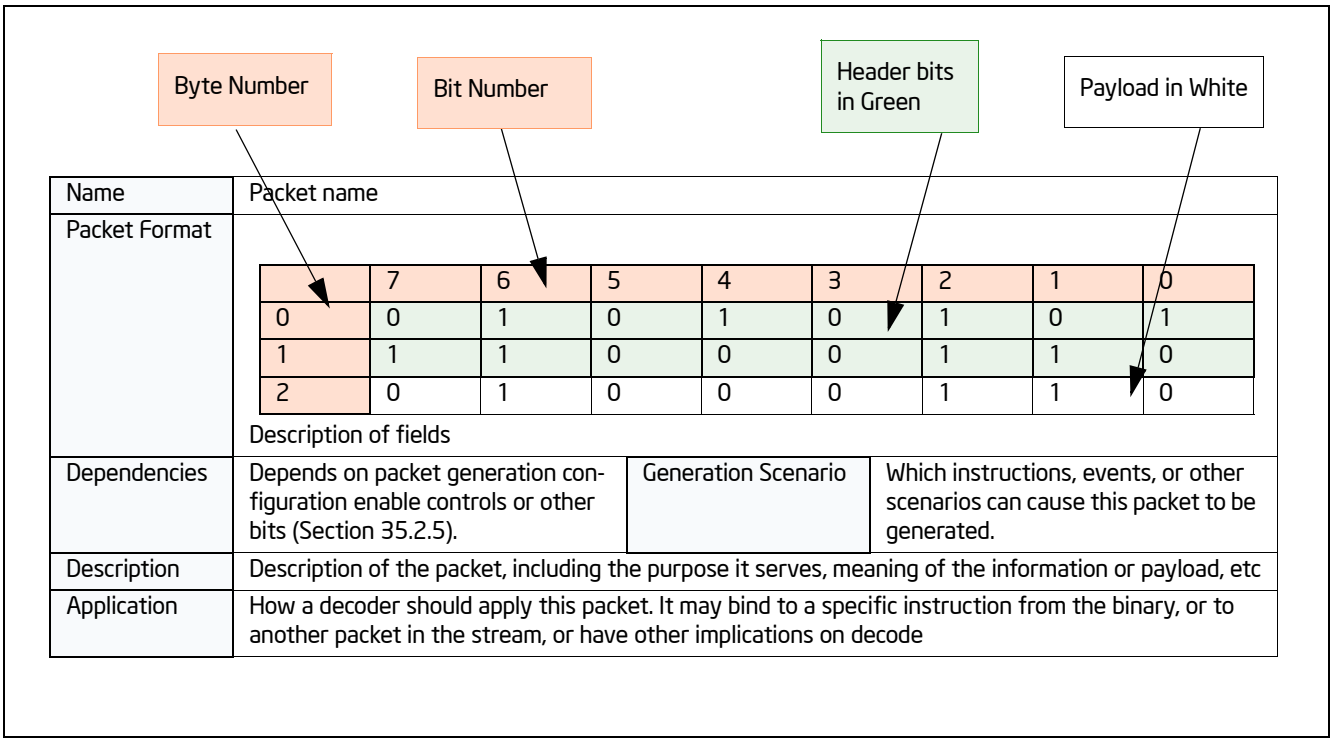

Figure 35-3. Interpreting Tabular Definition of Packet Format

35.4.2.1 Taken/Not-taken (TNT) Packet

Table 35-16. TNT Packet Definition

<tr><td>Description</td><td colspan="3">Provides the target for some control flow transfers</td></tr>
<tr><td>Application</td><td colspan="3">Anytime a TIP is encountered, it indicates that control was transferred to the IP provided in the payload.</td></tr>
<tr><td></td><td colspan="3">The source of this control flow change, and hence the IP or instruction to which it binds, depends on the packets that precede the TIP. If a TIP is encountered and all preceding packets have already been bound, then the TIP will apply to the upcoming indirect branch, far branch, or VMRESUME. However, if there was a preceding FUP that remains unbound, it will bind to the TIP. Here, the TIP provides the target of an asynchronous event or TSX abort that occurred at the IP given in the FUP payload. Note that there may be other packets, in addition to the FUP, which will bind to the TIP packet. See the packet application descriptions for other packets for details.</td></tr>
</table>

NOTES:

1. EENTER, EEXIT, ERESUME, AEX would be possible only for a debug enclave.

IP Compression

The IP payload in a TIP. FUP, TIP.PGE, or TIP.PGD packet can vary in size, based on the mode of execution, and the use of IP compression. IP compression is an optional compression technique the processor may choose to employ to reduce bandwidth. With IP compression, the IP to be represented in the payload is compared with the last IP sent out, via any of FUP, TIP, TIP.PGE, or TIP.PGD. If that previous IP had the same upper (most significant) address bytes, those matching bytes may be suppressed in the current packet. The processor maintains an internal state of the "Last IP" that was encoded in trace packets, thus the decoder will need to keep track of the "Last IP" state in software, to match fidelity with packets generated by hardware. "Last IP" is initialized to zero, hence if the first IP in the trace may be compressed if the upper bytes are zeroes.

The "IPBytes" field of the IP packets (FUP, TIP, TIP.PGE, TIP.PGD) serves to indicate how many bytes of payload are provided, and how the decoder should fill in any suppressed bytes. The algorithm for reconstructing the IP for a TIP/FUP packet is shown in the table below.

Table 35-18. FUP/TIP IP Reconstruction

IPBytes	Uncompressed IP Value							
	63:56	55:48	47:40	39:32	31:24	23:16	15:8	7:0
000b	None, IP is out of context							
001b	Last IP[63:16]						IP Payload[15:0]	
010b	Last IP[63:32]				IP Payload[31:0]			
011b	IP Payload[47] extended		IP Payload[47:0]					
100b	Last IP [63:48]		IP Payload[47:0]					
101b	Reserved							
110b	IP Payload[63:0]							
111b	Reserved							

The processor-internal Last IP state is guaranteed to be reset to zero when a PSB is sent out. This means that the IP that follows the PSB with either be un-compressed (011b or 110b, see Table 35-18), or compressed against zero.

At times, "IPbytes" will have a value of 0. As shown above, this does not mean that the IP payload matches the full address of the last IP, but rather that the IP for this packet was suppressed. This is used for cases where the IP that applies to the packet is out of context. An example is the TIP.PGD sent on a SYSCALL, when tracing only USR code. In that case, no TargetIP will be included in the packet, since that would expose an instruction point at CPL = 0. When the IP payload is suppressed in this manner, Last IP is not cleared, and instead refers to the last IP packet with a non-zero IPBytes field.

On processors that support a maximum linear address size of 32 bits, IP payloads may never exceed 32 bits (IPBytes <= 010b).

Indirect Transfer Compression for Returns (RET)

In addition to IP compression, TIP packets for near return (RET) instructions can also be compressed. If the RET target matches the next IP of the corresponding CALL, then the TIP packet is unneeded, since the decoder can deduce the target IP by maintaining a CALL/RET stack of its own.

A CALL/RET stack can be maintained by the decoder by doing the following:

1. Allocate space to store 64 RET targets.
2. For near CALLs, push the Next IP onto the stack. Once the stack is full, new CALLs will force the oldest entry off the end of the stack, such that only the youngest 64 entries are stored. Note that this excludes zero-length CALLs, which are direct near CALLs with displacement zero (to the next IP). These CALLs typically don't have matching RETs.
3. For near RETs, pop the top (youngest) entry off the stack. This will be the target of the RET.

In cases where the RET is compressed, the target is guaranteed to match the value produced in 2) above. If the target is not compressed, a TIP packet will be generated with the RET target, which may differ from 2).

The hardware ensure that packets read by the decoder will always have seen the CALL that corresponds to any compressed RET. The processor will never compress a RET across a PSB, a buffer overflow, or scenario where PacketEn=0. This means that a RET whose corresponding CALL executed while PacketEn=0, or before the last PSB, etc., will not be compressed.

If the CALL/RET stack is manipulated or corrupted by software, and thereby causes a RET to transfer control to a target that is inconsistent with the CALL/RET stack, then the RET will not be compressed, and will produce a TIP packet. This can happen, for example, if software executes a PUSH instruction to push a target onto the stack, and a later RET uses this target.

When a RET is compressed, a Taken indication is added to the TNT buffer. Because it sends no TIP packet, it also does not update the internal Last IP value, and thus the decoder should treat it the same way. If the RET is not compressed, it will generate a TIP packet (just like when RET compression is disabled, via IA32_RTIT_CTL.DisRETC). For processors that employ deferred TIPs (Section 35.4.2.3), an uncompressed RET will not be deferred, and hence will force out any accumulated TNTs or TIPs. This serves to avoid ambiguity, and make

clear to the decoder whether the near RET was compressed, and hence a bit in the in-progress TNT should be consumed, or uncompressed, in which case there will be no in-progress TNT and thus a TIP should be consumed.

Note that in the unlikely case that a RET executes in a different execution mode than the associated CALL, the decoder will need to model the same behavior with its CALL stack. For instance, if a CALL executes in 64-bit mode, a 64-bit IP value will be pushed onto the software stack. If the corresponding RET executes in 32-bit mode, then only the lower 32 target bits will be popped off of the stack, which may mean that the RET does not go to the CALL's Next IP. This is architecturally correct behavior, and this RET could be compressed, thus the decoder should match this behavior

35.4.2.3 Deferred TIPs

The processor may opt to defer sending out the TNT when TIPs are generated. Thus, rather than sending a partial TNT followed by a TIP, both packets will be deferred while the TNT accumulates more Jcc/RET results. Any number of TIP packets may be accumulated this way, such that only once the TNT is filled, or once another packet (e.g., FUP) is generated, the TNT will be sent, followed by all the deferred TIP packets, and finally terminated by the other packet(s) that forced out the TNT and TIP packets. Generation of many other packets (see list below) will force out the TNT and any accumulated TIP packets. This is an optional optimization in hardware to reduce the bandwidth consumption, and hence the performance impact, incurred by tracing.

Table 35-19. TNT Examples with Deferred TIPs

Code Flow	Packets, Non-Deferred TIPS	Packets, Deferred TIPS
0x1000 cmp %rcx, 0 0x1004 jnz Foo // not-taken 0x1008 jmp %rdx	TNT(0b0), TIP(0x1308)

<table>
<tr><td>Name</td><td colspan="4">Target IP - Packet Generation Disable (TIP.PGD)</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td colspan="3">IPBytes</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td></tr>
<tr><td>1</td><td colspan="8">TargetIP[7:0]</td></tr>
<tr><td>2</td><td colspan="8">TargetIP[15:8]</td></tr>
<tr><td>3</td><td colspan="8">TargetIP[23:16]</td></tr>
<tr><td>4</td><td colspan="8">TargetIP[31:24]</td></tr>
<tr><td>5</td><td colspan="8">TargetIP[39:32]</td></tr>
<tr><td>6</td><td colspan="8">TargetIP[47:40]</td></tr>
<tr><td>7</td><td colspan="8">TargetIP[55:48]</td></tr>
<tr><td>8</td><td colspan="8">TargetIP[63:56]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>PacketEn transitions to 0</td><td>Generation Scenario</td><td colspan="2">Any branch instruction, control flow transfer, or MOV CR3 that clears PacketEn, a WRMSR that disables packet generation and clears PacketEn</td></tr>
<tr><td>Description</td><td colspan="4">Indicates that PacketEn has transitioned to 0. It will include the IP at which the tracing ends, unless ContextEn= 0 or TraceEn=0 at the conclusion of the instruction or event that cleared PacketEn.
PacketEn can be cleared due to any of the enables that comprise PacketEn transitioning from 1 to 0. Examples:
▪ TriggerEn: This is cleared on software write to clear IA32_RTIT_CTL.TraceEn, or when IA32_RTIT_STATUS.Stopped is set, or on operational error. The IP payload will be suppressed in this case, and the “IPBytes” field will have the value 0.
▪ FilterEn: This is set when software jumps out of the tracing region. This region is defined by enabling IP filtering in IA32_RTIT_CTL.ADDRn_CFG, and defining the range in IA32_RTIT_ADDRn_[AB], see. Section 35.2.4.3. The IP payload will depend on the type of the branch. For conditional branches, the payload is suppressed (IPBytes = 0), and in this case the destination can be inferred from the disassembly. For any other type of branch, the IP payload will be the target of the branch.
▪ ContextEn: This can happen on a CPL change, a CR3 write or any other means of changing ContextEn. See Section 35.2.4.3 for details. In this case, when ContextEn is cleared, there will be no IP payload. The “IPBytes” field will have value 0.
Note that, in cases where a branch that would normally produce a TIP packet (i.e., far transfer, indirect branch, interrupt, etc) or TNT update (conditional branch or compressed RT) causes PacketEn to transition from 1 to 0, the TIP or TNI bit will be replaced with TIP.PGD. The payload of the TIP.PGD will be the target of the branch, unless the result of the instruction causes TraceEn or ContextEn to be cleared (ie, SYSCALL when IA32_RTIT_CTL.OS=0, In the case where a conditional branch clears FilterEn and hence PacketEn, there will be no TNT bit for this branch, replaced instead by the TIP.PGD.</td></tr>
<tr><td>Application</td><td colspan="4">TIP.PGD can be produced by any branch instructions, as well as some non-branch instructions, that clear PacketEn. When produced by a branch, it replaces any TIP or TNT update that the branch would normally produce.
In cases where there is an unbound FUP preceding the TIP.PGD, then the TIP.PGD is part of compound operation (i.e., asynchronous event or TSX abort) which cleared PacketEn. For most such cases, the TIP.PGD is simply replacing a TIP, and should be treated the same way. The TIP.PGD may or may not have an IP payload, depending on whether the operation cleared ContextEn.
If there is not an associated FUP, the binding will depend on whether there is an IP payload. If there is an IP payload, then the TIP.PGD should be applied to either the next direct branch whose target matches the TIP.PGD payload, or the next branch that would normally generate a TIP or TNT packet. If there is no IP payload, then the TIP.PGD should apply to the next branch or MOV CR3 instruction.</td></tr>
</table>

35.4.2.6 Flow Update (FUP) Packet

Table 35-22. FUP Packet Definition

<table>
<tr><td>Name</td><td colspan="4">Flow Update (FUP) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td colspan="3">IPBytes</td><td>1</td><td>1</td><td>1</td><td>0</td><td>1</td></tr>
<tr><td>1</td><td colspan="8">IP[7:0]</td></tr>
<tr><td>2</td><td colspan="8">IP[15:8]</td></tr>
<tr><td>3</td><td colspan="8">IP[23:16]</td></tr>
<tr><td>4</td><td colspan="8">IP[31:24]</td></tr>
<tr><td>5</td><td colspan="8">IP[39:32]</td></tr>
<tr><td>6</td><td colspan="8">IP[47:40]</td></tr>
<tr><td>7</td><td colspan="8">IP[55:48]</td></tr>
<tr><td>8</td><td colspan="8">IP[63:56]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn & ContextEn. (Typically depends on BranchEn and FilterEn as well, see Section 35.2.4 for details.)</td><td>Generation Scenario</td><td colspan="2">Asynchronous Events (interrupts, exceptions, INIT, SIPI, SMI, VM exit, #MC), XBEGIN, XEND, XABORT, XACQUIRE, XRELEASE, EENTER, EEXIT, ERESUME, EEE, AEX,[1], INT 0, INT 3, INT n, a WRMSR that disables packet generation.</td></tr>
<tr><td>Description</td><td colspan="4">Provides the source address for asynchronous events, and some other instructions. Is never sent alone, always sent with an associated TIP or MODE packet, and potentially others.</td></tr>
<tr><td>Application</td><td colspan="4">FUP packets provide the IP to which they bind. However, they are never standalone, but are coupled with other packets.
In TSX cases, the FUP is immediately preceded by a MODE.TSX, which binds to the same IP. A TIP will follow only in the case of TSX aborts, see Section 35.4.2.8 for details.
Otherwise, FUPs are part of compound packet events (see Section 35.4.1). In these compound cases, the FUP provides the source IP for an instruction or event, while a following TIP (or TIP.PGD) uop will provide any destination IP. Other packets may be included in the compound event between the FUP and TIP.</td></tr>
</table>

NOTES:

1. EENTER, EEXIT, ERESUME, EEE, AEX apply only if Intel Software Guard Extensions is supported.

FUP IP Payload

Flow Update Packet gives the source address of an instruction when it is needed. In general, branch instructions do not need a FUP, because the source address is clear from the disassembly. For asynchronous events, however, the source address cannot be inferred from the source, and hence a FUP will be sent. Table 35-23 illustrates cases where FUPs are sent, and which IP can be expected in those cases.

Table 35-23. FUP Cases and IP Payload

Event	Flow Update IP	Comment
External Interrupt, NMI/SMI, Traps, Machine Check (trap-like), INIT/SIPI	Address of next instruction (Next IP) that would have been executed	Functionally, this matches the LBR FROM field value and also the EIP value which is saved onto the stack.
Exceptions/Faults, Machine check (fault-like)	Address of the instruction which took the exception/fault (Current IP)	This matches the similar functionality of LBR FROM field value and also the EIP value which is saved onto the stack.
Software Interrupt	Address of the software interrupt instruction (Current IP)	This matches the similar functionality of LBR FROM field value, but does not match the EIP value which is saved onto the stack (Next Linear Instruction Pointer - NLIP).
EENTER, EEXIT, ERESUME, Enclave Exiting Event (EEE), AEX[1]	Current IP of the instruction	This matches the LBR FROM field value and also the EIP value which is saved onto the stack.
XACQUIRE	Address of the X* instruction	
XRELEASE, XBEGIN, XEND, XABORT, other transactional abort	Current IP	
#SMI	IP that is saved into SMRAM	
WRMSR that clears TraceEn	Current IP	

NOTES:

1. Information on EENTER, EEXIT, ERESUME, EEE, Asynchronous Enclave eXit (AEX) can be found in *Intel® Software Guard Extensions Programming Reference*.

On a canonical fault due to sequentially fetching an instruction in non-canonical space (as opposed to jumping to non-canonical space), the IP of the fault (and thus the payload of the FUP) will be a non-canonical address. This is consistent with what is pushed on the stack for such faulting cases.

If there are post-commit task switch faults, the IP value of the FUP will be the original IP when the task switch started. This is the same value as would be seen in the LBR_FROM field. But it is a different value as is saved on the stack or VMCS.

35.4.2.7 Paging Information (PIP) Packet

Table 35-24. PIP Packet Definition

<table>
<tr><td>Name</td><td colspan="4">Paging Information (PIP) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>1</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td></tr>
<tr><td>2</td><td colspan="7">CR3[11:5] or 0</td><td>RSVD/NR</td></tr>
<tr><td>3</td><td colspan="8">CR3[19:12]</td></tr>
<tr><td>4</td><td colspan="8">CR3[27:20]</td></tr>
<tr><td>5</td><td colspan="8">CR3[35:28]</td></tr>
<tr><td>6</td><td colspan="8">CR3[43:36]</td></tr>
<tr><td>7</td><td colspan="8">CR3[51:44]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && ContextEn && IA32_RTIT_CTL.OS</td><td>Generation Scenario</td><td colspan="2">MOV CR3, Task switch, INIT, SIPI, PSB+, VM exit, VM entry</td></tr>
<tr><td>Description</td><td colspan="4">The CR3 payload shown includes only the address portion of the CR3 value. For PAE paging, CR3[11:5] are thus included. For other page modes (32-bit and 4-level paging[1]), these bits are 0.
This packet holds the CR3 address value. It will be generated on operations that modify CR3:
▪ MOV CR3 operation
▪ Task Switch
▪ INIT and SIPI
▪ VM exit, if “conceal VMX from PT” VM-exit control is 0 (see Section 35.5.1)
▪ VM entry, if “conceal VMX from PT” VM-entry control is 0
PIPs are not generated, despite changes to CR3, on SMI and RSM. This is due to the special behavior on these operations, see Section 35.2.8.3 for details. Note that, for some cases of task switch where CR3 is not modified, no PIP will be produced.
The purpose of the PIP is to indicate to the decoder which application is running, so that it can apply the proper binaries to the linear addresses that are being traced.
The PIP packet contains the new CR3 value when CR3 is written.
PIPs generated by VM entries set the NR bit. PIPs generated in VMX non-root operation set the NR bit if the “conceal VMX from PT” VM-execution control is 0 (see Section 35.5.1). All other PIPs clear the NR bit.</td></tr>
<tr><td>Application</td><td colspan="4">The purpose of the PIP packet is to help the decoder uniquely identify what software is running at any given time. When a PIP is encountered, a decoder should do the following:
1) If there was a prior unbound FUP (that is, a FUP not preceded by a packet such as MODE.TSX that consumes it, and it hence pairs with a TIP that has not yet been seen), then this PIP is part of a compound packet event (Section 35.4.1). Find the ending TIP and apply the new CR3/NR values to the TIP payload IP.
2) Otherwise, look for the next MOV CR3, far branch, or VMRESUME/VMLAUNCH in the disassembly, and apply the new CR3 to the next (or target) IP.
For examples of the packets generated by these flows, see Section 35.7.</td></tr>
</table>

NOTES:

1. Earlier versions of this manual used the term “IA-32e paging” to identify 4-level paging.

35.4.2.8 MODE Packets

MODE packets keep the decoder informed of various processor modes about which it needs to know in order to properly manage the packet output, or to properly disassemble the associated binaries. MODE packets include a header and a mode byte, as shown below.

Table 35-25. General Form of MODE Packets

	7	6	5	4	3	2	1	0
0	1	0	0	1	1	0	0	1
1	Leaf ID			Mode				

The MODE Leaf ID indicates which set of mode bits are held in the lower bits.

MODE.Exec Packet

Table 35-26. MODE.Exec Packet Definition

<table>
<tr><td>Name</td><td colspan="4">MODE.Exec Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td></tr>
<tr><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>CS.D</td><td>(CS.L & LMA)</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>PacketEn</td><td>Generation Scenario</td><td colspan="2">Far branch, interrupt, exception, VM exit, and VM entry, if the mode changes. PSB+, and any scenario that can generate a TIP.PGE, such that the mode may have changed since the last MODE.Exec.</td></tr>
<tr><td>Description</td><td colspan="4">Indicates whether software is in 16, 32, or 64-bit mode, by providing the CS.D and (CS.L & IA32_EFER.LMA) values. Essential for the decoder to properly disassemble the associated binary.

<table>
<tr><td>CS.D</td><td>(CS.L & IA32_EFER.LMA)</td><td>Addressing Mode</td></tr>
<tr><td>1</td><td>1</td><td>N/A</td></tr>
<tr><td>0</td><td>1</td><td>64-bit mode</td></tr>
<tr><td>1</td><td>0</td><td>32-bit mode</td></tr>
<tr><td>0</td><td>0</td><td>16-bit mode</td></tr>
</table>

MODE.Exec is sent at the time of a mode change, if PacketEn=1 at the time, or when tracing resumes, if necessary. In the former case, the MODE.Exec packet is generated along with other packets that result from the far transfer operation that changes the mode. In cases where the mode changes while PacketEn=0, the processor will send out a MODE.Exec along with the TIP.PGE when tracing resumes. The processor may opt to suppress the MODE.Exec when tracing resumes if the mode matches that from the last MODE.Exec packet, if there was no PSB in between.</td></tr>
<tr><td>Application</td><td colspan="4">MODE.Exec always immediately precedes a TIP or TIP.PGE. The mode change applies to the IP address in the payload of the next TIP or TIP.PGE.</td></tr>
</table>

MODE.TSX Packet

Table 35-27. MODE.TSX Packet Definition

<table>
<tr><td>Name</td><td colspan="4">MODE.TSX Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>

<tr><td>1</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>TXAbort</td><td>InTX</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn and ContextEn</td><td>Generation Scenario</td><td colspan="2">XBEGIN, XEND, XABORT, XACQUIRE, XRELEASE, if INTX changes, Asynchronous TSX Abort, PSB+</td></tr>
<tr><td>Description</td><td colspan="4">Indicates when a TSX transaction (either HLE or RTM) begins, commits, or aborts. Instructions executed transactionally will be “rolled back” if the transaction is aborted.
<table>
<tr><td>TXAbort</td><td>InTX</td><td>Implication</td></tr>
<tr><td>1</td><td>1</td><td>N/A</td></tr>
<tr><td>0</td><td>1</td><td>Transaction begins, or executing transactionally</td></tr>
<tr><td>1</td><td>0</td><td>Transaction aborted</td></tr>
<tr><td>0</td><td>0</td><td>Transaction committed, or not executing transactionally</td></tr>
</table>
</td></tr>
<tr><td>Application</td><td colspan="4">If PacketEn=1, MODE.TSX always immediately precedes a FUP. If the TXAbort bit is zero, then the mode change applies to the IP address in the payload of the FUP. If TXAbort=1, then the FUP will be followed by a TIP, and the mode change will apply to the IP address in the payload of the TIP.
MODE.TSX packets may be generated when PacketEn=0, due to FilterEn=0. In this case, only the last MODE.TSX generated before TIP.PGE need be applied.</td></tr>
</table>

35.4.2.9 TraceStop Packet

Table 35-28. TraceStop Packet Definition

Name	TraceStop Packet		
Packet Format			
Dependencies	TriggerEn && ContextEn	Generation Scenario	Taken branch with target in TraceStop IP region, MOV CR3 in TraceStop IP region, or WRMSR that sets TraceEn in TraceStop IP region.
Description	Indicates when software has entered a user-configured TraceStop region. When the IP matches a TraceStop range while ContextEn and TriggerEn are set, a TraceStop action occurs. This disables tracing by setting IA32_RTIT_STATUS.Stopped, thereby clearing TriggerEn, and causes a TraceStop packet to be generated. The TraceStop action also forces FilterEn to 0. Note that TraceStop may not force a flush of internally buffered packets, and thus trace packet generation should still be manually disabled by clearing IA32_RTIT_CTL.TraceEn before examining output. See Section 35.2.4.3 for more details.		
Application	If TraceStop follows a TIP.PGD (before the next TIP.PGE), then it was triggered either by the instruction that cleared PacketEn, or it was triggered by some later instruction that executed while FilterEn=0. In either case, the TraceStop can be applied at the IP of the TIP.PGD (if any). If TraceStop follows a TIP.PGE (before the next TIP.PGD), it should be applied at the last known IP.		

	7	6	5	4	3	2	1	0

<tr><td>7</td><td colspan="8">SW TSC[55:48]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>IA32_RTIT_CTL.TSCEn && TriggerEn</td><td>Generation Scenario</td><td colspan="2">Sent after any event that causes the processor clocks or Intel PT timing packets (such as MTC or CYC) to stop, This may include P-state changes, wake from C-state, or clock modulation. Also on transition of TraceEn from 0 to 1.</td></tr>
<tr><td>Description</td><td colspan="4">When enabled by software, a TSC packet provides the lower 7 bytes of the current TSC value, as returned by the RDTSC instruction. This may be useful for tracking wall-clock time, and synchronizing the packets in the log with other timestamped logs.</td></tr>
<tr><td>Application</td><td colspan="4">TSC packet provides a wall-clock proxy of the event which generated it (packet generation enable, sleep state wake, etc). In all cases, TSC does not precisely indicate the time of any control flow packets; however, all preceding packets represent instructions that executed before the indicated TSC time, and all subsequent packets represent instructions that executed after it. There is not a precise IP to which to bind the TSC packet.</td></tr>
</table>

35.4.2.12 Mini Time Counter (MTC) Packet

Table 35-31. MTC Packet Definition

<table>
<tr><td>Name</td><td colspan="3">Mini time Counter (MTC) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="3">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td></tr>
<tr><td>1</td><td colspan="8">CTC[N+7:N]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>IA32_RTIT_CTL.MTCEn && TriggerEn</td><td>Generation Scenario</td><td>Periodic, based on the core crystal clock, or Always Running Timer (ART).</td></tr>
<tr><td>Description</td><td colspan="3">When enabled by software, an MTC packet provides a periodic indication of wall-clock time. The 8-bit CTC (Common Timestamp Copy) payload value is set to (ART >> N) & FFH. The frequency of the ART is related to the Maximum Non-Turbo frequency, and the ratio can be determined from CPUID leaf 15H, as described in Section 35.8.3.
Software can select the threshold N, which determines the MTC frequency by setting the IA32_RTIT_CTL.MTCFreq field (see Section 35.2.7.2) to a supported value using the lookup enumerated by CPUID (see Section 35.3.1).
See Section 35.8.3 for details on how to use the MTC payload to track TSC time.
MTC provides 8 bits from the ART, starting with the bit selected by MTCFreq to dictate the frequency of the packet. Whenever that 8-bit range being watched changes, an MTC packet will be sent out with the new value of that 8-bit range. This allows the decoder to keep track of how much wall-clock time has elapsed since the last TSC packet was sent, by keeping track of how many MTC packets were sent and what their value was. The decoder can infer the truncated bits, CTC[N-1:0], are 0 at the time of the MTC packet.
There are cases in which MTC packet can be dropped, due to overflow or other micro-architectural conditions. The decoder should be able to recover from such cases by checking the 8-bit payload of the next MTC packet, to determine how many MTC packets were dropped. It is not expected that >256 consecutive MTC packets should ever be dropped.</td></tr>
<tr><td>Application</td><td colspan="3">MTC does not precisely indicate the time of any other packet, nor does it bind to any IP. However, all preceding packets represent instructions or events that executed before the indicated ART time, and all subsequent packets represent instructions that executed after, or at the same time as, the ART time.</td></tr>
</table>

35.4.2.13 TSC/MTC Alignment (TMA) Packet

<tr><td>6</td><td colspan="7">Reserved</td><td>FC[8]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>IA32_RTIT_CTL.MTCEn && IA32_RTIT_CTL.TSCEn && TriggerEn</td><td>Generation Scenario</td><td colspan="2">Sent with any TSC packet.</td></tr>
<tr><td>Description</td><td colspan="4">The TMA packet serves to provide the information needed to allow the decoder to correlate MTC packets with TSC packets. With this packet, when a MTC packet is encountered, the decoder can determine how many timestamp counter ticks have passed since the last TSC or MTC packet. See Section 35.8.3.2 for details on how to make this calculation.</td></tr>
<tr><td>Application</td><td colspan="4">TMA is always sent immediately following a TSC packet, and the payload values are consistent with the TSC payload value. Thus the application of TMA matches that of TSC.</td></tr>
</table>

35.4.2.14 Cycle Count Packet (CYC) Packet

Table 35-33. Cycle Count Packet Definition

<table>
<tr><td>Name</td><td colspan="4">Cycle Count (CYC) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td colspan="5">Cycle Counter[4:0]</td><td>Exp</td><td>1</td><td>1</td></tr>
<tr><td>1</td><td colspan="7">Cycle Counter[11:5]</td><td>Exp</td></tr>
<tr><td>2</td><td colspan="7">Cycle Counter[18:12]</td><td>Exp</td></tr>
<tr><td>...</td><td colspan="8">... (if Exp = 1 in the previous byte)</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>IA32_RTIT_CTL.CYCEn && TriggerEn</td><td>Generation Scenario</td><td colspan="2">Can be sent at any time, though a maximum of one CYC packet is sent per core clock cycle. See Section 35.3.6 for CYC-eligible packets.</td></tr>
<tr><td>Description</td><td colspan="4">The Cycle Counter field increments at the same rate as the processor core clock ticks, but with a variable length format (using a trailing EXP bit field) and a range-capped byte length.
If the CYC value is less than 32, a 1-byte CYC will be generated, with Exp=0. If the CYC value is between 32 and 4095 inclusive, a 2-byte CYC will be generated, with byte 0 Exp=1 and byte 1 Exp=0. And so on.
CYC provides the number of core clocks that have passed since the last CYC packet. CYC can be configured to be sent in every cycle in which an eligible packet is generated, or software can opt to use a threshold to limit the number of CYC packets, at the expense of some precision. These settings are configured using the IA32_RTIT_CTL.CycThresh field (see Section 35.2.7.2). For details on Cycle-Accurate Mode, IPC calculation, etc, see Section 35.3.6.
When CycThresh=0, and hence no threshold is in use, then a CYC packet will be generated in any cycle in which any CYC-eligible packet is generated. The CYC packet will precede the other packets generated in the cycle, and provides the precise cycle time of the packets that follow.
In addition to these CYC packets generated with other packets, CYC packets can be sent stand-alone. These packets serve simply to update the decoder with the number of cycles passed, and are used to ensure that a wrap of the processor's internal cycle counter doesn't cause cycle information to be lost. These stand-alone CYC packets do not indicate the cycle time of any other packet or operation, and will be followed by another CYC packet before any other CYC-eligible packet is seen.
When CycThresh>0, CYC packets are generated only after a minimum number of cycles have passed since the last CYC packet. Once this threshold has passed, the behavior above resumes, where CYC will either be sent in the next cycle that produces other CYC-eligible packets, or could be sent stand-alone.
When using CYC thresholds, only the cycle time of the operation (instruction or event) that generates the CYC packet is truly known. Other operations simply have their execution time bounded: they completed at or after the last CYC time, and before the next CYC time.</td></tr>
<tr><td>Application</td><td colspan="4">CYC provides the offset cycle time (since the last CYC packet) for the CYC-eligible packet that follows. If another CYC is encountered before the next CYC-eligible packet, the cycle values should be accumulated and applied to the next CYC-eligible packet.
If a CYC packet is generated by a TNT, note that the cycle time provided by the CYC packet applies to the first branch in the TNT packet.</td></tr>
</table>

35.4.2.15 VMCS Packet

<tr><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td></tr>
<tr><td>2</td><td colspan="8">VMCS pointer [19:12]</td></tr>
<tr><td>3</td><td colspan="8">VMCS pointer [27:20]</td></tr>
<tr><td>4</td><td colspan="8">VMCS pointer [35:28]</td></tr>
<tr><td>5</td><td colspan="8">VMCS pointer [43:36]</td></tr>
<tr><td>6</td><td colspan="8">VMCS pointer [51:44]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && ContextEn; Also in VMX operation.</td><td>Generation Scenario</td><td colspan="2">Generated on successful VMPTRLD, and optionally on SMM VM exits and VM entries that return from SMM (see Section 35.5).</td></tr>
<tr><td>Description</td><td colspan="4">The VMCS packet provides a VMCS pointer for a decoder to determine the transition of code contexts:
• On a successful VMPTRLD (i.e., a VMPTRLD that doesn't fault, fail, or VM exit), the VMCS packet contains the logical processor's VMCS pointer established by VMPTRLD (for subsequent execution of a VM guest context).
• An SMM VM exit loads the logical processor's VMCS pointer with the SMM-transfer VMCS pointer. If the "conceal VMX from PT" VM-exit control is 0 (see Section 35.5.1), a VMCS packet provides this pointer. See Section 35.6 on tracing inside and outside STM.
• A VM entry that returns from SMM loads the logical processor's VMCS pointer from a field in the SMM-transfer VMCS. If the "conceal VMX from PT" VM-entry control is 0, a VMCS packet provides this pointer. Whether the VM entry is to VMX root operation or VMX non-root operation is indicated by the PIP.NR bit.
A VMCS packet generated before a VMCS pointer has been loaded, or after the VMCS pointer has been cleared will set all 64 bits in the VMCS pointer field.
VMCS packets will not be seen on processors with IA32_VMX_MISC[bit 14]=0, as these processors do not allow TraceEn to be set in VMX operation.</td></tr>
<tr><td>Application</td><td colspan="4">The purpose of the VMCS packet is to help the decoder uniquely identify changes in the executing software context in situations that CR3 may not be unique.
When a VMCS packet is encountered, a decoder should do the following:
▪ If there was a prior unbound FUP (that is, a FUP not preceded by a packet such as MODE.TSX that consumes it, and it hence pairs with a TIP that has not yet been seen), then this VMCS is part of a compound packet event (Section 35.4.1). Find the ending TIP and apply the new VMCS base pointer value to the TIP payload IP.
▪ Otherwise, look for the next VMPTRLD, VMRESUME, or VMLAUNCH in the disassembly, and apply the new VMCS base pointer on the next VM entry.
For examples of the packets generated by these flows, see Section 35.7.</td></tr>
</table>

35.4.2.16 Overflow (OVF) Packet

Table 35-35. OVF Packet Definition

Name	Overflow (OVF) Packet		
Packet Format			
Dependencies	TriggerEn	Generation Scenario	On resolution of internal buffer overflow
Description	OVF simply indicates to the decoder that an internal buffer overflow occurred, and packets were likely lost. If BranchEN= 1, OVF is followed by a FUP or TIP.PGE which will provide the IP at which packet generation resumes. See Section 35.3.8.		
Application	When an OVF packet is encountered, the decoder should skip to the IP given in the subsequent FUP or TIP.PGE. The cycle counter for the CYC packet will be reset at the time the OVF packet is sent. Software should reset its call stack depth on overflow, since no RET compression is allowed across an overflow. Similarly, any IP compression that follows the OVF is guaranteed to use as a reference LastIP the IP payload of an IP packet that preceded the overflow.

15	1	0	0	0	0	0	1	0

Table 35-36. PSB Packet Definition (Contd.)

Dependencies	TriggerEn	Generation Scenario	Periodic, based on the number of output bytes generated while tracing. PSB is sent when IA32_RTIT_STATUS.PacketByteCnt=0, and each time it crosses the software selected threshold after that. May be sent for other micro-architectural conditions as well.
Description	PSB is a unique pattern in the packet output log, and hence serves as a sync point for the decoder. It is a pattern that the decoder can search for in order to get aligned on packet boundaries. This packet is periodic, based on the number of output bytes, as indicated by IA32_RTIT_STATUS.PacketByteCnt. The period is chosen by software, via IA32_RTIT_CTL.PSBFreq (see Section 35.2.7.2). Note, however, that the PSB period is not precise, it simply reflects the average number of output bytes that should pass between PSBs. The processor will make a best effort to insert PSB as quickly after the selected threshold is reached as possible. The processor also may send extra PSB packets for some micro-architectural conditions. PSB also serves as the leading packet for a set of "status-only" packets collectively known as PSB+ (Section 35.3.7).		
Application	When a PSB is seen, the decoder should interpret all following packets as "status only", until either a PSBEND or OVF packet is encountered. "Status only" implies that the binding and ordering rules to which these packets normally adhere are ignored, and the state they carry can instead be applied to the IP payload in the FUP packet that is included.		

35.4.2.18 PSBEND Packet

Table 35-37. PSBEND Packet Definition

Name	PSBEND Packet		
Packet Format			
Dependencies	TriggerEn	Generation Scenario	Always follows PSB packet, separated by PSB+ packets
Description	PSBEND is simply a terminator for the series of "status only" (PSB+) packets that follow PSB (Section 35.3.7).		
Application	When a PSBEND packet is seen, the decoder should cease to treat packets as "status only".

<tr><td>2</td><td colspan="4">Last Core C-State</td><td colspan="4">Deepest Core C-State</td></tr>
<tr><td>3</td><td colspan="4">Reserved</td><td colspan="4">Wake Reason</td></tr>
<tr><td>4</td><td colspan="8">Reserved</td></tr>
<tr><td>5</td><td colspan="8">Reserved</td></tr>
<tr><td>6</td><td colspan="8">Reserved</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn & PwrEvtEn</td><td>Generation Scenario</td><td colspan="2">Transition from a C-state deeper than C0.0 to C0.</td></tr>
<tr><td>Description</td><td colspan="4">Indicates processor return to thread C0 from a C-state deeper than C0.0.
The Last Core C-State field provides the MWAIT encoding for the core C-state at the time of the wake. The Deepest Core C-State provides the MWAIT encoding for the deepest core C-state achieved during the sleep session, or since leaving thread C0. MWAIT encodings for C-states can be found in Table 4-11 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B. Note that these values reflect only the core C-state, and hence will not exceed the maximum supported core C-state, even if deeper C-states can be requested.
The Wake Reason field is one-hot, encoded as follows:
<table>
<tr><th>Bit</th><th>Field</th><th>Meaning</th></tr>
<tr><td>0</td><td>Interrupt</td><td>Wake due to external interrupt received.</td></tr>
<tr><td>1</td><td>Reserved</td><td></td></tr>
<tr><td>2</td><td>Store to Monitored Address</td><td>Wake due to store to monitored address.</td></tr>
<tr><td>3</td><td>HW Wake</td><td>Wake due to hardware autonomous condition, such as HDC.</td></tr>
</table>
</td></tr>
<tr><td>Application</td><td colspan="4">PWRX will always apply to the same IP as the PWRE. The time of wake can be discerned from (optional) timing packets that precede PWRX.</td></tr>
</table>

35.5 TRACING IN VMX OPERATION

On processors that IA32_VMX_MISC[bit 14] reports 1, TraceEn can be set in VMX operation. A series of mechanisms exist to allow the VMM to configure tracing based on the desired trace domain, and on the consumer of the trace output. The VMM can configure specific VMX controls to control what virtualization-specific data are included within the trace packets (see Section 35.5.1 for details). The MSR-load areas used by VMX transitions can be employed by the VMM to restrict tracing to the desired context (see Section 35.5.2 for details). These configuration options are summarized in Table 35-45. Table 35-45 covers common Intel PT usages while SMIs are handled by the default SMM treatment. Tracing with SMM Transfer Monitor is described in Section 35.6.

Table 35-45. Common Usages of Intel PT and VMX

Target Domain	Output Consumer	Virtualize Output	Configure VMX Controls	TraceEN Configuration	Save/Restore MSR states of Trace Configuration
System-Wide (VMM + VMs)	Host	N/A	Default setting (no suppression)	WRMSR or XRSTORS by Host	N/A
VMM Only	Intel PT Aware VMM	N/A	Enable suppression	Use VMX MSR-load areas to disable tracing in VM, enable tracing on VM exits	N/A
VM Only	Intel PT Aware VMM	N/A	Enable suppression	Use VMX MSR-load areas to enable tracing in VM, disable tracing on VM exits	N/A
Intel PT Aware Guest(s)	Per Guest	VMM adds trace output virtualization	Enable suppression	Use VMX MSR-load areas to enable tracing in VM, disable tracing on VM exits	VMM updates guest state on VM exits due to XRSTORS

35.5.1 VMX-Specific Packets and VMCS Controls

In all of the usages of VMX and Intel PT, a decoder in the host or VMM context can identify the occurrences of VMX transitions with the aid of VMX-specific packets. There are two kinds of packets relevant to VMX:

- **VMCS packet.** The VMX transitions of individual VMs can be distinguished by a decoder using the VMCS-pointer field in a VMCS packet. A VMCS packet is sent on a successful execution of VMPTRLD, and its VMCS-pointer field stores the VMCS pointer loaded by that execution. See Section 35.4.2.15 for details.
- **The NR (non-root) bit in a PIP packet.** Normally, the NR bit is set in any PIP packet generated in VMX non-root operation. In addition, PIP packets are generated with each VM entry and VM exit. Thus a transition of the NR bit from 0 to 1 indicates the occurrence of a VM entry, and a transition of 1 to 0 indicates the occurrence of a VM exit.

There are VMX controls that a VMM can set to conceal some of this VMX-specific information (by suppressing its recording) and thereby prevent it from leaking across virtualization boundaries. There is one of these controls (each of which is called "conceal VMX from PT") of each type of VMX control.

Table 35-46. VMX Controls For Intel Processor Trace

Type of VMX Control	Bit Position[1]	Value	Behavior
Secondary processor-based VM-execution control	19	0	Each PIP generated in VM non-root operation will set the NR bit. PSB+ in VMX non-root operation will include the VMCS packet, to ensure that the decoder knows which guest is currently in use.
		1	Each PIP generated in VMX non-root operation will clear the NR bit. PSB+ in VMX non-root operation will not include the VMCS packet.
VM-exit control	24	0	Each VM exit generates a PIP in which the NR bit is clear. In addition, SMM VM exits generate VMCS packets.
		1	VM exits do not generate PIPs, and no VMCS packets are generated on SMM VM exits.
VM-entry control	17	0	Each VM entry generates a PIP in which the NR bit is set (except VM entries that return from SMM to VMX root operation). In addition, VM entries that return from SMM generate VMCS packets.
		1	VM entries do not generate PIPs, and no VMCS packets are generated on VM entries that return from SMM.

NOTES:

1. These are the positions of the control bits in the relevant VMX control fields.

The 0-settings of these VMX controls enable all VMX-specific packet information. The scenarios that would use these default settings also do not require the VMM to use VMX MSR-load areas to enable and disable trace-packet generation across VMX transitions.

If IA32_VMX_MISC[bit 14] reports 0, the 1-settings of the VMX controls in Table 35-46 are not supported, and VM entry will fail on any attempt to set them.

35.5.2 Managing Trace Packet Generation Across VMX Transitions

In tracing scenarios that collect packets for both VMX root operation and VMX non-root operation, a host executive can manage the MSRs associated with trace packet generation directly. The states of these MSRs need not be modified using MSR load areas across VMX transitions.

For tracing scenarios that collect packets only within VMX root operation or only within VMX non-root operation, the VMM can use the MSR load areas to toggle IA32_RTIT_CTL.TraceEn.

35.5.2.1 System-Wide Tracing

When a host or VMM configures Intel PT to collect trace packets of the entire system, it can leave the relevant VMX controls clear to allow VMX-specific packets to provide information across VMX transitions. The VMX MSR-load areas need not be used to load Intel PT MSRs on VM exits or VM entries.

The decoder will desire to identify the occurrence of VMX transitions. The packets of interests to a decoder are shown in Table 35-47.

Table 35-47. Packets on VMX Transitions (System-Wide Tracing)

Event	Packets	Description
VM exit	FUP(GuestIP)	The FUP indicates at which point in the guest flow the VM exit occurred. This is important, since VM exit can be an asynchronous event. The IP will match that written into the VMCS.
	PIP(HostCR3, NR=0)	The PIP packet provides the new host CR3 value, as well as indication that the logical processor is entering VMX root operation. This allows the decoder to identify the change of executing context from guest to host and load the appropriate set of binaries to continue decode.
	TIP(HostIP)	The TIP indicates the destination IP, the IP of the first instruction to be executed in VMX root operation. Note, this packet could be preceded by a MODE.Exec packet (Section 35.4.2.8). This is generated only in cases where CS.D or (CS.L & EFER.LMA) change during the transition.
VM entry	PIP(GuestCR3, NR=1)	The PIP packet provides the new guest CR3 value, as well as indication that the logical processor is entering VMX non-root operation. This allows the decoder to identify the change of executing context from host to guest and load the appropriate set of binaries to continue decode.
	TIP(GuestIP)	The TIP indicates the destination IP, the IP of the first instruction to be executed in VMX non-root operation. This should match the RIP loaded from the VMCS. Note, this packet could be preceded by a MODE.Exec packet (Section 35.4.2.8). This is generated only in cases where CS.D or (CS.L & EFER.LMA) change during the transition.

Since the VMX controls that suppress packet generation are cleared, a VMCS packet will be included in all PSB+ for this usage scenario. Additionally, VMPTRLD will generate such a packet. Thus the decoder can distinguish the execution context of different VMs.

When the host VMM configures a system to collect trace packets in this scenario, it should emulate CPUID to report CPUID.(EAX=07H, ECX=0):EBX[bit 26] as 0 to guests, indicating to guests that Intel PT is not available.

VMX TSC Manipulation

The TSC packets generated while in VMX non-root operation will include any changes resulting from the use of a VMM's use of the TSC offsetting or TSC scaling VMX controls (see Chapter 25, "VMX Non-Root Operation"). In this system-wide usage model, the decoder may need to account for the effect of per-VM adjustments in the TSC

packets generated in VMX non-root operation and the absence of TSC adjustments in TSC packets generated in VMX root operation. The VMM can supply this information to the decoder.

35.5.2.2 Host-Only Tracing

When trace packets in VMX non-root operation are not desired, the VMM can use the VM-entry MSR-load area to load IA32_RTIT_CTL (clearing TraceEn) to disable trace-packet generation in guests, and use the VM-exit MSR-load area to load IA32_RTIT_CTL to set TraceEn.

When tracing only the host, the decoder does not need information about the guests, and the VMX controls for suppressing VMX-specific packets can be set to reduce the packets generated. VMCS packets will still be generated on execution of VMPTRLD and in PSB+ generated in the host, but these will be unused by the decoder.

The packets of interests to a decoder when trace packets are collected for host-only tracing are shown in Table 35-48.

Table 35-48. Packets on VMX Transitions (Host-Only Tracing)

Event	Packets	Description
VM exit	TIP.PGE(HostIP)	The TIP.PGE indicates that trace packet generation is enabled and gives the IP of the first instruction to be executed in VMX root operation. Note, this packet could be preceded by a MODE.Exec packet (Section 35.4.2.8). This is generated only in cases where CS.D or (CS.L & EFER.LMA) change during the transition.
VM entry	TIP.PGD()	The TIP indicates that trace packet generation was disabled. This ensure that all buffered packets are flushed out.

35.5.2.3 Guest-Only Tracing

A VMM can configure trace-packet generation while in VMX non-root operation for guests executing normally. This is accomplished by utilizing the VMX MSR-load areas on VM exits and VM entries to limit trace-packet generation to the guest environment.

For this usage, the VM-entry MSR load area is programmed to enable trace packet generation; the VM-exit MSR load area is used to clear IA32_RTIT_CTL.TraceEn so as to disable trace-packet generation in the host. Further, if it is preferred that the guest packet stream contain no indication that execution was in VMX non-root operation, the VMM should set to 1 all the VMX controls enumerated in Table 35-46.

35.5.2.4 Virtualization of Guest Output Packet Streams

Each Intel PT aware guest OS can produce one or more output packet streams to destination addresses specified as guest physical address using by context-switching IA32_RTIT_OUTPUT_BASE within the guest. The processor generates trace packets to the physical address specified in IA32_RTIT_OUTPUT_BASE, and those specified in the ToPA tables. Thus, a VMM that supports Intel PT aware guest OS may wish to virtualize the output configurations of IA32_RTIT_OUTPUT_BASE and ToPA for each trace configuration state of all the guests.

35.5.2.5 Emulation of Intel PT Traced State

If a VMM emulates an element of processor state by taking a VM exit on reads and/or writes to that piece of state, and the state element impacts Intel PT packet generation or values, it may be incumbent upon the VMM to insert or modify the output trace data.

If a VM exit is taken on a guest write to CR3 (including “MOV CR3” as well as task switches), the PIP packet normally generated on the CR3 write will be missing.

To avoid decoder confusion when the guest trace is decoded, the VMM should emulate the missing PIP by writing it into the guest output buffer. If the guest CR3 value is manipulated, the VMM may also need to manipulate the IA32_RTIT_CR3_MATCH value, in order to ensure the trace behavior matches the guest's expectation.

Similarly, if a VMM emulates the TSC value by taking a VM exit on RDTSC, the TSC packets generated in the trace may mismatch the TSC values returned by the VMM on RDTSC. To ensure that the trace can be properly aligned

with software logs based on RDTSC, the VMM should either make corresponding modifications to the TSC packet values in the guest trace, or use mechanisms such as TSC offsetting or TSC scaling in place of exiting.

35.5.2.6 TSC Scaling

When TSC scaling is enabled for a guest using Intel PT, the VMM should ensure that the value of Maximum Non-Turbo Ratio[15:8] in MSR_PLATFORM_INFO (MSR 0CEH) and the TSC/"core crystal clock" ratio (EBX/EAX) in CPUID leaf 15H are set in a manner consistent with the resulting TSC rate that will be visible to the VM. This will allow the decoder to properly apply TSC packets, MTC packets (based on the core crystal clock or ART, whose frequency is indicated by CPUID leaf 15H), and CBR packets (which indicate the ratio of the processor frequency to the Max Non-Turbo frequency). Absent this, or separate indication of the scaling factor, the decoder will be unable to properly track time in the trace. See Section 35.8.3 for details on tracking time within an Intel PT trace.

35.5.2.7 Failed VM Entry

The packets generated by a failed VM entry depend both on the VMCS configuration, as well as on the type of failure. The results to expect are summarized in the table below. Note that packets in *italics* may or may not be generated, depending on implementation choice, and the point of failure.

Table 35-49. Packets on a Failed VM Entry

Usage Model	Entry Configuration	Early Failure (fall through to next IP)	Late Failure (VM-exit like)
System-Wide	No use of VM-entry MSR-load area	TIP (NextIP)	PIP(Guest CR3, NR=1), TraceEn 0->1 Packets (See Section 35.2.7.3), PIP(HostCR3, NR=0), TIP(HostIP)
VMM Only	VM-entry MSR-load area used to clear TraceEn	TIP (NextIP)	TraceEn 0->1 Packets (See Section 35.2.7.3), TIP(HostIP)
VM Only	VM-entry MSR-load area used to set TraceEn	None	None

35.5.2.8 VMX Abort

VMX abort conditions take the processor into a shutdown state. On a VM exit that leads to VMX abort, some packets (FUP, PIP) may be generated, but any expected TIP, TIP.PGE, or TIP.PGD may be dropped.

35.6 TRACING AND SMM TRANSFER MONITOR (STM)

The SMM-transfer monitor (STM) is a VMM that operates inside SMM while in VMX root operation. An STM operates in conjunction with an executive monitor. The latter operates outside SMM and in VMX root operation. Transitions from the executive monitor or its VMs to the STM are called SMM VM exits. The STM returns from SMM via a VM entry to the VM in VMX non-root operation or the executive monitor in VMX root operation.

Intel PT supports tracing in an STM similar to tracing support for VMX operation as described above in Section 35.5. As a result, on a SMM VM exit resulting from #SMI, TraceEn is not saved and then cleared. Software can save the state of the trace configuration MSRs and clear TraceEn using the MSR load/save lists.

35.7 PACKET GENERATION SCENARIOS

Table 35-50 and Table 35-52 illustrate the packets generated in various scenarios. In the heading row, PacketEn is abbreviated as PktEn, ContextEn as CntxEn. Note that this assumes that TraceEn=1 in IA32_RTIT_CTL, while TriggerEn=1 and Error=0 in IA32_RTIT_STATUS, unless otherwise specified. Entries that do not matter in packet generation are marked "D.C." Packets followed by a "?" imply that these packets depend on additional factors, which are listed in the "Other Dependencies" column.

In Table 35-50, PktEn is evaluated based on TiggerEn & ContextEn & FilterEn & BranchEn.

Table 35-50. Packet Generation under Different Enable Conditions

Case	Operation	PktEn Before	PktEn After	CntxEn After	Other Dependencies	Packets Output
1a	Normal non-jump operation	0	0	D.C.		None
1b	Normal non-jump operation	1	1	1		None
2a	WRMSR/XRSTORS/RSM that changes TraceEn 0 -> 1, with PacketByteCnt >0	0	0	D.C.	*TSC if TSCEn=1; *TMA if TSCEn=MTCEn=1	TSC?, TMA?, CBR
2b	WRMSR/XRSTORS/RSM that changes TraceEn 0 -> 1, with PacketByteCnt =0	0	0	D.C.	*TSC if TSCEn=1; *TMA if TSCEn=MTCEn=1	PSB, PSBEND (see Section 35.4.2.17)
2d	WRMSR/XRSTORS/RSM that changes TraceEn 0 -> 1, with PacketByteCnt >0	0	1	1	TSC if TSCEn=1; TMA if TSCEn=MTCEn=1	TSC?, TMA?, CBR, MODE.Exec, TIP.PGE(NLIP)
2e	WRMSR/XRSTORS/RSM that changes TraceEn 0 -> 1, with PacketByteCnt =0	0	1	1		MODE.Exec, TIP.PGE(NLIP), PSB, PSBEND (see Section 35.4.2.8, 35.4.2.7, 35.4.2.13,35.4.2.15, 35.4.2.17)
3a	WRMSR that changes TraceEn 1 -> 0	0	0	D.C.		None
3b	WRMSR that changes TraceEn 1 -> 0	1	0	D.C.		FUP(CLIP), TIP.PGD()

35.8 SOFTWARE CONSIDERATIONS

35.8.1 Tracing SMM Code

Nothing prevents an SMM handler from configuring and enabling packet generation for its own use. As described in Section , SMI will always clear TraceEn, so the SMM handler would have to set TraceEn in order to enable tracing. There are some unique aspects and guidelines involved with tracing SMM code, which follows:

1. SMM should save away the existing values of any configuration MSRs that SMM intends to modify for tracing. This will allow the non-SMM tracing context to be restored before RSM.
2. It is recommended that SMM wait until it sets CSbase to 0 before enabling packet generation, to avoid possible LIP vs RIP confusion.
3. Packet output cannot be directed to SMRR memory, even while tracing in SMM.
4. Before performing RSM, SMM should take care to restore modified configuration MSRs to the values they had immediately after #SMI. This involves first disabling packet generation by clearing TraceEn, then restoring any other configuration MSRs that were modified.
5. RSM
   - Software must ensure that TraceEn=0 at the time of RSM. Tracing RSM is not a supported usage model, and the packets generated by RSM are undefined.
   - For processors on which Intel PT and LBR use are mutually exclusive (see Section 35.3.1.2), any RSM during which TraceEn is restored to 1 will suspend any LBR or BTS logging.

35.8.2 Cooperative Transition of Multiple Trace Collection Agents

A third-party trace-collection tool should take into consideration the fact that it may be deployed on a processor that supports Intel PT but may run under any operating system.

In such a deployment scenario, Intel recommends that tool agents follow similar principles of cooperative transition of single-use hardware resources, similar to how performance monitoring tools handle performance monitoring hardware:

- Respect the "in-use" ownership of an agent who already configured the trace configuration MSRs, see architectural MSRs with the prefix "IA32_RTIT_" in Chapter 2, "Model-Specific Registers (MSRs)" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4*, where "in-use" can be determined by reading the "enable bits" in the configuration MSRs.

- Relinquish ownership of the trace configuration MSRs by clearing the "enabled bits" of those configuration MSRs.

35.8.3 Tracking Time

This section describes the relationships of several clock counters whose update frequencies reside in different domains that feed into the timing packets. To track time, the decoder also needs to know the regularity or irregularity of the occurrences of various timing packets that store those clock counters.

Intel PT provides time information for three different but related domains:

- Processor timestamp counter

  This counter increments at the max non-turbo or P1 frequency, and its value is returned on a RDTSC. Its frequency is fixed. The TSC packet holds the lower 7 bytes of the timestamp counter value. The TSC packet occurs occasionally and are much less frequent than the frequency of the time stamp counter. The timestamp counter will continue to increment when the processor is in deep C-States, with the exception of processors reporting CPUID.80000007H:EDX.InvariantTSC[bit 8] =0.
- Core crystal clock

  The ratio of the core crystal clock to timestamp counter frequency is known as P, and can be calculated as CPUID.15H:EBX[31:0] / CPUID.15H:EAX[31:0]. The frequency of the core crystal clock is fixed and lower than that of the timestamp counter. The periodic MTC packet is generated based on software-selected multiples of the crystal clock frequency. The MTC packet is expected to occur more frequently than the TSC packet.
- Processor core clock

  The processor core clock frequency can vary due to P-state and thermal conditions. The CYC packet provides elapsed time as measured in processor core clock cycles relative to the last CYC packet.

A decoder can use all or some combination of these packets to track time at different resolutions throughout the trace packets.

35.8.3.1 Time Domain Relationships

The three domains are related by the following formula:

```
TimeStampValue = (CoreCrystalClockValue * P) + AdjustedProcessorCycles + Software_Offset;
```

The CoreCrystalClockValue can provide the coarse-grained component of the TSC value. P, or the TSC/"core crystal clock" ratio, can be derived from CPUID leaf 15H, as described in Section 35.8.3.

The AdjustedProcessorCycles component provides the fine-grained distance from the rising edge of the last core crystal clock. Specifically, it is a cycle count in the same frequency as the timestamp counter from the last crystal clock rising edge. The value is adjusted based on the ratio of the processor core clock frequency to the Maximum Non-Turbo (or P1) frequency.

The Software_Offsets component includes software offsets that are factored into the timestamp value, such as IA32_TSC_ADJUST.

35.8.3.2 Estimating TSC within Intel PT

For many usages, it may be useful to have an estimated timestamp value for all points in the trace. The formula provided in Section 35.8.3.1 above provides the framework for how such an estimate can be calculated from the various timing packets present in the trace.

The TSC packet provides the precise timestamp value at the time it is generated; however, TSC packets are infrequent, and estimates of the current timestamp value based purely on TSC packets are likely to be very inaccurate for this reason. In order to get more precise timing information between TSC packets, CYC packets and/or MTC packets should be enabled.

MTC packets provide incremental updates of the CoreCrystalClockValue. On processors that support CPUID leaf 15H, the frequency of the timestamp counter and the core crystal clock is fixed, thus MTC packets provide a means to update the running timestamp estimate. Between two MTC packets A and B, the number of crystal clock cycles passed is calculated from the 8-bit payloads of respective MTC packets:

(CTC_B - CTC_A), where CTC_i = MTC_i[15:8] << IA32_RTIT_CTL.MTCFreq and i = A, B.

The time from a TSC packet to the subsequent MTC packet can be calculated using the TMA packet that follows the TSC packet. The TMA packet provides both the crystal clock value (lower 16 bits, in the CTC field) and the AdjustedProcessorCycles value (in the FastCounter field) that can be used in the calculation of the corresponding core crystal clock value of the TSC packet.

When the next MTC after a pair of TSC/TMA is seen, the number of crystal clocks passed since the TSC packet can be calculated by subtracting the TMA.CTC value from the time indicated by the MTC_{Next} packet by

CTC_{Delta}[15:0] = (CTC_{Next}[15:0] - TMA.CTC[15:0]), where CTC_{Next} = $MTC_{Payload}$ << IA32_RTIT_CTL.MTCFreq.

The TMA.FastCounter field provides the fractional component of the TSC packet into the next crystal clock cycle.

CYC packets can provide further precision of an estimated timestamp value to many non-timing packets, by providing an indication of the time passed between other timing packets (MTCs or TSCs).

When enabled, CYC packets are sent preceding each CYC-eligible packet, and provide the number of processor core clock cycles that have passed since the last CYC packet. Thus between MTCs and TSCs, the accumulated CYC values can be used to estimate the adjusted_processor_cycles component of the timestamp value. The accumulated CPU cycles will have to be adjusted to account for the difference in frequency between the processor core clock and the P1 frequency. The necessary adjustment can be estimated using the core:bus ratio value given in the CBR packet, by multiplying the accumulated cycle count value by $P1/CBR_{payload}$.

Note that stand-alone TSC packets (that is, TSC packets that are not a part of a PSB+) are typically generated only when generation of other timing packets (MTCs and CYCs) has ceased for a period of time. Example scenarios include when Intel PT is re-enabled, or on wake after a sleep state. Thus any calculation of ART or cycle time leading up to a TSC packet will likely result in a discrepancy, which the TSC packet serves to correct.

A greater level of precision may be achieved by calculating the CPU clock frequency, see Section 35.8.3.4 below for a method to do so using Intel PT packets.

CYCs can be used to estimate time between TSCs even without MTCs, though this will likely result in a reduction in estimated TSC precision.

35.8.3.3 VMX TSC Manipulation

When software executes in non-Root operation, additional offset and scaling factors may be applied to the TSC value. These are optional, but may be enabled via VMCS controls on a per-VM basis. See Chapter 25, “VMX Non-Root Operation” for details on VMX TSC offsetting and TSC scaling.

Like the value returned by RDTSC, TSC packets will include these adjustments, but other timing packets (such as MTC, CYC, and CBR) are not impacted. In order to use the algorithm above to estimate the TSC value when TSC scaling is in use, it will be necessary for software to account for the scaling factor. See Section 35.5.2.6 for details.

35.8.3.4 Calculating Frequency with Intel PT

Because Intel PT can provide both wall-clock time and processor clock cycle time, it can be used to measure the processor core clock frequency. Either TSC or MTC packets can be used to track the wall-clock time. By using CYC packets to count the number of processor core cycles that pass in between a pair of wall-clock time packets, the ratio between processor core clock frequency and TSC frequency can be derived. If the P1 frequency is known, it can be applied to determine the CPU frequency. See Section 35.8.3.1 above for details on the relationship between TSC, MTC, and CYC.

23.Updates to Chapter 36, Volume 3D

Change bars show changes to Chapter 36 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D:* System Programming Guide, Part 4.

Changes to this chapter: Various updates throughout chapter regarding Intel SGX and new Intel SGX VM Over-subscription feature.

CHAPTER 36
INTRODUCTION TO INTEL® SOFTWARE GUARD EXTENSIONS

36.1 OVERVIEW

Intel® Software Guard Extensions (Intel® SGX) is a set of instructions and mechanisms for memory accesses added to Intel® Architecture processors. Intel SGX can encompass two collections of instruction extensions, referred to as SGX1 and SGX2, see Table 36-1 and Table 36-2. The SGX1 extensions allow an application to instantiate a protected container, referred to as an enclave. An enclave is a protected area in the application's address space (see Figure 36-1), which provides confidentiality and integrity even in the presence of privileged malware. Accesses to the enclave memory area from any software not resident in the enclave are prevented. The SGX2 extensions allow additional flexibility in runtime management of enclave resources and thread execution within an enclave.

Chapter 37 covers main concepts, objects and data structure formats that interact within the Intel SGX architecture. Chapter 38 covers operational aspects ranging from preparing an enclave, transferring control to enclave code, and programming considerations for the enclave code and system software providing support for enclave execution. Chapter 39 describes the behavior of Asynchronous Enclave Exit (AEX) caused by events while executing enclave code. Chapter 40 covers the syntax and operational details of the instruction and associated leaf functions available in Intel SGX. Chapter 41 describes interaction of various aspects of IA32 and Intel® 64 architectures with Intel SGX. Chapter 42 covers Intel SGX support for application debug, profiling and performance monitoring.

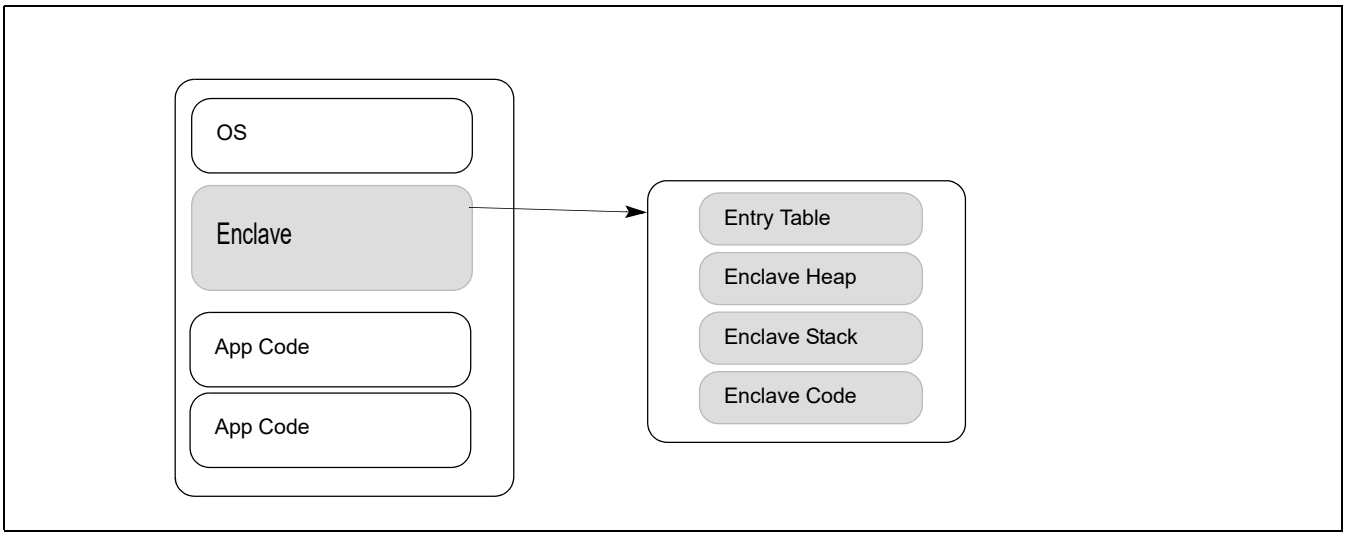

Figure 36-1. An Enclave Within the Application's Virtual Address Space

36.2 ENCLAVE INTERACTION AND PROTECTION

Intel SGX allows the protected portion of an application to be distributed in the clear. Before the enclave is built, the enclave code and data are free for inspection and analysis. The protected portion is loaded into an enclave where its code and data is measured. Once the application's protected portion of the code and data are loaded into an enclave, it is protected against external software access. An enclave can prove its identity to a remote party and provide the necessary building-blocks for secure provisioning of keys and credentials. The application can also request an enclave-specific and platform-specific key that it can use to protect keys and data that it wishes to store outside the enclave.[1]

1. For additional information, see white papers on Intel SGX at http://software.intel.com/en-us/intel-isa-extensions.

Intel SGX introduces two significant capabilities to the Intel Architecture. First is the change in enclave memory access semantics. The second is protection of the address mappings of the application.

36.3 ENCLAVE LIFE CYCLE

Enclave memory management is divided into two parts: address space allocation and memory commitment. Address space allocation is the specification of the range of logical addresses that the enclave may use. This range is called the ELRANGE. No actual resources are committed to this region. Memory commitment is the assignment of actual memory resources (as pages) within the allocated address space. This two-phase technique allows flexibility for enclaves to control their memory usage and to adjust dynamically without overusing memory resources when enclave needs are low. Commitment adds physical pages to the enclave. An operating system may support separate allocate and commit operations.

During enclave creation, code and data for an enclave are loaded from a clear-text source, i.e. from non-enclave memory.

Untrusted application code starts using an initialized enclave typically by using the EENTER leaf function provided by Intel SGX to transfer control to the enclave code residing in the protected Enclave Page Cache (EPC). The enclave code returns to the caller via the EEXIT leaf function. Upon enclave entry, control is transferred by hardware to software inside the enclave. The software inside the enclave switches the stack pointer to one inside the enclave. When returning back from the enclave, the software swaps back the stack pointer then executes the EEXIT leaf function.

On processors that support the SGX2 extensions, an enclave writer may add memory to an enclave using the SGX2 instruction set, after the enclave is built and running. These instructions allow adding additional memory resources to the enclave for use in such areas as the heap. In addition, SGX2 instructions allow the enclave to add new threads to the enclave. The SGX2 features provide additional capabilities to the software model without changing the security properties of the Intel SGX architecture.

Calling an external procedure from an enclave could be done using the EEXIT leaf function. Software would use EEXIT and a software convention between the trusted section and the untrusted section.

An active enclave consumes resources from the Enclave Page Cache (EPC, see Section 36.5). Intel SGX provides the EREMOVE instruction that an EPC manager can use to reclaim EPC pages committed to an enclave. The EPC manager uses EREMOVE on every enclave page when the enclave is torn down. After successful execution of EREMOVE the EPC page is available for allocation to another enclave.

36.4 DATA STRUCTURES AND ENCLAVE OPERATION

There are 2 main data structures associated with operating an enclave, the SGX Enclave Control Structure (SECS, see Section 37.7) and the Thread Control Structure (TCS, see Section 37.8).

There is one SECS for each enclave. The SECS contains meta-data about the enclave which is used by the hardware and cannot be directly accessed by software. Included in the SECS is a field that stores the enclave build measurement value. This field, MRENCLAVE, is initialized by the ECREATE instruction and updated by every EADD and EEXTEND. It is locked by EINIT.

Every enclave contains one or more TCS structures. The TCS contains meta-data used by the hardware to save and restore thread specific information when entering/exiting the enclave. There is one field, FLAGS, that may be accessed by software. This field can only be accessed by debug enclaves. The flag bit, DBGOPTIN, allows to single step into the thread associated with the TCS. (see Section 37.8.1)

The SECS is created when ECREATE (see Table 36-1) is executed. The TCS can be created using the EADD instruction or the SGX2 instructions (see Table 36-2).

36.5 ENCLAVE PAGE CACHE

The Enclave Page Cache (EPC) is the secure storage used to store enclave pages when they are a part of an executing enclave. For an EPC page, hardware performs additional access control checks to restrict access to the page. After the current page access checks and translations are performed, the hardware checks that the EPC page

is accessible to the program currently executing. Generally an EPC page is only accessed by the owner of the executing enclave or an instruction which is setting up an EPC page

The EPC is divided into EPC pages. An EPC page is 4KB in size and always aligned on a 4KB boundary.

Pages in the EPC can either be valid or invalid. Every valid page in the EPC belongs to one enclave instance. Each enclave instance has an EPC page that holds its SECS. The security metadata for each EPC page is held in an internal micro-architectural structure called Enclave Page Cache Map (EPCM, see Section 36.5.1).

The EPC is managed by privileged software. Intel SGX provides a set of instructions for adding and removing content to and from the EPC. The EPC may be configured by BIOS at boot time. On implementations in which EPC memory is part of system DRAM, the contents of the EPC are protected by an encryption engine.

36.5.1 Enclave Page Cache Map (EPCM)

The EPCM is a secure structure used by the processor to track the contents of the EPC. The EPCM holds one entry for each page in the EPC. The format of the EPCM is micro-architectural, and consequently is implementation dependent. However, the EPCM contains the following architectural information:

- The status of EPC page with respect to validity and accessibility.
- An SECS identifier (see Section 37.19) of the enclave to which the page belongs.
- The type of page: regular, SECS, TCS or VA.
- The linear address through which the enclave is allowed to access the page.
- The specified read/write/execute permissions on that page.

The EPCM structure is used by the CPU in the address-translation flow to enforce access-control on the EPC pages. The EPCM structure is described in Table 37-27, and the conceptual access-control flow is described in Section 37.5.

The EPCM entries are managed by the processor as part of various instruction flows.

36.6 ENCLAVE INSTRUCTIONS AND INTEL® SGX

The enclave instructions available with Intel SGX are organized as leaf functions under three instruction mnemonics: ENCLS (ring 0), ENCLU (ring 3), and ENCLV (VT root mode). Each leaf function uses EAX to specify the leaf function index, and may require additional implicit input registers as parameters. The use of EAX is implied implicitly by the ENCLS, ENCLU, and ENCLV instructions; ModR/M byte encoding is not used with ENCLS, ENCLU, and ENCLV. The use of additional registers does not use ModR/M encoding and is implied implicitly by the respective leaf function index.

Each leaf function index is also associated with a unique, leaf-specific mnemonic. A long-form expression of Intel SGX instruction takes the form of ENCLx[LEAF_MNEMONIC], where 'x' is either 'S', 'U', or 'V'. The long-form expression provides clear association of the privilege-level requirement of a given "leaf mnemonic". For simplicity, the unique "Leaf_Mnemonic" name is used (omitting the ENCLx for convenience) throughout in this document.

Details of individual SGX leaf functions are described in Chapter 40. Table 36-1 provides a summary of the instruction leaves that are available in the initial implementation of Intel SGX, which is introduced in the 6th generation Intel Core processors. Table 36-2 summarizes enhancement of Intel SGX for future Intel processors.

Table 36-1. Supervisor and User Mode Enclave Instruction Leaf Functions in Long-Form of SGX1

Supervisor Instruction	Description	User Instruction	Description
ENCLS[EADD]	Add an EPC page to an enclave.	ENCLU[EENTER]	Enter an enclave.
ENCLS[EBLOCK]	Block an EPC page.	ENCLU[EEXIT]	Exit an enclave.
ENCLS[ECREATE]	Create an enclave.	ENCLU[EGETKEY]	Create a cryptographic key.
ENCLS[EDBGRD]	Read data from a debug enclave by debugger.	ENCLU[EREPORT]	Create a cryptographic report.

Table 36-1. Supervisor and User Mode Enclave Instruction Leaf Functions in Long-Form of SGX1

Supervisor Instruction	Description	User Instruction	Description
ENCLS[EDBGWR]	Write data into a debug enclave by debugger.	ENCLU[ERESUME]	Re-enter an enclave.
ENCLS[EEXTEND]	Extend EPC page measurement.		
ENCLS[EINIT]	Initialize an enclave.		
ENCLS[ELDB]	Load an EPC page in blocked state.		
ENCLS[ELDU]	Load an EPC page in unblocked state.		
ENCLS[EPA]	Add an EPC page to create a version array.		
ENCLS[EREMOVE]	Remove an EPC page from an enclave.		
ENCLS[ETRACK]	Activate EBLOCK checks.		
ENCLS[EWB]	Write back/invalidate an EPC page.		

Table 36-2. Supervisor and User Mode Enclave Instruction Leaf Functions in Long-Form of SGX2

Supervisor Instruction	Description	User Instruction	Description
ENCLS[EAUG]	Allocate EPC page to an existing enclave.	ENCLU[EACCEPT]	Accept EPC page into the enclave.
ENCLS[EMODPR]	Restrict page permissions.	ENCLU[EMODPE]	Enhance page permissions.
ENCLS[EMODT]	Modify EPC page type.	ENCLU[EACCEPTCOPY]	Copy contents to an augmented EPC page and accept the EPC page into the enclave.

Table 36-3. VMX Operation and Supervisor Mode Enclave Instruction Leaf Functions in Long-Form of OVERSUB

Supervisor Instruction	Description	User Instruction	Description
ENCLV[EDECVIRTCHILD]	Decrement the virtual child page count.	ENCLS[ERDINFO]	Read information about EPC page.
ENCLV[EINCVIRTCHILD]	Increment the virtual child page count.	ENCLS[TRACKC]	Activate EBLOCK checks with conflict reporting.
ENCLV[ESETCONTEXT]	Set virtualization context.	ENCLS[ELDBC/UC]	Load an EPC page with conflict reporting.

36.7 DISCOVERING SUPPORT FOR INTEL® SGX AND ENABLING ENCLAVE INSTRUCTIONS

Detection of support of Intel SGX and enumeration of available and enabled Intel SGX resources are queried using the CPUID instruction. The enumeration interface comprises the following:

- Processor support of Intel SGX is enumerated by a feature flag in CPUID leaf 07H: CPUID.(EAX=07H, ECX=0H):EBX.SGX[bit 2]. If CPUID.(EAX=07H, ECX=0H):EBX.SGX = 1, the processor has support for Intel SGX, and requires opt-in enabling by BIOS via IA32_FEATURE_CONTROL MSR.

  If CPUID.(EAX=07H, ECX=0H):EBX.SGX = 1, CPUID will report via the available sub-leaves of CPUID.(EAX=12H) on available and/or configured Intel SGX resources.
- The available and configured Intel SGX resources enumerated by the sub-leaves of CPUID.(EAX=12H) depend on the state of BIOS configuration.

36.7.1 Intel® SGX Opt-In Configuration

On processors that support Intel SGX, IA32_FEATURE_CONTROL provides the SGX_ENABLE field (bit 18). Before system software can configure and enable Intel SGX resources, BIOS is required to set IA32_FEATURE_CONTROL.SGX_ENABLE = 1 to opt-in the use of Intel SGX by system software.

The semantics of setting SGX_ENABLE follows the rules of IA32_FEATURE_CONTROL.LOCK (bit 0). Software is considered to have opted into Intel SGX if and only if IA32_FEATURE_CONTROL.SGX_ENABLE and IA32_FEATURE_CONTROL.LOCK are set to 1. The setting of IA32_FEATURE_CONTROL.SGX_ENABLE (bit 18) is not reflected by CPUID.

Table 36-4. Intel® SGX Opt-in and Enabling Behavior

CPUID.(07H,0H):EBX.SGX	CPUID.(12H)	FEATURE_CONTROL.LOCK	FEATURE_CONTROL.SGX_ENABLE	Enclave Instruction
0	Invalid	X	X	#UD
1	Valid*	X	X	#UD**
1	Valid*	0	X	#GP
1	Valid*	1	0	#GP
1	Valid*	1	1	Available (see Table 36-5 for details of SGX1 and SGX2).
* Leaf 12H enumeration results are dependent on enablement. ** See list of conditions in the #UD section of the reference pages of ENCLS and ENCLU				

36.7.2 Intel® SGX Resource Enumeration Leaves

If CPUID.(EAX=07H, ECX=0H):EBX.SGX = 1, the processor also supports querying CPUID with EAX=12H on Intel SGX resource capability and configuration. The number of available sub-leaves in leaf 12H depends on the Opt-in and system software configuration. Information returned by CPUID.12H is thread specific; software should not assume that if Intel SGX instructions are supported on one hardware thread, they are also supported elsewhere.

A properly configured processor exposes Intel SGX functionality with CPUID.EAX=12H reporting valid information (non-zero content) in three or more sub-leaves, see Table 36-5.

- CPUID.(EAX=12H, ECX=0H) enumerates Intel SGX capability, including enclave instruction opcode support.
- CPUID.(EAX=12H, ECX=1H) enumerates Intel SGX capability of processor state configuration and enclave configuration in the SECS structure (see Table 37-3).
- CPUID.(EAX=12H, ECX >1) enumerates available EPC resources.

Table 36-5. CPUID Leaf 12H, Sub-Leaf 0 Enumeration of Intel® SGX Capabilities

CPUID.(EAX=12H,ECX=0)		Description Behavior
Register	Bits	
EAX	0	SGX1: If 1, indicates leaf functions of SGX1 instruction listed in Table 36-1 are supported.
	1	SGX2: If 1, indicates leaf functions of SGX2 instruction listed in Table 36-2 are supported.
	4:2	Reserved (0)
	5	OVERSUB: If 1, indicates Intel SGX supports instructions: EINCVIRTCHILD, EDECVIRTCHILD, and ESETCONTEXT.
	6	OVERSUB: If 1, indicates Intel SGX supports instructions: ETRACKC, ERDINFO, ELDBC, and ELDUC.
	31:7	Reserved (0)
EBX	31:0	MISCSELECT: Reports the bit vector of supported extended features that can be written to the MISC region of the SSA.
ECX	31:0	Reserved (0).

Table 36-5. CPUID Leaf 12H, Sub-Leaf 0 Enumeration of Intel® SGX Capabilities

CPUID.(EAX=12H,ECX=0)		Description Behavior
Register	Bits	
EDX	7:0	MaxEnclaveSize_Not64: the maximum supported enclave size is 2^(EDX[7:0]) bytes when not in 64-bit mode.
	15:8	MaxEnclaveSize_64: the maximum supported enclave size is 2^(EDX[15:8]) bytes when operating in 64-bit mode.
	31:16	Reserved (0).

Table 36-6. CPUID Leaf 12H, Sub-Leaf 1 Enumeration of Intel® SGX Capabilities

CPUID.(EAX=12H,ECX=1)		Description Behavior
Register	Bits	
EAX	31:0	Report the valid bits of SECS.ATTRIBUTES[31:0] that software can set with ECREATE. SECS.ATTRIBUTES[n] can be set to 1 using ECREATE only if EAX[n] is 1, where n < 32.
EBX	31:0	Report the valid bits of SECS.ATTRIBUTES[63:32] that software can set with ECREATE. SECS.ATTRIBUTES[n+32] can be set to 1 using ECREATE only if EBX[n] is 1, where n < 32.
ECX	31:0	Report the valid bits of SECS.ATTRIBUTES[95:64] that software can set with ECREATE. SECS.ATTRIBUTES[n+64] can be set to 1 using ECREATE only if ECX[n] is 1, where n < 32.
EDX	31:0	Report the valid bits of SECS.ATTRIBUTES[127:96] that software can set with ECREATE. SECS.ATTRIBUTES[n+96] can be set to 1 using ECREATE only if EDX[n] is 1, where n < 32.

On processors that support Intel SGX1 and SGX2, CPUID leaf 12H sub-leaf 2 report physical memory resources available for use with Intel SGX. These physical memory sections are typically allocated by BIOS as **Processor Reserved Memory**, and available to the OS to manage as EPC.

To enumerate how many EPC sections are available to the EPC manager, software can enumerate CPUID leaf 12H with sub-leaf index starting from 2, and decode the sub-leaf-type encoding (returned in EAX[3:0]) until the sub-leaf type is invalid. All invalid sub-leaves of CPUID leaf 12H return EAX/EBX/ECX/EDX with 0.

Table 36-7. CPUID Leaf 12H, Sub-Leaf Index 2 or Higher Enumeration of Intel® SGX Resources

CPUID.(EAX=12H,ECX > 1)		Description Behavior
Register	Bits	
EAX	3:0	0000b: This sub-leaf is invalid; EDX:ECX:EBX:EAX return 0. 0001b: This sub-leaf enumerates an EPC section. EBX:EAX and EDX:ECX provide information on the Enclave Page Cache (EPC) section. All other encoding are reserved.
	11:4	Reserved (enumerate 0).
	31:12	If EAX[3:0] = 0001b, these are bits 31:12 of the physical address of the base of the EPC section.
EBX	19:0	If EAX[3:0] = 0001b, these are bits 51:32 of the physical address of the base of the EPC section.
	31:20	Reserved.
ECX	3: 0	If EAX[3:0] 0000b, then all bits of the EDX:ECX pair are enumerated as 0. If EAX[3:0] 0001b, then this section has confidentiality and integrity protection. All other encoding are reserved.
	11:4	Reserved (enumerate 0).
	31:12	If EAX[3:0] = 0001b, these are bits 31:12 of the size of the corresponding EPC section within the Processor Reserved Memory.

Table 36-7. CPUID Leaf 12H, Sub-Leaf Index 2 or Higher Enumeration of Intel® SGX Resources

CPUID.(EAX=12H,ECX > 1)		Description Behavior
Register	**Bits**	
EDX	19: 0	If EAX[3:0] = 0001b, these are bits 51:32 of the size of the corresponding EPC section within the Processor Reserved Memory.
	31:20	Reserved.

24.Updates to Chapter 37, Volume 3D

Change bars show changes to Chapter 37 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D:* System Programming Guide, Part 4.

Changes to this chapter: Various updates throughout chapter regarding Intel SGX and new Intel SGX VM Over-subscription feature.

CHAPTER 37
ENCLAVE ACCESS CONTROL AND DATA STRUCTURES

37.1 OVERVIEW OF ENCLAVE EXECUTION ENVIRONMENT

When an enclave is created, it has a range of linear addresses that the processor applies enhanced access control. This ranged is called the ELRANGE (see Section 36.3). When an enclave generates a memory access, the existing IA32 segmentation and paging architecture are applied. Additionally, linear addresses inside the ELRANGE must map to an EPC page otherwise when an enclave attempts to access that linear address a fault is generated.

The EPC pages need not be physically contiguous. System software allocates EPC pages to various enclaves. Enclaves must abide by OS/VMM imposed segmentation and paging policies. OS/VMM-managed page tables and extended page tables provide address translation for the enclave pages. Hardware requires that these pages are properly mapped to EPC (any failure generates an exception).

Enclave entry must happen through specific enclave instructions:

- ENCLU[EENTER], ENCLU[ERESUME].

Enclave exit must happen through specific enclave instructions or events:

- ENCLU[EEXIT], Asynchronous Enclave Exit (AEX).

Attempts to execute, read, or write to linear addresses mapped to EPC pages when not inside an enclave will result in the processor altering the access to preserve the confidentiality and integrity of the enclave. The exact behavior may be different between implementations. As an example a read of an enclave page may result in the return of all one's or return of cyphertext of the cache line. Writing to an enclave page may result in a dropped write or a machine check at a later time. The processor will provide the protections as described in Section 37.4 and Section 37.5 on such accesses.

37.2 TERMINOLOGY

A memory access to the ELRANGE and initiated by an instruction executed by an enclave is called a Direct Enclave Access (Direct EA).

Memory accesses initiated by certain Intel® SGX instruction leaf functions such as ECREATE, EADD, EDBGRD, EDBGWR, ELDU/ELDB, EWB, EREMOVE, EENTER, and ERESUME to EPC pages are called Indirect Enclave Accesses (Indirect EA). Table 37-1 lists additional details of the indirect EA of SGX1 and SGX2 extensions.

Direct EAs and Indirect EAs together are called Enclave Accesses (EAs).

Any memory access that is not an Enclave Access is called a non-enclave access.

37.3 ACCESS-CONTROL REQUIREMENTS

Enclave accesses have the following access-control attributes:

- All memory accesses must conform to segmentation and paging protection mechanisms.
- Code fetches from inside an enclave to a linear address outside that enclave result in a #GP(0) exception.
- Non-enclave accesses to EPC memory result in undefined behavior. EPC memory is protected as described in Section 37.4 and Section 37.5 on such accesses.
- EPC pages of page types PT_REG, PT_TCS and PT_TRIM must be mapped to ELRANGE at the linear address specified when the EPC page was allocated to the enclave using ENCLS[EADD] or ENCLS[EAUG] leaf functions. Enclave accesses through other linear address result in a #PF with the PFEC.SGX bit set.
- Direct EAs to any EPC pages must conform to the currently defined security attributes for that EPC page in the EPCM. These attributes may be defined at enclave creation time (EADD) or when the enclave sets them using SGX2 instructions. The failure of these checks results in a #PF with the PFEC.SGX bit set.

— Target page must belong to the currently executing enclave.
— Data may be written to an EPC page if the EPCM allow write access.
— Data may be read from an EPC page if the EPCM allow read access.
— Instruction fetches from an EPC page are allowed if the EPCM allows execute access.
— Target page must not have a restricted page type[1] (PT_SECS, PT_TCS, PT_VA, or PT_TRIM).
— The EPC page must not be BLOCKED.
— The EPC page must not be PENDING.
— The EPC page must not be MODIFIED.

37.4 SEGMENT-BASED ACCESS CONTROL

Intel SGX architecture does not modify the segment checks performed by a logical processor. All memory accesses arising from a logical processor in protected mode (including enclave access) are subject to segmentation checks with the applicable segment register.

To ensure that outside entities do not modify the enclave's logical-to-linear address translation in an unexpected fashion, ENCLU[EENTER] and ENCLU[ERESUME] check that CS, DS, ES, and SS, if usable (i.e., not null), have segment base value of zero. A non-zero segment base value for these registers results in a #GP(0).

On enclave entry either via EENTER or ERESUME, the processor saves the contents of the external FS and GS registers, and loads these registers with values stored in the TCS at build time to enable the enclave’s use of these registers for accessing the thread-local storage inside the enclave. On EEXIT and AEX, the contents at time of entry are restored. On AEX, the values of FS and GS are saved in the SSA frame. On ERESUME, FS and GS are restored from the SSA frame. The details of these operations can be found in the descriptions of EENTER, ERESUME, EEXIT, and AEX flows.

37.5 PAGE-BASED ACCESS CONTROL

37.5.1 Access-control for Accesses that Originate from non-SGX Instructions

Intel SGX builds on the processor's paging mechanism to provide page-granular access-control for enclave pages. Enclave pages are only accessible from inside the currently executing enclave if they belong to that enclave. In addition, enclave accesses must conform to the access control requirements described in Section 37.3. or through certain Intel SGX instructions. Attempts to execute, read, or write to linear addresses mapped to EPC pages when not inside an enclave will result in the processor altering the access to preserve the confidentiality and integrity of the enclave. The exact behavior may be different between implementations.

37.5.2 Memory Accesses that Split across ELRANGE

Memory data accesses are allowed to split across ELRANGE (i.e., a part of the access is inside ELRANGE and a part of the access is outside ELRANGE) while the processor is inside an enclave. If an access splits across ELRANGE, the processor splits the access into two sub-accesses (one inside ELRANGE and the other outside ELRANGE), and each access is evaluated. A code-fetch access that splits across ELRANGE results in a #GP due to the portion that lies outside of the ELRANGE.

37.5.3 Implicit vs. Explicit Accesses

Memory accesses originating from Intel SGX instruction leaf functions are categorized as either explicit accesses or implicit accesses. Table 37-1 lists the implicit and explicit memory accesses made by Intel SGX leaf functions.

1. EPCM may allow write, read or execute access only for pages with page type PT_REG.

37.5.3.1 Explicit Accesses

Accesses to memory locations provided as explicit operands to Intel SGX instruction leaf functions, or their linked data structures are called explicit accesses.

Explicit accesses are always made using logical addresses. These accesses are subject to segmentation, paging, extended paging, and APIC-virtualization checks, and trigger any faults/exit associated with these checks when the access is made.

The interaction of explicit memory accesses with data breakpoints is leaf-function-specific, and is documented in Section 42.3.4.

37.5.3.2 Implicit Accesses

Accesses to data structures whose physical addresses are cached by the processor are called implicit accesses. These addresses are not passed as operands of the instruction but are implied by use of the instruction.

These accesses do not trigger any access-control faults/exits or data breakpoints. Table 37-1 lists memory objects that Intel SGX instruction leaf functions access either by explicit access or implicit access. The addresses of explicit access objects are passed via register operands with the second through fourth column of Table 37-1 matching implicitly encoded registers RBX, RCX, RDX.

Physical addresses used in different implicit accesses are cached via different instructions and for different durations. The physical address of SECS associated with each EPC page is cached at the time the page is added to the enclave via ENCLS[EADD] or ENCLS[EAUG], or when the page is loaded to EPC via ENCLS[ELDB] or ENCLS[ELDU]. This binding is severed when the corresponding page is removed from the EPC via ENCLS[EREMOVE] or ENCLS[EWB]. Physical addresses of TCS and SSA pages are cached at the time of most-recent enclave entry. Exit from an enclave (ENCLU[EEXIT] or AEX) flushes this caching. Details of Asynchronous Enclave Exit is described in Chapter 39.

The physical addresses that are cached for use by implicit accesses are derived from logical (or linear) addresses after checks such as segmentation, paging, EPT, and APIC virtualization checks. These checks may trigger exceptions or VM exits. Note, however, that such exception or VM exits may not occur after a physical address is cached and used for an implicit access.

Table 37-1. List of Implicit and Explicit Memory Access by Intel® SGX Enclave Instructions

Instr. Leaf	Enum.	Explicit 1	Explicit 2	Explicit 3	Implicit
EACCEPT	SGX2	SECINFO	EPCPAGE		SECS
EACCEPTCOPY	SGX2	SECINFO	EPCPAGE (Src)	EPCPAGE (Dst)	
EADD	SGX1	PAGEINFO and linked structures	EPCPAGE		
EAUG	SGX2	PAGEINFO and linked structures	EPCPAGE		SECS
EBLOCK	SGX1	EPCPAGE			SECS
ECREATE	SGX1	PAGEINFO and linked structures	EPCPAGE		
EDBGRD	SGX1	EPCADDR	Destination		SECS

37.6 INTEL® SGX DATA STRUCTURES OVERVIEW

Enclave operation is managed via a collection of data structures. Many of the top-level data structures contain sub-structures. The top-level data structures relate to parameters that may be used in enclave setup/maintenance, by Intel SGX instructions, or AEX event. The top-level data structures are:

- SGX Enclave Control Structure (SECS)
- Thread Control Structure (TCS)
- State Save Area (SSA)
- Page Information (PAGEINFO)
- Security Information (SECINFO)
- Paging Crypto MetaData (PCMD)
- Enclave Signature Structure (SIGSTRUCT)
- EINIT Token Structure (EINITTOKEN)
- Report Structure (REPORT)
- Report Target Info (TARGETINFO)
- Key Request (KEYREQUEST)
- Version Array (VA)
- Enclave Page Cache Map (EPCM)
- Read Info (RDINFO)

Details of the top-level data structures and associated sub-structures are listed in Section 37.7 through Section 37.19.

37.7 SGX ENCLAVE CONTROL STRUCTURE (SECS)

The SECS data structure requires 4K-Bytes alignment.

Table 37-2. Layout of SGX Enclave Control Structure (SECS)

Field	OFFSET (Bytes)	Size (Bytes)	Description
SIZE	0	8	Size of enclave in bytes; must be power of 2.
BASEADDR	8	8	Enclave Base Linear Address must be naturally aligned to size.
SSAFRAMESIZE	16	4	Size of one SSA frame in pages, including XSAVE, pad, GPR, and MISC (if CPUID.(EAX=12H, ECX=0):.EBX != 0).
MISCSELECT	20	4	Bit vector specifying which extended features are saved to the MISC region (see Section 37.7.2) of the SSA frame when an AEX occurs.
RESERVED	24	24	
ATTRIBUTES	48	16	Attributes of the Enclave, see Table 37-3.
MRENCLAVE	64	32	Measurement Register of enclave build process. See SIGSTRUCT for format.
RESERVED	96	32	
MRSIGNER	128	32	Measurement Register extended with the public key that verified the enclave. See SIGSTRUCT for format.
RESERVED	160	32	
CONFIGID	192	64	Post EINIT configuration identity.
ISVPRODID	256	2	Product ID of enclave.
ISVSVN	258	2	Security version number (SVN) of the enclave.
CONFIGSVN	260	2	Post EINIT configuration security version number (SVN).
RESERVED	260	3834	The RESERVED field consists of the following: ▪ EID: An 8 byte Enclave Identifier. Its location is implementation specific. ▪ PAD: A 352 bytes padding pattern from the Signature (used for key derivation strings). It's location is implementation specific. ▪ VIRTCHILDCNT: An 8 byte Count of virtual children that have been paged out by a VMM. Its location is implementation specific. ▪ ENCLAVECONTEXT: An 8 byte Enclave context pointer. Its location is implementation specific. ▪ ISVFAMILYID: A 16 byte value assigned to identify the family of products the enclave belongs to. ▪ ISVEXTPRODID: A 16 byte value assigned to identify the product identity of the enclave. ▪ The remaining 3226 bytes are reserved area. The entire 3836 byte field must be cleared prior to executing ECREATE.

37.7.1 ATTRIBUTES

The ATTRIBUTES data structure is comprised of bit-granular fields that are used in the SECS, the REPORT and the KEYREQUEST structures. CPUID.(EAX=12H, ECX=1) enumerates a bitmap of permitted 1-setting of bits in ATTRIBUTES.

Table 37-3. Layout of ATTRIBUTES Structure

Field	Bit Position	Description
INIT	0	This bit indicates if the enclave has been initialized by EINIT. It must be cleared when loaded as part of ECREATE. For EREPORT instruction, TARGET_INFO.ATTRIBUTES[ENIT] must always be 1 to match the state after EINIT has initialized the enclave.
DEBUG	1	If 1, the enclave permit debugger to read and write enclave data using EDBGRD and EDBGWR.
MODE64BIT	2	Enclave runs in 64-bit mode.
RESERVED	3	Must be Zero.
PROVISIONKEY	4	Provisioning Key is available from EGETKEY.

Table 37-3. Layout of ATTRIBUTES Structure

Field	Bit Position	Description
EINITTOKEN_KEY	5	EINIT token key is available from EGETKEY.
RESERVED	6	Must be zero.
KSS	7	Key Separation and Sharing Enabled.
RESERVED	63:8	Must be zero.
XFRM	127:64	XSAVE Feature Request Mask. See Section 41.7.

37.7.2 SECS.MISCSELECT Field

CPUID.(EAX=12H, ECX=0):EBX[31:0] enumerates which extended information that the processor can save into the MISC region of SSA when an AEX occurs. An enclave writer can specify via SIGSTRUCT how to set the SECS.MISCSELECT field. The bit vector of MISCSELECT selects which extended information is to be saved in the MISC region of the SSA frame when an AEX is generated. The bit vector definition of extended information is listed in Table 37-4.

If CPUID.(EAX=12H, ECX=0):EBX[31:0] = 0, SECS.MISCSELECT field must be all zeros.

The SECS.MISCSELECT field determines the size of MISC region of the SSA frame, see Section 37.9.2.

Table 37-4. Bit Vector Layout of MISCSELECT Field of Extended Information

Field	Bit Position	Description
EXINFO	0	Report information about page fault and general protection exception that occurred inside an enclave.
Reserved	31:1	Reserved (0).

37.8 THREAD CONTROL STRUCTURE (TCS)

Each executing thread in the enclave is associated with a Thread Control Structure. It requires 4K-Bytes alignment.

Table 37-5. Layout of Thread Control Structure (TCS)

Field	OFFSET (Bytes)	Size (Bytes)	Description
STAGE	0	8	Enclave execution state of the thread controlled by this TCS. A value of 0 indicates that this TCS is available for enclave entry. A value of 1 indicates that a processer is currently executing an enclave in the context of this TCS.
FLAGS	8	8	The thread's execution flags (see Section 37.8.1).
OSSA	16	8	Offset of the base of the State Save Area stack, relative to the enclave base. Must be page aligned.
CSSA	24	4	Current slot index of an SSA frame, cleared by EADD and EACCEPT.
NSSA	28	4	Number of available slots for SSA frames.
OENTRY	32	8	Offset in enclave to which control is transferred on EENTER relative to the base of the enclave.
AEP	40	8	The value of the Asynchronous Exit Pointer that was saved at EENTER time.
OFSBASGX	48	8	Offset to add to the base address of the enclave for producing the base address of FS segment inside the enclave. Must be page aligned.
OGSBASGX	56	8	Offset to add to the base address of the enclave for producing the base address of GS segment inside the enclave. Must be page aligned.
FSLIMIT	64	4	Size to become the new FS limit in 32-bit mode.

Table 37-5. Layout of Thread Control Structure (TCS)

Field	OFFSET (Bytes)	Size (Bytes)	Description
GSLIMIT	68	4	Size to become the new GS limit in 32-bit mode.
RESERVED	72	4024	Must be zero.

37.8.1 TCS.FLAGS

Table 37-6. Layout of TCS.FLAGS Field

Field	Bit Position	Description
DBGOPTIN	0	If set, allows debugging features (single-stepping, breakpoints, etc.) to be enabled and active while executing in the enclave on this TCS. Hardware clears this bit on EADD. A debugger may later modify it if the enclave's ATTRIBUTES.DEBUG is set.
RESERVED	63:1	

37.8.2 State Save Area Offset (OSSA)

The OSSA points to a stack of State Save Area (SSA) frames (see Section 37.9) used to save the processor state when an interrupt or exception occurs while executing in the enclave.

37.8.3 Current State Save Area Frame (CSSA)

CSSA is the index of the current SSA frame that will be used by the processor to determine where to save the processor state on an interrupt or exception that occurs while executing in the enclave. It is an index into the array of frames addressed by OSSA. CSSA is incremented on an AEX and decremented on an ERESUME.

37.8.4 Number of State Save Area Frames (NSSA)

NSSA specifies the number of SSA frames available for this TCS. There must be at least one available SSA frame when EENTER-ing the enclave or the EENTER will fail.

37.9 STATE SAVE AREA (SSA) FRAME

When an AEX occurs while running in an enclave, the architectural state is saved in the thread's current SSA frame, which is pointed to by TCS.CSSA. An SSA frame must be page aligned, and contains the following regions:

- The XSAVE region starts at the base of the SSA frame, this region contains extended feature register state in an XSAVE/FXSAVE-compatible non-compacted format.
- A Pad region: software may choose to maintain a pad region separating the XSAVE region and the MISC region. Software choose the size of the pad region according to the sizes of the MISC and GPRSGX regions.
- The GPRSGX region. The GPRSGX region is the last region of an SSA frame (see Table 37-7). This is used to hold the processor general purpose registers (RAX … R15), the RIP, the outside RSP and RBP, RFLAGS and the AEX information.
- The MISC region (If CPUIDEAX=12H, ECX=0):EBX[31:0] != 0). The MISC region is adjacent to the GRPSGX region, and may contain zero or more components of extended information that would be saved when an AEX occurs. If the MISC region is absent, the region between the GPRSGX and XSAVE regions is the pad region that software can use. If the MISC region is present, the region between the MISC and XSAVE regions is the pad region that software can use. See additional details in Section 37.9.2.

Table 37-7. Top-to-Bottom Layout of an SSA Frame

Region	Offset (Byte)	Size (Bytes)	Description
XSAVE	0	Calculate using CPUID leaf 0DH information	The size of XSAVE region in SSA is derived from the enclave's support of the collection of processor extended states that would be managed by XSAVE. The enablement of those processor extended state components in conjunction with CPUID leaf 0DH information determines the XSAVE region size in SSA.
Pad	End of XSAVE region	Chosen by enclave writer	Ensure the end of GPRSGX region is aligned to the end of a 4KB page.
MISC	base of GPRSGX – sizeof(MISC)	Calculate from highest set bit of SECS.MISCSELECT	See Section 37.9.2.
GPRSGX	SSAFRAMESIZE – 176	176	See Table 37-8 for layout of the GPRSGX region.

37.9.1 GPRSGX Region

The layout of the GPRSGX region is shown in Table 37-8.

Table 37-8. Layout of GPRSGX Portion of the State Save Area

Field	OFFSET (Bytes)	Size (Bytes)	Description
RAX	0	8	
RCX	8	8	
RDX	16	8	
RBX	24	8	
RSP	32	8	
RBP	40	8	
RSI	48	8	
RDI	56	8	
R8	64	8	
R9	72	8	
R10	80	8	
R11	88	8	
R12	96	8	
R13	104	8	
R14	112	8	
R15	120	8	
RFLAGS	128	8	Flag register.
RIP	136	8	Instruction pointer.
URSP	144	8	Non-Enclave (outside) stack pointer. Saved by EENTER, restored on AEX.
URBP	152	8	Non-Enclave (outside) RBP pointer. Saved by EENTER, restored on AEX.
EXITINFO	160	4	Contains information about exceptions that cause AEXs, which might be needed by enclave software (see Section 37.9.1.1).
RESERVED	164	4	
FSBASE	168	8	FS BASE.
GSBASE	176	8	GS BASE.

37.9.1.1 EXITINFO

EXITINFO contains the information used to report exit reasons to software inside the enclave. It is a 4 byte field laid out as in Table 37-9. The VALID bit is set only for the exceptions conditions which are reported inside an enclave. See Table 37-10 for which exceptions are reported inside the enclave. If the exception condition is not one reported inside the enclave then VECTOR and EXIT_TYPE are cleared.

Table 37-9. Layout of EXITINFO Field

Field	Bit Position	Description
VECTOR	7:0	Exception number of exceptions reported inside enclave.
EXIT_TYPE	10:8	011b: Hardware exceptions. 110b: Software exceptions. Other values: Reserved.
RESERVED	30:11	Reserved as zero.
VALID	31	0: unsupported exceptions. 1: Supported exceptions. Includes two categories: • Unconditionally supported exceptions: #DE, #DB, #BP, #BR, #UD, #MF, #AC, #XM. • Conditionally supported exception: — #PF, #GP if SECS.MISCSELECT.EXINFO = 1.

37.9.1.2 VECTOR Field Definition

Table 37-10 contains the VECTOR field. This field contains information about some exceptions which occur inside the enclave. These vector values are the same as the values that would be used when vectoring into regular exception handlers. All values not shown are not reported inside an enclave.

Table 37-10. Exception Vectors

Name	Vector #	Description
#DE	0	Divider exception.
#DB	1	Debug exception.
#BP	3	Breakpoint exception.
#BR	5	Bound range exceeded exception.
#UD	6	Invalid opcode exception.
#GP	13	General protection exception. Only reported if SECS.MISCSELECT.EXINFO = 1.
#PF	14	Page fault exception. Only reported if SECS.MISCSELECT.EXINFO = 1.
#MF	16	x87 FPU floating-point error.
#AC	17	Alignment check exceptions.
#XM	19	SIMD floating-point exceptions.

37.9.2 MISC Region

The layout of the MISC region is shown in Table 37-11. The number of components that the processor supports in the MISC region corresponds to the set bits of CPUID.(EAX=12H, ECX=0):EBX[31:0] set to 1. Each set bit in CPUID.(EAX=12H, ECX=0):EBX[31:0] has a defined size for the corresponding component, as shown in Table 37-11. Enclave writers needs to do the following:

- Decide which MISC region components will be supported for the enclave.
- Allocate an SSA frame large enough to hold the components chosen above.
- Instruct each enclave builder software to set the appropriate bits in SECS.MISCSELECT.

The first component, EXINFO, starts next to the GPRSGX region. Additional components in the MISC region grow in ascending order within the MISC region towards the XSAVE region.

The size of the MISC region is calculated as follows:

- If CPUID.(EAX=12H, ECX=0):EBX[31:0] = 0, MISC region is not supported.
- If CPUID.(EAX=12H, ECX=0):EBX[31:0] != 0, the size of MISC region is derived from sum of the highest bit set in SECS.MISCSELECT and the size of the MISC component corresponding to that bit. Offset and size information of currently defined MISC components are listed in Table 37-11. For example, if the highest bit set in SECS.MISCSELECT is bit 0, the MISC region offset is OFFSET(GPRSGX)-16 and size is 16 bytes.
- The processor saves a MISC component i in the MISC region if and only if SECS.MISCSELECT[i] is 1.

Table 37-11. Layout of MISC region of the State Save Area

MISC Components	OFFSET (Bytes)	Size (Bytes)	Description
EXINFO	Offset(GPRSGX) -16	16	if CPUID.(EAX=12H, ECX=0):EBX[0] = 1, exception information on #GP or #PF that occurred inside an enclave can be written to the EXINFO structure if specified by SECS.MISCSELECT[0] = 1.
Future Extension	Below EXINFO	TBD	Reserved. (Zero size if CPUID.(EAX=12H, ECX=0):EBX[31:1] =0).

37.9.2.1 EXINFO Structure

Table 37-12 contains the layout of the EXINFO structure that provides additional information.

Table 37-12. Layout of EXINFO Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
MADDR	0	8	If #PF: contains the page fault linear address that caused a page fault. If #GP: the field is cleared.
ERRCD	8	4	Exception error code for either #GP or #PF.
RESERVED	12	4	

37.9.2.2 Page Fault Error Codes

Table 37-13 contains page fault error code that may be reported in EXINFO.ERRCD.

Table 37-13. Page Fault Error Codes

Name	Bit Position	Description
P	0	Same as non-SGX page fault exception P flag.
W/R	1	Same as non-SGX page fault exception W/R flag.
U/S[1]	2	Always set to 1 (user mode reference).
RSVD	3	Same as non-SGX page fault exception RSVD flag.
I/D	4	Same as non-SGX page fault exception I/D flag.
PK	5	Protection Key induced fault.
RSVD	14:6	Reserved.
SGX	15	EPCM induced fault.
RSVD	31:5	Reserved.

NOTES:

1. Page faults incident to enclave mode that report U/S=0 are not reported in EXINFO.

37.10 PAGE INFORMATION (PAGEINFO)

PAGEINFO is an architectural data structure that is used as a parameter to the EPC-management instructions. It requires 32-Byte alignment.

Table 37-14. Layout of PAGEINFO Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
LINADDR	0	8	Enclave linear address.
SRCPGE	8	8	Effective address of the page where contents are located.
SECINFO/PCMD	16	8	Effective address of the SECINFO or PCMD (for ELDU, ELDB, EWB) structure for the page.
SECS	24	8	Effective address of EPC slot that currently contains the SECS.

37.11 SECURITY INFORMATION (SECINFO)

The SECINFO data structure holds meta-data about an enclave page.

Table 37-15. Layout of SECINFO Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
FLAGS	0	8	Flags describing the state of the enclave page.
RESERVED	8	56	Must be zero.

37.11.1 SECINFO.FLAGS

The SECINFO.FLAGS are a set of fields describing the properties of an enclave page.

Table 37-16. Layout of SECINFO.FLAGS Field

Field	Bit Position	Description
R	0	If 1 indicates that the page can be read from inside the enclave; otherwise the page cannot be read from inside the enclave.
W	1	If 1 indicates that the page can be written from inside the enclave; otherwise the page cannot be written from inside the enclave.
X	2	If 1 indicates that the page can be executed from inside the enclave; otherwise the page cannot be executed from inside the enclave.
PENDING	3	If 1 indicates that the page is in the PENDING state; otherwise the page is not in the PENDING state.
MODIFIED	4	If 1 indicates that the page is in the MODIFIED state; otherwise the page is not in the MODIFIED state.
PR	5	If 1 indicates that a permission restriction operation on the page is in progress, otherwise a permission restriction operation is not in progress.
RESERVED	7:6	Must be zero.
PAGE_TYPE	15:8	The type of page that the SECINFO is associated with.
RESERVED	63:16	Must be zero.

37.11.2 PAGE_TYPE Field Definition

The SECINFO flags and EPC flags contain bits indicating the type of page.

Table 37-17. Supported PAGE_TYPE

TYPE	Value	Description
PT_SECS	0	Page is an SECS.
PT_TCS	1	Page is a TCS.
PT_REG	2	Page is a regular page.
PT_VA	3	Page is a Version Array.
PT_TRIM	4	Page is in trimmed state.
	All other	Reserved.

37.12 PAGING CRYPTO METADATA (PCMD)

The PCMD structure is used to keep track of crypto meta-data associated with a paged-out page. Combined with PAGEINFO, it provides enough information for the processor to verify, decrypt, and reload a paged-out EPC page. The size of the PCMD structure (128 bytes) is architectural.

EWB calculates the Message Authentication Code (MAC) value and writes out the PCMD. ELDB/U reads the fields and checks the MAC.

The format of PCMD is as follows:

Table 37-18. Layout of PCMD Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
SECINFO	0	64	Flags describing the state of the enclave page; R/W by software.
ENCLAVEID	64	8	Enclave Identifier used to establish a cryptographic binding between paged-out page and the enclave.
RESERVED	72	40	Must be zero.
MAC	112	16	Message Authentication Code for the page, page meta-data and reserved field.

37.13 ENCLAVE SIGNATURE STRUCTURE (SIGSTRUCT)

SIGSTRUCT is a structure created and signed by the enclave developer that contains information about the enclave. SIGSTRUCT is processed by the EINIT leaf function to verify that the enclave was properly built.

SIGSTRUCT includes ENCLAVEHASH as SHA256 digest, as defined in FIPS PUB 180-4. The digests are byte strings of length 32. Each of the 8 HASH dwords is stored in little-endian order.

SIGSTRUCT includes four 3072-bit integers (MODULUS, SIGNATURE, Q1, Q2). Each such integer is represented as a byte strings of length 384, with the most significant byte at the position "offset + 383", and the least significant byte at position "offset".

The (3072-bit integer) SIGNATURE should be an RSA signature, where: a) the RSA modulus (MODULUS) is a 3072-bit integer; b) the public exponent is set to 3; c) the signing procedure uses the EMSA-PKCS1-v1.5 format with DER encoding of the "DigestInfo" value as specified in of PKCS#1 v2.1/RFC 3447.

The 3072-bit integers Q1 and Q2 are defined by:

q1 = floor(Signature^2 / Modulus);

q2 = floor((Signature^3 - q1 * Signature * Modulus) / Modulus);

SIGSTRUCT must be page aligned

In column 5 of Table 37-19, 'Y' indicates that this field should be included in the signature generated by the developer.

Table 37-19. Layout of Enclave Signature Structure (SIGSTRUCT)

Field	OFFSET (Bytes)	Size (Bytes)	Description	Signed
HEADER	0	16	Must be byte stream 06000000E10000000000010000000000H	Y
VENDOR	16	4	Intel Enclave: 00008086H Non-Intel Enclave: 00000000H	Y
DATE	20	4	Build date is yyyymmdd in hex: yyyy=4 digit year, mm=1-12, dd=1-31	Y
HEADER2	24	16	Must be byte stream 01010000600000006000000001000000H	Y
SWDEFINED	40	4	Available for software use.	Y
RESERVED	44	84	Must be zero.	Y
MODULUS	128	384	Module Public Key (keylength=3072 bits).	N
EXPONENT	512	4	RSA Exponent = 3.	N
SIGNATURE	516	384	Signature over Header and Body.	N
MISCSELECT*	900	4	Bit vector specifying Extended SSA frame feature set to be used.	Y
MISCMASK*	904	4	Bit vector mask of MISCSELECT to enforce.	Y
RESERVED	908	4	Must be zero.	Y
ISVFAMILYID	912	16	ISV assigned Product Family ID.	Y
ATTRIBUTES	928	16	Enclave Attributes that must be set.	Y
ATTRIBUTEMASK	944	16	Mask of Attributes to enforce.	Y
ENCLAVEHASH	960	32	MRENCLAVE of enclave this structure applies to.	Y
RESERVED	992	16	Must be zero.	Y
ISVEXTPRODID	1008	16	ISV assigned extended Product ID.	Y
ISVPRODID	1024	2	ISV assigned Product ID.	Y
ISVSVN	1026	2	ISV assigned SVN (security version number).	Y
RESERVED	1028	12	Must be zero.	N
Q1	1040	384	Q1 value for RSA Signature Verification.	N
Q2	1424	384	Q2 value for RSA Signature Verification.	N

* If CPUID.(EAX=12H, ECX=0):EBX[31:0] = 0, MISCSELECT must be 0.

If CPUID.(EAX=12H, ECX=0):EBX[31:0] !=0, enclave writers must specify MISCSELECT such that each cleared bit in MISCMASK must also specify the corresponding bit as 0 in MISCSELECT.

37.14 EINIT TOKEN STRUCTURE (EINITTOKEN)

The EINIT token is used by EINIT to verify that the enclave is permitted to launch. EINIT token is generated by an enclave in possession of the EINITTOKEN key (the Launch Enclave).

EINIT token must be 512-Byte aligned.

Table 37-20. Layout of EINIT Token (EINITTOKEN)

Field	OFFSET (Bytes)	Size (Bytes)	MACed	Description
Valid	0	4	Y	Bit 0: 1: Valid; 0: Invalid. All other bits reserved.
RESERVED	4	44	Y	Must be zero.
ATTRIBUTES	48	16	Y	ATTRIBUTES of the Enclave.
MRENCLAVE	64	32	Y	MRENCLAVE of the Enclave.
RESERVED	96	32	Y	Reserved.
MRSIGNER	128	32	Y	MRSIGNER of the Enclave.
RESERVED	160	32	Y	Reserved.
CPUSVNLE	192	16	N	Launch Enclave's CPUSVN.
ISVPRODIDLE	208	02	N	Launch Enclave's ISVPRODID.
ISVSVNLE	210	02	N	Launch Enclave's ISVSVN.
RESERVED	212	24	N	Reserved.
MASKEDMISCSELECTLE	236	4		Launch Enclave's MASKEDMISCSELECT: set by the LE to the resolved MISCSELECT value, used by EGETKEY (after applying KEYREQUEST's masking).
MASKEDATTRIBUTESLE	240	16	N	Launch Enclave's MASKEDATTRIBUTES: This should be set to the LE's ATTRIBUTES masked with ATTRIBUTEMASK of the LE's KEYREQUEST.
KEYID	256	32	N	Value for key wear-out protection.
MAC	288	16	N	Message Authentication Code on EINITTOKEN using EINITTOKEN_KEY.

37.15 REPORT (REPORT)

The REPORT structure is the output of the EREPORT instruction, and must be 512-Byte aligned.

Table 37-21. Layout of REPORT

Field	OFFSET (Bytes)	Size (Bytes)	Description
CPUSVN	0	16	The security version number of the processor.
MISCSELECT	16	4	Bit vector specifying which extended features are saved to the MISC region of the SSA frame when an AEX occurs.
RESERVED	20	12	Zero.
ISVEXTNPRODID	32	16	The value of SECS.ISVEXTPRODID.
ATTRIBUTES	48	16	ATTRIBUTES of the Enclave. See Section 37.7.1.
MRENCLAVE	64	32	The value of SECS.MRENCLAVE.
RESERVED	96	32	Zero.
MRSIGNER	128	32	The value of SECS.MRSIGNER.
RESERVED	160	32	Zero.
CONFIGID	192	64	Value provided by SW to identify enclave's post EINIT configuration.
ISVPRODID	256	02	Product ID of enclave.
ISVSVN	258	02	Security version number (SVN) of the enclave.
CONFIGSVN	260	02	Value provided by SW to indicate expected SVN of enclave's post EINIT configuration.
RESERVED	262	42	Zero.
ISVFAMILYID	304	16	The value of SECS.ISVFAMILYID.

Table 37-21. Layout of REPORT

Field	OFFSET (Bytes)	Size (Bytes)	Description
REPORTDATA	320	64	Data provided by the user and protected by the REPORT's MAC, see Section 37.15.1.
KEYID	384	32	Value for key wear-out protection.
MAC	416	16	Message Authentication Code on the report using report key.

37.15.1 REPORTDATA

REPORTDATA is a 64-Byte data structure that is provided by the enclave and included in the REPORT. It can be used to securely pass information from the enclave to the target enclave.

37.16 REPORT TARGET INFO (TARGETINFO)

This structure is an input parameter to the EREPORT leaf function. The address of TARGETINFO is specified as an effective address in RBX. It is used to identify the target enclave which will be able to cryptographically verify the REPORT structure returned by EREPORT. TARGETINFO must be 512-Byte aligned.

Table 37-22. Layout of TARGETINFO Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
MEASUREMENT	0	32	The MRENCLAVE of the target enclave.
ATTRIBUTES	32	16	The ATTRIBUTES field of the target enclave.
RESERVED	48	2	Must be zero.
CONFIGSVN	50	2	CONFIGSVN of the target enclave.
MISCSELECT	52	4	The MISCSELECT of the target enclave.
RESERVED	56	8	Must be zero.
CONFIGID	64	64	CONFIGID of target enclave.
RESERVED	128	384	Must be zero.

37.17 KEY REQUEST (KEYREQUEST)

This structure is an input parameter to the EGETKEY leaf function. It is passed in as an effective address in RBX and must be 512-Byte aligned. It is used for selecting the appropriate key and any additional parameters required in the derivation of that key.

Table 37-23. Layout of KEYREQUEST Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
KEYNAME	0	02	Identifies the Key Required.
KEYPOLICY	02	02	Identifies which inputs are required to be used in the key derivation.
ISVSVN	04	02	The ISV security version number that will be used in the key derivation.
RESERVED	06	02	Must be zero.
CPUSVN	08	16	The security version number of the processor used in the key derivation.
ATTRIBUTEMASK	24	16	A mask defining which ATTRIBUTES bits will be included in key derivation.
KEYID	40	32	Value for key wear-out protection.
MISCMASK	72	04	A mask defining which MISCSELECT bits will be included in key derivation.

Table 37-23. Layout of KEYREQUEST Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
CONFIGSVN	76	02	Identifies which enclave Configuration's Security Version should be used in key derivation.
RESERVED	78	434	

37.17.1 KEY REQUEST KeyNames

Table 37-24. Supported KEYName Values

Key Name	Value	Description
EINITTOKEN_KEY	0	EINIT_TOKEN key
PROVISION_KEY	1	Provisioning Key
PROVISION_SEAL_KEY	2	Provisioning Seal Key
REPORT_KEY	3	Report Key
SEAL_KEY	4	Seal Key
	All other	Reserved

37.17.2 Key Request Policy Structure

Table 37-25. Layout of KEYPOLICY Field

Field	Bit Position	Description
MRENCLAVE	0	If 1, derive key using the enclave's MRENCLAVE measurement register.
MRSIGNER	1	If 1, derive key using the enclave's MRSIGNER measurement register.
NOISVPRODID	2	If 1, derive key WITHOUT using the enclave' ISVPRODID value.
CONFIGID	3	If 1, derive key using the enclave's CONFIGID value.
ISVFAMILYID	4	If 1, derive key using the enclave ISVFAMILYID value.
ISVEXTPRODID	5	If 1, derive key using enclave's ISVEXTPRODID value.
RESERVED	15:6	Must be zero.

37.18 VERSION ARRAY (VA)

In order to securely store the versions of evicted EPC pages, Intel SGX defines a special EPC page type called a Version Array (VA). Each VA page contains 512 slots, each of which can contain an 8-byte version number for a page evicted from the EPC. When an EPC page is evicted, software chooses an empty slot in a VA page; this slot receives the unique version number of the page being evicted. When the EPC page is reloaded, there must be a VA slot that must hold the version of the page. If the page is successfully reloaded, the version in the VA slot is cleared.

VA pages can be evicted, just like any other EPC page. When evicting a VA page, a version slot in some other VA page must be used to hold the version for the VA being evicted. A Version Array Page must be 4K-Bytes aligned.

Table 37-26. Layout of Version Array Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
Slot 0	0	08	Version Slot 0
Slot 1	8	08	Version Slot 1
…			
Slot 511	4088	08	Version Slot 511

37.19 ENCLAVE PAGE CACHE MAP (EPCM)

EPCM is a secure structure used by the processor to track the contents of the EPC. The EPCM holds exactly one entry for each page that is currently loaded into the EPC. EPCM is not accessible by software, and the layout of EPCM fields is implementation specific.

Table 37-27. Content of an Enclave Page Cache Map Entry

Field	Description
VALID	Indicates whether the EPCM entry is valid.
R	Read access; indicates whether enclave accesses for reads are allowed from the EPC page referenced by this entry.
W	Write access; indicates whether enclave accesses for writes are allowed to the EPC page referenced by this entry.
X	Execute access; indicates whether enclave accesses for instruction fetches are allowed from the EPC page referenced by this entry.
PT	EPCM page type (PT_SECS, PT_TCS, PT_REG, PT_VA, PT_TRIM).
ENCLAVESECS	SECS identifier of the enclave to which the EPC page belongs.
ENCLAVEADDRESS	Linear enclave address of the EPC page.
BLOCKED	Indicates whether the EPC page is in the blocked state.
PENDING	Indicates whether the EPC page is in the pending state.
MODIFIED	Indicates whether the EPC page is in the modified state.
PR	Indicates whether the EPC page is in a permission restriction state.

37.20 READ INFO (RDINFO)

The RDINFO structure contains status information about an EPC page. It must be aligned to 32-Bytes.

Table 37-28. Layout of RDINFO Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
STATUS	0	8	Page status information.
FLAGS	8	8	EPCM state of the page.
ENCLAVECONTEXT	16	8	Context pointer describing the page's parent location.

37.20.1 RDINFO Status Structure

Table 37-29. Layout of RDINFO STATUS Structure

Field	Bit Position	Description
CHILDPRESENT	0	Indicates that the page has one or more child pages present (always zero for non-SECS pages). In VMX non-root operation includes the presence of virtual children.
VIRTCHLDPRESENT	1	Indicates that the page has one or more virtual child pages present (always zero for non-SECS pages). In VMX non-root operation this value is always zero.
RESERVED	63:2	

37.20.2 RDINFO Flags Structure

Table 37-30. Layout of RDINFO FLAGS Structure

Field	Bit Position	Description
R	0	Read access; indicates whether enclave accesses for reads are allowed from the EPC page referenced by this entry.
W	1	Write access; indicates whether enclave accesses for writes are allowed to the EPC page referenced by this entry.
X	2	Execute access; indicates whether enclave accesses for instruction fetches are allowed from the EPC page referenced by this entry.
PENDING	3	Indicates whether the EPC page is in the pending state.
MODIFIED	4	Indicates whether the EPC page is in the modified state.
PR	5	Indicates whether the EPC page is in a permission restriction state.
RESERVED	7:6	
PAGE_TYPE	15:8	Indicates the page type of the EPC page.
RESERVED	62:16	
BLOCKED	63	Indicates whether the EPC page is in the blocked state.

25.Updates to Chapter 38, Volume 3D

Change bars show changes to Chapter 38 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D:* System Programming Guide, Part 4.

Changes to this chapter: Various updates throughout chapter regarding Intel SGX and new Intel SGX VM Over-subscription feature.

CHAPTER 38
ENCLAVE OPERATION

The following aspects of enclave operation are described in this chapter:

- Enclave creation: Includes loading code and data from outside of enclave into the EPC and establishing the enclave entity.
- Adding pages and measuring the enclave.
- Initialization of an enclave: Finalizes the cryptographic log and establishes the enclave identity and sealing identity.
- Enclave entry and exiting including:
  - — Controlled entry and exit.
  - — Asynchronous Enclave Exit (AEX) and resuming execution after an AEX.

38.1 CONSTRUCTING AN ENCLAVE

Figure 38-1 illustrates a typical Enclave memory layout.

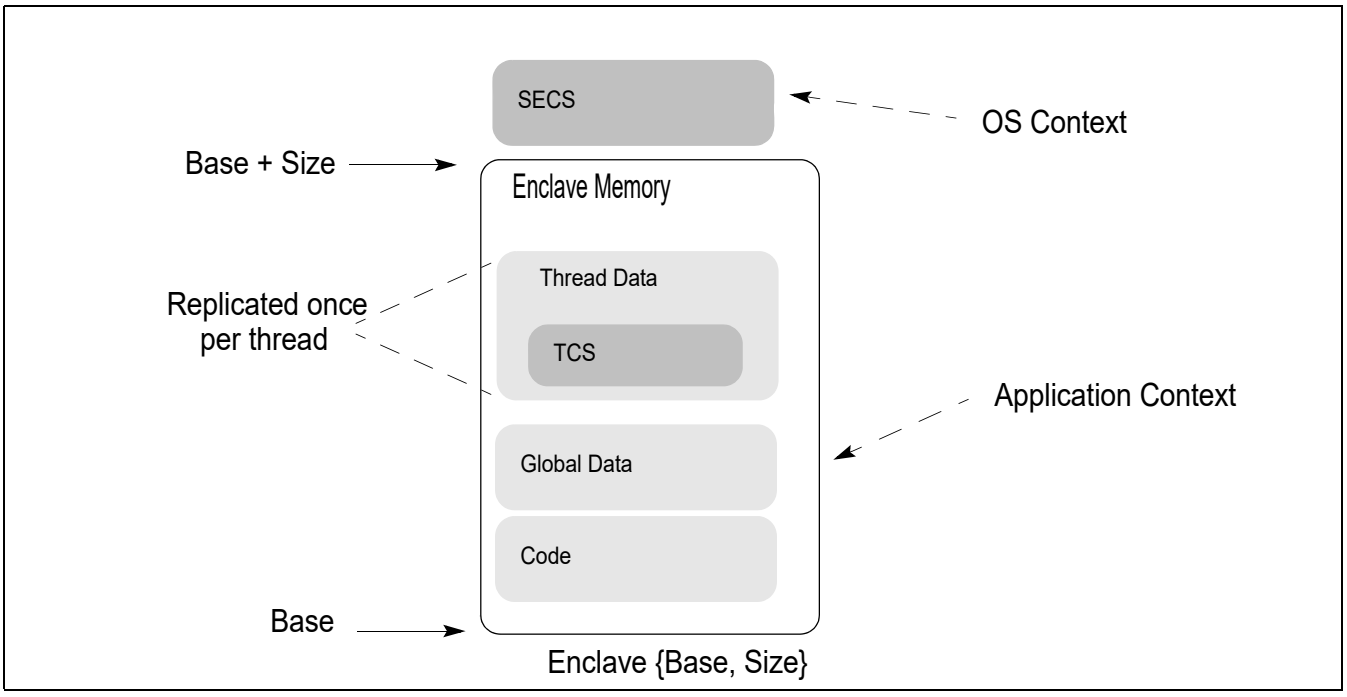

Figure 38-1. Enclave Memory Layout

The enclave creation, commitment of memory resources, and finalizing the enclave's identity with measurement comprises multiple phases. This process can be illustrated by the following exemplary steps:

1. The application hands over the enclave content along with additional information required by the enclave creation API to the enclave creation service running at privilege level 0.
2. The enclave creation service running at privilege level 0 uses the ECREATE leaf function to set up the initial environment, specifying base address and size of the enclave. This address range, the ELRANGE, is part of the application's address space. This reserves the memory range. The enclave will now reside in this address

region. ECREATE also allocates an Enclave Page Cache (EPC) page for the SGX Enclave Control Structure (SECS). Note that this page is not required to be a part of the enclave linear address space and is not required to be mapped into the process.

3. The enclave creation service uses the EADD leaf function to commit EPC pages to the enclave, and use EEXTEND to measure the committed memory content of the enclave. For each page to be added to the enclave:
   — Use EADD to add the new page to the enclave.
   — If the enclave developer requires measurement of the page as a proof for the content, use EEXTEND to add a measurement for 256 bytes of the page. Repeat this operation until the entire page is measured.
4. The enclave creation service uses the EINIT leaf function to complete the enclave creation process and finalize the enclave measurement to establish the enclave identity. Until an EINIT is executed, the enclave is not permitted to execute any enclave code (i.e. entering the enclave by executing EENTER would result in a fault).

38.1.1 ECREATE

The ECREATE leaf function sets up the initial environment for the enclave by reading an SGX Enclave Control Structure (SECS) that contains the enclave's address range (ELRANGE) as defined by BASEADDR and SIZE, the ATTRIBUTES and MISCSELECT bitmaps, and the SSAFRAMESIZE. It then securely stores this information in an Enclave Page Cache (EPC) page. ELRANGE is part of the application's address space. ECREATE also initializes a cryptographic log of the enclave's build process.

38.1.2 EADD and EEXTEND Interaction

Once the SECS has been created, enclave pages can be added to the enclave via EADD. This involves converting a free EPC page into either a PT_REG or a PT_TCS page.

When EADD is invoked, the processor will update the EPCM entry with the type of page (PT_REG or PT_TCS), the linear address used by the enclave to access the page, and the enclave access permissions for the page. It associates the page to the SECS provided as input. The EPCM entry information is used by hardware to manage access control to the page. EADD records EPCM information in the cryptographic log stored in the SECS and copies 4 KBytes of data from unprotected memory outside the EPC to the allocated EPC page.

System software is responsible for selecting a free EPC page. System software is also responsible for providing the type of page to be added, the attributes of the page, the contents of the page, and the SECS (enclave) to which the page is to be added as requested by the application. Incorrect data would lead to a failure of EADD or to an incorrect cryptographic log and a failure at EINIT time.

After a page has been added to an enclave, software can measure a 256 byte region as determined by the developer by invoking EEXTEND. Thus to measure an entire 4KB page, system software must execute EEXTEND 16 times. Each invocation of EEXTEND adds to the cryptographic log information about which region is being measured and the measurement of the section.

Entries in the cryptographic log define the measurement of the enclave and are critical in gaining assurance that the enclave was correctly constructed by the untrusted system software.

38.1.3 EINIT Interaction

Once system software has completed the process of adding and measuring pages, the enclave needs to be initialized by the EINIT leaf function. After an enclave is initialized, EADD and EEXTEND are disabled for that enclave (An attempt to execute EADD/EEXTEND to enclave after enclave initialization will result in a fault). The initialization process finalizes the cryptographic log and establishes the **enclave identity** and **sealing identity** used by EGETKEY and EREPORT.

A cryptographic hash of the log is stored as the **enclave identity**. Correct construction of the enclave results in the cryptographic hash matching the one built by the enclave owner and included as the ENCLAVEHASH field of SIGSTRUCT. The **enclave identity** provided by the EREPORT leaf function can be verified by a remote party.

The EINIT leaf function checks the EINIT token to validate that the enclave has been enabled on this platform. If the enclave is not correctly constructed, or the EINIT token is not valid for the platform, or SIGSTRUCT isn't properly signed, then EINIT will fail. See the EINIT leaf function for details on the error reporting.

The **enclave identity** is a cryptographic hash that reflects the enclave attributes and MISCSELECT value, content of the enclave, the order in which it was built, the addresses it occupies in memory, the security attributes, and access right permissions of each page. The **enclave identity** is established by the EINIT leaf function.

The **sealing identity** is managed by a sealing authority represented by the hash of the public key used to sign the SIGSTRUCT structure processed by EINIT. The sealing authority assigns a product ID (ISVPRODID) and security version number (ISVSVN) to a particular enclave identity.

EINIT establishes the sealing identity using the following steps:

1. Verifies that SIGSTRUCT is properly signed using the public key enclosed in the SIGSTRUCT.
2. Checks that the measurement of the enclave matches the measurement of the enclave specified in SIGSTRUCT.
3. Checks that the enclave's attributes and MISCSELECT values are compatible with those specified in SIGSTRUCT.
4. Finalizes the measurement of the enclave and records the **sealing identity** (the sealing authority, product id and security version number) and **enclave identity** in the SECS.
5. Sets the ATTRIBUTES.INIT bit for the enclave.

38.1.4 Intel® SGX Launch Control Configuration

Intel® SGX Launch Control is a set of controls that govern the creation of enclaves. Before the EINIT leaf function will successfully initialize an enclave, a designated Launch Enclave must create an EINITTOKEN for that enclave. Launch Enclaves have SECS.ATTRIBUTES.EINITTOKEN_KEY = 1, granting them access to the EINITTOKEN_KEY from the EGETKEY leaf function. EINITTOKEN_KEY must be used by the Launch Enclave when computing EINITTOKEN.MAC, the Message Authentication Code of the EINITTOKEN.

The hash of the public key used to sign the SIGSTRUCT of the Launch Enclave must equal the value in the IA32_SGXLEPUBKEYHASH MSRs. Only Launch Enclaves are allowed to launch without a valid token.

The IA32_SGXLEPUBKEYHASH MSRs are provided to designate the platform's Launch Enclave. IA32_SGXLEPUBKEYHASH defaults to digest of Intel's launch enclave signing key after reset.

IA32_FEATURE_CONTROL bit 17 controls the permissions on the IA32_SGXLEPUBKEYHASH MSRs when CPUID.(EAX=12H, ECX=00H):EAX[0] = 1. If IA32_FEATURE_CONTROL is locked with bit 17 set, IA32_SGXLEPUBKEYHASH MSRs are reconfigurable (writeable). If either IA32_FEATURE_CONTROL is not locked or bit 17 is clear, the MSRs are read only. By leaving these MSRs writable, system SW or a VMM can support a plurality of Launch Enclaves for hosting multiple execution environments. See Table 42.2.2 for more details.

38.2 ENCLAVE ENTRY AND EXITING

38.2.1 Controlled Entry and Exit

The EENTER leaf function is the method to enter the enclave under program control. To execute EENTER, software must supply an address of a TCS that is part of the enclave to be entered. The TCS holds the location inside the enclave to transfer control to and a pointer to the SSA frame inside the enclave that an AEX should store the register state to.

When a logical processor enters an enclave, the TCS is considered busy until the logical processors exits the enclave. An attempt to enter an enclave through a busy TCS results in a fault. Intel® SGX allows an enclave builder to define multiple TCSs, thereby providing support for multithreaded enclaves.

Software must also supply to EENTER the Asynchronous Exit Pointer (AEP) parameter. AEP is an address external to the enclave which an exception handler will return to using IRET. Typically the location would contain the ERESUME instruction. ERESUME transfers control back to the enclave, to the address retrieved from the enclave thread's saved state.

EENTER performs the following operations:

1. Check that TCS is not busy and flush all cached linear-to-physical mappings.
2. Change the mode of operation to be in enclave mode.
3. Save the old RSP, RBP for later restore on AEX (Software is responsible for setting up the new RSP, RBP to be used inside enclave).
4. Save XCR0 and replace it with the XFRM value for the enclave.
5. Check if software wishes to debug (applicable to a debuggable enclave):
   — If not debugging, then configure hardware so the enclave appears as a single instruction.
   — If debugging, then configure hardware to allow traps, breakpoints, and single steps inside the enclave.
6. Set the TCS as busy.
7. Transfer control from outside enclave to predetermined location inside the enclave specified by the TCS.

The EEXIT leaf function is the method of leaving the enclave under program control. EEXIT receives the target address outside of the enclave that the enclave wishes to transfer control to. It is the responsibility of enclave software to erase any secret from the registers prior to invoking EEXIT. To allow enclave software to easily perform an external function call and re-enter the enclave (using EEXIT and EENTER leaf functions), EEXIT returns the value of the AEP that was used when the enclave was entered.

EEXIT performs the following operations:

1. Clear enclave mode and flush all cached linear-to-physical mappings.
2. Mark TCS as not busy.
3. Transfer control from inside the enclave to a location on the outside specified as parameter to the EEXIT leaf function.

38.2.2 Asynchronous Enclave Exit (AEX)

Asynchronous and synchronous events, such as exceptions, interrupts, traps, SMIs, and VM exits may occur while executing inside an enclave. These events are referred to as Enclave Exiting Events (EEE). Upon an EEE, the processor state is securely saved inside the enclave (in the thread's current SSA frame) and then replaced by a synthetic state to prevent leakage of secrets. The process of securely saving state and establishing the synthetic state is called an Asynchronous Enclave Exit (AEX). Details of AEX is described in Chapter 39, "Enclave Exiting Events".

As part of most EEEs, the AEP is pushed onto the stack as the location of the eventing address. This is the location where control will return to after executing the IRET. The ERESUME leaf function can be executed from that point to reenter the enclave and resume execution from the interrupted point.

After AEX has completed, the logical processor is no longer in enclave mode and the exiting event is processed normally. Any new events that occur after the AEX has completed are treated as having occurred outside the enclave (e.g. a #PF in dispatching to an interrupt handler).

38.2.3 Resuming Execution after AEX

After system software has serviced the event that caused the logical processor to exit an enclave, the logical processor can continue enclave execution using ERESUME. ERESUME restores processor state and returns control to where execution was interrupted.

If the cause of the exit was an exception or a fault and was not resolved, the event will be triggered again if the enclave is re-entered using ERESUME. For example, if an enclave performs a divide by 0 operation, executing ERESUME will cause the enclave to attempt to re-execute the faulting instruction and result in another divide by 0 exception. Intel® SGX provides the means for an enclave developer to handle enclave exceptions from within the enclave. Software can enter the enclave at a different location and invoke the exception handler within the enclave by executing the EENTER leaf function. The exception handler within the enclave can read the fault information from the SSA frame and attempt to resolve the faulting condition or simply return and indicate to software that the enclave should be terminated (e.g. using EEXIT).

38.2.3.1 ERESUME Interaction

ERESUME restores registers depending on the mode of the enclave (32 or 64 bit).

- In 32-bit mode (IA32_EFER.LMA = 0 || CS.L = 0), the low 32-bits of the legacy registers (EAX, EBX, ECX, EDX, ESP, EBP, ESI, EDI, EIP and EFLAGS) are restored from the thread's GPR area of the current SSA frame. Neither the upper 32 bits of the legacy registers nor the 64-bit registers (R8 … R15) are loaded.
- In 64-bit mode (IA32_EFER.LMA = 1 && CS.L = 1), all 64 bits of the general processor registers (RAX, RBX, RCX, RDX, RSP, RBP, RSI, RDI, R8 … R15, RIP and RFLAGS) are loaded.

Extended features specified by SECS.ATTRIBUTES.XFRM are restored from the XSAVE area of the current SSA frame. The layout of the x87 area depends on the current values of IA32_EFER.LMA and CS.L:

- IA32_EFER.LMA = 0 || CS.L = 0
  - 32-bit load in the same format that XSAVE/FXSAVE uses with these values.
- IA32_EFER.LMA = 1 && CS.L = 1
  - 64-bit load in the same format that XSAVE/FXSAVE uses with these values as if REX.W = 1.

38.3 CALLING ENCLAVE PROCEDURES

38.3.1 Calling Convention

In standard call conventions subroutine parameters are generally pushed onto the stack. The called routine, being aware of its own stack layout, knows how to find parameters based on compile-time-computable offsets from the SP or BP register (depending on runtime conventions used by the compiler).

Because of the stack switch when calling an enclave, stack-located parameters cannot be found in this manner. Entering the enclave requires a modified parameter passing convention.

For example, the caller might push parameters onto the untrusted stack and then pass a pointer to those parameters in RAX to the enclave software. The exact choice of calling conventions is up to the writer of the edge routines; be those routines hand-coded or compiler generated.

38.3.2 Register Preservation

As with most systems, it is the responsibility of the callee to preserve all registers except that used for returning a value. This is consistent with conventional usage and tends to optimize the number of register save/restore operations that need be performed. It has the additional security result that it ensures that data is scrubbed from any registers that were used by enclave to temporarily contain secrets.

38.3.3 Returning to Caller

No registers are modified during EEXIT. It is the responsibility of software to remove secrets in registers before executing EEXIT.

38.4 INTEL® SGX KEY AND ATTESTATION

38.4.1 Enclave Measurement and Identification

During the enclave build process, two "measurements" are taken of each enclave and are stored in two 256-bit Measurement Registers (MR): MRENCLAVE and MRSIGNER. MRENCLAVE represents the enclave's contents and build process. MRSIGNER represents the entity that signed the enclave's SIGSTRUCT.

The values of the Measurement Registers are included in attestations to identify the enclave to remote parties. The MRs are also included in most keys, binding keys to enclaves with specific MRs.

38.4.1.1 MRENCLAVE

MRENCLAVE is a unique 256 bit value that identifies the code and data that was loaded into the enclave during the initial launch. It is computed as a SHA256 hash that is initialized by the ECREATE leaf function. EADD and EEXTEND leaf functions record information about each page and the content of those pages. The EINIT leaf function finalizes the hash, which is stored in SECS.MRENCLAVE. Any tampering with the build process, contents of a page, page permissions, etc will result in a different MRENCLAVE value.

Figure 38-2 illustrates a simplified flow of changes to the MRENCLAVE register when building an enclave:

- Enclave creation with ECREATE.
- Copying a non-enclave source page into the EPC of an un-initialized enclave with EADD.
- Updating twice of the MRENCLAVE after modifying the enclave's page content, i.e. EEXTEND twice.
- Finalizing the enclave build with EINIT.

Details on specific values inserted in the hash are available in the individual instruction definitions.

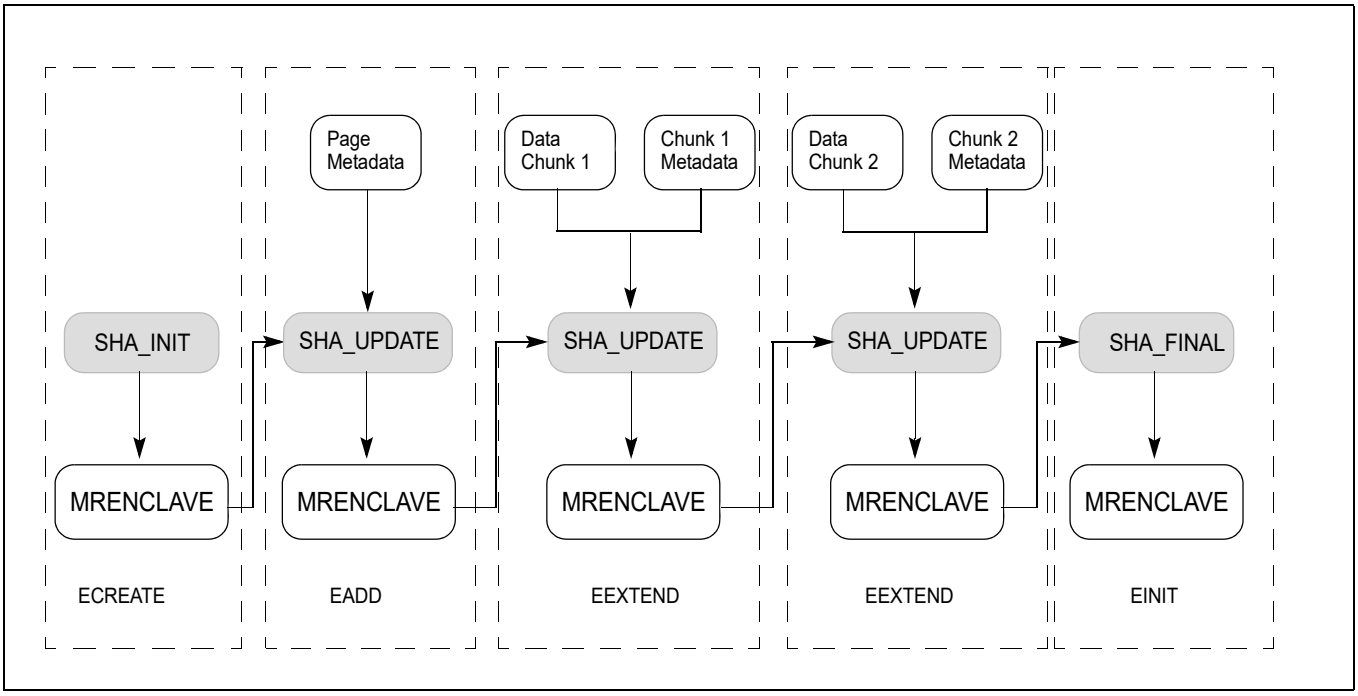

Figure 38-2. Measurement Flow of Enclave Build Process

38.4.1.2 MRSIGNER

Each enclave is signed using a 3072 bit RSA key. The signature is stored in the SIGSTRUCT. In the SIGSTRUCT, the enclave's signer also assigns a product ID (ISVPRODID) and a security version (ISVSVN) to the enclave. MRSIGNER is the SHA-256 hash of the signer's public key. For platforms that support Key Separation and Sharing (CPUID.(EAX=12H, ECX=1).EAX.KSS[7]) the SIGSTRUCT can additionally specify an 16 byte extended product ID (ISVEXTPRODID), and a 16 byte family ID (ISVFAMILYID).

In attestation, MRSIGNER can be used to allow software to approve of an enclave based on the author rather than maintaining a list of MRENCLAVEs. It is used in key derivation to allow software to create a lineage of an application. By signing multiple enclaves with the same key, the enclaves will share the same keys and data. Combined

with security version numbering, the author can release multiple versions of an application which can access keys for previous versions, but not future versions of that application.

38.4.1.3 CONFIGID

For platforms that support enhancements for key separation and sharing (CPUID.(EAX=12H, ECX=1).EAX.KSS[7]) when the enclave is created the platform can additionally provide 32-byte configuration identifier (CONFIGID). How this value is used is dependent on the enclave but it is intended to allow enclave creators to indicate what additional content may be accepted by the enclave post-initialization.

38.4.2 Security Version Numbers (SVN)

Intel® SGX supports a versioning system that allows the signer to identify different versions of the same software released by an author. The security version is independent of the functional version an author uses and is intended to specify security equivalence. Multiple releases with functional enhancements may all share the same SVN if they all have the same security properties or posture. Each enclave has an SVN and the underlying hardware has an SVN.

The SVNs are attested to in EREPORT and are included in the derivation of most keys, thus providing separation between data for older/newer versions.

38.4.2.1 Enclave Security Version

In the SIGSTRUCT, the MRSIGNER is associated with a 16-bit Product ID (ISVPRODID) and a 16 bit integer SVN (ISVSVN). Together they define a specific group of versions of a specific product. Most keys, including the Seal Key, can be bound to this pair.

To support upgrading from one release to another, EGETKEY will return keys corresponding to any value less than or equal to the software's ISVSVN.

38.4.2.2 Hardware Security Version

CPUSVN is a 128 bit value that reflects the microcode update version and authenticated code modules supported by the processor. Unlike ISVSVN, CPUSVN is not an integer and cannot be compared mathematically. Not all values are valid CPUSVNs.

Software must ensure that the CPUSVN provided to EGETKEY is valid. EREPORT will return the CPUSVN of the current environment. Software can execute EREPORT with TARGETINFO set to zeros to retrieve a CPUSVN from REPORTDATA. Software can access keys for a CPUSVN recorded previously, provided that each of the elements reflected in CPUSVN are the same or have been upgraded.

38.4.2.3 CONFIGID Security Version

The CONFIGID field can be used to contain the hash of a signing key for verifying the additional content. In this case, similar to the relationship between MRSIGNER and ISVSVN, CONFIGID needs a CONFIGID Security Version Number. CONFIGIDSVN can be specified at the same time as CONFIGID.

38.4.3 Keys

Intel® SGX provides software with access to keys unique to each processor and rooted in HW keys inserted into the processor during manufacturing.

Each enclave requests keys using the EGETKEY leaf function. The key is based on enclave parameters such as measurement, the enclave signing key, security attributes of the enclave, and the Hardware Security version of the processor itself. A full list of parameter options is specified in the KEYREQUEST structure, see details in Section 37.17.

By deriving keys using enclave properties, SGX guarantees that if two enclaves call EGETKEY, they will receive a unique key only accessible by the respective enclave. It also guarantees that the enclave will receive the same key

on every future execution of EGETKEY. Some parameters are optional or configurable by software. For example, a Seal key can be based on the signer of the enclave, resulting in a key available to multiple enclaves signed by the same party.

The EGETKEY leaf function provides several key types. Each key is specific to the processor, CPUSVN, and the enclave that executed EGETKEY. The EGETKEY instruction definition details how each of these keys is derived, see Table 40-64. Additionally,

- SEAL Key: The Seal key is a general purpose key for the enclave to use to protect secrets. Typical uses of the Seal key are encrypting and calculating MAC of secrets on disk. There are 2 types of Seal Key described in Section 38.4.3.1.
- REPORT Key: This key is used to compute the MAC on the REPORT structure. The EREPORT leaf function is used to compute this MAC, and destination enclave uses the Report key to verify the MAC. The software usage flow is detailed in Section 38.4.3.2.
- EINITTOKEN_KEY: This key is used by Launch Enclaves to compute the MAC on EINITTOKENs. These tokens are then verified in the EINIT leaf function. The key is only available to enclaves with ATTRIBUTE.EINITTOKEN_KEY set to 1.
- PROVISIONING Key and PROVISIONING SEAL Key: These keys are used by attestation key provisioning software to prove to remote parties that the processor is genuine and identify the currently executing TCB. These keys are only available to enclaves with ATTRIBUTE.PROVISIONKEY set to 1.

38.4.3.1 Sealing Enclave Data

Enclaves can protect persistent data using Seal keys to provide encryption and/or integrity protection. EGETKEY provides two types of Seal keys specified in KEYREQUEST.KEYPOLICY field: MRENCLAVE-based key and MRSIGNER-based key.

The MRENCLAVE-based keys are available only to enclave instances sharing the same MRENCLAVE. If a new version of the enclave is released, the Seal keys will be different. Retrieving previous data requires additional software support.

The MRSIGNER-based keys are bound to the 3 tuple (MRSIGNER, ISVPRODID, ISVSVN). These keys are available to any enclave with the same MRSIGNER and ISVPRODID and an ISVSVN equal to or greater than the key in questions. This is valuable for allowing new versions of the same software to retrieve keys created before an upgrade.

For platforms that support enhancements for key separation and sharing (CPUID.(EAX=12H, ECX=1).EAX.KSS[7]) four additional key policies for seal key derivation are provided. These add the ISVEXTPRODID, ISVFAMILYID and CONFIGID/CONFIGSVN to the key derivation. Additionally there is a policy to remove ISVPRODID from a key derivation to create a shared between different products that share the same MRSIGNER.

38.4.3.2 Using REPORTs for Local Attestation

SGX provides a means for enclaves to securely identify one another, this is referred to as "Local Attestation". SGX provides a hardware assertion, REPORT that contains calling enclaves Attributes, Measurements and User supplied data (described in detail in Section 37.15). Figure 38-3 shows the basic flow of information.

1. The source enclave determines the identity of the target enclave to populate TARGETINFO.
2. The source enclave calls EREPORT instruction to generate a REPORT structure. The EREPORT instruction conducts the following:
   — Populates the REPORT with identify information about the calling enclave.
   — Derives the Report Key that is returned when the target enclave executes the EGETKEY. TARGETINFO provides information about the target.
   — Computes a MAC over the REPORT using derived target enclave Report Key.
3. Non-enclave software copies the REPORT from source to destination.
4. The target enclave executes the EGETKEY instruction to request its REPORT key, which is the same key used by EREPORT at the source.
5. The target enclave verifies the MAC and can then inspect the REPORT to identify the source.

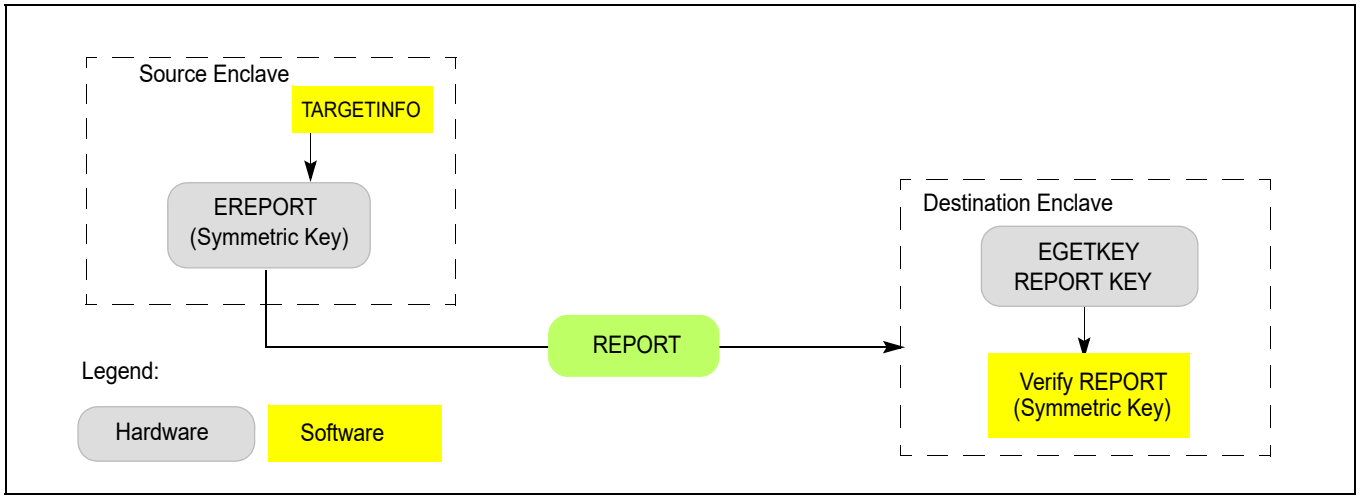

Figure 38-3. SGX Local Attestation

38.5 EPC AND MANAGEMENT OF EPC PAGES

EPC layout is implementation specific, and is enumerated through CPUID (see Table 36-7 for EPC layout). EPC is typically configured by BIOS at system boot time.

38.5.1 EPC Implementation

EPC must be properly protected against attacks. One example of EPC implementation could use a Memory Encryption Engine (MEE). An MEE provides a cost-effective mechanism of creating cryptographically protected volatile storage using platform DRAM. These units provide integrity, replay, and confidentiality protection. Details are implementation specific.

38.5.2 OS Management of EPC Pages

The EPC is a finite resource. SGX1 (i.e. CPUID.(EAX=12H, ECX=0):EAX.SGX1 = 1 but CPUID.(EAX=12H, ECX=0):EAX.SGX2 = 0) provides the EPC manager with leaf functions to manage this resource and properly swap pages out of and into the EPC. For that, the EPC manager would need to keep track of all EPC entries, type and state, context affiliation, and SECS affiliation.

Enclave pages that are candidates for eviction should be moved to BLOCKED state using EBLOCK instruction that ensures no new cached virtual to physical address mappings can be created by attempts to reference a BLOCKED page.

Before evicting blocked pages, EPC manager should execute ETRACK leaf function on that enclave and ensure that there are no stale cached virtual to physical address mappings for the blocked pages remain on any thread on the platform.

After removing all stale translations from blocked pages, system software should use the EWB leaf function for securely evicting pages out of the EPC. EWB encrypts a page in the EPC, writes it to unprotected memory, and invalidates the copy in EPC. In addition, EWB also creates a cryptographic MAC (PCMD.MAC) of the page and stores it in unprotected memory. A page can be reloaded back to the processor only if the data and MAC match. To ensure that only the latest version of the evicted page can be loaded back, the version of the evicted page is stored securely in a Version Array (VA) in EPC.

SGX1 includes two instructions for reloading pages that have been evicted by system software: ELDU and ELDB. The difference between the two instructions is the value of the paging state at the end of the instruction. ELDU results in a page being reloaded and set to an UNBLOCKED state, while ELDB results in a page loaded to a BLOCKED state.

ELDB is intended for use by a Virtual Machine Monitor (VMM). When a VMM reloads an evicted page, it needs to restore it to the correct state of the page (BLOCKED vs. UNBLOCKED) as it existed at the time the page was evicted. Based on the state of the page at eviction, the VMM chooses either ELDB or ELDU.

38.5.2.1 Enhancement to Managing EPC Pages

On processors supporting SGX2 (i.e. CPUID.(EAX=12H, ECX=0):EAX.SGX2 = 1), the EPC manager can manage EPC resources (while enclave is running) with more flexibility provided by the SGX2 leaf functions. The additional flexibility is described in Section 38.5.7 through Section 38.5.11.

38.5.3 Eviction of Enclave Pages

Intel SGX paging is optimized to allow the Operating System (OS) to evict multiple pages out of the EPC under a single synchronization.

The suggested flow for evicting a list of pages from the EPC is:

1. For each page to be evicted from the EPC:
   a. Select an empty slot in a Version Array (VA) page.
      - If no empty VA page slots exist, create a new VA page using the EPA leaf function.
   b. Remove linear-address to physical-address mapping from the enclave context's mapping tables (page table and EPT tables).
   c. Execute the EBLOCK leaf function for the target page. This sets the target page state to BLOCKED. At this point no new mappings of the page will be created. So any access which does not have the mapping cached in the TLB will generate a #PF.
2. For each enclave containing pages selected in step 1:
   — Execute an ETRACK leaf function pointing to that enclave's SECS. This initiates the tracking process that ensures that all caching of linear-address to physical-address translations for the blocked pages is cleared.
3. For all logical processors executing in processes (OS) or guests (VMM) that contain the enclaves selected in step 1:
   — Issue an IPI (inter-processor interrupt) to those threads. This causes those logical processors to asynchronously exit any enclaves they might be in, and as a result flush cached linear-address to physical-address translations that might hold stale translations to blocked pages. There is no need for additional measures such as performing a "TLB shootdown".
4. After enclaves exit, allow logical processors to resume normal operation, including enclave re-entry as the tracking logic keeps track of the activity.
5. For each page to be evicted:
   — Evict the page using the EWB leaf function with parameters include the effective-address pointer to the EPC page, the VA slot, a 4K byte buffer to hold the encrypted page contents, and a 128 byte buffer to hold page metadata. The last three elements are tied together cryptographically and must be used to later reload the page.

At this point, system software has the only copy of each page data encrypted with its page metadata in main memory.

38.5.4 Loading an Enclave Page

To reload a previously evicted page, system software needs four elements: the VA slot used when the page was evicted, a buffer containing the encrypted page contents, a buffer containing the page metadata, and the parent SECS to associate this page with. If the VA page or the parent SECS are not already in the EPC, they must be reloaded first.

1. Execute ELDB/ELDU (depending on the desired BLOCKED state for the page), passing as parameters: the EPC page linear address, the VA slot, the encrypted page, and the page metadata.

2. Create a mapping in the enclave context's mapping tables (page tables and EPT tables) to allow the application to access that page (OS: system page table; VMM: EPT).

The ELDB/ELDU instruction marks the VA slot empty so that the page cannot be replayed at a later date.

38.5.5 Eviction of an SECS Page

The eviction of an SECS page is similar to the eviction of an enclave page. The only difference is that an SECS page cannot be evicted until all other pages belonging to the enclave have been evicted. Since all other pages have been evicted, there will be no threads executing inside the enclave and tracking with ETRACK isn't necessary. When reloading an enclave, the SECS page must be reloaded before all other constituent pages.

1. Ensure all pages are evicted from enclave.
2. Select an empty slot in a Version Array page.
   — If no VA page exists with an empty slot, create a new one using the EPA function leaf.
3. Evict the page using the EWB leaf function with parameters include the effective-address pointer to the EPC page, the VA slot, a 4K byte buffer to hold the encrypted page contents and a 128 byte buffer to hold page metadata. The last three elements are tied together cryptographically and must be used to later reload the page.

38.5.6 Eviction of a Version Array Page

VA pages do not belong to any enclave and tracking with ETRACK isn't necessary. When evicting the VA page, a slot in a different VA page must be specified in order to provide versioning of the evicted VA page.

1. Select a slot in a Version Array page other than the page being evicted.
   — If no VA page exists with an empty slot, create a new one using the EPA leaf function.
2. Evict the page using the EWB leaf function with parameters include the effective-address pointer to the EPC page, the VA slot, a 4K byte buffer to hold the encrypted page contents, and a 128 byte buffer to hold page metadata. The last three elements are tied together cryptographically and must be used to later reload the page.

38.5.7 Allocating a Regular Page

On processors that support SGX2, allocating a new page to an already initialized enclave is accomplished by invoking the EAUG leaf function. Typically, the enclave requests that the OS allocate a new page at a particular location within the enclave's address space. Once allocated, the page remains in a pending state until the enclave executes the corresponding EACCEPT leaf function to accept the new page into the enclave. Page allocation operations may be batched to improve efficiency.

The typical process for allocating a regular page is as follows:

1. Enclave requests additional memory from OS when the current allocation becomes insufficient.
2. The OS invokes the EAUG leaf function to add a new memory page to the enclave.
   a. EAUG may only be called on a free EPC page.
   b. Successful completion of the EAUG instruction places the target page in the VALID and PENDING state.
   c. All dynamically created pages have the type PT_REG and content of all zeros.
3. The OS maps the page in the enclave context's mapping tables.
4. The enclave issues an EACCEPT instruction, which verifies the page's attributes and clears the PENDING state. At that point the page becomes accessible for normal enclave use.

38.5.8 Allocating a TCS Page

On processors that support SGX2, allocating a new TCS page to an already initialized enclave is a two-step process. First the OS allocates a regular page with a call to EAUG. This page must then be accepted and initialized by the enclave to which it belongs. Once the page has been initialized with appropriate values for a TCS page, the enclave requests the OS to change the page's type to PT_TCS. This change must also be accepted. As with allocating a regular page, TCS allocation operations may be batched.

A typical process for allocating a TCS page is as follows:

1. Enclave requests an additional page from the OS.
2. The OS invokes EAUG to add a new regular memory page to the enclave.
   a. EAUG may only be called on a free EPC page.
   b. Successful completion of the EAUG instruction places the target page in the VALID and PENDING state.
3. The OS maps the page in the enclave context's mapping tables.
4. The enclave issues an EACCEPT instruction, at which point the page becomes accessible for normal enclave use.
5. The enclave initializes the contents of the new page.
6. The enclave requests that the OS convert the page from type PT_REG to PT_TCS.
7. OS issues an EMODT instruction on the page.
   a. The parameters to EMODT indicate that the regular page should be converted into a TCS.
   b. EMODT forces all access rights to a page to be removed because TCS pages may not be accessed by enclave code.
8. The enclave issues an EACCEPT instruction to confirm the requested modification.

38.5.9 Trimming a Page

On processors that support SGX2, Intel SGX supports the trimming of an enclave page as a special case of EMODT. Trimming allows an enclave to actively participate in the process of removing a page from the enclave (deallocation) by splitting the process into first removing it from the enclave's access and then removing it from the EPC using the EREMOVE leaf function. The page type PT_TRIM indicates that a page has been trimmed from the enclave's address space and that the page is no longer accessible to enclave software. Modifications to a page in the PT_TRIM state are not permitted; the page must be removed and then reallocated by the OS before the enclave may use the page again. Page deallocation operations may be batched to improve efficiency.

The typical process for trimming a page from an enclave is as follows:

1. Enclave signals OS that a particular page is no longer in use.
2. OS invokes the EMODT leaf function on the page, requesting that the page's type be changed to PT_TRIM.
   a. SECS and VA pages cannot be trimmed in this way, so the initial type of the page must be PT_REG or PT_TCS.
   b. EMODT may only be called on valid enclave pages.
3. OS invokes the ETRACK leaf function on the enclave containing the page to track removal the TLB addresses from all the processors.
4. Issue an IPI (inter-processor interrupt) to flush the stale linear-address to physical-address translations for all logical processors executing in processes that contain the enclave.
5. Enclave issues an EACCEPT leaf function.
6. The OS may now permanently remove the page from the EPC (by issuing EREMOVE).

38.5.10 Restricting the EPCM Permissions of a Page

On processors that support SGX2, restricting the EPCM permissions associated with an enclave page is accomplished using the EMODPR leaf function. This operation requires the cooperation of the OS to flush stale entries to

the page and to update the page-table permissions of the page to match. Permissions restriction operations may be batched.

The typical process for restricting the permissions of an enclave page is as follows:

1. Enclave requests that the OS to restrict the permissions of an EPC page.
2. OS performs permission restriction, flushing cached linear-address to physical-address translations, and page-table modifications.
   a. Invokes the EMODPR leaf function to restrict permissions (EMODPR may only be called on VALID pages).
   b. Invokes the ETRACK leaf function on the enclave containing the page to track removal of the TLB addresses from all the processor.
   c. Issue an IPI (inter-processor interrupt) to flush the stale linear-address to physical-address translations for all logical processors executing in processes that contain the enclave.
   d. Sends IPIs to trigger enclave thread exit and TLB shootdown.
   e. OS informs the Enclave that all logical processors should now see the new restricted permissions.
3. Enclave invokes the EACCEPT leaf function.
   a. Enclave may access the page throughout the entire process.
   b. Successful call to EACCEPT guarantees that no stale cached linear-address to physical-address translations are present.

38.5.11 Extending the EPCM Permissions of a Page

On processors that support SGX2, extending the EPCM permissions associated with an enclave page is accomplished directly be the enclave using the EMODPE leaf function. After performing the EPCM permission extension, the enclave requests the OS to update the page table permissions to match the extended permission. Security wise, permission extension does not require enclave threads to leave the enclave as TLBs with stale references to the more restrictive permissions will be flushed on demand, but to allow forward progress, an OS needs to be aware that an application might signal a page fault.

The typical process for extending the permissions of an enclave page is as follows:

1. Enclave invokes EMODPE to extend the EPCM permissions associated with an EPC page (EMODPE may only be called on VALID pages).
2. Enclave requests that OS update the page tables to match the new EPCM permissions.
3. Enclave code resumes.
   a. If cached linear-address to physical-address translations are present to the more restrictive permissions, the enclave thread will page fault. The SGX2-aware OS will see that the page tables permit the access and resume the thread, which can now successfully access the page because exiting cleared the TLB.
   b. If cached linear-address to physical-address translations are not present, access to the page with the new permissions will succeed without an enclave exit.

38.5.12 VMM Oversubscription of EPC

On processors supporting oversubscription enhancements (.e. CPUID.(EAX=12H, ECX=0):EAX.[5]=1 & EAX[6] = 1) a Virtual Machine Monitor or other executive can more efficiently manage the EPC space available on the platform between virtualized entities. A typical process for using these instructions to support oversubscribing the physical EPC space on the platform is as follows:

1. VMM creates data structures for SECS tracking including a count of child pages.
2. VMM selects possible EPC victim pages.
3. VMM ages the victim pages. Some of the selected pages will be accessed by the guest. In this case the VMM will remove these pages from the victim pool and return them to the guest.
4. VMM makes remaining pages not present in EPT. It then issues IPI on each page to remove TLB mappings.

5. For every EPC victim page the VMM obtains the victim's SECS page info using ERDINFO.
   a. ENCLAVECONTEXT field in RDINFO structure will indicate the location of SECS, and the PAGE_TYPE field will indicate the page type.
   b. Child pages of SECS can be evicted.
   c. SECS pages may be evicted if the child count is zero.
   d. Some pages may be returned to active state depending on such things as page type or child count.
6. VMM increments its evicted page count for the SECS of each page (stored in the data structure created in 1).
7. If this is the first evicted page of that SECS, set Marker on SECS of the victim page (EINCVIRTCHILD). This locks the SECS in the guest. The guest cannot page out the SECS.
8. EBLOCK, ETRACK, EWB eviction sequence is executed for page.
9. After loading an SECS page back in, the VMM will set the correct ENCLAVECONTEXT for the guest using ESETCONTEXT instruction.

38.6 CHANGES TO INSTRUCTION BEHAVIOR INSIDE AN ENCLAVE

This section covers instructions whose behavior changes when executed in enclave mode.

38.6.1 Illegal Instructions

The instructions listed in Table 38-1 are ring 3 instructions which become illegal when executed inside an enclave. Executing these instructions inside an enclave will generate an exception.

The first row of Table 38-1 enumerates instructions that may cause a VM exit for VMM emulation. Since a VMM cannot emulate enclave execution, execution of any these instructions inside an enclave results in an invalid-opcode exception (#UD) and no VM exit.

The second row of Table 38-1 enumerates I/O instructions that may cause a fault or a VM exit for emulation. Again, enclave execution cannot be emulated, so execution of any these instructions inside an enclave results in #UD.

The third row of Table 38-1 enumerates instructions that load descriptors from the GDT or the LDT or that change privilege level. The former class is disallowed because enclave software should not depend on the contents of the descriptor tables and the latter because enclave execution must be entirely with CPL = 3. Again, execution of any these instructions inside an enclave results in #UD.

The fourth row of Table 38-1 enumerates instructions that provide access to kernel information from user mode and can be used to aid kernel exploits from within enclave. Execution of any these instructions inside an enclave results in #UD

Table 38-1. Illegal Instructions Inside an Enclave

Instructions	Result	Comment
CPUID, GETSEC, RDPMC, SGDT, SIDT, SLDT, STR, VMCALL, VMFUNC	#UD	Might cause VM exit.
IN, INS/INSB/INSW/INSD, OUT, OUTS/OUTSB/OUTSW/OUTSD	#UD	I/O fault may not safely recover. May require emulation.
Far call, Far jump, Far Ret, INT n/INTO, IRET, LDS/LES/LFS/LGS/LSS, MOV to DS/ES/SS/FS/GS, POP DS/ES/SS/FS/GS, SYSCALL, SYSENTER	#UD	Access segment register could change privilege level.
SMSW	#UD	Might provide access to kernel information.
ENCLU[EENTER], ENCLU[ERESUME]	#GP	Cannot enter an enclave from within an enclave.

RDTSC and RDTSCP are legal inside an enclave for processors that support SGX2 (subject to the value of CR4.TSD). For processors which support SGX1 but not SGX2, RDTSC and RDTSCP will cause #UD.

RDTSC and RDTSCP instructions may cause a VM exit when inside an enclave.

Software developers must take into account that the RDTSC/RDTSCP results are not immune to influences by other software, e.g. the TSC can be manipulated by software outside the enclave.

38.6.2 RDRAND and RDSEED Instructions

These instructions may cause a VM exit if the "RDRAND exiting" VM-execution control is 1. Unlike other instructions that can cause VM exits, these instructions are legal inside an enclave. As noted in Section 6.5.5, any VM exit originating on an instruction boundary inside an enclave sets bit 27 of the exit-reason field of the VMCS. If a VMM receives a VM exit due to an attempt to execute either of these instructions determines (by that bit) that the execution was inside an enclave, it can do either of two things. It can clear the "RDRAND exiting" VM-execution control and execute VMRESUME; this will result in the enclave executing RDRAND or RDSEED again, and this time a VM exit will not occur. Alternatively, the VMM might choose to discontinue execution of this virtual machine.

NOTE

It is expected that VMMs that virtualize Intel SGX will not set "RDRAND exiting" to 1.

38.6.3 PAUSE Instruction

The PAUSE instruction may cause a VM exit from an enclave if the "PAUSE exiting" VM-execution control is 1. Unlike other instructions that can cause VM exits, the PAUSE instruction is legal inside an enclave. If a VMM receives a VM exit due to the 1-setting of "PAUSE exiting", it can do either of two things. It can clear the "PAUSE exiting" VM-execution control and execute VMRESUME; this will result in the enclave executing PAUSE again, but this time a VM exit will not occur. Alternatively, the VMM might choose to discontinue execution of this virtual machine.

The PAUSE instruction may also cause a VM exit outside of an enclave if the "PAUSE-loop exiting" VM-execution control is 1, but as the "PAUSE-loop exiting" control is ignored at CPL > 0 (see Section 25.1.3), VM exit from an enclave due to the 1-setting of "PAUSE-LOOP exiting" will never occur.

NOTE

It is expected that VMMs that virtualize Intel SGX will not set "PAUSE exiting" to 1.

38.6.4 INT 3 Behavior Inside an Enclave

INT3 is legal inside an enclave, however, the behavior inside an enclave is different from its behavior outside an enclave. See Section 42.4.1 for details.

38.6.5 INVD Handling when Enclaves Are Enabled

Once processor reserved memory protections are activated (see Section 38.5), any execution of INVD will result in a #GP(0).

26.Updates to Chapter 40, Volume 3D

Change bars show changes to Chapter 40 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D:* System Programming Guide, Part 4.

Changes to this chapter: Various updates throughout chapter regarding Intel SGX and new Intel SGX VM Over-subscription feature.

CHAPTER 40
SGX INSTRUCTION REFERENCES

This chapter describes the supervisor and user level instructions provided by Intel® Software Guard Extensions (Intel® SGX). In general, various functionality is encoded as leaf functions within the ENCLS (supervisor), ENCLU (user), and the ENCLV (virtualization operation) instruction mnemonics. Different leaf functions are encoded by specifying an input value in the EAX register of the respective instruction mnemonic.

40.1 INTEL® SGX INSTRUCTION SYNTAX AND OPERATION

ENCLS, ENCLU and ENCLV instruction mnemonics for all leaf functions are covered in this section.

For all instructions, the value of CS.D is ignored; addresses and operands are 64 bits in 64-bit mode and are otherwise 32 bits. Aside from EAX specifying the leaf number as input, each instruction leaf may require all or some subset of the RBX/RCX/RDX as input parameters. Some leaf functions may return data or status information in one or more of the general purpose registers.

40.1.1 ENCLS Register Usage Summary

Table 40-1 summarizes the implicit register usage of supervisor mode enclave instructions.

Table 40-1. Register Usage of Privileged Enclave Instruction Leaf Functions

40.1.4 Information and Error Codes

Information and error codes are reported by various instruction leaf functions to show an abnormal termination of the instruction or provide information which may be useful to the developer. Table 40-4 shows the various codes and the instruction which generated the code. Details of the meaning of the code is provided in the individual instruction.

Table 40-4. Error or Information Codes for Intel® SGX Instructions

Name	Value	Returned By
No Error	0	
SGX_INVALID_SIG_STRUCT	1	EINIT
SGX_INVALID_ATTRIBUTE	2	EINIT, EGETKEY
SGX_BLSTATE	3	EBLOCK
SGX_INVALID_MEASUREMENT	4	EINIT
SGX_NOTBLOCKABLE	5	EBLOCK
SGX_PG_INVLD	6	EBLOCK, ERDINFO, ETRACKC

SGX_INVALID_KEYNAME	256	EGETKEY

40.1.5 Internal CREGs

The CREGs as shown in Table 5-4 are hardware specific registers used in this document to indicate values kept by the processor. These values are used while executing in enclave mode or while executing an Intel SGX instruction. These registers are not software visible and are implementation specific. The values in Table 40-5 appear at various places in the pseudo-code of this document. They are used to enhance understanding of the operations.

Table 40-5. List of Internal CREG

Name	Size (Bits)	Scope
CR_ENCLAVE_MODE	1	LP

40.1.6 Concurrent Operation Restrictions

Under certain conditions, Intel SGX disallows certain leaf functions from operating concurrently. Listed below are some examples of concurrency that are not allowed.

- For example, Intel SGX disallows the following leafs to concurrently operate on the same EPC page.
  - ECREATE, EADD, and EREMOVE are not allowed to operate on the same EPC page concurrently with themselves.
  - EADD, EEXTEND, and EINIT leaves are not allowed to operate on the same SECS concurrently.
- Intel SGX disallows the EREMOVE leaf from removing pages from an enclave that is in use.
- Intel SGX disallows entry (EENTER and ERESUME) to an enclave while a page from that enclave is being removed.

When disallowed operation is detected, a leaf function may do one of the following:

- Return an SGX_EPC_PAGE_CONFLICT error code in RAX.
- Cause a #GP(0) exception.

To prevent such exceptions, software must serialize leaf functions or prevent these leaf functions from accessing the same EPC page.

40.1.6.1 Concurrency Tables of Intel® SGX Instructions

The tables below detail the concurrent operation restrictions of all SGX leaf functions. For each leaf function, the table has a separate line for each of the EPC pages the leaf function accesses.

For each such EPC page, the base concurrency requirements are detailed as follows:

- **Exclusive Access** means that no other leaf function that requires either shared or exclusive access to the same EPC page may be executed concurrently. For example, EADD requires an exclusive access to the target page it accesses.
- **Shared Access** means that no other leaf function that requires an exclusive access to the same EPC page may be executed concurrently. Other leaf functions that require shared access may run concurrently. For example, EADD requires a shared access to the SECS page it accesses.
- **Concurrent Access** means that any other leaf function that requires any access to the same EPC page may be executed concurrently. For example, EGETKEY has no concurrency requirements for the KEYREQUEST page.

In addition to the base concurrency requirements, additional concurrency requirements are listed, which apply only to specific sets of leaf functions. For example, there are additional requirements that apply for EADD, EXTEND and EINIT. EADD and EEXTEND can't execute concurrently on the same SECS page.

The tables also detail the leaf function's behavior when a conflict happens, i.e., a concurrency requirement is not met. In this case, the leaf function may return an SGX_EPC_PAGE_CONFLICT error code in RAX, or it may cause an exception. In addition, the tables detail those conflicts where a VM Exit may be triggered, and list the Exit Qualification code that is provided in such cases.

Table 40-6. Base Concurrency Restrictions

Leaf	Parameter		Base Concurrency Restrictions		
			Access	On Conflict	SGX_CONFLICT VM Exit Qualification
EACCEPT	Target	[DS:RCX]	Shared	#GP	
	SECINFO	[DS:RBX]	Concurrent

40.2 INTEL® SGX INSTRUCTION REFERENCE

ENCLS—Execute an Enclave System Function of Specified Leaf Number

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
NP 0F 01 CF ENCLS	NP	V/V	SGX1	This instruction is used to execute privileged Intel SGX leaf functions that are used for managing and debugging the enclaves.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Implicit Register Operands
NP	NA	NA	NA	See Section 40.3

Description

The ENCLS instruction invokes the specified privileged Intel SGX leaf function for managing and debugging enclaves. Software specifies the leaf function by setting the appropriate value in the register EAX as input. The registers RBX, RCX, and RDX have leaf-specific purpose, and may act as input, as output, or may be unused. In 64-bit mode, the instruction ignores upper 32 bits of the RAX register.

The ENCLS instruction produces an invalid-opcode exception (#UD) if CR0.PE = 0 or RFLAGS.VM = 1, or if it is executed in system-management mode (SMM). Additionally, any attempt to execute the instruction when CPL > 0 results in #UD. The instruction produces a general-protection exception (#GP) if CR0.PG = 0 or if an attempt is made to invoke an undefined leaf function.

In VMX non-root operation, execution of ENCLS may cause a VM exit if the "enable ENCLS exiting" VM-execution control is 1. In this case, execution of individual leaf functions of ENCLS is governed by the ENCLS-exiting bitmap field in the VMCS. Each bit in that field corresponds to the index of an ENCLS leaf function (as provided in EAX).

Software in VMX root operation can thus intercept the invocation of various ENCLS leaf functions in VMX non-root operation by setting the "enable ENCLS exiting" VM-execution control and setting the corresponding bits in the ENCLS-exiting bitmap.

Addresses and operands are 32 bits outside 64-bit mode (IA32_EFER.LMA = 0 || CS.L = 0) and are 64 bits in 64-bit mode (IA32_EFER.LMA = 1 || CS.L = 1). CS.D value has no impact on address calculation. The DS segment is used to create linear addresses.

Segment override prefixes and address-size override prefixes are ignored, and is the REX prefix in 64-bit mode.

Operation

```
IF TSX_ACTIVE
    THEN GOTO TSX_ABORT_PROCESSING; FI;

IF CR0.PE = 0 or RFLAGS.VM = 1 or in SMM or CPUID.SGX_LEAF.0:EAX.SE1 = 0
    THEN #UD; FI;

IF (CPL > 0)
    THEN #UD; FI;

IF in VMX non-root operation and the "enable ENCLS exiting" VM-execution control is 1
    THEN
        IF EAX < 63 and ENCLS_exiting_bitmap[EAX] = 1 or EAX> 62 and ENCLS_exiting_bitmap[63] = 1
            THEN VM exit;
        FI;
FI;
IF IA32_FEATURE_CONTROL.LOCK = 0 or IA32_FEATURE_CONTROL.SGX_ENABLE = 0
    THEN #GP(0); FI;

IF EAX is invalid leaf number)
    THEN #GP(0); FI;
```

```
IF CR0.PG = 0
    THEN #GP(0); FI;

(* DS must not be an expanded down segment *)
IF not in 64-bit mode and DS.Type is expand-down data
    THEN #GP(0); FI;

Jump to leaf specific flow
```

Flags Affected

See individual leaf functions

Protected Mode Exceptions

#UD	If any of the LOCK/OSIZE/REP/VEX prefix is used.
	If current privilege level is not 0.
	If CPUID.(EAX=12H,ECX=0):EAX.SGX1 [bit 0] = 0.
	If logical processor is in SMM.
#GP(0)	If IA32_FEATURE_CONTROL.LOCK = 0.
	If IA32_FEATURE_CONTROL.SGX_ENABLE = 0.
	If input value in EAX encodes an unsupported leaf.
	If data segment expand down.
	If CR0.PG=0.

Real-Address Mode Exceptions

#UD	ENCLS is not recognized in real mode.

Virtual-8086 Mode Exceptions

#UD	ENCLS is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

#UD	If any of the LOCK/OSIZE/REP/VEX prefix is used.
	If current privilege level is not 0.
	If CPUID.(EAX=12H,ECX=0):EAX.SGX1 [bit 0] = 0.
	If logical processor is in SMM.
#GP(0)	If IA32_FEATURE_CONTROL.LOCK = 0.
	If IA32_FEATURE_CONTROL.SGX_ENABLE = 0.
	If input value in EAX encodes an unsupported leaf.

ENCLU—Execute an Enclave User Function of Specified Leaf Number

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
NP 0F 01 D7 ENCLU	NP	V/V	SGX1	This instruction is used to execute non-privileged Intel SGX leaf functions.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Implicit Register Operands
NP	NA	NA	NA	See Section 40.4

Description

The ENCLU instruction invokes the specified non-privileged Intel SGX leaf functions. Software specifies the leaf function by setting the appropriate value in the register EAX as input. The registers RBX, RCX, and RDX have leaf-specific purpose, and may act as input, as output, or may be unused. In 64-bit mode, the instruction ignores upper 32 bits of the RAX register.

The ENCLU instruction produces an invalid-opcode exception (#UD) if CR0.PE = 0 or RFLAGS.VM = 1, or if it is executed in system-management mode (SMM). Additionally, any attempt to execute this instruction when CPL < 3 results in #UD. The instruction produces a general-protection exception (#GP) if either CR0.PG or CR0.NE is 0, or if an attempt is made to invoke an undefined leaf function. The ENCLU instruction produces a device not available exception (#NM) if CR0.TS = 1.

Addresses and operands are 32 bits outside 64-bit mode (IA32_EFER.LMA = 0 or CS.L = 0) and are 64 bits in 64-bit mode (IA32_EFER.LMA = 1 and CS.L = 1). CS.D value has no impact on address calculation. The DS segment is used to create linear addresses.

Segment override prefixes and address-size override prefixes are ignored, as is the REX prefix in 64-bit mode.

Operation

```
IN_64BIT_MODE← 0;
IF TSX_ACTIVE
    THEN GOTO TSX_ABORT_PROCESSING; FI;

	If CR0.NE= 0.
#NM	If CR0.TS = 1.

ENCLV—Execute an Enclave VMM Function of Specified Leaf Number

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
NP 0F 01 C0 ENCLV	NP	V/V	SGX1	This instruction is used to execute privileged SGX leaf functions that are reserved for VMM use. They are used for managing the enclaves.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Implicit Register Operands
NP	NA	NA	NA	See Section 40.3

Description

The ENCLV instruction invokes the virtualization SGX leaf functions for managing enclaves in a virtualized environment. Software specifies the leaf function by setting the appropriate value in the register EAX as input. The registers RBX, RCX, and RDX have leaf-specific purpose, and may act as input, as output, or may be unused. In non 64-bit mode, the instruction ignores upper 32 bits of the RAX register.

The ENCLV instruction produces an invalid-opcode exception (#UD) if CR0.PE = 0 or RFLAGS.VM = 1, if it is executed in system-management mode (SMM), or not in VMX operation. Additionally, any attempt to execute the instruction when CPL > 0 results in #UD. The instruction produces a general-protection exception (#GP) if CR0.PG = 0 or if an attempt is made to invoke an undefined leaf function.

Software in VMX root mode of operation can enable execution of the ENCLV instruction in VMX non-root mode by setting enable ENCLV execution control in the VMCS. If enable ENCLV execution control in the VMCS is clear, execution of the ENCLV instruction in VMX non-root mode results in #UD.

When execution of ENCLV instruction in VMX non-root mode is enabled, software in VMX root operation can intercept the invocation of various ENCLS leaf functions in VMX non-root operation by setting the corresponding bits in the ENCLV-exiting bitmap.

Addresses and operands are 32 bits in 32-bit mode (IA32_EFER.LMA == 0 || CS.L == 0) and are 64 bits in 64-bit mode (IA32_EFER.LMA == 1 && CS.L == 1). CS.D value has no impact on address calculation.

Segment override prefixes and address-size override prefixes are ignored, as is the REX prefix in 64-bit mode.

Operation

```
IF TSX_ACTIVE
    THEN GOTO TSX_ABORT_PROCESSING; FI;

IF CR0.PE = 0 or RFLAGS.VM = 1 or in SMM or CPUID.SGX_LEAF.0:EAX.OSS = 0
    THEN #UD; FI;

IF in VMX non-root operation and IA_32_EFER.LMA = 1 and CS.L = 1
    THEN #UD; FI;

IF (CPL > 0)
    THEN #UD; FI;

IF in VMX non-root operation
  IF "enable ENCLV exiting" VM-execution control is 1
    THEN
      IF EAX < 63 and ENCLV_exiting_bitmap[EAX] = 1 or EAX> 62 and ENCLV_exiting_bitmap[63] = 1
          THEN VM exit;
      FI;
  ELSE
    #UD; FI;
```

```
FI;

IF IA32_FEATURE_CONTROL.LOCK = 0 or IA32_FEATURE_CONTROL.SGX_ENABLE = 0
    THEN #GP(0); FI;

IF EAX is invalid leaf number)
    THEN #GP(0); FI;

IF CR0.PG = 0
    THEN #GP(0); FI;

(* DS must not be an expanded down segment *)
IF not in 64-bit mode and DS.Type is expand-down data
    THEN #GP(0); FI;

Jump to leaf specific flow
```

Flags Affected

See individual leaf functions.

Protected Mode Exceptions

#UD	If any of the LOCK/OSIZE/REP/VEX prefix is used.
	If current privilege level is not 0.
	If CPUID.(EAX=12H,ECX=0):EAX.OSS [bit 5] = 0.
	If logical processor is in SMM.
#GP(0)	If IA32_FEATURE_CONTROL.LOCK = 0.
	If IA32_FEATURE_CONTROL.SGX_ENABLE = 0.
	If input value in EAX encodes an unsupported leaf.
	If data segment expand down.
	If CR0.PG=0.

Real-Address Mode Exceptions

#UD	ENCLV is not recognized in real mode.

Virtual-8086 Mode Exceptions

#UD	ENCLV is not recognized in virtual-8086 mode.

	If IA32_FEATURE_CONTROL.SGX_ENABLE = 0.
	If input value in EAX encodes an unsupported leaf.

40.3 INTEL® SGX SYSTEM LEAF FUNCTION REFERENCE

Leaf functions available with the ENCLS instruction mnemonic are covered in this section. In general, each instruction leaf requires EAX to specify the leaf function index and/or additional implicit registers specifying leaf-specific input parameters. An instruction operand encoding table provides details of each implicit register usage and associated input/output semantics.

In many cases, an input parameter specifies an effective address associated with a memory object inside or outside the EPC, the memory addressing semantics of these memory objects are also summarized in a separate table.

EADD—Add a Page to an Uninitialized Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 01H ENCLS[EADD]	IR	V/V	SGX1	This leaf function adds a page to an uninitialized enclave.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EADD (In)	Address of a PAGEINFO (In)	Address of the destination EPC page (In)

Description

This leaf function copies a source page from non-enclave memory into the EPC, associates the EPC page with an SECS page residing in the EPC, and stores the linear address and security attributes in EPCM. As part of the association, the enclave offset and the security attributes are measured and extended into the SECS.MRENCLAVE. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a PAGEINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of EADD leaf function.

EADD Memory Parameter Semantics

PAGEINFO	PAGEINFO.SECS	PAGEINFO.SRCPGE	PAGEINFO.SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read/Write access permitted by Enclave	Read access permitted by Non Enclave	Read access permitted by Non Enclave	Write access permitted by Enclave

The instruction faults if any of the following:

EADD Faulting Conditions

The operands are not properly aligned.	Unsupported security attributes are set.
Refers to an invalid SECS.	Reference is made to an SECS that is locked by another thread.
The EPC page is locked by another thread.	RCX does not contain an effective address of an EPC page.
The EPC page is already valid.	If security attributes specifies a TCS and the source page specifies unsupported TCS values or fields.
The SECS has been initialized.	The specified enclave offset is outside of the enclave address space.

Concurrency Restrictions

Table 40-8. Base Concurrency Restrictions of EADD

Leaf	Parameter	Base Concurrency Restrictions

EAUG—Add a Page to an Initialized Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 0DH ENCLS[EAUG]	IR	V/V	SGX2	This leaf function adds a page to an initialized enclave.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EAUG (In)	Address of a SECINFO (In)	Address of the destination EPC page (In)

Description

This leaf function zeroes a page of EPC memory, associates the EPC page with an SECS page residing in the EPC, and stores the linear address and security attributes in the EPCM. As part of the association, the security attributes are configured to prevent access to the EPC page until a corresponding invocation of the EACCEPT leaf or EACCEPT-COPY leaf confirms the addition of the new page into the enclave. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a PAGEINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EAUG leaf function.

EAUG Memory Parameter Semantics

PAGEINFO	PAGEINFO.SECS	PAGEINFO.SRCPGE	PAGEINFO.SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read/Write access permitted by Enclave	Must be zero	Read access permitted by Non Enclave	Write access permitted by Enclave

The instruction faults if any of the following:

EAUG Faulting Conditions

The operands are not properly aligned.	Unsupported security attributes are set.
Refers to an invalid SECS.	Reference is made to an SECS that is locked by another thread.
The EPC page is locked by another thread.	RCX does not contain an effective address of an EPC page.
The EPC page is already valid.	The specified enclave offset is outside of the enclave address space.
The SECS has been initialized.	

Concurrency Restrictions

EBLOCK—Mark a page in EPC as Blocked

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 09H ENCLS[EBLOCK]	IR	V/V	SGX1	This leaf function marks a page in the EPC as blocked.

Instruction Operand Encoding

Op/En	EAX		RCX
IR	EBLOCK (In)	Return error code (Out)	Effective address of the EPC page (In)

Description

This leaf function causes an EPC page to be marked as BLOCKED. This instruction can only be executed when current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create linear address. Segment override is not supported.

An error code is returned in RAX.

The table below provides additional information on the memory parameter of EBLOCK leaf function.

EBLOCK Memory Parameter Semantics

EPCPAGE
Read/Write access permitted by Enclave

The error codes are:

Table 40-12. EBLOCK Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	EBLOCK successful.
SGX_BLKSTATE	Page already blocked. This value is used to indicate to a VMM that the page was already in BLOCKED state as a result of EBLOCK and thus will need to be restored to this state when it is eventually reloaded (using ELDB).
SGX_ENTRYEPOCH_LOCKED	SECS locked for Entry Epoch update. This value indicates that an ETRACK is currently executing on the SECS. The EBLOCK should be reattempted.
SGX_NOTBLOCKABLE	Page type is not one which can be blocked.
SGX_PG_INVLD	Page is not valid and cannot be blocked.
SGX_EPC_PAGE_CONFLICT	Page is being written by EADD, EAUG, ECREATE, ELDU/B, EMODT, or EWB.

ECREATE—Create an SECS page in the Enclave Page Cache

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 00H ENCLS[ECREATE]	IR	V/V	SGX1	This leaf function begins an enclave build by creating an SECS page in EPC.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	ECREATE (In)	Address of a PAGEINFO (In)	Address of the destination SECS page (In)

Description

ENCLS[ECREATE] is the first instruction executed in the enclave build process. ECREATE copies an SECS structure outside the EPC into an SECS page inside the EPC. The internal structure of SECS is not accessible to software.

ECREATE will set up fields in the protected SECS and mark the page as valid inside the EPC. ECREATE initializes or checks unused fields.

Software sets the following fields in the source structure: SECS:BASEADDR, SECS:SIZE in bytes, ATTRIBUTES, CONFIGID and CONFIGSVN. SECS:BASEADDR must be naturally aligned on an SECS.SIZE boundary. SECS.SIZE must be at least 2 pages (8192).

The source operand RBX contains an effective address of a PAGEINFO structure. PAGEINFO contains an effective address of a source SECS and an effective address of an SECINFO. The SECS field in PAGEINFO is not used.

The RCX register is the effective address of the destination SECS. It is an address of an empty slot in the EPC. The SECS structure must be page aligned. SECINFO flags must specify the page as an SECS page.

ECREATE Memory Parameter Semantics

PAGEINFO	PAGEINFO.SRCPGE	PAGEINFO.SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read access permitted by Non Enclave	Read access permitted by Non Enclave	Write access permitted by Enclave

ECREATE will fault if the SECS target page is in use; already valid; outside the EPC. It will also fault if addresses are not aligned; unused PAGEINFO fields are not zero.

If the amount of space needed to store the SSA frame is greater than the amount specified in SECS.SSAFRAME-SIZE, a #GP(0) results. The amount of space needed for an SSA frame is computed based on DS:TMP_SECS.ATTRIBUTES.XFRM size. Details of computing the size can be found Section 41.7.

EDBGRD—Read From a Debug Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 04H ENCLS[EDBGRD]	IR	V/V	SGX1	This leaf function reads a dword/quadword from a debug enclave.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EDBGRD (In)	Data read from a debug enclave (Out)	Address of source memory in the EPC (In)

Description

This leaf function copies a quadword/doubleword from an EPC page belonging to a debug enclave into the RBX register. Eight bytes are read in 64-bit mode, four bytes are read in non-64-bit modes. The size of data read cannot be overridden.

The effective address of the source location inside the EPC is provided in the register RCX.

EDBGRD Memory Parameter Semantics

EPCQW
Read access permitted by Enclave

The error codes are:

Table 40-17. EDBGRD Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	EDBGRD successful.
SGX_PAGE_NOT_DEBUGGABLE	The EPC page cannot be accessed because it is in the PENDING or MODIFIED state.

The instruction faults if any of the following:

EDBGRD Faulting Conditions

RCX points into a page that is an SECS.	RCX does not resolve to a naturally aligned linear address.
RCX points to a page that does not belong to an enclave that is in debug mode.	RCX points to a location inside a TCS that is beyond the architectural size of the TCS (SGX_TCS_LIMIT).
An operand causing any segment violation.	May page fault.
CPL > 0.	

This instruction ignores the EPCM RWX attributes on the enclave page. Consequently, violation of EPCM RWX attributes via EDBGRD does not result in a #GP.

EDBGWR—Write to a Debug Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 05H ENCLS[EDBGWR]	IR	V/V	SGX1	This leaf function writes a dword/quadword to a debug enclave.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EDBGWR (In)	Data to be written to a debug enclave (In)	Address of Target memory in the EPC (In)

Description

This leaf function copies the content in EBX/RBX to an EPC page belonging to a debug enclave. Eight bytes are written in 64-bit mode, four bytes are written in non-64-bit modes. The size of data cannot be overridden.

The effective address of the source location inside the EPC is provided in the register RCX.

EDBGWR Memory Parameter Semantics

EPCQW
Write access permitted by Enclave

The instruction faults if any of the following:

EDBGWR Faulting Conditions

RCX points into a page that is an SECS.	RCX does not resolve to a naturally aligned linear address.
RCX points to a page that does not belong to an enclave that is in debug mode.	RCX points to a location inside a TCS that is not the FLAGS word.
An operand causing any segment violation.	May page fault.
CPL > 0.	

The error codes are:

Table 40-20. EDBGWR Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	EDBGWR successful.
SGX_PAGE_NOT_DEBUGGABLE	The EPC page cannot be accessed because it is in the PENDING or MODIFIED state.

This instruction ignores the EPCM RWX attributes on the enclave page. Consequently, violation of EPCM RWX attributes via EDBGRD does not result in a #GP.

EEXTEND—Extend Uninitialized Enclave Measurement by 256 Bytes

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 06H ENCLS[EEXTEND]	IR	V/V	SGX1	This leaf function measures 256 bytes of an uninitialized enclave page.

Instruction Operand Encoding

Op/En	EAX	EBX	RCX
IR	EEXTEND (In)	Effective address of the SECS of the data chunk (In)	Effective address of a 256-byte chunk in the EPC (In)

Description

This leaf function updates the MRENCLAVE measurement register of an SECS with the measurement of an EXTEND string compromising of "EEXTEND" || ENCLAVEOFFSET || PADDING || 256 bytes of the enclave page. This instruction can only be executed when current privilege level is 0 and the enclave is uninitialized.

RBX contains the effective address of the SECS of the region to be measured. The address must be the same as the one used to add the page into the enclave.

RCX contains the effective address of the 256 byte region of an EPC page to be measured. The DS segment is used to create linear addresses. Segment override is not supported.

EEXTEND Memory Parameter Semantics

EPC[RCX]
Read access by Enclave

The instruction faults if any of the following:

EEXTEND Faulting Conditions

RBX points to an address not 4KBytes aligned.	RBX does not resolve to an SECS.
RBX does not point to an SECS page.	RBX does not point to the SECS page of the data chunk.
RCX points to an address not 256B aligned.	RCX points to an unused page or a SECS.
RCX does not resolve in an EPC page.	If SECS is locked.
If the SECS is already initialized.	May page fault.

EINIT—Initialize an Enclave for Execution

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 02H ENCLS[EINIT]	IR	V/V	SGX1	This leaf function initializes the enclave and makes it ready to execute enclave code.

Instruction Operand Encoding

Op/En	EAX		RBX	RCX	RDX
IR	EINIT (In)	Error code (Out)	Address of SIGSTRUCT (In)	Address of SECS (In)	Address of EINITTOKEN (In)

Description

This leaf function is the final instruction executed in the enclave build process. After EINIT, the MRENCLAVE measurement is complete, and the enclave is ready to start user code execution using the EENTER instruction.

EINIT takes the effective address of a SIGSTRUCT and EINITTOKEN. The SIGSTRUCT describes the enclave including MRENCLAVE, ATTRIBUTES, ISVSVN, a 3072 bit RSA key, and a signature using the included key. SIGSTRUCT must be populated with two values, q1 and q2. These are calculated using the formulas shown below:

q1 = floor(Signature^2 / Modulus);

q2 = floor((Signature^3 - q1 * Signature * Modulus) / Modulus);

The EINITTOKEN contains the MRENCLAVE, MRSIGNER, and ATTRIBUTES. These values must match the corresponding values in the SECS. If the EINITTOKEN was created with a debug launch key, the enclave must be in debug mode as well.

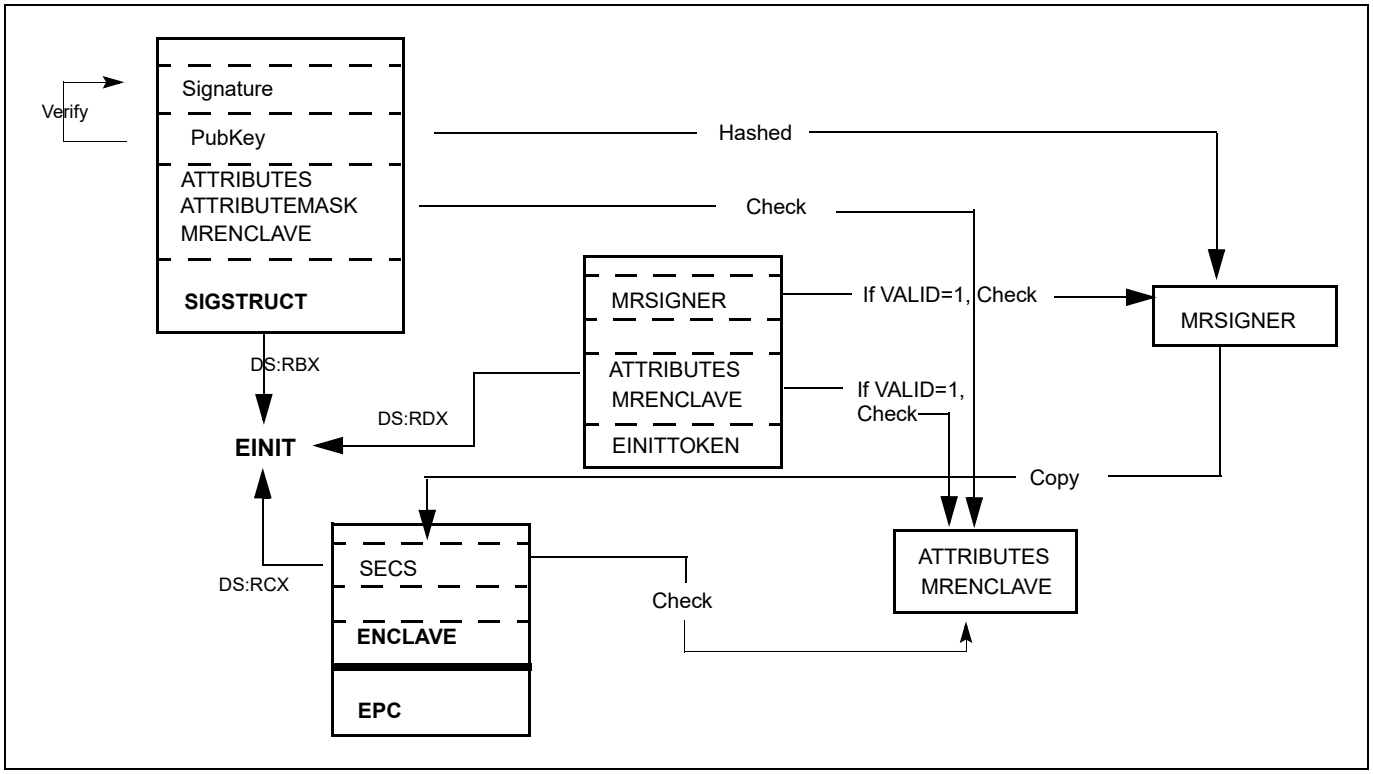

Figure 40-1. Relationships Between SECS, SIGSTRUCT and EINITTOKEN

EINIT Memory Parameter Semantics

SIGSTRUCT	SECS	EINITTOKEN
Access by non-Enclave	Read/Write access by Enclave	Access by non-Enclave

EINIT performs the following steps, which can be seen in Figure 40-1:

Validates that SIGSTRUCT is signed using the enclosed public key.

Checks that the completed computation of SECS.MRENCLAVE equals SIGSTRUCT.HASHENCLAVE.

Checks that no reserved bits are set to 1 in SIGSTRUCT.ATTRIBUTES and no reserved bits in SIGSTRUCT.ATTRIBUTESMASK are set to 0.

Checks that no controlled ATTRIBUTES bits are set in SIGSTRUCT.ATTRIBUTES unless the SHA256 digest of SIGSTRUCT.MODULUS equals IA32_SGX_LEPUBKEYHASH.

Checks that SIGSTRUCT.ATTRIBUTES equals the result of logically and-ing SIGSTRUCT.ATTRIBUTEMASK with SECS.ATTRIBUTES.

If EINITTOKEN.VALID is 0, checks that the SHA256 digest of SIGSTRUCT.MODULUS equals IA32_SGX_LEPUBKEYHASH.

If EINITTOKEN.VALID is 1, checks the validity of EINITTOKEN.

If EINITTOKEN.VALID is 1, checks that EINITTOKEN.MRENCLAVE equals SECS.MRENCLAVE.

If EINITTOKEN.VALID is 1 and EINITTOKEN.ATTRIBUTES.DEBUG is 1, SECS.ATTRIBUTES.DEBUG must be 1.

Commits SECS.MRENCLAVE, and sets SECS.MRSIGNER, SECS.ISVSVN, and SECS.ISVPRODID based on SIGSTRUCT.

Update the SECS as Initialized.

Periodically, EINIT polls for certain asynchronous events. If such an event is detected, it completes with failure code (ZF=1 and RAX = SGX_UNMASKED_EVENT), and RIP is incremented to point to the next instruction. These events includes external interrupts, non-maskable interrupts, system-management interrupts, machine checks, INIT signals, and the VMX-preemption timer. EINIT does not fail if the pending event is inhibited (e.g., external interrupts could be inhibited due to blocking by MOV SS blocking or by STI).

The following bits in RFLAGS are cleared: CF, PF, AF, OF, and SF. When the instruction completes with an error, RFLAGS.ZF is set to 1, and the corresponding error bit is set in RAX. If no error occurs, RFLAGS.ZF is cleared and RAX is set to 0.

The error codes are:

Table 40-25. EINIT Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	EINIT successful.
SGX_INVALID_SIG_STRUCT	If SIGSTRUCT contained an invalid value.
SGX_INVALID_ATTRIBUTE	If SIGSTRUCT contains an unauthorized attributes mask.
SGX_INVALID_MEASUREMENT	If SIGSTRUCT contains an incorrect measurement. If EINITTOKEN contains an incorrect measurement.
SGX_INVALID_SIGNATURE	If signature does not validate with enclosed public key.
SGX_INVALID_LICENSE	If license is invalid.
SGX_INVALID_CPUSVN	If license SVN is unsupported.
SGX_UNMASKED_EVENT	If an unmasked event is received before the instruction completes its operation.

Flags Affected

ZF is cleared if successful, otherwise ZF is set and RAX contains the error code. CF, PF, AF, OF, SF are cleared.

Protected Mode Exceptions

#GP(0)	If a memory operand is not properly aligned. If another instruction is modifying the SECS. If the enclave is already initialized. If the SECS.MRENCLAVE is in use.
#PF(error code)	If a page fault occurs in accessing memory operands. If RCX does not resolve in an EPC page. If the memory address is not a valid, uninitialized SECS.

64-Bit Mode Exceptions

#GP(0)	If a memory operand is not properly aligned. If another instruction is modifying the SECS. If the enclave is already initialized. If the SECS.MRENCLAVE is in use.
#PF(error code)	If a page fault occurs in accessing memory operands. If RCX does not resolve in an EPC page. If the memory address is not a valid, uninitialized SECS.

ELDB/ELDU/ELDBC/ELBUC—Load an EPC Page and Marked its State

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 07H ENCLS[ELDB]	IR	V/V	SGX1	This leaf function loads, verifies an EPC page and marks the page as blocked.
EAX = 08H ENCLS[ELDU]	IR	V/V	SGX1	This leaf function loads, verifies an EPC page and marks the page as unblocked.
EAX = 12H ENCLS[ELDBC]	IR	V/V	EAX[5]	This leaf function behaves lie ELDB but with improved conflict handling for oversubscription.
EAX = 13H ENCLS[ELDBC]	IR	V/V	EAX[5]	This leaf function behaves like ELDU but with improved conflict handling for oversubscription.

Instruction Operand Encoding

Op/En	EAX		RBX	RCX	RDX
IR	ELDB/ELDU (In)	Return error code (Out)	Address of the PAGEINFO (In)	Address of the EPC page (In)	Address of the version-array slot (In)

Description

This leaf function copies a page from regular main memory to the EPC. As part of the copying process, the page is cryptographically authenticated and decrypted. This instruction can only be executed when current privilege level is 0.

The ELDB leaf function sets the BLOCK bit in the EPCM entry for the destination page in the EPC after copying. The ELDU leaf function clears the BLOCK bit in the EPCM entry for the destination page in the EPC after copying.

RBX contains the effective address of a PAGEINFO structure; RCX contains the effective address of the destination EPC page; RDX holds the effective address of the version array slot that holds the version of the page.

The ELDBC/ELDUC leafs are very similar to ELDB and ELDU. They provide an error code on the concurrency conflict for any of the pages which need to acquire a lock. These include the destination, SECS, and VA slot.

The table below provides additional information on the memory parameter of ELDB/ELDU leaf functions.

ELDB/ELDU/ELDBC/ELBUC Memory Parameter Semantics

PAGEINFO	PAGEINFO.SRCPGE	PAGEINFO.PCMD	PAGEINFO.SECS	EPCPAGE	Version-Array Slot
Non-enclave read access	Non-enclave read access	Non-enclave read access	Enclave read/write access	Read/Write access permitted by Enclave	Read/Write access permitted by Enclave

The error codes are:

Table 40-28. ELDB/ELDU/ELDBC/ELBUC Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	ELDB/ELDU successful.
SGX_MAC_COMPARE_FAIL	If the MAC check fails.

	If one of the EPC memory operands has incorrect page type.
	If the destination EPC page is already valid.

EMODPR—Restrict the Permissions of an EPC Page

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 0EH ENCLS[EMODPR]	IR	V/V	SGX2	This leaf function restricts the access rights associated with a EPC page in an initialized enclave.

Instruction Operand Encoding

Op/En	EAX		RBX	RCX
IR	EMODPR (In)	Return Error Code (Out)	Address of a SECINFO (In)	Address of the destination EPC page (In)

Description

This leaf function restricts the access rights associated with an EPC page in an initialized enclave. THE RWX bits of the SECINFO parameter are treated as a permissions mask; supplying a value that does not restrict the page permissions will have no effect. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EMODPR leaf function.

EMODPR Memory Parameter Semantics

SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read/Write access permitted by Enclave

The instruction faults if any of the following:

EMODPR Faulting Conditions

The operands are not properly aligned.	If unsupported security attributes are set.
The Enclave is not initialized.	SECS is locked by another thread.
The EPC page is locked by another thread.	RCX does not contain an effective address of an EPC page in the running enclave.
The EPC page is not valid.	

The error codes are:

Table 40-31. EMODPR Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	EMODPR successful.
SGX_PAGE_NOT_MODIFIABLE	The EPC page cannot be modified because it is in the PENDING or MODIFIED state.
SGX_EPC_PAGE_CONFLICT	Page is being written by EADD, EAUG, ECREATE, ELDU/B, EMODT, or EWB.

Concurrency Restrictions

IR	EMODT (In)	Return Error Code (Out)	Address of a SECINFO (In)	Address of the destination EPC page (In)

Description

This leaf function modifies the type of an EPC page. The security attributes are configured to prevent access to the EPC page at its new type until a corresponding invocation of the EACCEPT leaf confirms the modification. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EMODT leaf function.

EMODT Memory Parameter Semantics

SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read/Write access permitted by Enclave

The instruction faults if any of the following:

EMODT Faulting Conditions

The operands are not properly aligned.	If unsupported security attributes are set.
The Enclave is not initialized.	SECS is locked by another thread.
The EPC page is locked by another thread.	RCX does not contain an effective address of an EPC page in the running enclave.
The EPC page is not valid.	

The error codes are:

Table 40-34. EMODT Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	EMODT successful.
SGX_PAGE_NOT_MODIFIABLE	The EPC page cannot be modified because it is in the PENDING or MODIFIED state.
SGX_EPC_PAGE_CONFLICT	Page is being written by EADD, EAUG, ECREATE, ELDU/B, EMODPR, or EWB.

Concurrency Restrictions

ERDINFO—Read Type and Status Information About an EPC Page

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 10H ENCLS[ERDINFO]	IR	V/V	EAX[6]	This leaf function returns type and status information about an EPC page.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	ERDINFO (In)	Address of a RDINFO structure (In)	Address of the destination EPC page (In)

Description

This instruction reads type and status information about an EPC page and returns it in a RDINFO structure. The STATUS field of the structure describes the status of the page and determines the validity of the remaining fields. The FLAGS field returns the EPCM permissions of the page; the page type; and the BLOCKED, PENDING, MODIFIED, and PR status of the page. For enclave pages, the ENCLAVECONTEXT field of the structure returns the value of SECS.ENCLAVECONTEXT. For non-enclave pages (e.g., VA) ENCLAVECONTEXT returns 0.

For invalid or non-EPC pages, the instruction returns an information code indicating the page's status, in addition to populating the STATUS field.

ERDINFO returns an error code if the destination EPC page is being modified by a concurrent SGX instruction.

RBX contains the effective address of a RDINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of ERDINFO leaf function.

ERDINFO Memory Parameter Semantics

RDINFO	EPCPAGE
Read/Write access permitted by Non Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

ERDINFO Faulting Conditions

A memory operand effective address is outside the DS segment limit (32b mode).	A memory operand is not properly aligned.
DS segment is unusable (32b mode).	A page fault occurs in accessing memory operands.
A memory address is in a non-canonical form (64b mode).	

The error codes are:

Table 40-39. ERDINFO Return Value in RAX

Error Code	Value	Description
No Error	0	ERDINFO successful.
SGX_EPC_PAGE_CONFLICT		Failure due to concurrent operation of another SGX instruction.
SGX_PG_INVLD		Target page is not a valid EPC page.
SGX_PG_NONEPC		Page is not an EPC page.

EREMOVE—Remove a page from the EPC

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 03H ENCLS[EREMOVE]	IR	V/V	SGX1	This leaf function removes a page from the EPC.

Instruction Operand Encoding

Op/En	EAX	RCX
IR	EREMOVE (In)	Effective address of the EPC page (In)

Description

This leaf function causes an EPC page to be un-associated with its SECS and be marked as unused. This instruction leaf can only be executed when the current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create linear address. Segment override is not supported.

The instruction fails if the operand is not properly aligned or does not refer to an EPC page or the page is in use by another thread, or other threads are running in the enclave to which the page belongs. In addition the instruction fails if the operand refers to an SECS with associations.

EREMOVE Memory Parameter Semantics

EPCPAGE
Write access permitted by Enclave

The instruction faults if any of the following:

EREMOVE Faulting Conditions

The memory operand is not properly aligned.	The memory operand does not resolve in an EPC page.
Refers to an invalid SECS.	Refers to an EPC page that is locked by another thread.
Another Intel SGX instruction is accessing the EPC page.	RCX does not contain an effective address of an EPC page.
the EPC page refers to an SECS with associations.	

The error codes are:

Table 40-42. EREMOVE Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	EREMOVE successful.
SGX_CHILD_PRESENT	If the SECS still have enclave pages loaded into EPC.
SGX_ENCLAVE_ACT	If there are still logical processors executing inside the enclave.

Flags Affected

Sets ZF if SECS is in use or invalid, otherwise cleared. Clears CF, PF, AF, OF, SF.

Protected Mode Exceptions

#GP(0)	If a memory operand effective address is outside the DS segment limit.
	If a memory operand is not properly aligned.
	If another thread is concurrently using the tracking facility on this SECS.
#PF(error code)	If a page fault occurs in accessing memory operands.
	If a memory operand is not an EPC page.

64-Bit Mode Exceptions

#GP(0)	If a memory operand is non-canonical form.
	If a memory operand is not properly aligned.
	If the specified EPC resource is in use.
#PF(error code)	If a page fault occurs in accessing memory operands.
	If a memory operand is not an EPC page.

ETRACKC—Activates EBLOCK Checks

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 11H ENCLS[ETRACKC]	IR	V/V	EAX[6]	This leaf function activates EBLOCK checks.

Instruction Operand Encoding

Op/En	EAX		RCX	
IR	ETRACK (In)	Return error code (Out)	Address of the destination EPC page (In, EA)	Address of the SECS page (In, EA)

Description

The ETRACKC instruction is thread safe variant of ETRACK leaf and can be executed concurrently with other CPU threads operating on the same SECS.

This leaf function provides the mechanism for hardware to track that software has completed the required TLB address clears successfully. The instruction can only be executed when the current privilege level is 0.

The content of RCX is an effective address of an EPC page.

The table below provides additional information on the memory parameter of ETRACK leaf function.

ETRACKC Memory Parameter Semantics

EPCPAGE
Read/Write access permitted by Enclave

The error codes are:

Table 40-48. ETRACKC Return Value in RAX

Error Code	Value	Description
No Error	0	ETRACKC successful.
SGX_EPC_PAGE_CONFLICT	7	Failure due to concurrent operation of another SGX instruction.
SGX_PG_INVLD	6	Target page is not a VALID EPC page.
SGX_PREV_TRK_INCMPL	17	All processors did not complete the previous tracking sequence.
SGX_TRACK_NOT_REQUIRED	27	Target page type does not require tracking.

Concurrency Restrictions

Flags Affected

ZF is set if ETRACKC fails due to concurrent operations with another SGX instructions or target page is an invalid EPC page or tracking is not completed on SECS page; otherwise cleared.

CF is set if target page is not of a type that requires tracking; otherwise cleared.

PF, AF, OF and SF are cleared.

Protected Mode Exceptions

#GP(0)	If the memory operand violates access-control policies of DS segment. If DS segment is unusable. If the memory operand is not properly aligned.
#PF(error code)	If the memory operand expected to be in EPC does not resolve to an EPC page. If a page fault occurs in access memory operand.

64-Bit Mode Exceptions

#GP(0)	If a memory address is in a non-canonical form. If a memory operand is not properly aligned.
#PF(error code)	If the memory operand expected to be in EPC does not resolve to an EPC page. If a page fault occurs in access memory operand.

EWB—Invalidate an EPC Page and Write out to Main Memory

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 0BH ENCLS[EWB]	IR	V/V	SGX1	This leaf function invalidates an EPC page and writes it out to main memory.

Instruction Operand Encoding

Op/En	EAX		RBX	RCX	RDX
IR	EWB (In)	Error code (Out)	Address of an PAGEINFO (In)	Address of the EPC page (In)	Address of a VA slot (In)

Description

This leaf function copies a page from the EPC to regular main memory. As part of the copying process, the page is cryptographically protected. This instruction can only be executed when current privilege level is 0.

The table below provides additional information on the memory parameter of EPA leaf function.

EWB Memory Parameter Semantics

PAGEINFO	PAGEINFO.SRCPGE	PAGEINFO.PCMD	EPCPAGE	VASLOT
Non-EPC R/W access	Non-EPC R/W access	Non-EPC R/W access	EPC R/W access	EPC R/W access

The error codes are:

Table 40-51. EWB Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	EWB successful.
SGX_PAGE_NOT_BLOCKED	If page is not marked as blocked.
SGX_NOT_TRACKED	If EWB is racing with ETRACK instruction.
SGX_VA_SLOT_OCCUPIED	Version array slot contained valid entry.
SGX_CHILD_PRESENT	Child page present while attempting to page out enclave.

	If the parameters fail consistency checks.
#PF(error code)	If a page fault occurs in accessing memory operands.
	If a memory operand is not an EPC page.
	If one of the EPC memory operands has incorrect page type.

40.4 INTEL® SGX USER LEAF FUNCTION REFERENCE

Leaf functions available with the ENCLU instruction mnemonic are covered in this section. In general, each instruction leaf requires EAX to specify the leaf function index and/or additional registers specifying leaf-specific input parameters. An instruction operand encoding table provides details of the implicitly-encoded register usage and associated input/output semantics.

In many cases, an input parameter specifies an effective address associated with a memory object inside or outside the EPC, the memory addressing semantics of these memory objects are also summarized in a separate table.

EACCEPT—Accept Changes to an EPC Page

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 05H ENCLU[EACCEPT]	IR	V/V	SGX2	This leaf function accepts changes made by system software to an EPC page in the running enclave.

Instruction Operand Encoding

Op/En	EAX		RBX	RCX
IR	EACCEPT (In)	Return Error Code (Out)	Address of a SECINFO (In)	Address of the destination EPC page (In)

Description

This leaf function accepts changes to a page in the running enclave by verifying that the security attributes specified in the SECINFO match the security attributes of the page in the EPCM. This instruction leaf can only be executed when inside the enclave.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EACCEPT leaf function.

EACCEPT Memory Parameter Semantics

SECINFO	EPCPAGE (Destination)
Read access permitted by Non Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

EACCEPT Faulting Conditions

The operands are not properly aligned.	RBX does not contain an effective address in an EPC page in the running enclave.
The EPC page is locked by another thread.	RCX does not contain an effective address of an EPC page in the running enclave.
The EPC page is not valid.	Page type is PT_REG and MODIFIED bit is 0.
SECINFO contains an invalid request.	Page type is PT_TCS or PT_TRIM and PENDING bit is 0 and MODIFIED bit is 1.
If security attributes of the SECINFO page make the page inaccessible.	

The error codes are:

Table 40-54. EACCEPT Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	EACCEPT successful.
SGX_PAGE_ATTRIBUTES_MISMATCH	The attributes of the target EPC page do not match the expected values.
SGX_NOT_TRACKED	The OS did not complete an ETRACK on the target page.

Concurrency Restrictions

	If a memory operand is not an EPC page.
	If EPC page has incorrect page type or security attributes.

64-Bit Mode Exceptions

#GP(0)	If a memory operand is non-canonical form.
	If a memory operand is not properly aligned.
	If a memory operand is locked.
#PF(error code)	If a page fault occurs in accessing memory operands.
	If a memory operand is not an EPC page.
	If EPC page has incorrect page type or security attributes.

EACCEPTCOPY—Initialize a Pending Page

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 07H ENCLU[EACCEPTCOPY]	IR	V/V	SGX2	This leaf function initializes a dynamically allocated EPC page from another page in the EPC.

Instruction Operand Encoding

Op/En	EAX		RBX	RCX	RDX
IR	EACCEPTCOPY (In)	Return Error Code (Out)	Address of a SECINFO (In)	Address of the destination EPC page (In)	Address of the source EPC page (In)

Description

This leaf function copies the contents of an existing EPC page into an uninitialized EPC page (created by EAUG). After initialization, the instruction may also modify the access rights associated with the destination EPC page. This instruction leaf can only be executed when inside the enclave.

RBX contains the effective address of a SECINFO structure while RCX and RDX each contain the effective address of an EPC page. The table below provides additional information on the memory parameter of the EACCEPTCOPY leaf function.

EACCEPTCOPY Memory Parameter Semantics

SECINFO	EPCPAGE (Destination)	EPCPAGE (Source)
Read access permitted by Non Enclave	Read/Write access permitted by Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

EACCEPTCOPY Faulting Conditions

The operands are not properly aligned.	If security attributes of the SECINFO page make the page inaccessible.
The EPC page is locked by another thread.	If security attributes of the source EPC page make the page inaccessible.
The EPC page is not valid.	RBX does not contain an effective address in an EPC page in the running enclave.
SECINFO contains an invalid request.	RCX/RDX does not contain an effective address of an EPC page in the running enclave.

The error codes are:

Table 40-57. EACCEPTCOPY Return Value in RAX

Error Code (see Table 40-4)	Description
No Error	EACCEPTCOPY successful.
SGX_PAGE_ATTRIBUTES_MISMATCH	The attributes of the target EPC page do not match the expected values.

EENTER—Enters an Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 02H ENCLU[EENTER]	IR	V/V	SGX1	This leaf function is used to enter an enclave.

Instruction Operand Encoding

Op/En	EAX		RBX	RCX	
IR	EENTER (In)	Content of RBX.CSSA (Out)	Address of a TCS (In)	Address of AEP (In)	Address of IP following EENTER (Out)

Description

The ENCLU[EENTER] instruction transfers execution to an enclave. At the end of the instruction, the logical processor is executing in enclave mode at the RIP computed as EnclaveBase + TCS.OENTRY. If the target address is not within the CS segment (32-bit) or is not canonical (64-bit), a #GP(0) results.

EENTER Memory Parameter Semantics

TCS
Enclave access

EENTER is a serializing instruction. The instruction faults if any of the following occurs:

Address in RBX is not properly aligned.	Any TCS.FLAGS's must-be-zero bit is not zero.
TCS pointed to by RBX is not valid or available or locked.	Current 32/64 mode does not match the enclave mode in SECS.ATTRIBUTES.MODE64.
The SECS is in use.	Either of TCS-specified FS and GS segment is not a subsets of the current DS segment.
Any one of DS, ES, CS, SS is not zero.	If XSAVE available, CR4.OSXSAVE = 0, but SECS.ATTRIBUTES.XFRM ≠ 3.
CR4.OSFXSR ≠ 1.	If CR4.OSXSAVE = 1, SECS.ATTRIBUTES.XFRM is not a subset of XCR0.

The following operations are performed by EENTER:

- RSP and RBP are saved in the current SSA frame on EENTER and are automatically restored on EEXIT or interrupt.
- The AEP contained in RCX is stored into the TCS for use by AEXs.FS and GS (including hidden portions) are saved and new values are constructed using TCS.OFSBASE/GSBASE (32 and 64-bit mode) and TCS.OFSLIMIT/GSLIMIT (32-bit mode only). The resulting segments must be a subset of the DS segment.
- If CR4.OSXSAVE == 1, XCR0 is saved and replaced by SECS.ATTRIBUTES.XFRM. The effect of RFLAGS.TF depends on whether the enclave entry is opt-in or opt-out (see Section 42.1.2):
  - — On opt-out entry, TF is saved and cleared (it is restored on EEXIT or AEX). Any attempt to set TF via a POPF instruction while inside the enclave clears TF (see Section 42.2.5).
  - — On opt-in entry, a single-step debug exception is pended on the instruction boundary immediately after EENTER (see Section 42.2.2).
- All code breakpoints that do not overlap with ELRANGE are also suppressed. If the entry is an opt-out entry, all code and data breakpoints that overlap with the ELRANGE are suppressed.
- On opt-out entry, a number of performance monitoring counters and behaviors are modified or suppressed (see Section 42.2.3):

— All performance monitoring activity on the current thread is suppressed except for incrementing and firing of FIXED_CTR1 and FIXED_CTR2.

— PEBS is suppressed.

— AnyThread counting on other threads is demoted to MyThread mode and IA32_PERF_GLOBAL_STATUS[60] on that thread is set

— If the opt-out entry on a hardware thread results in suppression of any performance monitoring, then the processor sets IA32_PERF_GLOBAL_STATUS[60] and IA32_PERF_GLOBAL_STATUS[63].

Flags Affected

RFLAGS.TF is cleared on opt-out entry

Protected Mode Exceptions

#GP(0)	If DS:RBX is not page aligned.
	If the enclave is not initialized.
	If part or all of the FS or GS segment specified by TCS is outside the DS segment or not properly aligned.
	If the thread is not in the INACTIVE state.
	If CS, DS, ES or SS bases are not all zero.
	If executed in enclave mode.
	If any reserved field in the TCS FLAG is set.
	If the target address is not within the CS segment.
	If CR4.OSFXSR = 0.
	If CR4.OSXSAVE = 0 and SECS.ATTRIBUTES.XFRM ≠ 3.
	If CR4.OSXSAVE = 1and SECS.ATTRIBUTES.XFRM is not a subset of XCR0.
#PF(error code)	If a page fault occurs in accessing memory.
	If DS:RBX does not point to a valid TCS.
	If one or more pages of the current SSA frame are not readable/writable, or do not resolve to a valid PT_REG EPC page.

64-Bit Mode Exceptions

#GP(0)	If DS:RBX is not page aligned.
	If the enclave is not initialized.
	If the thread is not in the INACTIVE state.
	If CS, DS, ES or SS bases are not all zero.
	If executed in enclave mode.
	If part or all of the FS or GS segment specified by TCS is outside the DS segment or not properly aligned.
	If the target address is not canonical.
	If CR4.OSFXSR = 0.
	If CR4.OSXSAVE = 0 and SECS.ATTRIBUTES.XFRM ≠ 3.
	If CR4.OSXSAVE = 1and SECS.ATTRIBUTES.XFRM is not a subset of XCR0.
#PF(error code)	If a page fault occurs in accessing memory operands.
	If DS:RBX does not point to a valid TCS.
	If one or more pages of the current SSA frame are not readable/writable, or do not resolve to a valid PT_REG EPC page.

EEXIT—Exits an Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 04H ENCLU[EEXIT]	IR	V/V	SGX1	This leaf function is used to exit an enclave.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EEXIT (In)	Target address outside the enclave (In)	Address of the current AEP (In)

Description

The ENCLU[EEXIT] instruction exits the currently executing enclave and branches to the location specified in RBX. RCX receives the current AEP. If RBX is not within the CS (32-bit mode) or is not canonical (64-bit mode) a #GP(0) results.

EEXIT Memory Parameter Semantics

Target Address
Non-Enclave read and execute access

If RBX specifies an address that is inside the enclave, the instruction will complete normally. The fetch of the next instruction will occur in non-enclave mode, but will attempt to fetch from inside the enclave. This has the effect of abort page semantics on the next destination.

If secrets are contained in any registers, it is responsibility of enclave software to clear those registers.

If XCR0 was modified on enclave entry, it is restored to the value it had at the time of the most recent EENTER or ERESUME.

If the enclave is opt-out, RFLAGS.TF is loaded from the value previously saved on EENTER.

Code and data breakpoints are unsuppressed.

Performance monitoring counters are unsuppressed.

Concurrency Restrictions

Table 40-62. Base Concurrency Restrictions of EEXIT

Leaf	Parameter	Base Concurrency Restrictions		
		Access	On Conflict	SGX_CONFLICT VM Exit Qualification
EEXIT		Concurrent

#PF(error code)	If a page fault occurs in accessing memory operands.

EGETKEY—Retrieves a Cryptographic Key

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 01H ENCLU[EGETKEY]	IR	V/V	SGX1	This leaf function retrieves a cryptographic key.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EGETKEY (In)	Address to a KEYREQUEST (In)	Address of the OUTPUTDATA (In)

Description

The ENCLU[EGETKEY] instruction returns a 128-bit secret key from the processor specific key hierarchy. The register RBX contains the effective address of a KEYREQUEST structure, which the instruction interprets to determine the key being requested. The Requesting Keys section below provides a description of the keys that can be requested. The RCX register contains the effective address where the key will be returned. Both the addresses in RBX & RCX should be locations inside the enclave.

EGETKEY derives keys using a processor unique value to create a specific key based on a number of possible inputs. This instruction leaf can only be executed inside an enclave.

EEGETKEY Memory Parameter Semantics

KEYREQUEST	OUTPUTDATA
Enclave read access	Enclave write access

After validating the operands, the instruction determines which key is to be produced and performs the following actions:

- The instruction assembles the derivation data for the key based on the Table 40-64.
- Computes derived key using the derivation data and package specific value.
- Outputs the calculated key to the address in RCX.

The instruction fails with #GP(0) if the operands are not properly aligned. Successful completion of the instruction will clear RFLAGS.{ZF, CF, AF, OF, SF, PF}. The instruction returns an error code if the user tries to request a key based on an invalid CPUSVN or ISVSVN (when the user request is accepted, see the table below), requests a key for which it has not been granted the attribute to request, or requests a key that is not supported by the hardware. These checks may be performed in any order. Thus, an indication by error number of one cause (for example, invalid attribute) does not imply that there are not also other errors. Different processors may thus give different error numbers for the same Enclave. The correctness of software should not rely on the order resulting from the checks documented in this section. In such cases the ZF flag is set and the corresponding error bit (SGX_INVALID_SVN, SGX_INVALID_ATTRIBUTE, SGX_INVALID_KEYNAME) is set in RAX and the data at the address specified by RCX is unmodified.

Requesting Keys

The KEYREQUEST structure (see Section 37.17.1) identifies the key to be provided. The Keyrequest.KeyName field identifies which type of key is requested.

Deriving Keys

Key derivation is based on a combination of the enclave specific values (see Table 40-64) and a processor key. Depending on the key being requested a field may either be included by definition or the value may be included from the KeyRequest. A "yes" in Table 40-64 indicates the value for the field is included from its default location, identified in the source row, and a "request" indicates the values for the field is included from its corresponding KeyRequest field.

Keys that permit the specification of a CPU or ISV's code's, or enclave configuration's SVNs have additional requirements. The caller may not request a key for an SVN beyond the current CPU, ISV or enclave configuration's SVN, respectively.

Several keys are access controlled. Access to the Provisioning Key and Provisioning Seal key requires the enclave's ATTRIBUTES.PROVISIONKEY be set. The EINITTOKEN Key requires ATTRIBUTES.EINITTOKEN_KEY be set and SECS.MRSIGNER equal IA32_SGXLEPUBKEYHASH.

Some keys are derived based on a hardcode PKCS padding constant (352 byte string):

HARDCODED_PKCS1_5_PADDING[15:0] ← 0100H;

HARDCODED_PKCS1_5_PADDING[2655:16] ← SignExtend330Byte(-1); // 330 bytes of 0FFH

HARDCODED_PKCS1_5_PADDING[2815:2656] ←

Flags Affected

ZF is cleared if successful, otherwise ZF is set. CF, PF, AF, OF, SF are cleared.

Protected Mode Exceptions

#GP(0)	If a memory operand effective address is outside the current enclave.
	If an effective address is not properly aligned.
	If an effective address is outside the DS segment limit.
	If KEYREQUEST format is invalid.
#PF(error code)	If a page fault occurs in accessing memory.

64-Bit Mode Exceptions

#GP(0)	If a memory operand effective address is outside the current enclave.
	If an effective address is not properly aligned.
	If an effective address is not canonical.
	If KEYREQUEST format is invalid.
#PF(error code)	If a page fault occurs in accessing memory operands.

EMODPE—Extend an EPC Page Permissions

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 06H ENCLU[EMODPE]	IR	V/V	SGX2	This leaf function extends the access rights of an existing EPC page.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EMODPE (In)	Address of a SECINFO (In)	Address of the destination EPC page (In)

Description

This leaf function extends the access rights associated with an existing EPC page in the running enclave. THE RWX bits of the SECINFO parameter are treated as a permissions mask; supplying a value that does not extend the page permissions will have no effect. This instruction leaf can only be executed when inside the enclave.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EMODPE leaf function.

EMODPE Memory Parameter Semantics

SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

EMODPE Faulting Conditions

The operands are not properly aligned.	If security attributes of the SECINFO page make the page inaccessible.
The EPC page is locked by another thread.	RBX does not contain an effective address in an EPC page in the running enclave.
The EPC page is not valid.	RCX does not contain an effective address of an EPC page in the running enclave.
SECINFO contains an invalid request.	

Concurrency Restrictions

EREPORT—Create a Cryptographic Report of the Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 00H ENCLU[EREPORT]	IR	V/V	SGX1	This leaf function creates a cryptographic report of the enclave.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX	RDX
IR	EREPORT (In)	Address of TARGETINFO (In)	Address of REPORTDATA (In)	Address where the REPORT is written to in an OUTPUTDATA (In)

Description

This leaf function creates a cryptographic REPORT that describes the contents of the enclave. This instruction leaf can only be executed when inside the enclave. The cryptographic report can be used by other enclaves to determine that the enclave is running on the same platform.

RBX contains the effective address of the MRENCLAVE value of the enclave that will authenticate the REPORT output, using the REPORT key delivered by EGETKEY command for that enclave. RCX contains the effective address of a 64-byte REPORTDATA structure, which allows the caller of the instruction to associate data with the enclave from which the instruction is called. RDX contains the address where the REPORT will be output by the instruction.

EREPORT Memory Parameter Semantics

TARGETINFO	REPORTDATA	OUTPUTDATA
Read access by Enclave	Read access by Enclave	Read/Write access by Enclave

This instruction leaf perform the following:

1. Validate the 3 operands (RBX, RCX, RDX) are inside the enclave.
2. Compute a report key for the target enclave, as indicated by the value located in RBX(TARGETINFO).
3. Assemble the enclave SECS data to complete the REPORT structure (including the data provided using the RCX (REPORTDATA) operand).
4. Computes a cryptographic hash over REPORT structure.
5. Add the computed hash to the REPORT structure.
6. Output the completed REPORT structure to the address in RDX (OUTPUTDATA).

The instruction fails if the operands are not properly aligned.

CR_REPORT_KEYID, used to provide key wearout protection, is populated with a statistically unique value on boot of the platform by a trusted entity within the SGX TCB.

The instruction faults if any of the following:

EREPORT Faulting Conditions

An effective address not properly aligned.	An memory address does not resolve in an EPC page.
If accessing an invalid EPC page.	If the EPC page is blocked.
May page fault.	

Concurrency Restrictions

ERESUME—Re-Enters an Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 03H ENCLU[ERESUME]	IR	V/V	SGX1	This leaf function is used to re-enter an enclave after an interrupt.

Instruction Operand Encoding

Op/En	RAX	RBX	RCX
IR	ERESUME (In)	Address of a TCS (In)	Address of AEP (In)

Description

The ENCLU[ERESUME] instruction resumes execution of an enclave that was interrupted due to an exception or interrupt, using the machine state previously stored in the SSA.

ERESUME Memory Parameter Semantics

TCS
Enclave read/write access

The instruction faults if any of the following:

Address in RBX is not properly aligned.	Any TCS.FLAGS's must-be-zero bit is not zero.
TCS pointed to by RBX is not valid or available or locked.	Current 32/64 mode does not match the enclave mode in SECS.ATTRIBUTES.MODE64.
The SECS is in use by another enclave.	Either of TCS-specified FS and GS segment is not a subset of the current DS segment.
Any one of DS, ES, CS, SS is not zero.	If XSAVE available, CR4.OSXSAVE = 0, but SECS.ATTRIBUTES.XFRM ≠ 3.
CR4.OSFXSR ≠ 1.	If CR4.OSXSAVE = 1, SECS.ATTRIBUTES.XFRM is not a subset of XCR0.
Offsets 520-535 of the XSAVE area not 0.	The bit vector stored at offset 512 of the XSAVE area must be a subset of SECS.ATTRIBUTES.XFRM.
The SSA frame is not valid or in use.	

The following operations are performed by ERESUME:

- RSP and RBP are saved in the current SSA frame on EENTER and are automatically restored on EEXIT or an asynchronous exit due to any Interrupt event.
- The AEP contained in RCX is stored into the TCS for use by AEXs.FS and GS (including hidden portions) are saved and new values are constructed using TCS.OFSBASE/GSBASE (32 and 64-bit mode) and TCS.OFSLIMIT/GSLIMIT (32-bit mode only). The resulting segments must be a subset of the DS segment.
- If CR4.OSXSAVE == 1, XCR0 is saved and replaced by SECS.ATTRIBUTES.XFRM. The effect of RFLAGS.TF depends on whether the enclave entry is opt-in or opt-out (see Section 42.1.2):
  - — On opt-out entry, TF is saved and cleared (it is restored on EEXIT or AEX). Any attempt to set TF via a POPF instruction while inside the enclave clears TF (see Section 42.2.5).
  - — On opt-in entry, a single-step debug exception is pended on the instruction boundary immediately after EENTER (see Section 42.2.3).
- All code breakpoints that do not overlap with ELRANGE are also suppressed. If the entry is an opt-out entry, all code and data breakpoints that overlap with the ELRANGE are suppressed.

- On opt-out entry, a number of performance monitoring counters and behaviors are modified or suppressed (see Section 42.2.3):
  - All performance monitoring activity on the current thread is suppressed except for incrementing and firing of FIXED_CTR1 and FIXED_CTR2.
  - PEBS is suppressed.
  - AnyThread counting on other threads is demoted to MyThread mode and IA32_PERF_GLOBAL_STATUS[60] on that thread is set.
  - If the opt-out entry on a hardware thread results in suppression of any performance monitoring, then the processor sets IA32_PERF_GLOBAL_STATUS[60] and IA32_PERF_GLOBAL_STATUS[63].

	If one or more pages of the current SSA frame are not readable/writable, or do not resolve to a valid PT_REG EPC page.

40.5 INTEL® SGX VIRTUALIZATION LEAF FUNCTION REFERENCE

Leaf functions available with the ENCLV instruction mnemonic are covered in this section. In general, each instruction leaf requires EAX to specify the leaf function index and/or additional implicit registers specifying leaf-specific input parameters. An instruction operand encoding table provides details of each implicit register usage and associated input/output semantics.

In many cases, an input parameter specifies an effective address associated with a memory object inside or outside the EPC, the memory addressing semantics of these memory objects are also summarized in a separate table.

EDECVIRTCHILD—Decrement VIRTCHILDCNT in SECS

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 00H ENCLV[EDECVIRTCHILD]	IR	V/V	EAX[5]	This leaf function decrements the SECS VIRTCHILDCNT field.

Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EDECVIRTCHILD (In)	Address of an enclave page (In)	Address of an SECS page (In)

Description

This instruction decrements the SECS VIRTCHILDCNT field. This instruction can only be executed when current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create linear address. Segment override is not supported.

EDECVIRTCHILD Memory Parameter Semantics

EPCPAGE	SECS
Read/Write access permitted by Non Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

EDECVIRTCHILD Faulting Conditions

A memory operand effective address is outside the DS segment limit (32b mode).	A page fault occurs in accessing memory operands.
DS segment is unusable (32b mode).	RBX does not refer to an enclave page (REG, TCS, TRIM, SECS).
A memory address is in a non-canonical form (64b mode).	RCX does not refer to an SECS page.
A memory operand is not properly aligned.	RBX does not refer to an enclave page associated with SECS referenced in RCX.

64-Bit Mode Exceptions

#GP(0)	If a memory address is in a non-canonical form. If a memory operand is not properly aligned. RBX does not refer to an enclave page associated with SECS referenced in RCX.
#PF(error code)	If a page fault occurs in accessing memory operands. If RBX does not refer to an enclave page (REG, TCS, TRIM, SECS). If RCX does not refer to an SECS page.

ESETCONTEXT—Set the ENCLAVECONTEXT Field in SECS

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 02H ENCLV[ESETCONTEXT]	IR	V/V	EAX[5]	This leaf function sets the ENCLAVECONTEXT field in SECS.

Instruction Operand Encoding

Op/En	EAX	RCX	RDX
IR	ESETCONTEXT (In)	Address of the destination EPC page (In, EA)	Context Value (In, EA)

Description

The ESETCONTEXT leaf overwrites the ENCLAVECONTEXT field in the SECS. ECREATE and ELD of an SECS set the ENCLAVECONTEXT field in the SECS to the address of the SECS (for access later in ERDINFO). The ESETCONTEXT instruction allows a VMM to overwrite the default context value if necessary, for example, if the VMM is emulating ECREATE or ELD on behalf of the guest.

The content of RCX is an effective address of the SECS page to be updated, RDX contains the address pointing to the value to be stored in the SECS. The DS segment is used to create linear address. Segment override is not supported.

The instruction fails if:

- The operand is not properly aligned.
- RCX does not refer to an SECS page.

ESETCONTEXT Memory Parameter Semantics

EPCPAGE	CONTEXT
Read access permitted by Enclave	Read/Write access permitted by Non Enclave

The instruction faults if any of the following:

ESETCONTEXT Faulting Conditions

A memory operand effective address is outside the DS segment limit (32b mode).	A memory operand is not properly aligned.
DS segment is unusable (32b mode).	A page fault occurs in accessing memory operands.
A memory address is in a non-canonical form (64b mode).

DONE:
(* clear flags *)
RFLAGS.CF,PF,AF,OF,SF ← 0;
```

Flags Affected

ZF is set if ESETCONTEXT fails due to concurrent operation with another SGX instruction; otherwise cleared. CF, PF, AF, OF and SF are cleared.

Protected Mode Exceptions

#GP(0)	If a memory operand effective address is outside the DS segment limit.
	If DS segment is unusable.
	If a memory operand is not properly aligned.
#PF(error code)	If a page fault occurs in accessing memory operands.

64-Bit Mode Exceptions

#GP(0)	If a memory address is in a non-canonical form.
	If a memory operand is not properly aligned.
#PF(error code)	If a page fault occurs in accessing memory operands.

27. Updates to Chapter 41, Volume 3D

Change bars show changes to Chapter 41 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D:* System Programming Guide, Part 4.

Changes to this chapter: Various updates throughout chapter regarding Intel SGX and new Intel SGX VM Over-subscription feature.

CHAPTER 41
INTEL® SGX INTERACTIONS WITH IA32 AND INTEL® 64 ARCHITECTURE

Intel® SGX provides Intel® Architecture with a collection of enclave instructions for creating protected execution environments on processors supporting IA32 and Intel® 64 architectures. These Intel SGX instructions are designed to work with legacy software and the various IA32 and Intel 64 modes of operation.

41.1 INTEL® SGX AVAILABILITY IN VARIOUS PROCESSOR MODES

The Intel SGX extensions (see Table 36-1) are available only when the processor is executing in protected mode of operation. Additionally, the extensions are not available in System Management Mode (SMM) of operation or in Virtual 8086 (VM86) mode of operation. Finally, all leaf functions of ENCLU and ENCLS require CR0.PG enabled.

The exact details of exceptions resulting from illegal modes and their priority are listed in the reference pages of ENCLS and ENCLU.

41.2 IA32_FEATURE_CONTROL

IA32_FEATURE_CONTROL MSR provides two new bits related to two aspects of Intel SGX: using the instruction extensions and launch control configuration.

41.2.1 Availability of Intel SGX

IA32_FEATURE_CONTROL[bit 18] allows BIOS to control the availability of Intel SGX extensions. For Intel SGX extensions to be available on a logical processor, bit 18 in the IA32_FEATURE_CONTROL MSR on that logical processor must be set, and IA32_FEATURE_CONTROL MSR on that logical processor must be locked (bit 0 must be set). See Section 36.7.1 for additional details. OS is expected to examine the value of bit 18 prior to enabling Intel SGX on the thread, as the settings of bit 18 is not reflected by CPUID.

41.2.2 Intel SGX Launch Control Configuration

The IA32_SGXLEPUBKEYHASHn MSRs used to configure authorized launch enclaves' MRSIGNER digest value. They are present on logical processors that support the collection of SGX1 leaf functions (i.e. CPUID.(EAX=12H, ECX=00H):EAX[0] = 1) and that CPUID.(EAX=07H, ECX=00H):ECX[30] = 1. IA32_FEATURE_CONTROL[bit 17] allows to BIOS to enable write access to these MSRs. If IA32_FEATURE_CONTROL.LE_WR (bit 17) is set to 1 and IA32_FEATURE_CONTROL is locked on that logical processor, IA32_SGXLEPUBKEYHASH MSRs on that logical processor are writeable. If this bit 17 is not set or IA32_FEATURE_CONTROL is not locked, IA32_SGXLEPUBKEYHASH MSRs are read only. See Section 38.1.4 for additional details.

41.3 INTERACTIONS WITH SEGMENTATION

41.3.1 Scope of Interaction

Intel SGX extensions are available only when the processor is executing in a protected mode operation (see Section 41.1 for Intel SGX availability in various processor modes). Enclaves abide by all the segmentation policies set up by the OS, but they can be more restrictive than the OS.

Intel SGX interacts with segmentation at two levels:

- The Intel SGX instruction (see the enclave instruction in Table 36-1).

- While executing inside an enclave (legacy instructions and enclave instructions permitted inside an enclave).

41.3.2 Interactions of Intel® SGX Instructions with Segment, Operand, and Addressing Prefixes

All the memory operands used by the Intel SGX instructions are interpreted as offsets within the data segment (DS). The segment-override prefix on Intel SGX instructions is ignored.

Operand size is fixed for each enclave instruction. The operand-size prefix is reserved, and results in a #UD exception if used.

All address sizes are determined by the operating mode of the processor. The address-size prefix is ignored. This implies that while operating in 64-bit mode of operation, the address size is always 64 bits, and while operating in 32-bit mode of operation, the address size is always 32 bits. Additionally, when operating in 16-bit addressing, memory operands used by enclave instructions use 32 bit addressing; the value of CS.D is ignored.

41.3.3 Interaction of Intel® SGX Instructions with Segmentation

All leaf functions of ENCLU and ENCLS instructions require that the DS segment be usable, and be an expand-up segment. Failing this check results in generation of a #GP(0) exception.

The Intel SGX leaf functions used for entering the enclave (ENCLU[EENTER] and ENCLU[ERESUME]) operate as follows:

- All usable segment registers except for FS and GS have a zero base.
- The contents of the FS/GS segment registers (including the hidden portion) is saved in the processor.
- New FS and GS values compatible with enclave security are loaded from the TCS
- The linear ranges and access rights available under the newly-loaded FS and GS must abide to OS policies by ensuring they are subsets of the linear-address range and access rights available for the DS segment.
- The CS segment mode (64-bit, compatible, or 32 bit modes) must be consistent with the segment mode for which the enclave was created, as indicated by the SECS.ATTRIBUTES.MODE64 bit, and that the CPL of the logical processor is 3

An exit from the enclave either via ENCLU[EEXIT] or via an AEX restores the saved values of FS/GS segment registers.

41.3.4 Interactions of Enclave Execution with Segmentation

During the course of execution, enclave code abides by all segmentation policies as dictated by IA32 and Intel 64 Architectures, and generates appropriate exceptions on violations.

Additionally, any attempt by software executing inside an enclave to modify the processor's segmentation state (e.g. via MOV seg register, POP seg register, LDS, far jump, etc; excluding WRFSBASE/WRGSBASE) results in the generation of a #UD. See Section 38.6.1 for more information.

Upon enclave entry via the EENTER leaf function, FS is loaded from the (TCS.OFSBASE + SECS.BASEADDR) and TCS.FSLIMIT fields and GS is loaded from the (TCS.OGSBASE + SECS.BASEADDR) and TCS.GSLIMIT fields.

Execution of WRFSBASE and WRGSBASE from inside a 64-bit enclave is allowed. The processor will save the new values into the current SSA frame on an asynchronous exit (AEX) and restore them back on enclave entry via ENCLU[ERESUME] instruction.

41.4 INTERACTIONS WITH PAGING

Intel SGX instructions are available only when the processor is executing in a protected mode of operation. Additionally, all Intel SGX leaf functions except for EDBGRD and EDBGWR are available only if paging is enabled. Any attempt to execute these leaf functions with paging disabled results in an invalid-opcode exception (#UD). As with

segmentation, enclaves abide by all the paging policies set up by the OS, but they can be more restrictive than the OS.

All the memory operands passed into Intel SGX instructions are interpreted as offsets within the DS segment, and the linear addresses generated by combining these offsets with DS segment register are subject to paging-based access control if paging is enabled at the time of the execution of the leaf function.

Since the ENCLU[EENTER] and ENCLU[ERESUME] can only be executed when paging is enabled, and since paging cannot be disabled by software running inside an enclave (recall that enclaves always run with CPL = 3), enclave execution is always subject to paging-based access control. The Intel SGX access control itself is implemented as an extension to the existing paging modes. See Section 37.5 for details.

Execution of Intel SGX instructions may set accessed and dirty flags on accesses to EPC pages that do not fault even if the instruction later causes a fault for some other reason.

41.5 INTERACTIONS WITH VMX

Intel SGX functionality (including SGX1 and SGX2) can be made available to software running in either VMX root operation or VMX non-root operation, as long as the processor is using a legal mode of operation (see Section 41.1).

A VMM has the flexibility to configure a VMCS to permit a guest to use any subset of the ENCLS leaf functions. Availability of the ENCLU leaf functions in VMX non-root operation has the same requirement as ENCLU leaf functions outside of a virtualized environment.

Details of the VMCS control to allow VMM to configure support of Intel SGX in VMX non-root operation is described in Section 41.5.1

41.5.1 VMM Controls to Configure Guest Support of Intel® SGX

Intel SGX capabilities are primarily exposed to the software via the CPUID instruction. VMMs can virtualize CPUID instruction to expose/hide this capability to/from guests.

Some of Intel SGX resources are exposed/controlled via model-specific registers (see Section 36.7). VMMs can virtualize these MSRs for the guests using the MSR bitmaps referenced by pointers in the VMCS.

The VMM can partition the Enclave Page Cache, and assign various partitions to (a subset of) its guests via the usual memory-virtualization techniques such as paging or the extended page table mechanism (EPT).

The VMM can set the "enable ENCLS exiting" VM-execution controls to cause a VM exit when the ENCLS instruction is executed in VMX non-root operation. If the "enable ENCLS exiting" control is 0, all of the ENCLS leaf functions are permitted in VMX non-root operation. If the "enable ENCLS exiting" control is 1, execution of ENCLS leaf functions in VMX non-root operation is governed by consulting the bits in a new 64-bit VM-execution control field called the ENCLS-exiting bitmap (Each bit in the bitmap corresponds to an ENCLS leaf function with an EAX value that is identical to the bit's position). When bits in the "ENCLS-exiting bitmap" are set, attempts to execute the corresponding ENCLS leaf functions in VMX non-root operation causes VM exits. The checking for these VM exits occurs immediately after checking that CPL = 0.

41.5.2 Interactions with the Extended Page Table Mechanism (EPT)

Intel SGX instructions are fully compatible with the extended page-table mechanism (EPT; see Section 28.2).

All the memory operands passed into Intel SGX instructions are interpreted as offsets within the DS segment, and the linear addresses generated by combining these offsets with DS segment register are subject to paging and EPT. As with paging, enclaves abide by all the policies set up by the VMM.

The Intel SGX access control itself is implemented as an extension to paging and EPT, and may be more restrictive. See Section 41.4 for details of this extension.

An execution of an Intel SGX instruction may set accessed and dirty flags for EPT (when enabled; see Section 28.2.4) on accesses to EPC pages that do not fault or cause VM exits even if the instruction later causes a fault or VM exit for some other reason.

41.5.3 Interactions with APIC Virtualization

This section applies to Intel SGX in VMX non-root operation when the "virtualize APIC accesses" VM-execution control is 1.

A memory access by an enclave instruction that implicitly uses a cached physical address is never checked for overlap with the APIC-access page. Such accesses never cause APIC-access VM exits and are never redirected to the virtual-APIC page. Implicit memory accesses can only be made to the SECS, the TCS, or the SSA of an enclave (see Section 37.5.3.2).

An explicit Enclave Access (a linear memory access which is either from within an enclave into its ELRANGE, or an access by an Intel SGX instruction that is expected to be in the EPC) that overlaps with the APIC-access page causes a #PF exception (APIC page is expected to be outside of EPC).

Non-Enclave accesses made either by an Intel SGX instruction or by a logical processor inside an enclave to an address that without SGX would have caused redirection to the virtual-APIC page instead cause an APIC-access VM exit.

Other than implicit accesses made by Intel SGX instructions, guest-physical and physical accesses are not considered "enclave accesses"; consequently, such accesses result in undefined behavior if these accesses eventually reach EPC. This applies to any non-enclave physical accesses.

While a logical processor is executing inside an enclave, an attempt to execute an instruction outside of ELRANGE results in a #GP(0), even if the linear address would translate to a physical address that overlaps the APIC-access page.

41.5.4 Interactions with VT and SGX concurrency

In some cases, a VMM is required to handle conflicts between its own operation and a guest operation on EPC pages that are present in both guest and VMM address space. These conflict would otherwise cause the guest to experience an unexpected behavior (vs. running directly on the h/w). These conflict cases are:

- ETRACK/ETRACKC failure due to Entry Epoch Object Lock conflict or reference tracking check failure.
- EPC Page Resource conflict.

A new exit reason is defined for all those cases: SGX_CONFLICT (value 71). The VMCS exit qualification field details the specific case as follows:

Table 41-1. SGX Conflict Exit Qualification

Bits	Size (bits)	Name	Description
15:0	16	Code	Exit qualification code. The following values are defined: 0: TRACKING_RESOURCE_CONFLICT 1: TRACKING_REFERENCE_CONFLICT 2: EPC_PAGE_CONFLICT_EXCEPTION 3: EPC_PAGE_CONFLICT_ERROR Other: Reserved
31:16	16	Error	Error code. Applicable only if the exit qualification code is EPC_PAGE_CONFLICT_ERROR; contains the error code that would be returned in RAX if the instruction was executed on bare metal platform or if the ENABLE_EPC_VIRTUALIZATION_EXTENSIONS bit in the secondary processor control field is not set. In other cases this field is reserved as 0.
63:32	32	Reserved	Always 0.

This SGX_CONFLICT exiting behavior is controlled by a VM execution control called ENABLE_EPC_VIRTUALIZATION_EXTENSIONS (bit 29 of the secondary processor control field).

Details for various SGX_CONFLICT VMEXIT cases are provided in the following sections.

41.5.5 Virtual Child Tracking

SGX oversubscription support adds the ability to associate virtual children with each enclave using the ENCLV[EINCVIRTCHILD] and ENCLV[EDECVIRTCHILD] instructions. The VMM enables checking of the virtual child count by EREMOVE and EWB in guests with a new VM execution control called ENABLE_EPC_VIRTUALIZATION_EXTENSIONS.

When in VMX non-root operation and the ENABLE_EPC_VIRTUALIZATION_EXTENSIONS control enabled, the following instructions change their behavior:

- EWB and EREMOVE return the SGX_CHILD_PRESENT error code if any virtual or physical children are associated with the enclave.
- ERDINFO set STATUS.CHILDPRESENT if any virtual or physical children are associated with the enclave.

41.5.6 Handling EPCM Entry Lock Conflicts

When performing paging within a VMM, it is possible for a contention on the EPC page to happen in the following case:

- The VMM performs an ELDB/ELDU/ELDBC/ELDUC of an enclave page, and the guest attempts to perform some SGX instruction (e.g., EREMOVE) where the same SECS parent page is required.

A similar conflict may occur if the VMM uses EINCVIRTCHILD or EDECVIRTCHILD pointing to an SECS page. In all other cases where a SGX instruction executed by the VMM the applicable EPC page should not be mapped to the guest, thus no resource conflict occurs.

This conflicting situation can cause the guest's instruction to fail and cause guest instability. To help the VMM manage such conflicts, the SGX VMM paging extensions introduce a new VM-Exit that will be triggered whenever the guest encounters a resource conflict.

The exit reason is SGX_CONFLICT. The exit qualification field is used to distinguish the two kinds of resource conflicts:

- A value of EPCM_RESOURCE_CONFLICT_EXCEPTION (2) in the exit qualification code field indicates that a resource conflict occurred that would result in a #GP. In that case, the exit qualification error field is set to zero.
- A value of EPC_PAGE_CONFLICT_ERROR (3) in the exit qualification code field indicates that a resource conflict occurred that would result in an error code being return in RAX. In that case, the exit qualification error field is set to SGX_EPC_PAGE_CONFLICT.

The Guest Linear Address and Guest Physical Address fields are set to the guest linear and guest physical addresses respectively of the EPC page on which the conflict occurred. The VMM may determine which instruction induced the exit by reading RAX. The exit also populates the VM-exit instruction length field.

The VMM can determine whether the conflict may be due to its own operation, e.g., by setting a per-enclave busy indicator before executing ELD*, and clearing it afterwards. In that case, the VMM can handle an SGX Conflict (EPCM_PAGE_CONFLICT_*) exit by resuming guest execution at the same instruction, allowing the guest to re-execute the instruction. The VMM may also take steps to throttle its own paging thread to reduce contention with the guest.

If the VMM determines that the conflict is not due to its own operation, it may inject a #GP (in case of EPC_PAGE_CONFLICT_EXCEPTION), or emulate an error code as the guest instruction would return (in case of EPC_PAGE_CONFLICT_ERROR) by setting ZF and copying the error value provided in the exit qualification to guest RAX.

To gracefully handle resource contention on the VMM side, the VMM should use the new ELDBC and ELDUC instructions. These are similar to ELDB and ELDU respectively, except that on EPC resource contention they return an SGX_EPC_PAGE_CONFLICT error instead of issuing a #GP. In case of an error, the VMM can retry the instruction, possibly throttling the guest to assure progress.

When using EDECVIRTCHILD and EINCVIRTCHILD, the VMM should preferably point to the enclave child page, not to the SECS page, avoiding resource conflict on the SECS. If the VMM chooses to point to the SECS page, it should handle conflicts in the same way as handling the ELD* case.

41.5.7 Context Tracking

The ENCLAVECONTEXT field in the SECS is available for use by the VMM to track context information associated with that enclave, such as the GPA of the SECS in the context of the appropriate guest. This field is initialized by the successful execution of ECREATE and ELD of an SECS page. The value stored in the ENCLAVECONTEXT field will be the translation of the target page address produced by paging (GPA in VMMs that have EPTs turned on). VMMs may override this default value by calling the ENCLV[ESETCONTEXT] instruction, which allows the VMM to store an arbitrary 64-bit value in the ENCLAVECONTEXT field. The VMM may later access the ENCLAVECONTEXT field by calling ENCLS[ERDINFO] on any member page of the enclave, including the SECS.

For nested virtualization cases, the lowest level VMM can make SGX oversubscription instructions higher level guest VMMs. In that case the lower level VMM can simply inject #GP to higher level VMMs when attempting to execute these instructions.

However, if VMMs expose SGX oversubscription instructions to higher level VMMs, then VMMs have to use ENCLV[ESETCONTEXT] instruction to properly manage the ENCLAVECONTEXT field of SECS during paging operations. That may involve emulating ERCREATE, ELD, ESETCONTEXT and ERDINFO instructions apart from managing ENCLAVECONTEXT values.

41.6 INTEL® SGX INTERACTIONS WITH ARCHITECTURALLY-VISIBLE EVENTS

All architecturally visible vectored events (IA32 exceptions, interrupts, SMI, NMI, INIT, VM exit) can be detected while inside an enclave and will cause an asynchronous enclave exit if they are not blocked. Additionally, INT3, and the SignalTXTMsg[SENTER] (i.e. GETSEC[SENTER]'s rendezvous event message) events also cause asynchronous enclave exits. Note that SignalTXTMsg[SEXIT] (i.e. GETSEC[SEXIT]'s teardown message) does not cause an AEX.

On an AEX, information about the event causing the AEX is stored in the SSA (see Section 39.4 for details of AEX). The information stored in the SSA only describes the first event that triggered the AEX. If parsing/delivery of the first event results in detection of further events (e.g. VM exit, double fault, etc.), then the event information in the SSA is not updated to reflect these subsequently detected events.

41.7 INTERACTIONS WITH THE PROCESSOR EXTENDED STATE AND MISCELLANEOUS STATE

41.7.1 Requirements and Architecture Overview

Processor extended states are the ISA features that are enabled by the settings of CR4.OSXSAVE and the XCR0 register. Processor extended states are normally saved/restored by software via XSAVE/XRSTOR instructions. Details of discovery of processor extended states and management of these states are described in CHAPTER 13 of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*.

Additionally, the following requirements apply to Intel SGX:

- On an AEX, the Intel SGX architecture must protect the processor extended state and miscellaneous state by saving them in the enclave's state-save area (SSA), and clear the secrets from the processor extended state that is used by an enclave.
- Intel SGX architecture must verify that the SSA frame size is large enough to contain all the processor extended states and miscellaneous state used by the enclave.
- Intel SGX architecture must ensure that enclaves can only use processor extended state that is enabled by system software in XCR0.
- Enclave software should be able to discover only those processor extended state and miscellaneous state for which such protection is enabled.
- The processor extended states that are enabled inside the enclave must be approved by the enclave developer:
  - Certain processor extended state (e.g., Memory Protection Extensions, see Chapter 17, "Intel® MPX" of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1*) modify the behavior of the

legacy ISA software. If such features are enabled for enclaves that do not understand those features, then such a configuration could lead to a compromise of the enclave's security.

- The processor extended states that are enabled inside the enclave must form an integral part of the enclave's identity. This requirement has two implications:
  - Service providers may decide to assign different trust level to the same enclave depending on the ISA features the enclave is using.

To meet these requirements, the Intel SGX architecture defines a sub-field called X-Feature Request Mask (XFRM) in the ATTRIBUTES field of the SECS. On enclave creation (ENCLS[ECREATE] leaf function), the required SSA frame size is calculated by the processor from the list of enabled extended and miscellaneous states and verified against the actual SSA frame size defined by SECS.SSAFRAMESIZE.

On enclave entry, after verifying that XFRM is only enabling features that are already enabled in XCR0, the value in the XCR0 is saved internally by the processor, and is replaced by the XFRM. On enclave exit, the original value of XCR0 is restored. Consequently, while inside the enclave, the processor extended states enabled in XFRM are in enabled state, and those that are disabled in XFRM are in disabled state.

The entire ATTRIBUTES field, including the XFRM subfield is integral part of enclave's identity (i.e., its value is included in reports generated by ENCLU[EREPORT], and select bits from this field can be included in key-derivation for keys obtained via the ENCLU[EGETKEY] leaf function).

Enclave developers can create their enclave to work with certain features and fallback to another code path in case those features aren't available (e.g. optimize for AVX and fallback to SSE). For this purpose Intel SGX provides the following fields in SIGSTRUCT: ATTRIBUTES, ATTRIBUTESMASK, MISCSELECT, and MISCMASK. EINIT ensures that the final SECS.ATTRIBUTES and SECS.MISCSELECT comply with the enclave developer's requirements as follows:

SIGSTRUCT.ATTRIBUTES & SIGSTRUCT.ATTRIBUTEMASK = SECS.ATTRIBUTES & SIGSTRUCT.ATTRIBUTEMASK

SIGSTRUCT.MISCSELECT & SIGSTRUCT.MISCMASK = SECS.MISCSELECT & SIGSTRUCT.MISCMASK.

On an asynchronous enclave exit, the processor extended states enabled by XFRM are saved in the current SSA frame, and overwritten by synthetic state (see Section 39.3 for the definition of the synthetic state). When the interrupted enclave is resumed via the ENCLU[ERESUME] leaf function, the saved state for processor extended states enabled by XFRM is restored.

41.7.2 Relevant Fields in Various Data Structures

41.7.2.1 SECS.ATTRIBUTES.XFRM

The ATTRIBUTES field of the SECS data structure (see Section 37.7) contains a sub-field called XSAVE-Feature Request Mask (XFRM). Software populates this field at the time of enclave creation according to the features that are enabled by the operating system and approved by the enclave developer.

Intel SGX architecture guarantees that during enclave execution, the processor extended state configuration of the processor is identical to what is required by the XFRM sub-field. All the processor extended states enabled in XFRM are saved on AEX from the enclave and restored on ERESUME.

The XFRM sub-field has the same layout as XCR0, and has consistency requirements that are similar to those for XCR0. Specifically, the consistency requirements on XFRM values depend on the processor implementation and the set of features enabled in CR4.

Legal values for SECS.ATTRIBUTES.XFRM conform to these requirements:

- XFRM[1:0] must be set to 0x3.
- If the processor does not support XSAVE, or if the system software has not enabled XSAVE, then XFRM[63:2] must be zero.
- If the processor does support XSAVE, XFRM must contain a value that would be legal if loaded into XCR0.

The various consistency requirements are enforced at different times in the enclave's life cycle, and the exact enforcement mechanisms are elaborated in Section 41.7.3 through Section 41.7.6.

On processors not supporting XSAVE, software should initialize XFRM to 0x3. On processors supporting XSAVE, software should initialize XFRM to be a subset of XCR0 that would be present at the time of enclave execution.

Because bits 0 and 1 of XFRM must always be set, the use of Intel SGX requires that SSE be enabled (CR4.OSFXSR = 1).

41.7.2.2 SECS.SSAFRAMESIZE

The SSAFRAMESIZE field in the SECS data structure specifies the number of pages which software allocated[1] for each SSA frame, including both the GPRSGX area, MISC area, the XSAVE area (x87 and XMM states are stored in the latter area), and optionally padding between the MISC and XSAVE area. The GPRSGX area must hold all the general-purpose registers and additional Intel SGX specific information. The MISC area must hold the Miscellaneous state as specified by SECS.MISCSELECT, the XSAVE area holds the set of processor extended states specified by SECS.ATTRIBUTES.XFRM (see Section 37.9 for the layout of SSA and Section 41.7.3 for ECREATE's consistency checks). The SSA is always in non-compacted format.

If the processor does not support XSAVE, the XSAVE area will always be 576 bytes; a copy of XFRM (which will be set to 0x3) is saved at offset 512 on an AEX.

If the processor does support XSAVE, the length of the XSAVE area depends on SECS.ATTRIBUTES.XFRM. The length would be equal to what CPUID.(EAX=0DH, ECX= 0):EBX would return if XCR0 were set to XFRM. The following pseudo code illustrates how software can calculate this length using XFRM as the input parameter without modifying XCR0:

```
offset = 576;
size_last_x = 0;
For x=2 to 63
IF (XFRM[x] != 0) Then
   tmp_offset = CPUID.(EAX=0DH, ECX= x):EBX[31:0];
    IF (tmp_offset >= offset + size_last_x) Then
        offset = tmp_offset;
        size_last_x = CPUID.(EAX=0DH, ECX= x):EAX[31:0];
     FI;
FI;
EndFor
return (offset + size_last_x); (* compute_xsave_size(XFRM), see "ECREATE—Create an SECS page in the Enclave Page Cache"*)
```

Where the non-zero bits in XFRM are a subset of non-zero bit fields in XCR0.

The size of the MISC region depends on the setting of SECS.MISCSELECT and can be calculated using the layout information described in Section 37.9.2

41.7.2.3 XSAVE Area in SSA

The XSAVE area of an SSA frame begins at offset 0 of the frame.

41.7.2.4 MISC Area in SSA

The MISC area of an SSA frame is positioned immediately before the GPRSGX region.

41.7.2.5 SIGSTRUCT Fields

Intel SGX provides the flexibility for an enclave developer to choose the enclave's code path according to the features that are enabled on the platform (e.g. optimize for AVX and fallback to SSE). See Section 41.7.1 for details.

1. It is the responsibility of the enclave to actually allocate this memory.

SIGSTRUCT includes the following fields:

SIGSTRUCT.ATTRIBUTES, SIGSTRUCT.ATTRIBUTEMASK, SIGSTRUCT.MISCSELECT, SIGSTRUCT.MISCMASK.

41.7.2.6 REPORT.ATTRIBUTES.XFRM and REPORT.MISCSELECT

The processor extended states and miscellaneous states that are enabled inside the enclave form an integral part of the enclave's identity and are therefore included in the enclave's report, as provided by the ENCLU[EREPORT] leaf function. The REPORT structure includes the enclave's XFRM and MISCSELECT configurations.

41.7.2.7 KEYREQUEST

An enclave developer can specify which bits out of XFRM and MISCSELECT ENCLU[EGETKEY] should include in the derivation of the sealing key by specifying ATTRIBUTESMASK and MISCMASK in the KEYREQUEST structure.

41.7.3 Processor Extended States and ENCLS[ECREATE]

The ECREATE leaf function of the ENCLS instruction enforces a number of consistency checks described earlier. The execution of ENCLS[ECREATE] leaf function results in a #GP(0) in any of the following cases:

- SECS.ATTRIBUTES.XFRM[1:0] is not 3.
- The processor does not support XSAVE and any of the following is true:
  - SECS.ATTRIBUTES.XFRM[63:2] is not 0.
  - SECS.SSAFRAMESIZE is 0.
- The processor supports XSAVE and any of the following is true:
  - XSETBV would fault on an attempt to load XFRM into XCR0.
  - XFRM[63]=1.
  - The SSAFRAME is too small to hold required, enabled states (see Section 41.7.2.2).

41.7.4 Processor Extended States and ENCLU[EENTER]

41.7.4.1 Fault Checking

The EENTER leaf function of the ENCLU instruction enforces a number of consistency requirements described earlier. The execution of the ENCLU[EENTER] leaf function results in a #GP(0) in any of the following cases:

- If CR4.OSFXSR=0.
- If The processor supports XSAVE and either of the following is true:
  - CR4.OSXSAVE=0 and SECS.ATTRIBUTES.XFRM is not 3.
  - (SECS.ATTRIBUTES.XFRM & XCR0) != SECS.ATTRIBUTES.XFRM

41.7.4.2 State Loading

If ENCLU[EENTER] is successful, the current value of XCR0 is saved internally by the processor and replaced by SECS.ATTRIBUTES.XFRM.

41.7.5 Processor Extended States and AEX

41.7.5.1 State Saving

On an AEX, processor extended states are saved into the XSAVE area of the SSA frame in a compatible format with XSAVE that was executed with EDX:EAX = SECS.ATTRIBUTES.XFRM, with the memory operand being the XSAVE area, and (for 64-bit enclaves) as if REX.W=1. The XSTATE_BV part of the XSAVE header is saved with 0 for every bit that is 0 in XFRM. Other bits may be saved as 0 if the state saved is initialized.

Note that enclave entry ensures that if CR4.OSXSAVE is set to 0, then SECS.ATTRIBUTES.XFRM is set to 3. It should also be noted that it is not possible to enter an enclave with FXSAVE disabled.

41.7.5.2 State Synthesis

After saving the extended state, the processor restores XCR0 to the value it held at the time of the most recent enclave entry.

The state of features corresponding to bits set in XFRM is synthesized. In general, these states are initialized. Details of state synthesis on AEX are documented in Section 39.3.1.

41.7.6 Processor Extended States and ENCLU[ERESUME]

41.7.6.1 Fault Checking

The ERESUME leaf function of the ENCLU instruction enforces a number of consistency requirements described earlier. Specifically, the ENCLU[ERESUME] leaf function results in a #GP(0) in any of the following cases:

- CR4.OSFXSR=0.
- The processor supports XSAVE and either of the following is true:
  - CR4.OSXSAVE=0 and SECS.ATTRIBUTES.XFRM is not 3.
  - (SECS.ATTRIBUTES.XFRM & XCR0) != SECS.ATTRIBUTES.XFRM.

A successful execution of ENCLU[ERESUME] loads state from the XSAVE area of the SSA frame in a fashion similar to that used by the XRSTOR instruction. Data in the XSAVE area that would cause the XRSTOR instruction to fault will cause the ENCLU[ERESUME] leaf function to fault. Examples include, but are not restricted to the following:

- A bit is set in the XSTATE_BV field and clear in XFRM.
- The required bytes in the header are not clear.
- Loading data would set a reserved bit in MXCSR.

Any of these conditions will cause ERESUME to fault, even if CR4.OSXSAVE=0.

41.7.6.2 State Loading

If ENCLU[ERESUME] is successful, the current value of XCR0 is saved internally by the processor and replaced by SECS.ATTRIBUTES.XFRM.

State is loaded from the XSAVE area of the SSA frame as if the XRSTOR instruction were executed with XCR0=XFRM, EDX:EAX = XFRM, with the memory operand being the XSAVE area, and (for 64-bit enclaves) as if REX.W=1.

ENCLU[ERESUME] ensures that a subsequent execution of XSAVEOPT inside the enclave will operate properly (e.g., by marking all state as modified).

41.7.7 Processor Extended States and ENCLU[EEXIT]

The ENCLU[EEXIT] leaf function does not perform any X-feature specific consistency checks, nor performs any state synthesis. It is the responsibility of enclave software to clear any sensitive data from the registers before

executing EEXIT. However, successful execution of the ENCLU[EEXIT] leaf function restores XCR0 to the value it held at the time of the most recent enclave entry.

41.7.8 Processor Extended States and ENCLU[EREPORT]

The ENCLU[EREPORT] leaf function creates the MAC-protected REPORT structure that reports on the enclave's identity. ENCLU[EREPORT] includes in the report the values of SECS.ATTRIBUTES.XFRM and SECS.MISCSELECT.

41.7.9 Processor Extended States and ENCLU[EGETKEY]

The ENCLU[EGETKEY] leaf function returns a cryptographic key based on the information provided by the KEYREQUEST structure. Intel SGX provides the means for isolation between different operating conditions by allowing an enclave developer to select which bits out of XFRM and MISCSELECT need to be included in the derivation of the keys.

41.8 INTERACTIONS WITH SMM

41.8.1 Availability of Intel® SGX instructions in SMM

Enclave instructions are not available in SMM, and any attempt to execute ENCLS or ENCLU instructions inside SMM results in an invalid-opcode exception (#UD).

41.8.2 SMI while Inside an Enclave

If the logical processor executing inside an enclave receives an SMI, the logical processor exits the enclave asynchronously. The response to an SMI received while executing inside an enclave depends on whether the dual-monitor treatment is enabled. For detailed discussion of transfer to SMM, see Chapter 34, "System Management Mode" of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C*.

If the logical processor executing inside an enclave receives an SMI when dual-monitor treatment is not enabled, the logical processor exits the enclave asynchronously, and transfers the control to the SMM handler. In addition to saving the synthetic architectural state to the SMRAM State Save Map (SSM), the logical processor also sets the "Enclave Interruption" bit in the SMRAM SSM (bit position 1 in SMRAM field at offset 7EE0H).

If the logical processor executing inside an enclave receives an SMI when dual-monitor treatment is enabled, the logical processor exits the enclave asynchronously, and transfers the control to the SMM monitor via SMM VM exit. The SMM VM exit sets the "Enclave Interruption" bit in the Exit Reason (see Table 41-2) and in the Guest Interruptibility State field (see Table 41-3) of the SMM VMCS.

41.8.3 SMRAM Synthetic State of AEX Triggered by SMI

All processor registers saved in the SMRAM have the same synthetic values listed in Section 39.3. Additional SMRAM fields that are treated specially on SMI are:

Table 41-2. SMRAM Synthetic States on Asynchronous Enclave Exit

Position	Field	Value	Writable
SMRAM Offset 07EE0H.Bit 1	ENCLAVE_INTERRUPTION	Set to 1 if exit occurred in enclave mode	No

41.9 INTERACTIONS OF INIT, SIPI, AND WAIT-FOR-SIPI WITH INTEL® SGX

INIT received inside an enclave, while the logical processor is not in VMX operation, causes the logical processor to exit the enclave asynchronously. After the AEX, the processor's architectural state is initialized to "Power-on" state (Table 9.1 in *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*). If the logical processor is BSP, then it proceeds to execute the BIOS initialization code. If the logical processor is an AP, it enters wait-for-SIPI state.

INIT received inside an enclave, while the logical processor (LP) is in VMX root operation, follows regular Intel Architecture behavior and is blocked.

INIT received inside an enclave, while the logical processor is in VMX non-root operation, causes an AEX. Subsequent to the AEX, the INIT causes a VM exit with the Enclave Interruption bit in the exit-reason field in the VMCS.

A processor cannot be inside an enclave in the wait-for-SIPI state. Consequently, a SIPI received while inside an enclave is lost.

Intel SGX does not change the behavior of the processor in the wait-for-SIPI state.

The SGX-related processor states after INIT-SIPI-SIPI is as follows:

- EPC Settings: Unchanged
- EPCM: Unchanged
- CPUID.LEAF_12H.*: Unchanged
- ENCLAVE_MODE: 0 (LP exits enclave asynchronously)
- MEE state: Unchanged

Software should be aware that following INIT-SIPI-SIPI, the EPC might contain valid pages and should take appropriate measures such as initialize the EPC with the EREMOVE leaf function.

41.10 INTERACTIONS WITH DMA

DMA is not allowed to access any Processor Reserved Memory.

41.11 INTERACTIONS WITH TXT

41.11.1 Enclaves Created Prior to Execution of GETSEC

Enclaves which have been created before the GETSEC[SENTER] leaf function are available for execution after the successful completion of GETSEC[SENTER] and the corresponding SINIT ACM. Actions that a TXT Launched Environment performs in preparation to execute code in the Launched Environment, also applies to enclave code that would run after GETSEC[SENTER].

41.11.2 Interaction of GETSEC with Intel® SGX

All leaf functions of the GETSEC instruction are illegal inside an enclave, and results in an invalid-opcode exception (#UD).

Responding Logical Processors (RLP) which are executing inside an enclave at the time a GETSEC[SENTER] event occurs perform an AEX from the enclave and then enter the Wait-for-SIPI state.

RLP executing inside an enclave at the time of GETSEC[SEXIT], behave as defined for GETSEC[SEXIT]-that is, the RLPs pause during execution of SEXIT and resume after the completion of SEXIT.

The execution of a TXT launch does not affect Intel SGX configuration or security parameters.

41.11.3 Interactions with Authenticated Code Modules (ACMs)

Intel SGX only allows launching ACMs with an Intel SGX SVN that is at the same level or higher than the expected Intel SGX SVN. The expected Intel SGX SVN is specified by BIOS and locked down by the processor on the first successful execution of an Intel SGX instruction that doesn't return an error code. Intel SGX provides interfaces for system software to discover whether a non faulting Intel SGX instruction has been executed, and evaluate the suitability of the Intel SGX SVN value of any ACM that is expected to be launched by the OS or the VMM.

These interfaces are provided through a read-only MSR called the IA32_SGX_SVN_STATUS MSR (MSR address 500h). The IA32_SGX_SVN_STATUS MSR has the format shown in Table 41-3.

Table 41-3. Layout of the IA32_SGX_SVN_STATUS MSR

Bit Position	Name	ACM Module ID	Value
0	Lock	N.A.	▪ If 1, indicates that a non-faulting Intel SGX instruction has been executed, consequently, launching a properly signed ACM but with Intel SGX SVN value less than the BIOS specified Intel SGX SVN threshold would lead to an TXT shutdown. ▪ If 0, indicates that the processor will allow a properly signed ACM to launch irrespective of the Intel SGX SVN value of the ACM.
15:1	RSVD	N.A.	0
23:16	SGX_SVN_SINIT	SINIT ACM	▪ If CPUID.01H:ECX.SMX =1, this field reflects the expected threshold of Intel SGX SVN for the SINIT ACM. ▪ If CPUID.01H:ECX.SMX =0, this field is reserved (0).
63:24	RSVD	N.A.	0

OS/VMM that wishes to launch an architectural ACM such as SINIT is expected to read the IA32_SGX_SVN_STATUS MSR to determine whether the ACM can be launched or a new ACM is needed:

- If either the Intel SGX SVN of the ACM is greater than the value reported by IA32_SGX_SVN_STATUS, or the lock bit in the IA32_SGX_SVN_STATUS is not set, then the OS/VMM can safely launch the ACM.
- If the Intel SGX SVN value reported in the corresponding component of the IA32_SGX_SVN_STATUS is greater than the Intel SGX SVN value in the ACM's header, and if bit 0 of IA32_SGX_SVN_STATUS is 1, then the OS/VMM should not launch that version of the ACM. It should obtain an updated version of the ACM either from the BIOS or from an external resource.

However, OSVs/VMMs are strongly advised to update their version of the ACM any time they detect that the Intel SGX SVN of the ACM carried by the OS/VMM is lower than that reported by IA32_SGX_SVN_STATUS MSR, irrespective of the setting of the lock bit.

41.12 INTERACTIONS WITH CACHING OF LINEAR-ADDRESS TRANSLATIONS

Entering and exiting an enclave causes the logical processor to flush all the global linear-address context as well as the linear-address context associated with the current VPID and PCID. The MONITOR FSM is also cleared.

41.13 INTERACTIONS WITH INTEL® TRANSACTIONAL SYNCHRONIZATION EXTENSIONS (INTEL® TSX)

1. ENCLU or ENCLS instructions inside an HLE region will cause the flow to be aborted and restarted non-speculatively. ENCLU or ENCLS instructions inside an RTM region will cause the flow to be aborted and transfer control to the fallback handler.

2. If XBEGIN is executed inside an enclave, the processor does NOT check whether the address of the fallback handler is within the enclave.

3. If an RTM transaction is executing inside an enclave and there is an attempt to fetch an instruction outside the enclave, the transaction is aborted and control is transferred to the fallback handler. No #GP is delivered.

4. If an RTM transaction is executing inside an enclave and there is a data access to an address within the enclave that denied due to EPCM content (e.g., to a page belonging to a different enclave), the transaction is aborted and control is transferred to the fallback handler. No #GP is delivered.

5. If an RTM transaction executing inside an enclave aborts and the address of the fallback handler is outside the enclave, a #GP is delivered after the abort (EIP reported is that of the fallback handler).

41.13.1 HLE and RTM Debug

RTM debug will be suppressed on opt-out enclave entry. After opt-out entry, the logical processor will behave as if IA32_DEBUG_CTL[15]=0. Any #DB detected inside an RTM transaction region will just cause an abort with no exception delivered.

After opt-in entry, if either DR7[11] = 0 OR IA32_DEBUGCTL[15] = 0, any #DB or #BP detected inside an RTM transaction region will just cause an abort with no exception delivered.

After opt-in entry, if DR7[11] = 1 AND IA32_DEBUGCTL[15] = 1, any #DB or #BP detected inside an RTM translation will

- terminate speculative execution,
- set RIP to the address of the XBEGIN instruction, and
- be delivered as #DB (implying an Intel SGX AEX; any #BP is converted to #DB).
- DR6[16] will be cleared, indicating RTM debug (if the #DB causes a VM exit, DR6 is not modified but bit 16 of the pending debug exceptions field in the VMCS will be set).

41.14 INTEL® SGX INTERACTIONS WITH S STATES

Whenever an Intel SGX enabled processor enters S3-S5 state, enclaves are destroyed. This is due to the EPC being destroyed when power down occurs. It is the application runtime's responsibility to re-instantiate an enclave after a power transition for which the enclaves were destroyed.

41.15 INTEL® SGX INTERACTIONS WITH MACHINE CHECK ARCHITECTURE (MCA)

41.15.1 Interactions with MCA Events

All architecturally visible machine check events (#MC and CMCI) that are detected while inside an enclave cause an asynchronous enclave exit.

Any machine check exception (#MC) that occurs after Intel SGX is first enables causes Intel SGX to be disabled, (CPUID.SGX_Leaf.0:EAX[SGX1] == 0). It cannot be enabled until after the next reset.

41.15.2 Machine Check Enables (IA32_MCi_CTL)

All supported IA32_MCi_CTL bits for all the machine check banks must be set for Intel SGX to be available (CPUID.SGX_Leaf.0:EAX[SGX1] == 1). Any act of clearing bits from '1 to '0 in any of the IA32_MCi_CTL register may disable Intel SGX (set CPUID.SGX_Leaf.0:EAX[SGX1] to 0) until the next reset.

41.15.3 CR4.MCE

CR4.MCE can be set or cleared with no interactions with Intel SGX.

41.16 INTEL® SGX INTERACTIONS WITH PROTECTED MODE VIRTUAL INTERRUPTS

ENCLS[EENTER] modifies neither EFLAGS.VIP nor EFLAGS.VIF.

ENCLS[ERESUME] loads EFLAGS in a manner similar to that of an execution of IRET with CPL = 3. This means that ERESUME modifies neither EFLAGS.VIP nor EFLAGS.VIF regardless of the value of the EFLAGS image in the SSA frame.

AEX saves EFLAGS.VIP and EFLAGS.VIF unmodified into the EFLAGS image in the SSA frame. AEX modifies neither EFLAGS.VIP nor EFLAGS.VIF after saving EFLAGS.

If CR4.PVI = 1, CPL = 3, EFLAGS.VM = 0, IOPL < 3, EFLAGS.VIP = 1, and EFLAGS.VIF = 0, execution of STI causes a #GP fault. In this case, STI modifies neither EFLAGS.IF nor EFLAGS.VIF. This behavior applies without change within an enclave (where CPL is always 3). Note that, if IOPL = 3, STI always sets EFLAGS.IF without fault; CR4.PVI, EFLAGS.VIP, and EFLAGS.VIF are neither consulted nor modified in this case.

41.17 INTEL SGX INTERACTION WITH PROTECTION KEYS

SGX interactions with PKRU are as follows:

- CPUID.(EAX=12H, ECX=1):ECX.PKRU indicates whether SECS.ATTRIBUTES.XFRM.PKRU can be set. If SECS.ATTRIBUTES.XFRM.PKRU is set, then PKRU is saved and cleared as part of AEX and is restored as part of ERESUME. If CR4.PKE is set, an enclave can execute RDPKRU and WRKRU independent of whether SECS.ATTRIBUTES.XFRM.PKRU is set.

SGX interactions with domain permission checks are as follows:

1) If CR4.PKE is not set, then legacy and SGX permission checks are not effected.

2) If CR4.PKE is set, then domain permission checks are applied to all non-enclave access and enclave accesses to user pages in addition to legacy and SGX permission checks at a higher priority than SGX permission checks.

3) Implicit accesses aren't subject to domain permission checks.

28. Updates to Appendix A, Volume 3D

Change bars show changes to Appendix A of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D:* System Programming Guide, Part 4.

Change to this chapter: Deletion of duplicate paragraph.

APPENDIX A
VMX CAPABILITY REPORTING FACILITY

The ability of a processor to support VMX operation and related instructions is indicated by CPUID.1:ECX.VMX[bit 5] = 1. A value 1 in this bit indicates support for VMX features.

Support for specific features detailed in Chapter 26 and other VMX chapters is determined by reading values from a set of capability MSRs. These MSRs are indexed starting at MSR address 480H. VMX capability MSRs are read-only; an attempt to write them (with WRMSR) produces a general-protection exception (#GP(0)). They do not exist on processors that do not support VMX operation; an attempt to read them (with RDMSR) on such processors produces a general-protection exception (#GP(0)).

A.1 BASIC VMX INFORMATION

The IA32_VMX_BASIC MSR (index 480H) consists of the following fields:

- Bits 30:0 contain the 31-bit VMCS revision identifier used by the processor. Processors that use the same VMCS revision identifier use the same size for VMCS regions (see subsequent item on bits 44:32).[1]
- Bit 31 is always 0.
- Bits 44:32 report the number of bytes that software should allocate for the VMXON region and any VMCS region. It is a value greater than 0 and at most 4096 (bit 44 is set if and only if bits 43:32 are clear).
- Bit 48 indicates the width of the physical addresses that may be used for the VMXON region, each VMCS, and data structures referenced by pointers in a VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions). If the bit is 0, these addresses are limited to the processor's physical-address width.[2] If the bit is 1, these addresses are limited to 32 bits. This bit is always 0 for processors that support Intel 64 architecture.
- If bit 49 is read as 1, the logical processor supports the dual-monitor treatment of system-management interrupts and system-management mode. See Section 34.15 for details of this treatment.
- Bits 53:50 report the memory type that should be used for the VMCS, for data structures referenced by pointers in the VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions), and for the MSEG header. If software needs to access these data structures (e.g., to modify the contents of the MSR bitmaps), it can configure the paging structures to map them into the linear-address space. If it does so, it should establish mappings that use the memory type reported bits 53:50 in this MSR.[3]

  As of this writing, all processors that support VMX operation indicate the write-back type. The values used are given in Table A-1.

Table A-1. Memory Types Recommended for VMCS and Related Data Structures

Value(s)	Field
0	Uncacheable (UC)
1–5	Not used
6	Write Back (WB)
7–15	Not used

1. Earlier versions of this manual specified that the VMCS revision identifier was a 32-bit field in bits 31:0 of this MSR. For all processors produced prior to this change, bit 31 of this MSR was read as 0.
2. On processors that support Intel 64 architecture, the pointer must not set bits beyond the processor's physical address width.
3. Alternatively, software may map any of these regions or structures with the UC memory type. (This may be necessary for the MSEG header.) Doing so is discouraged unless necessary as it will cause the performance of software accesses to those structures to suffer.

- If bit 54 is read as 1, the processor reports information in the VM-exit instruction-information field on VM exits due to execution of the INS and OUTS instructions (see Section 27.2.4). This reporting is done only if this bit is read as 1.
- Bit 55 is read as 1 if any VMX controls that default to 1 may be cleared to 0. See Appendix A.2 for details. It also reports support for the VMX capability MSRs IA32_VMX_TRUE_PINBASED_CTLS, IA32_VMX_TRUE_PROCBASED_CTLS, IA32_VMX_TRUE_EXIT_CTLS, and IA32_VMX_TRUE_ENTRY_CTLS. See Appendix A.3.1, Appendix A.3.2, Appendix A.4, and Appendix A.5 for details.
- The values of bits 47:45 and bits 63:56 are reserved and are read as 0.

A.2 RESERVED CONTROLS AND DEFAULT SETTINGS

As noted in Chapter 26, "VM Entries", certain VMX controls are reserved and must be set to a specific value (0 or 1) determined by the processor. The specific value to which a reserved control must be set is its **default setting**. Software can discover the default setting of a reserved control by consulting the appropriate VMX capability MSR (see Appendix A.3 through Appendix A.5).

Future processors may define new functionality for one or more reserved controls. Such processors would allow each newly defined control to be set either to 0 or to 1. Software that does not desire a control's new functionality should set the control to its default setting. For that reason, it is useful for software to know the default settings of the reserved controls.

Default settings partition the various controls into the following classes:

- **Always-flexible**. These have never been reserved.
- **Default0**. These are (or have been) reserved with a default setting of 0.
- **Default1**. They are (or have been) reserved with a default setting of 1.

As noted in Appendix A.1, a logical processor uses bit 55 of the IA32_VMX_BASIC MSR to indicate whether any of the default1 controls may be 0:

- If bit 55 of the IA32_VMX_BASIC MSR is read as 0, all the default1 controls are reserved and must be 1. VM entry will fail if any of these controls are 0 (see Section 26.2.1).
- If bit 55 of the IA32_VMX_BASIC MSR is read as 1, not all the default1 controls are reserved, and some (but not necessarily all) may be 0. The CPU supports four (4) new VMX capability MSRs: IA32_VMX_TRUE_PINBASED_CTLS, IA32_VMX_TRUE_PROCBASED_CTLS, IA32_VMX_TRUE_EXIT_CTLS, and IA32_VMX_TRUE_ENTRY_CTLS. See Appendix A.3 through Appendix A.5 for details. (These MSRs are not supported if bit 55 of the IA32_VMX_BASIC MSR is read as 0.)

See Section 31.5.1 for recommended software algorithms for proper capability detection of the default1 controls.

A.3 VM-EXECUTION CONTROLS

There are separate capability MSRs for the pin-based VM-execution controls, the primary processor-based VM-execution controls, and the secondary processor-based VM-execution controls. These are described in Appendix A.3.1, Appendix A.3.2, and Appendix A.3.3, respectively.

A.3.1 Pin-Based VM-Execution Controls

The IA32_VMX_PINBASED_CTLS MSR (index 481H) reports on the allowed settings of **most** of the pin-based VM-execution controls (see Section 24.6.1):

- Bits 31:0 indicate the **allowed 0-settings** of these controls. VM entry allows control X (bit X of the pin-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

  Exceptions are made for the pin-based VM-execution controls in the default1 class (see Appendix A.2). These are bits 1, 2, and 4; the corresponding bits of the IA32_VMX_PINBASED_CTLS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:

  - If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any pin-based VM-execution control in the default1 class is 0.
  - If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PINBASED_CTLS MSR (see below) reports which of the pin-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the **allowed 1-settings** of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PINBASED_CTLS MSR (index 48DH) reports on the allowed settings of **all** of the pin-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the pin-based VM-execution controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32_VMX_PINBASED_CTLS MSR. (The IA32_VMX_TRUE_PINBASED_CTLS MSR is not supported.)
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32_VMX_TRUE_PINBASED_CTLS MSR. Assuming that software knows that the default1 class of pin-based VM-execution controls contains bits 1, 2, and 4, there is no need for software to consult the IA32_VMX_PINBASED_CTLS MSR.

A.3.2 Primary Processor-Based VM-Execution Controls

The IA32_VMX_PROCBASED_CTLS MSR (index 482H) reports on the allowed settings of **most** of the primary processor-based VM-execution controls (see Section 24.6.2):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the primary processor-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

  Exceptions are made for the primary processor-based VM-execution controls in the default1 class (see Appendix A.2). These are bits 1, 4–6, 8, 13–16, and 26; the corresponding bits of the IA32_VMX_PROCBASED_CTLS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:
  - If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any of the primary processor-based VM-execution controls in the default1 class is 0.
  - If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PROCBASED_CTLS MSR (see below) reports which of the primary processor-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PROCBASED_CTLS MSR (index 48EH) reports on the allowed settings of **all** of the primary processor-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the primary processor-based VM-execution controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the primary processor-based VM-execution controls is contained in the IA32_VMX_PROCBASED_CTLS MSR. (The IA32_VMX_TRUE_PROCBASED_CTLS MSR is not supported.)

- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the processor-based VM-execution controls is contained in the IA32_VMX_TRUE_PROCBASED_CTLS MSR. Assuming that software knows that the default1 class of processor-based VM-execution controls contains bits 1, 4–6, 8, 13–16, and 26, there is no need for software to consult the IA32_VMX_PROCBASED_CTLS MSR.

A.3.3 Secondary Processor-Based VM-Execution Controls

The IA32_VMX_PROCBASED_CTLS2 MSR (index 48BH) reports on the allowed settings of the secondary processor-based VM-execution controls (see Section 24.6.2). VM entries perform the following checks:

- Bits 31:0 indicate the allowed 0-settings of these controls. These bits are always 0. This fact indicates that VM entry allows each bit of the secondary processor-based VM-execution controls to be 0 (reserved bits must be 0)
- Bits 63:32 indicate the allowed 1-settings of these controls; the 1-setting is not allowed for any reserved bit. VM entry allows control X (bit X of the secondary processor-based VM-execution controls) to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X and the "activate secondary controls" primary processor-based VM-execution control are both 1.

The IA32_VMX_PROCBASED_CTLS2 MSR exists only on processors that support the 1-setting of the "activate secondary controls" VM-execution control (only if bit 63 of the IA32_VMX_PROCBASED_CTLS MSR is 1).

A.4 VM-EXIT CONTROLS

The IA32_VMX_EXIT_CTLS MSR (index 483H) reports on the allowed settings of **most** of the VM-exit controls (see Section 24.7.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-exit controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

  Exceptions are made for the VM-exit controls in the default1 class (see Appendix A.2). These are bits 0–8, 10, 11, 13, 14, 16, and 17; the corresponding bits of the IA32_VMX_EXIT_CTLS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:

  — If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any VM-exit control in the default1 class is 0.

  — If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_EXIT_CTLS MSR (see below) reports which of the VM-exit controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_EXIT_CTLS MSR (index 48FH) reports on the allowed settings of **all** of the VM-exit controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-exit controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the VM-exit controls is contained in the IA32_VMX_EXIT_CTLS MSR. (The IA32_VMX_TRUE_EXIT_CTLS MSR is not supported.)
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the VM-exit controls is contained in the IA32_VMX_TRUE_EXIT_CTLS MSR. Assuming that software knows that the default1 class of VM-exit controls contains bits 0–8, 10, 11, 13, 14, 16, and 17, there is no need for software to consult the IA32_VMX_EXIT_CTLS MSR.

A.5 VM-ENTRY CONTROLS

The IA32_VMX_ENTRY_CTLS MSR (index 484H) reports on the allowed settings of **most** of the VM-entry controls (see Section 24.8.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-entry controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

  Exceptions are made for the VM-entry controls in the default1 class (see Appendix A.2). These are bits 0–8 and 12; the corresponding bits of the IA32_VMX_ENTRY_CTLS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:

  — If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any VM-entry control in the default1 class is 0.

  — If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_ENTRY_CTLS MSR (see below) reports which of the VM-entry controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry fails if bit X is 1 in the VM-entry controls and bit 32+X is 0 in this MSR.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_ENTRY_CTLS MSR (index 490H) reports on the allowed settings of **all** of the VM-entry controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-entry controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the VM-entry controls is contained in the IA32_VMX_ENTRY_CTLS MSR. (The IA32_VMX_TRUE_ENTRY_CTLS MSR is not supported.)
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the VM-entry controls is contained in the IA32_VMX_TRUE_ENTRY_CTLS MSR. Assuming that software knows that the default1 class of VM-entry controls contains bits 0–8 and 12, there is no need for software to consult the IA32_VMX_ENTRY_CTLS MSR.

A.6 MISCELLANEOUS DATA

The IA32_VMX_MISC MSR (index 485H) consists of the following fields:

- Bits 4:0 report a value X that specifies the relationship between the rate of the VMX-preemption timer and that of the timestamp counter (TSC). Specifically, the VMX-preemption timer (if it is active) counts down by 1 every time bit X in the TSC changes due to a TSC increment.
- If bit 5 is read as 1, VM exits store the value of IA32_EFER.LMA into the "IA-32e mode guest" VM-entry control; see Section 27.2 for more details. This bit is read as 1 on any logical processor that supports the 1-setting of the "unrestricted guest" VM-execution control.
- Bits 8:6 report, as a bitmap, the activity states supported by the implementation:

  — Bit 6 reports (if set) the support for activity state 1 (HLT).

  — Bit 7 reports (if set) the support for activity state 2 (shutdown).

  — Bit 8 reports (if set) the support for activity state 3 (wait-for-SIPI).

  If an activity state is not supported, the implementation causes a VM entry to fail if it attempts to establish that activity state. All implementations support VM entry to activity state 0 (active).
- If bit 14 is read as 1, Intel® Processor Trace (Intel PT) can be used in VMX operation. If the processor supports Intel PT but does not allow it to be used in VMX operation, execution of VMXON clears IA32_RTIT_CTL.TraceEn (see "VMXON—Enter VMX Operation" in Chapter 30); any attempt to write IA32_RTIT_CTL while in VMX operation (including VMX root operation) causes a general-protection exception.

- If bit 15 is read as 1, the RDMSR instruction can be used in system-management mode (SMM) to read the IA32_SMBASE MSR (MSR address 9EH). See Section 34.15.6.3.
- Bits 24:16 indicate the number of CR3-target values supported by the processor. This number is a value between 0 and 256, inclusive (bit 24 is set if and only if bits 23:16 are clear).
- Bits 27:25 is used to compute the recommended maximum number of MSRs that should appear in the VM-exit MSR-store list, the VM-exit MSR-load list, or the VM-entry MSR-load list. Specifically, if the value bits 27:25 of IA32_VMX_MISC is N, then 512 * (N + 1) is the recommended maximum number of MSRs to be included in each list. If the limit is exceeded, undefined processor behavior may result (including a machine check during the VMX transition).
- If bit 28 is read as 1, bit 2 of the IA32_SMM_MONITOR_CTL can be set to 1. VMXOFF unblocks SMIs unless IA32_SMM_MONITOR_CTL[bit 2] is 1 (see Section 34.14.4).
- If bit 29 is read as 1, software can use VMWRITE to write to any supported field in the VMCS; otherwise, VMWRITE cannot be used to modify VM-exit information fields.
- If bit 30 is read as 1, VM entry allows injection of a software interrupt, software exception, or privileged software exception with an instruction length of 0.
- Bits 63:32 report the 32-bit MSEG revision identifier used by the processor.
- Bits 13:9 and bit 31 are reserved and are read as 0.

A.7 VMX-FIXED BITS IN CR0

The IA32_VMX_CR0_FIXED0 MSR (index 486H) and IA32_VMX_CR0_FIXED1 MSR (index 487H) indicate how bits in CR0 may be set in VMX operation. They report on bits in CR0 that are allowed to be 0 and to be 1, respectively, in VMX operation. If bit X is 1 in IA32_VMX_CR0_FIXED0, then that bit of CR0 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in IA32_VMX_CR0_FIXED1, then that bit of CR0 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in IA32_VMX_CR0_FIXED0, then that bit is also 1 in IA32_VMX_CR0_FIXED1; if bit X is 0 in IA32_VMX_CR0_FIXED1, then that bit is also 0 in IA32_VMX_CR0_FIXED0. Thus, each bit in CR0 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in IA32_VMX_CR0_FIXED0 and 1 in IA32_VMX_CR0_FIXED1).

A.8 VMX-FIXED BITS IN CR4

The IA32_VMX_CR4_FIXED0 MSR (index 488H) and IA32_VMX_CR4_FIXED1 MSR (index 489H) indicate how bits in CR4 may be set in VMX operation. They report on bits in CR4 that are allowed to be 0 and 1, respectively, in VMX operation. If bit X is 1 in IA32_VMX_CR4_FIXED0, then that bit of CR4 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in IA32_VMX_CR4_FIXED1, then that bit of CR4 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in IA32_VMX_CR4_FIXED0, then that bit is also 1 in IA32_VMX_CR4_FIXED1; if bit X is 0 in IA32_VMX_CR4_FIXED1, then that bit is also 0 in IA32_VMX_CR4_FIXED0. Thus, each bit in CR4 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in IA32_VMX_CR4_FIXED0 and 1 in IA32_VMX_CR4_FIXED1).

A.9 VMCS ENUMERATION

The IA32_VMX_VMCS_ENUM MSR (index 48AH) provides information to assist software in enumerating fields in the VMCS.

As noted in Section 24.11.2, each field in the VMCS is associated with a 32-bit encoding which is structured as follows:

- Bits 31:15 are reserved (must be 0).
- Bits 14:13 indicate the field’s width.
- Bit 12 is reserved (must be 0).
- Bits 11:10 indicate the field’s type.

- Bits 9:1 is an index field that distinguishes different fields with the same width and type.
- Bit 0 indicates access type.

IA32_VMX_VMCS_ENUM indicates to software the highest index value used in the encoding of any field supported by the processor:

- Bits 9:1 contain the highest index value used for any VMCS encoding.
- Bit 0 and bits 63:10 are reserved and are read as 0.

A.10 VPID AND EPT CAPABILITIES

The IA32_VMX_EPT_VPID_CAP MSR (index 48CH) reports information about the capabilities of the logical processor with regard to virtual-processor identifiers (VPIDs, Section 28.1) and extended page tables (EPT, Section 28.2):

- If bit 0 is read as 1, the processor supports execute-only translations by EPT. This support allows software to configure EPT paging-structure entries in which bits 1:0 are clear (indicating that data accesses are not allowed) and bit 2 is set (indicating that instruction fetches are allowed).[1]
- Bit 6 indicates support for a page-walk length of 4.
- If bit 8 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be uncacheable (UC); see Section 24.6.11.
- If bit 14 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be write-back (WB).
- If bit 16 is read as 1, the logical processor allows software to configure a EPT PDE to map a 2-Mbyte page (by setting bit 7 in the EPT PDE).
- If bit 17 is read as 1, the logical processor allows software to configure a EPT PDPTE to map a 1-Gbyte page (by setting bit 7 in the EPT PDPTE).
- Support for the INVEPT instruction (see Chapter 30 and Section 28.3.3.1).
  - — If bit 20 is read as 1, the INVEPT instruction is supported.
  - — If bit 25 is read as 1, the single-context INVEPT type is supported.
  - — If bit 26 is read as 1, the all-context INVEPT type is supported.
- If bit 21 is read as 1, accessed and dirty flags for EPT are supported (see Section 28.2.4).
- If bit 22 is read as 1, the processor reports advanced VM-exit information for EPT violations (see Section 27.2.1). This reporting is done only if this bit is read as 1.
- Support for the INVVPID instruction (see Chapter 30 and Section 28.3.3.1).
  - — If bit 32 is read as 1, the INVVPID instruction is supported.
  - — If bit 40 is read as 1, the individual-address INVVPID type is supported.
  - — If bit 41 is read as 1, the single-context INVVPID type is supported.
  - — If bit 42 is read as 1, the all-context INVVPID type is supported.
  - — If bit 43 is read as 1, the single-context-retaining-globals INVVPID type is supported.
- Bits 5:1, bit 7, bits 13:9, bit 15, bits 19:18, bits 24:23, bits 31:27, bits 39:33, and bits 63:44 are reserved and are read as 0.

1. If the "mode-based execute control for EPT" VM-execution control is 1, setting bit 0 indicates also that software may also configure EPT paging-structure entries in which bits 1:0 are both clear and in which bit 10 is set (indicating a translation that can be used to fetch instructions from a supervisor-mode linear address or a user-mode linear address).

The IA32_VMX_EPT_VPID_CAP MSR exists only on processors that support the 1-setting of the "activate secondary controls" VM-execution control (only if bit 63 of the IA32_VMX_PROCBASED_CTLS MSR is 1) and that support either the 1-setting of the "enable EPT" VM-execution control (only if bit 33 of the IA32_VMX_PROCBASED_CTLS2 MSR is 1) or the 1-setting of the "enable VPID" VM-execution control (only if bit 37 of the IA32_VMX_PROCBASED_CTLS2 MSR is 1).

A.11 VM FUNCTIONS

The IA32_VMX_VMFUNC MSR (index 491H) reports on the allowed settings of the VM-function controls (see Section 24.6.14). VM entry allows bit X of the VM-function controls to be 1 if bit X in the MSR is set to 1; if bit X in the MSR is cleared to 0, VM entry fails if bit X of the VM-function controls, the "activate secondary controls" primary processor-based VM-execution control, and the "enable VM functions" secondary processor-based VM-execution control are all 1.

The IA32_VMX_VMFUNC MSR exists only on processors that support the 1-setting of the "activate secondary controls" VM-execution control (only if bit 63 of the IA32_VMX_PROCBASED_CTLS MSR is 1) and the 1-setting of the "enable VM functions" secondary processor-based VM-execution control (only if bit 45 of the IA32_VMX_PROCBASED_CTLS2 MSR is 1).

29.Updates to Chapter 2, Volume 4

Change bars show changes to Chapter 2 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4:* Model-Specific Registers.

Changes to this chapter: Update comments for IA32_SGXLEPUBKEYHASH0, IA32_SGXLEPUBKEYHASH1, IA32_SGXLEPUBKEYHASH2, and IA32_SGXLEPUBKEYHASH3 MSRs. Updated MSR_SGXOWNEREPOCH0 and MSR_SGXOWNEREPOCH1 to indicate they are write only. Updated MSR_BR_DETECT_CTRL with additional information regarding bits 17:8. Updated FREEZE_WHILE_SMM name.

CHAPTER 2
MODEL-SPECIFIC REGISTERS (MSRS)

This chapter lists MSRs across Intel processor families. All MSRs listed can be read with the RDMSR and written with the WRMSR instructions.

Register addresses are given in both hexadecimal and decimal. The register name is the mnemonic register name and the bit description describes individual bits in registers.

Model specific registers and its bit-fields may be supported for a finite range of processor families/models. To distinguish between different processor family and/or models, software must use CPUID.01H leaf function to query the combination of DisplayFamily and DisplayModel to determine model-specific availability of MSRs (see CPUID instruction in Chapter 3, "Instruction Set Reference, A-L" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A*). Table 2-1 lists the signature values of DisplayFamily and DisplayModel for various processor families or processor number series.

Table 2-1. CPUID Signature Values of DisplayFamily_DisplayModel

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_85H	Future Intel® Xeon Phi™ Processor based on Knights Mill microarchitecture
06_57H	Intel® Xeon Phi™ Processor 3200, 5200, 7200 Series based on Knights Landing microarchitecture
06_66H	Future Intel® Core™ processors based on Cannon Lake microarchitecture
06_8EH, 06_9EH	7th generation Intel® Core™ processors based on Kaby Lake microarchitecture
06_55H	Intel® Xeon® Processor Scalable Family based on Skylake microarchitecture
06_4EH, 06_5EH	6th generation Intel Core processors and Intel Xeon processor E3-1500m v5 product family and E3-1200 v5 product family based on Skylake microarchitecture
06_56H	Intel Xeon processor D-1500 product family based on Broadwell microarchitecture
06_4FH	Intel Xeon processor E5 v4 Family based on Broadwell microarchitecture, Intel Xeon processor E7 v4 Family, Intel Core i7-69xx Processor Extreme Edition
06_47H	5th generation Intel Core processors, Intel Xeon processor E3-1200 v4 product family based on Broadwell microarchitecture
06_3DH	Intel Core M-5xxx Processor, 5th generation Intel Core processors based on Broadwell microarchitecture
06_3FH	Intel Xeon processor E5-4600/2600/1600 v3 product families, Intel Xeon processor E7 v3 product families based on Haswell-E microarchitecture, Intel Core i7-59xx Processor Extreme Edition
06_3CH, 06_45H, 06_46H	4th Generation Intel Core processor and Intel Xeon processor E3-1200 v3 product family based on Haswell microarchitecture
06_3EH	Intel Xeon processor E7-8800/4800/2800 v2 product families based on Ivy Bridge-E microarchitecture
06_3EH	Intel Xeon processor E5-2600/1600 v2 product families and Intel Xeon processor E5-2400 v2 product family based on Ivy Bridge-E microarchitecture, Intel Core i7-49xx Processor Extreme Edition
06_3AH	3rd Generation Intel Core Processor and Intel Xeon processor E3-1200 v2 product family based on Ivy Bridge microarchitecture
06_2DH	Intel Xeon processor E5 Family based on Intel microarchitecture code name Sandy Bridge, Intel Core i7-39xx Processor Extreme Edition
06_2FH	Intel Xeon Processor E7 Family
06_2AH	Intel Xeon processor E3-1200 product family; 2nd Generation Intel Core i7, i5, i3 Processors 2xxx Series
06_2EH	Intel Xeon processor 7500, 6500 series

Table 2-1. CPUID Signature (Contd.)Values of DisplayFamily_DisplayModel (Contd.)

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_25H, 06_2CH	Intel Xeon processors 3600, 5600 series, Intel Core i7, i5 and i3 Processors
06_1EH, 06_1FH	Intel Core i7 and i5 Processors
06_1AH	Intel Core i7 Processor, Intel Xeon processor 3400, 3500, 5500 series
06_1DH	Intel Xeon processor MP 7400 series
06_17H	Intel Xeon processor 3100, 3300, 5200, 5400 series, Intel Core 2 Quad processors 8000, 9000 series
06_0FH	Intel Xeon processor 3000, 3200, 5100, 5300, 7300 series, Intel Core 2 Quad processor 6000 series, Intel Core 2 Extreme 6000 series, Intel Core 2 Duo 4000, 5000, 6000, 7000 series processors, Intel Pentium dual-core processors
06_0EH	Intel Core Duo, Intel Core Solo processors
06_0DH	Intel Pentium M processor
06_7AH	Intel® Atom™ processors based on Goldmont Plus Microarchitecture
06_5FH	Intel Atom processors based on Goldmont Microarchitecture (code name Denverton)
06_5CH	Intel Atom processors based on Goldmont Microarchitecture
06_4CH	Intel Atom processor X7-Z8000 and X5-Z8000 series based on Airmont Microarchitecture
06_5DH	Intel Atom processor X3-C3000 based on Silvermont Microarchitecture
06_5AH	Intel Atom processor Z3500 series
06_4AH	Intel Atom processor Z3400 series
06_37H	Intel Atom processor E3000 series, Z3600 series, Z3700 series
06_4DH	Intel Atom processor C2000 series
06_36H	Intel Atom processor S1000 Series
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	Intel Atom processor family, Intel Atom processor D2000, N2000, E2000, Z2000, C1000 series
0F_06H	Intel Xeon processor 7100, 5000 Series, Intel Xeon Processor MP, Intel Pentium 4, Pentium D processors
0F_03H, 0F_04H	Intel Xeon processor, Intel Xeon processor MP, Intel Pentium 4, Pentium D processors
06_09H	Intel Pentium M processor
0F_02H	Intel Xeon Processor, Intel Xeon processor MP, Intel Pentium 4 processors
0F_0H, 0F_01H	Intel Xeon Processor, Intel Xeon processor MP, Intel Pentium 4 processors
06_7H, 06_08H, 06_0AH, 06_0BH	Intel Pentium III Xeon processor, Intel Pentium III processor
06_03H, 06_05H	Intel Pentium II Xeon processor, Intel Pentium II processor
06_01H	Intel Pentium Pro processor
05_01H, 05_02H, 05_04H	Intel Pentium processor, Intel Pentium processor with MMX Technology

The Intel® Quark™ SoC X1000 processor can be identified by the signature of DisplayFamily_DisplayModel = 05_09H and SteppingID = 0

2.1 ARCHITECTURAL MSRS

Many MSRs have carried over from one generation of IA-32 processors to the next and to Intel 64 processors. A subset of MSRs and associated bit fields, which do not change on future processor generations, are now considered architectural MSRs. For historical reasons (beginning with the Pentium 4 processor), these "architectural MSRs" were given the prefix "IA32_". Table 2-2 lists the architectural MSRs, their addresses, their current names, their names in previous IA-32 processors, and bit fields that are considered architectural. MSR addresses outside Table 2-2 and certain bit fields in an MSR address that may overlap with architectural MSR addresses are model-specific.

Code that accesses a machine specified MSR and that is executed on a processor that does not support that MSR will generate an exception.

Architectural MSR or individual bit fields in an architectural MSR may be introduced or transitioned at the granularity of certain processor family/model or the presence of certain CPUID feature flags. The right-most column of Table 2-2 provides information on the introduction of each architectural MSR or its individual fields. This information is expressed either as signature values of "DF_DM" (see Table 2-1) or via CPUID flags.

Certain bit field position may be related to the maximum physical address width, the value of which is expressed as "MAXPHYADDR" in Table 2-2. "MAXPHYADDR" is reported by CPUID.8000_0008H leaf.

MSR address range between 40000000H - 400000FFH is marked as a specially reserved range. All existing and future processors will not implement any features using any MSR in this range.

Table 2-2. IA-32 Architectural MSRs

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
0H	0	IA32_P5_MC_ADDR (P5_MC_ADDR)	See Section 2.22, "MSRs in Pentium Processors."	**Pentium Processor (05_01H)**
1H	1	IA32_P5_MC_TYPE (P5_MC_TYPE)	See Section 2.22, "MSRs in Pentium Processors."	DF_DM = 05_01H
6H	6	IA32_MONITOR_FILTER_SIZE	See Section 8.10.5, "Monitor/Mwait Address Range Determination."	0F_03H
10H	16	IA32_TIME_STAMP_ COUNTER (TSC)	See Section 17.17, "Time-Stamp Counter."	05_01H
17H	23	IA32_PLATFORM_ID (MSR_PLATFORM_ID)	**Platform ID (RO)** The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.	06_01H
		49:0	Reserved.	
		52:50	**Platform Id (RO)** Contains information concerning the intended platform for the processor. 52 51 50 0 0 0 Processor Flag 0 0 0 1 Processor Flag 1 0 1 0 Processor Flag 2 0 1 1 Processor Flag 3 1 0 0 Processor Flag 4 1 0 1 Processor Flag 5 1 1 0 Processor Flag 6 1 1 1 Processor Flag 7	
		63:53	Reserved.	
1BH	27	IA32_APIC_BASE (APIC_BASE)	This register holds the APIC base address, permitting the relocation of the APIC memory map. See Section 10.4.4, "Local APIC Status and Location" and Section 10.4.5, "Relocating the Local APIC Registers".	06_01H
		7:0	Reserved	
		8	BSP flag (R/W)	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
		9	Reserved	
		10	Enable x2APIC mode	06_1AH
		11	APIC Global Enable (R/W)	
		(MAXPHYADDR - 1):12	APIC Base (R/W)	
		63: MAXPHYADDR	Reserved	
3AH	58	IA32_FEATURE_CONTROL	**Control Features in Intel 64 Processor (R/W)**	If any one enumeration condition for defined bit field holds
		0	Lock bit (R/WO): (1 = locked). When set, locks this MSR from being written, writes to this bit will result in GP(0). Note: Once the Lock bit is set, the contents of this register cannot be modified. Therefore the lock bit must be set after configuring support for Intel Virtualization Technology and prior to transferring control to an option ROM or the OS. Hence, once the Lock bit is set, the entire IA32_FEATURE_CONTROL contents are preserved across RESET when PWRGOOD is not deasserted.	If any one enumeration condition for defined bit field position greater than bit 0 holds
		1	Enable VMX inside SMX operation (R/WL): This bit enables a system executive to use VMX in conjunction with SMX to support Intel® Trusted Execution Technology. BIOS must set this bit only when the CPUID function 1 returns VMX feature flag and SMX feature flag set (ECX bits 5 and 6 respectively).	If CPUID.01H:ECX[5] = 1 && CPUID.01H:ECX[6] = 1
		2	Enable VMX outside SMX operation (R/WL): This bit enables VMX for system executive that do not require SMX. BIOS must set this bit only when the CPUID function 1 returns VMX feature flag set (ECX bit 5).	If CPUID.01H:ECX[5] = 1
		7:3	Reserved	
		14:8	SENTER Local Function Enables (R/WL): When set, each bit in the field represents an enable control for a corresponding SENTER function. This bit is supported only if CPUID.1:ECX.[bit 6] is set	If CPUID.01H:ECX[6] = 1
		15	SENTER Global Enable (R/WL): This bit must be set to enable SENTER leaf functions. This bit is supported only if CPUID.1:ECX.[bit 6] is set	If CPUID.01H:ECX[6] = 1
		16	Reserved	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
		17	SGX Launch Control Enable (R/WL): This bit must be set to enable runtime reconfiguration of SGX Launch Control via IA32_SGXLEPUBKEYHASHn MSR.	If CPUID.(EAX=07H, ECX=0H): ECX[30] = 1
		18	SGX Global Enable (R/WL): This bit must be set to enable SGX leaf functions.	If CPUID.(EAX=07H, ECX=0H): EBX[2] = 1
		19	Reserved	
		20	LMCE On (R/WL): When set, system software can program the MSRs associated with LMCE to configure delivery of some machine check exceptions to a single logical processor.	If IA32_MCG_CAP[27] = 1
		63:21	Reserved	
3BH	59	IA32_TSC_ADJUST	Per Logical Processor TSC Adjust (R/Write to clear)	If CPUID.(EAX=07H, ECX=0H): EBX[1] = 1
		63:0	**THREAD_ADJUST:** Local offset value of the IA32_TSC for a logical processor. Reset value is Zero. A write to IA32_TSC will modify the local offset in IA32_TSC_ADJUST and the content of IA32_TSC, but does not affect the internal invariant TSC hardware.	
79H	121	IA32_BIOS_UPDT_TRIG (BIOS_UPDT_TRIG)	BIOS Update Trigger (W) Executing a WRMSR instruction to this MSR causes a microcode update to be loaded into the processor. See Section 9.11.6, "Microcode Update Loader." A processor may prevent writing to this MSR when loading guest states on VM entries or saving guest states on VM exits.	06_01H
8BH	139	IA32_BIOS_SIGN_ID (BIOS_SIGN/BBL_CR_D3)	BIOS Update Signature (RO) Returns the microcode update signature following the execution of CPUID.01H. A processor may prevent writing to this MSR when loading guest states on VM entries or saving guest states on VM exits.	06_01H
		31:0	Reserved	
		63:32	It is recommended that this field be pre-loaded with 0 prior to executing CPUID. If the field remains 0 following the execution of CPUID; this indicates that no microcode update is loaded. Any non-zero value is the microcode update signature.

		63:32	Reserved.	
1A0H	416	IA32_MISC_ENABLE	**Enable Misc. Processor Features (R/W)** Allows a variety of processor functions to be enabled and disabled.	
		0	**Fast-Strings Enable** When set, the fast-strings feature (for REP MOVS and REP STORS) is enabled (default); when clear, fast-strings are disabled.	0F_0H
		2:1	Reserved.	
		3	**Automatic Thermal Control Circuit Enable (R/W)** 1 = Setting this bit enables the thermal control circuit (TCC) portion of the Intel Thermal Monitor feature. This allows the processor to automatically reduce power consumption in response to TCC activation. 0 = Disabled. Note: In some products clearing this bit might be ignored in critical thermal conditions, and TM1, TM2 and adaptive thermal throttling will still be activated. The default value of this field varies with product . See respective tables where default value is listed.	0F_0H

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
		6:4	Reserved	
		7	**Performance Monitoring Available (R)** 1 = Performance monitoring enabled 0 = Performance monitoring disabled	0F_0H
		10:8	Reserved.	
		11	**Branch Trace Storage Unavailable (RO)** 1 = Processor doesn't support branch trace storage (BTS) 0 = BTS is supported	0F_0H
		12	**Processor Event Based Sampling (PEBS) Unavailable (RO)** 1 = PEBS is not supported; 0 = PEBS is supported.	06_0FH
		15:13	Reserved.	
		16	**Enhanced Intel SpeedStep Technology Enable (R/W)** 0= Enhanced Intel SpeedStep Technology disabled 1 = Enhanced Intel SpeedStep Technology enabled	If CPUID.01H: ECX[7] =1
		17	Reserved.	
		18	**ENABLE MONITOR FSM (R/W)** When this bit is set to 0, the MONITOR feature flag is not set (CPUID.01H:ECX[bit 3] = 0). This indicates that MONITOR/MWAIT are not supported. Software attempts to execute MONITOR/MWAIT will cause #UD when this bit is 0. When this bit is set to 1 (default), MONITOR/MWAIT are supported (CPUID.01H:ECX[bit 3] = 1). If the SSE3 feature flag ECX[0] is not set (CPUID.01H:ECX[bit 0] = 0), the OS must not attempt to alter this bit. BIOS must leave it in the default state. Writing this bit when the SSE3 feature flag is set to 0 may generate a #GP exception.	0F_03H
		21:19	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
		22	**Limit CPUID Maxval (R/W)** When this bit is set to 1, CPUID.00H returns a maximum value in EAX[7:0] of 2. BIOS should contain a setup question that allows users to specify when the installed OS does not support CPUID functions greater than 2. Before setting this bit, BIOS must execute the CPUID.0H and examine the maximum value returned in EAX[7:0]. If the maximum value is greater than 2, this bit is supported. Otherwise, this bit is not supported. Setting this bit when the maximum value is not greater than 2 may generate a #GP exception. Setting this bit may cause unexpected behavior in software that depends on the availability of CPUID leaves greater than 2.	0F_03H
		23	**xTPR Message Disable (R/W)** When set to 1, xTPR messages are disabled. xTPR messages are optional messages that allow the processor to inform the chipset of its priority.	if CPUID.01H:ECX[14] = 1
		33:24	Reserved.	
		34	**XD Bit Disable (R/W)** When set to 1, the Execute Disable Bit feature (XD Bit) is disabled and the XD Bit extended feature flag will be clear (CPUID.80000001H: EDX[20]=0). When set to a 0 (default), the Execute Disable Bit feature (if available) allows the OS to enable PAE paging and take advantage of data only pages. BIOS must not alter the contents of this bit location, if XD bit is not supported. Writing this bit to 1 when the XD Bit extended feature flag is set to 0 may generate a #GP exception.	if CPUID.80000001H:EDX[20] = 1
		63:35	Reserved.	
1B0H	432	IA32_ENERGY_PERF_BIAS	Performance Energy Bias Hint (R/W)	if CPUID.6H:ECX[3] = 1
		3:0	Power Policy Preference: 0 indicates preference to highest performance. 15 indicates preference to maximize energy saving.	
		63:4	Reserved.

		0	**EN:** Enable Intel MPX in supervisor mode	
		1	**BNDPRESERVE:** Preserve the bounds registers for near branch instructions in the absence of the BND prefix	
		11:2	Reserved, must be 0	
		63:12	**Base Address of Bound Directory.**	
DA0H	3488	IA32_XSS	**Extended Supervisor State Mask (R/W)**	If(CPUID.(0DH, 1):EAX.[3] = 1
		7:0	**Reserved**	
		8	**Trace Packet Configuration State (R/W)**	
		63:9	Reserved.	
DB0H	3504	IA32_PKG_HDC_CTL	**Package Level Enable/disable HDC (R/W)**	If CPUID.06H:EAX.[13] = 1
		0	**HDC_Pkg_Enable (R/W)** Force HDC idling or wake up HDC-idled logical processors in the package. See Section 14.5.2, "Package level Enabling HDC"	If CPUID.06H:EAX.[13] = 1
		63:1	Reserved.	
DB1H	3505	IA32_PM_CTL1	**Enable/disable HWP (R/W)**	If CPUID.06H:EAX.[13] = 1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
		0	**HDC_Allow_Block (R/W)** Allow/Block this logical processor for package level HDC control. See Section 14.5.3	If CPUID.06H:EAX.[13] = 1
		63:1	Reserved.	
DB2H	3506	IA32_THREAD_STALL	**Per-Logical_Processor HDC Idle Residency (R/0)**	If CPUID.06H:EAX.[13] = 1
		63:0	**Stall_Cycle_Cnt (R/W)** Stalled cycles due to HDC forced idle on this logical processor. See Section 14.5.4.1	If CPUID.06H:EAX.[13] = 1
4000_0000H - 4000_00FFH		Reserved MSR Address Space	All existing and future processors will not implement MSR in this range.	
C000_0080H		IA32_EFER	**Extended Feature Enables**	If (CPUID.80000001H:EDX.[20] || CPUID.80000001H:EDX.[29])
		0	**SYSCALL Enable: IA32_EFER.SCE (R/W)** Enables SYSCALL/SYSRET instructions in 64-bit mode.	
		7:1	Reserved.	
		8	**IA-32e Mode Enable: IA32_EFER.LME (R/W)** Enables IA-32e mode operation.	
		9	Reserved.	
		10	**IA-32e Mode Active: IA32_EFER.LMA (R)** Indicates IA-32e mode is active when set.	
		11	**Execute Disable Bit Enable: IA32_EFER.NXE (R/W)**	
		63:12	Reserved.	
C000_0081H		IA32_STAR	**System Call Target Address (R/W)**	If CPUID.80000001:EDX.[29] = 1
C000_0082H		IA32_LSTAR	**IA-32e Mode System Call Target Address (R/W)** Target RIP for the called procedure when SYSCALL is executed in 64-bit mode.	If CPUID.80000001:EDX.[29] = 1
C000_0083H		IA32_CSTAR	**IA-32e Mode System Call Target Address (R/W)** Not used, as the SYSCALL instruction is not recognized in compatibility mode.	If CPUID.80000001:EDX.[29] = 1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
C000_0084H		IA32_FMASK	**System Call Flag Mask (R/W)**	If CPUID.80000001:EDX.[29] = 1
C000_0100H		IA32_FS_BASE	**Map of BASE Address of FS (R/W)**	If CPUID.80000001:EDX.[29] = 1
C000_0101H		IA32_GS_BASE	**Map of BASE Address of GS (R/W)**	If CPUID.80000001:EDX.[29] = 1
C000_0102H		IA32_KERNEL_GS_BASE	**Swap Target of BASE Address of GS (R/W)**	If CPUID.80000001:EDX.[29] = 1
C000_0103H		IA32_TSC_AUX	Auxiliary TSC (RW)	If CPUID.80000001H: EDX[27] = 1
		31:0	AUX: Auxiliary signature of TSC	
		63:32	Reserved.	

NOTES:

1. In processors based on Intel NetBurst® microarchitecture, MSR addresses 180H-197H are supported, software must treat them as model-specific. Starting with Intel Core Duo processors, MSR addresses 180H-185H, 188H-197H are reserved.
2. The *_ADDR MSRs may or may not be present; this depends on flag settings in IA32_MC*i*_STATUS. See Section 15.3.2.3 and Section 15.3.2.4 for more information.
3. MAXPHYADDR is reported by CPUID.80000008H:EAX[7:0].

2.2 MSRS IN THE INTEL® CORE™ 2 PROCESSOR FAMILY

Table 2-3 lists model-specific registers (MSRs) for Intel Core 2 processor family and for Intel Xeon processors based on Intel Core microarchitecture, architectural MSR addresses are also included in Table 2-3. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_0FH, see Table 2-1.

MSRs listed in Table 2-2 and Table 2-3 are also supported by processors based on the Enhanced Intel Core microarchitecture. Processors based on the Enhanced Intel Core microarchitecture have the CPUID signature DisplayFamily_DisplayModel of 06_17H.

The column "Shared/Unique" applies to multi-core processors based on Intel Core microarchitecture. "Unique" means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. "Shared" means the MSR or the bit field in an MSR address governs the operation of both processor cores.

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Unique	See Section 2.22, "MSRs in Pentium Processors."
1H	1	IA32_P5_MC_TYPE	Unique	See Section 2.22, "MSRs in Pentium Processors."
6H	6	IA32_MONITOR_FILTER_SIZE	Unique	See Section 8.10.5, "Monitor/Mwait Address Range Determination." andTable 2-2.

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
10H	16	IA32_TIME_STAMP_COUNTER	Unique	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Shared	**Platform ID (R)** See Table 2-2.
17H	23	MSR_PLATFORM_ID	Shared	**Model Specific Platform ID (R)**
		7:0		Reserved.
		12:8		**Maximum Qualified Ratio (R)** The maximum allowed bus ratio.
		49:13		Reserved.
		52:50		See Table 2-2.
		63:53		Reserved.
1BH	27	IA32_APIC_BASE	Unique	See Section 10.4.4, "Local APIC Status and Location." and Table 2-2.
2AH	42	MSR_EBL_CR_POWERON	Shared	**Processor Hard Power-On Configuration (R/W)** Enables and disables processor features; (R) indicates current processor configuration.
		0		Reserved.
		1		**Data Error Checking Enable (R/W)** 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		2		**Response Error Checking Enable (R/W)** 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		3		**MCERR# Drive Enable (R/W)** 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		4		**Address Parity Enable (R/W)** 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		5		Reserved.
		6		Reserved.
		7		**BINIT# Driver Enable (R/W)** 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		8		**Output Tri-state Enabled (R/O)** 1 = Enabled; 0 = Disabled
		9		**Execute BIST (R/O)** 1 = Enabled; 0 = Disabled

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		10		**MCERR# Observation Enabled (R/O)** 1 = Enabled; 0 = Disabled
		11		Intel TXT Capable Chipset. (R/O) 1 = Present; 0 = Not Present
		12		**BINIT# Observation Enabled (R/O)** 1 = Enabled; 0 = Disabled
		13		Reserved.
		14		**1 MByte Power on Reset Vector (R/O)** 1 = 1 MByte; 0 = 4 GBytes
		15		Reserved.
		17:16		**APIC Cluster ID (R/O)**
		18		**N/2 Non-Integer Bus Ratio (R/O)** 0 = Integer ratio; 1 = Non-integer ratio
		19		Reserved.
		21: 20		**Symmetric Arbitration ID (R/O)**
		26:22		**Integer Bus Frequency Ratio (R/O)**
3AH	58	MSR_FEATURE_CONTROL	Unique	**Control Features in Intel 64Processor (R/W)** See Table 2-2.
		3	Unique	**SMRR Enable (R/WL)** When this bit is set and the lock bit is set makes the SMRR_PHYS_BASE and SMRR_PHYS_MASK registers read visible and writeable while in SMM.
40H	64	MSR_ LASTBRANCH_0_FROM_IP	Unique	**Last Branch Record 0 From IP (R/W)** One of four pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the **source instruction**. See also: ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 17.5
41H	65	MSR_ LASTBRANCH_1_FROM_IP	Unique	**Last Branch Record 1 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
42H	66	MSR_ LASTBRANCH_2_FROM_IP	Unique	**Last Branch Record 2 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
43H	67	MSR_ LASTBRANCH_3_FROM_IP	Unique	**Last Branch Record 3 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
60H	96	MSR_ LASTBRANCH_0_TO_IP	Unique	**Last Branch Record 0 To IP (R/W)** One of four pairs of last branch record registers on the last branch record stack. This To_IP part of the stack contains pointers to the destination instruction.

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
61H	97	MSR_ LASTBRANCH_1_TO_IP	Unique	**Last Branch Record 1 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
62H	98	MSR_ LASTBRANCH_2_TO_IP	Unique	**Last Branch Record 2 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
63H	99	MSR_ LASTBRANCH_3_TO_IP	Unique	**Last Branch Record 3 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
79H	121	IA32_BIOS_UPDT_TRIG	Unique	**BIOS Update Trigger Register (W)** See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Unique	**BIOS Update Signature ID (RO)** See Table 2-2.
A0H	160	MSR_SMRR_PHYSBASE	Unique	**System Management Mode Base Address register (WO in SMM)** Model-specific implementation of SMRR-like interface, read visible and write only in SMM.
		11:0		Reserved.
		31:12		PhysBase. SMRR physical Base Address.
		63:32		Reserved.
A1H	161	MSR_SMRR_PHYSMASK	Unique	**System Management Mode Physical Address Mask register (WO in SMM)** Model-specific implementation of SMRR-like interface, read visible and write only in SMM.
		10:0		Reserved.
		11		Valid. Physical address base and range mask are valid.
		31:12		PhysMask. SMRR physical address range mask.
		63:32		Reserved.
C1H	193	IA32_PMC0	Unique	**Performance Counter Register** See Table 2-2.
C2H	194	IA32_PMC1	Unique	**Performance Counter Register** See Table 2-2.
CDH	205	MSR_FSB_FREQ	Shared	**Scaleable Bus Speed(RO)** This field indicates the intended scaleable bus clock speed for processors based on Intel Core microarchitecture:
		2:0		▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) ▪ 010B: 200 MHz (FSB 800) ▪ 000B: 267 MHz (FSB 1067) ▪ 100B: 333 MHz (FSB 1333)

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
				133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.
				266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 000B. 333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 100B.
		63:3		Reserved.
CDH	205	MSR_FSB_FREQ	Shared	**Scaleable Bus Speed(RO)** This field indicates the intended scaleable bus clock speed for processors based on Enhanced Intel Core microarchitecture:
		2:0		▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) ▪ 010B: 200 MHz (FSB 800) ▪ 000B: 267 MHz (FSB 1067) ▪ 100B: 333 MHz (FSB 1333) ▪ 110B: 400 MHz (FSB 1600)
				133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.
				266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 110B. 333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 111B.
		63:3		Reserved.
E7H	231	IA32_MPERF	Unique	**Maximum Performance Frequency Clock Count (RW)** See Table 2-2.
E8H	232	IA32_APERF	Unique	**Actual Performance Frequency Clock Count (RW)** See Table 2-2.
FEH	254	IA32_MTRRCAP	Unique	See Table 2-2.
		11	Unique	**SMRR Capability Using MSR 0A0H and 0A1H (R)**
174H	372	IA32_SYSENTER_CS	Unique	See Table 2-2.
175H	373	IA32_SYSENTER_ESP	Unique	See Table 2-2.
176H	374	IA32_SYSENTER_EIP	Unique	See Table 2-2.
179H	377	IA32_MCG_CAP	Unique	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Unique	Global Machine Check Status

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		0		**RIPV** When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.
		1		**EIPV** When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		**MCIP** When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved.
186H	390	IA32_PERFEVTSEL0	Unique	See Table 2-2.
187H	391	IA32_PERFEVTSEL1	Unique	See Table 2-2.
198H	408	IA32_PERF_STATUS	Shared	See Table 2-2.
198H	408	MSR_PERF_STATUS	Shared	Current performance status. See Section 14.1.1, "Software Interface For Initiating Performance State Transitions".
		15:0		Current Performance State Value.
		30:16		Reserved.
		31		XE Operation (R/O). If set, XE operation is enabled. Default is cleared.
		39:32		Reserved.
		44:40		Maximum Bus Ratio (R/O) Indicates maximum bus ratio configured for the processor.
		45		Reserved.
		46		Non-Integer Bus Ratio (R/O) Indicates non-integer bus ratio is enabled. Applies processors based on Enhanced Intel Core microarchitecture.
		63:47		Reserved.
199H	409	IA32_PERF_CTL	Unique	See Table 2-2.
19AH	410	IA32_CLOCK_MODULATION	Unique	**Clock Modulation (R/W)** See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.
19BH	411	IA32_THERM_INTERRUPT	Unique	**Thermal Interrupt Control (R/W)** See Table 2-2.

19DH	413	MSR_THERM2_CTL	Unique	Thermal Monitor 2 Control
		15:0		Reserved.
		16		**TM_SELECT (R/W)** Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 are enabled.
		63:16		Reserved.
1A0H	416	IA32_MISC_ENABLE		**Enable Misc. Processor Features (R/W)** Allows a variety of processor functions to be enabled and disabled.
		0		**Fast-Strings Enable** See Table 2-2.
		2:1		Reserved.
		3	Unique	**Automatic Thermal Control Circuit Enable (R/W)** See Table 2-2.
		6:4		Reserved.
		7	Shared	**Performance Monitoring Available (R)** See Table 2-2.
		8		Reserved.
		9		**Hardware Prefetcher Disable (R/W)** When set, disables the hardware prefetcher operation on streams of data. When clear (default), enables the prefetch queue. Disabling of the hardware prefetcher may impact processor performance.
		10	Shared	**FERR# Multiplexing Enable (R/W)** 1 = FERR# asserted by the processor to indicate a pending break event within the processor 0 = Indicates compatible FERR# signaling behavior This bit must be set to 1 to support XAPIC interrupt model usage.
		11	Shared	**Branch Trace Storage Unavailable (RO)** See Table 2-2.
		12	Shared	**Processor Event Based Sampling Unavailable (RO)** See Table 2-2.

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		13	Shared	**TM2 Enable (R/W)** When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0.
				When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state. The BIOS must enable this feature if the TM2 feature flag (CPUID.1:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location. The processor is operating out of specification if both this bit and the TM1 bit are set to 0.
		15:14		Reserved.
		16	Shared	**Enhanced Intel SpeedStep Technology Enable (R/W)** See Table 2-2.
		18	Shared	**ENABLE MONITOR FSM (R/W)** See Table 2-2.
		19	Shared	**Adjacent Cache Line Prefetch Disable (R/W)** When set to 1, the processor fetches the cache line that contains data currently required by the processor. When set to 0, the processor fetches cache lines that comprise a cache line pair (128 bytes). Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing. BIOS may contain a setup option that controls the setting of this bit.
		20	Shared	**Enhanced Intel SpeedStep Technology Select Lock (R/WO)** When set, this bit causes the following bits to become read-only: ▪ Enhanced Intel SpeedStep Technology Select Lock (this bit), ▪ Enhanced Intel SpeedStep Technology Enable bit. The bit must be set before an Enhanced Intel SpeedStep Technology transition is requested. This bit is cleared on reset.
		21		Reserved.
		22	Shared	**Limit CPUID Maxval (R/W)** See Table 2-2.
		23	Shared	**xTPR Message Disable (R/W)** See Table 2-2.
		33:24		Reserved.

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		34	Unique	**XD Bit Disable (R/W)** See Table 2-2.
		36:35		Reserved.
		37	Unique	**DCU Prefetcher Disable (R/W)** When set to 1, The DCU L1 data cache prefetcher is disabled. The default value after reset is 0. BIOS may write '1' to disable this feature. The DCU prefetcher is an L1 data cache prefetcher. When the DCU prefetcher detects multiple loads from the same line done within a time limit, the DCU prefetcher assumes the next line will be required. The next line is prefetched in to the L1 data cache from memory or L2.
		38	Shared	**IDA Disable (R/W)** When set to 1 on processors that support IDA, the Intel Dynamic Acceleration feature (IDA) is disabled and the IDA_Enable feature flag will be clear (CPUID.06H: EAX[1]=0). When set to a 0 on processors that support IDA, CPUID.06H: EAX[1] reports the processor's support of IDA is enabled. **Note:** the power-on default value is used by BIOS to detect hardware support of IDA. If power-on default value is 1, IDA is available in the processor. If power-on default value is 0, IDA is not available.
		39	Unique	**IP Prefetcher Disable (R/W)** When set to 1, The IP prefetcher is disabled. The default value after reset is 0. BIOS may write '1' to disable this feature. The IP prefetcher is an L1 data cache prefetcher. The IP prefetcher looks for sequential load history to determine whether to prefetch the next expected data into the L1 cache from memory or L2.
		63:40		Reserved.
1C9H	457	MSR_LASTBRANCH_TOS	Unique	**Last Branch Record Stack TOS (R/W)** Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).
1D9H	473	IA32_DEBUGCTL	Unique	**Debug Control (R/W)** See Table 2-2
1DDH	477	MSR_LER_FROM_LIP	Unique	**Last Exception Record From Linear IP (R)** Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.
1DEH	478	MSR_LER_TO_LIP	Unique	**Last Exception Record To Linear IP (R)** This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.

38DH	909	MSR_PERF_FIXED_CTR_ CTRL	Unique	**Fixed-Function-Counter Control Register (R/W)**
38EH	910	IA32_PERF_GLOBAL_ STATUS	Unique	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
38EH	910	MSR_PERF_GLOBAL_STATU S	Unique	See Section 18.6.2.2, "Global Counter Control Facilities."
38FH	911	IA32_PERF_GLOBAL_CTRL	Unique	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
38FH	911	MSR_PERF_GLOBAL_CTRL	Unique	See Section 18.6.2.2, "Global Counter Control Facilities."
390H	912	IA32_PERF_GLOBAL_OVF_ CTRL	Unique	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
390H	912	MSR_PERF_GLOBAL_OVF_ CTRL	Unique	See Section 18.6.2.2, "Global Counter Control Facilities."
3F1H	1009	MSR_PEBS_ENABLE	Unique	See Table 2-2. See Section 18.6.2.4, "Processor Event Based Sampling (PEBS)."
		0		Enable PEBS on IA32_PMC0. (R/W)
400H	1024	IA32_MC0_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MC0_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MC0_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
404H	1028	IA32_MC1_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
406H	1030	IA32_MC1_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	IA32_MC4_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC4_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40EH	1038	IA32_MC4_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	IA32_MC3_CTL		See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC3_STATUS		See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
412H	1042	IA32_MC3_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	IA32_MC3_MISC	Unique	Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCi_STATUS register is set.
414H	1044	IA32_MC5_CTL	Unique	Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
415H	1045	IA32_MC5_STATUS	Unique	Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.
416H	1046	IA32_MC5_ADDR	Unique	Machine Check Error Reporting Register - contains the address of the code or data memory location that produced the machine-check error if the ADDRV flag in the IA32_MCi_STATUS register is set.
417H	1047	IA32_MC5_MISC	Unique	Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCi_STATUS register is set.
419H	1045	IA32_MC6_STATUS	Unique	Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 15.3.2.2, "IA32_MCi_STATUS MSRS." and Chapter 23.
480H	1152	IA32_VMX_BASIC	Unique	**Reporting Register of Basic VMX Capabilities (R/O)** See Table 2-2. See Appendix A.1, "Basic VMX Information."
481H	1153	IA32_VMX_PINBASED_ CTLS	Unique	**Capability Reporting Register of Pin-based VM-execution Controls (R/O)** See Table 2-2. See Appendix A.3, "VM-Execution Controls."
482H	1154	IA32_VMX_PROCBASED_ CTLS	Unique	**Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls."
483H	1155	IA32_VMX_EXIT_CTLS	Unique	**Capability Reporting Register of VM-exit Controls (R/O)** See Table 2-2. See Appendix A.4, "VM-Exit Controls."
484H	1156	IA32_VMX_ENTRY_CTLS	Unique	**Capability Reporting Register of VM-entry Controls (R/O)** See Table 2-2. See Appendix A.5, "VM-Entry Controls."
485H	1157	IA32_VMX_MISC	Unique	**Reporting Register of Miscellaneous VMX Capabilities (R/O)** See Table 2-2. See Appendix A.6, "Miscellaneous Data."
486H	1158	IA32_VMX_CR0_FIXED0	Unique	**Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)** See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."
487H	1159	IA32_VMX_CR0_FIXED1	Unique	**Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)** See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
488H	1160	IA32_VMX_CR4_FIXED0	Unique	**Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)** See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."
489H	1161	IA32_VMX_CR4_FIXED1	Unique	**Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)** See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."
48AH	1162	IA32_VMX_VMCS_ENUM	Unique	**Capability Reporting Register of VMCS Field Enumeration (R/O)** See Table 2-2. See Appendix A.9, "VMCS Enumeration."
48BH	1163	IA32_VMX_PROCBASED_ CTLS2	Unique	**Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls."
600H	1536	IA32_DS_AREA	Unique	**DS Save Area (R/W)** See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
107CC H		MSR_EMON_L3_CTR_CTL0	Unique	**GBUSQ Event Control/Counter Register (R/W)** Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2
107CD H		MSR_EMON_L3_CTR_CTL1	Unique	**GBUSQ Event Control/Counter Register (R/W)** Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2
107CE H		MSR_EMON_L3_CTR_CTL2	Unique	**GSNPQ Event Control/Counter Register (R/W)** Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2
107CF H		MSR_EMON_L3_CTR_CTL3	Unique	**GSNPQ Event Control/Counter Register (R/W)** Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2
107D0 H		MSR_EMON_L3_CTR_CTL4	Unique	**FSB Event Control/Counter Register (R/W)** Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2
107D1 H		MSR_EMON_L3_CTR_CTL5	Unique	**FSB Event Control/Counter Register (R/W)** Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2
107D2 H		MSR_EMON_L3_CTR_CTL6	Unique	**FSB Event Control/Counter Register (R/W)** Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2
107D3 H		MSR_EMON_L3_CTR_CTL7	Unique	**FSB Event Control/Counter Register (R/W)** Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
107D8H		MSR_EMON_L3_GL_CTL	Unique	**L3/FSB Common Control Register (R/W)** Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2
C000_0080H		IA32_EFER	Unique	**Extended Feature Enables** See Table 2-2.
C000_0081H		IA32_STAR	Unique	**System Call Target Address (R/W)** See Table 2-2.
C000_0082H		IA32_LSTAR	Unique	**IA-32e Mode System Call Target Address (R/W)** See Table 2-2.
C000_0084H		IA32_FMASK	Unique	**System Call Flag Mask (R/W)** See Table 2-2.
C000_0100H		IA32_FS_BASE	Unique	**Map of BASE Address of FS (R/W)** See Table 2-2.
C000_0101H		IA32_GS_BASE	Unique	**Map of BASE Address of GS (R/W)** See Table 2-2.
C000_0102H		IA32_KERNEL_GS_BASE	Unique	**Swap Target of BASE Address of GS (R/W)** See Table 2-2.

2.3 MSRS IN THE 45 NM AND 32 NM INTEL® ATOM™ PROCESSOR FAMILY

Table 2-4 lists model-specific registers (MSRs) for 45 nm and 32 nm Intel Atom processors, architectural MSR addresses are also included in Table 2-4. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_1CH, 06_26H, 06_27H, 06_35H and 06_36H; see Table 2-1.

The column "Shared/Unique" applies to logical processors sharing the same core in processors based on the Intel Atom microarchitecture. "Unique" means each logical processor has a separate MSR, or a bit field in an MSR governs only a logical processor. "Shared" means the MSR or the bit field in an MSR address governs the operation of both logical processors in the same core.

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Shared	See Section 2.22, "MSRs in Pentium Processors."
1H	1	IA32_P5_MC_TYPE	Shared	See Section 2.22, "MSRs in Pentium Processors."
6H	6	IA32_MONITOR_FILTER_SIZE	Unique	See Section 8.10.5, "Monitor/Mwait Address Range Determination." andTable 2-2
10H	16	IA32_TIME_STAMP_COUNTER	Unique	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Shared	**Platform ID (R)** See Table 2-2.

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
17H	23	MSR_PLATFORM_ID	Shared	**Model Specific Platform ID (R)**
		7:0		Reserved.
		12:8		**Maximum Qualified Ratio (R)** The maximum allowed bus ratio.
		63:13		Reserved.
1BH	27	IA32_APIC_BASE	Unique	See Section 10.4.4, "Local APIC Status and Location," and Table 2-2.
2AH	42	MSR_EBL_CR_POWERON	Shared	**Processor Hard Power-On Configuration (R/W)** Enables and disables processor features; **(R)** indicates current processor configuration.
		0		Reserved.
		1		**Data Error Checking Enable (R/W)** 1 = Enabled; 0 = Disabled Always 0.
		2		**Response Error Checking Enable (R/W)** 1 = Enabled; 0 = Disabled Always 0.
		3		**AERR# Drive Enable (R/W)** 1 = Enabled; 0 = Disabled Always 0.
		4		**BERR# Enable for initiator bus requests (R/W)** 1 = Enabled; 0 = Disabled Always 0.
		5		Reserved.
		6		Reserved.
		7		**BINIT# Driver Enable (R/W)** 1 = Enabled; 0 = Disabled Always 0.
		8		Reserved.
		9		**Execute BIST (R/O)** 1 = Enabled; 0 = Disabled
		10		**AERR# Observation Enabled (R/O)** 1 = Enabled; 0 = Disabled Always 0.
		11		Reserved.
		12		**BINIT# Observation Enabled (R/O)** 1 = Enabled; 0 = Disabled Always 0.
		13		**Reserved.**

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		14		**1 MByte Power on Reset Vector (R/O)** 1 = 1 MByte; 0 = 4 GBytes
		15		Reserved
		17:16		**APIC Cluster ID (R/O)** Always 00B.
		19: 18		Reserved.
		21: 20		**Symmetric Arbitration ID (R/O)** Always 00B.
		26:22		**Integer Bus Frequency Ratio (R/O)**
3AH	58	IA32_FEATURE_CONTROL	Unique	**Control Features in Intel 64Processor (R/W)** See Table 2-2.
40H	64	MSR_ LASTBRANCH_0_FROM_IP	Unique	**Last Branch Record 0 From IP (R/W)** One of eight pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the **source instruction** . See also: ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 17.5
41H	65	MSR_ LASTBRANCH_1_FROM_IP	Unique	**Last Branch Record 1 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
42H	66	MSR_ LASTBRANCH_2_FROM_IP	Unique	**Last Branch Record 2 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
43H	67	MSR_ LASTBRANCH_3_FROM_IP	Unique	**Last Branch Record 3 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
44H	68	MSR_ LASTBRANCH_4_FROM_IP	Unique	**Last Branch Record 4 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
45H	69	MSR_ LASTBRANCH_5_FROM_IP	Unique	**Last Branch Record 5 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
46H	70	MSR_ LASTBRANCH_6_FROM_IP	Unique	**Last Branch Record 6 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
47H	71	MSR_ LASTBRANCH_7_FROM_IP	Unique	**Last Branch Record 7 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
60H	96	MSR_ LASTBRANCH_0_TO_IP	Unique	**Last Branch Record 0 To IP (R/W)** One of eight pairs of last branch record registers on the last branch record stack. The To_IP part of the stack contains pointers to the destination instruction.
61H	97	MSR_ LASTBRANCH_1_TO_IP	Unique	**Last Branch Record 1 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
62H	98	MSR_ LASTBRANCH_2_TO_IP	Unique	**Last Branch Record 2 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
63H	99	MSR_ LASTBRANCH_3_TO_IP	Unique	**Last Branch Record 3 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
64H	100	MSR_ LASTBRANCH_4_TO_IP	Unique	**Last Branch Record 4 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
65H	101	MSR_ LASTBRANCH_5_TO_IP	Unique	**Last Branch Record 5 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
66H	102	MSR_ LASTBRANCH_6_TO_IP	Unique	**Last Branch Record 6 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
67H	103	MSR_ LASTBRANCH_7_TO_IP	Unique	**Last Branch Record 7 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
79H	121	IA32_BIOS_UPDT_TRIG	Shared	**BIOS Update Trigger Register (W)** See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Unique	**BIOS Update Signature ID (RO)** See Table 2-2.
C1H	193	IA32_PMC0	Unique	**Performance counter register** See Table 2-2.
C2H	194	IA32_PMC1	Unique	**Performance Counter Register** See Table 2-2.
CDH	205	MSR_FSB_FREQ	Shared	**Scaleable Bus Speed(RO)** This field indicates the intended scaleable bus clock speed for processors based on Intel Atom microarchitecture:
		2:0		▪ 111B: 083 MHz (FSB 333) ▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) 133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.
		63:3		Reserved.
E7H	231	IA32_MPERF	Unique	**Maximum Performance Frequency Clock Count (RW)** See Table 2-2.
E8H	232	IA32_APERF	Unique	**Actual Performance Frequency Clock Count (RW)** See Table 2-2.
FEH	254	IA32_MTRRCAP	Shared	**Memory Type Range Register (R)** See Table 2-2.
11EH	281	MSR_BBL_CR_CTL3	Shared	Control register 3. Used to configure the L2 Cache.
		0		**L2 Hardware Enabled (RO)** 1 = If the L2 is hardware-enabled 0 = Indicates if the L2 is hardware-disabled
		7:1		Reserved.

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		8		**L2 Enabled. (R/W)** 1 = L2 cache has been initialized 0 = Disabled (default) Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9		Reserved.
		23		**L2 Not Present (RO)** 0 = L2 Present 1 = L2 Not Present
		63:24		Reserved.
174H	372	IA32_SYSENTER_CS	Unique	See Table 2-2.
175H	373	IA32_SYSENTER_ESP	Unique	See Table 2-2.
176H	374	IA32_SYSENTER_EIP	Unique	See Table 2-2.
179H	377	IA32_MCG_CAP	Unique	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Unique	Global Machine Check Status
		0		**RIPV** When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted
		1		**EIPV** When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		**MCIP** When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved.
186H	390	IA32_PERFEVTSEL0	Unique	See Table 2-2.
187H	391	IA32_PERFEVTSEL1	Unique	See Table 2-2.
198H	408	IA32_PERF_STATUS	Shared	See Table 2-2.
198H	408	MSR_PERF_STATUS	Shared	Performance Status
		15:0		Current Performance State Value.
		39:16		Reserved.
		44:40		Maximum Bus Ratio (R/O) Indicates maximum bus ratio configured for the processor.
		63:45		Reserved.
199H	409	IA32_PERF_CTL	Unique	See Table 2-2.

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
19AH	410	IA32_CLOCK_MODULATION	Unique	**Clock Modulation (R/W)** See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.
19BH	411	IA32_THERM_INTERRUPT	Unique	**Thermal Interrupt Control (R/W)** See Table 2-2.
19CH	412	IA32_THERM_STATUS	Unique	**Thermal Monitor Status (R/W)** See Table 2-2.
19DH	413	MSR_THERM2_CTL	Shared	Thermal Monitor 2 Control
		15:0		Reserved.
		16		**TM_SELECT (R/W)** Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 are enabled.
		63:17		Reserved.
1A0H	416	IA32_MISC_ENABLE	Unique	**Enable Misc. Processor Features (R/W)** Allows a variety of processor functions to be enabled and disabled.
		0		**Fast-Strings Enable** See Table 2-2.
		2:1		Reserved.
		3	Unique	**Automatic Thermal Control Circuit Enable (R/W)** See Table 2-2. Default value is 0.
		6:4		Reserved.
		7	Shared	**Performance Monitoring Available (R)** See Table 2-2.
		8		Reserved.
		9		Reserved.
		10	Shared	**FERR# Multiplexing Enable (R/W)** 1 = FERR# asserted by the processor to indicate a pending break event within the processor 0 = Indicates compatible FERR# signaling behavior This bit must be set to 1 to support XAPIC interrupt model usage.
		11	Shared	**Branch Trace Storage Unavailable (RO)** See Table 2-2.
		12	Shared	**Processor Event Based Sampling Unavailable (RO)** See Table 2-2.

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		13	Shared	**TM2 Enable (R/W)** When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0.
				When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state. The BIOS must enable this feature if the TM2 feature flag (CPUID.1:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location. The processor is operating out of specification if both this bit and the TM1 bit are set to 0.
		15:14		Reserved.
		16	Shared	**Enhanced Intel SpeedStep Technology Enable (R/W)** See Table 2-2.
		18	Shared	**ENABLE MONITOR FSM (R/W)** See Table 2-2.
		19		Reserved.
		20	Shared	**Enhanced Intel SpeedStep Technology Select Lock (R/WO)** When set, this bit causes the following bits to become read-only: ▪ Enhanced Intel SpeedStep Technology Select Lock (this bit), ▪ Enhanced Intel SpeedStep Technology Enable bit. The bit must be set before an Enhanced Intel SpeedStep Technology transition is requested. This bit is cleared on reset.
		21		Reserved.
		22	Unique	**Limit CPUID Maxval (R/W)** See Table 2-2.
		23	Shared	**xTPR Message Disable (R/W)** See Table 2-2.
		33:24		Reserved.
		34	Unique	**XD Bit Disable (R/W)** See Table 2-2.
		63:35		Reserved.
1C9H	457	MSR_LASTBRANCH_TOS	Unique	**Last Branch Record Stack TOS (R/W)** Contains an index (bits 0-2) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).
1D9H	473	IA32_DEBUGCTL	Unique	**Debug Control (R/W)** See Table 2-2.

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
1DDH	477	MSR_LER_FROM_LIP	Unique	**Last Exception Record From Linear IP (R)** Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.
1DEH	478	MSR_LER_TO_LIP	Unique	**Last Exception Record To Linear IP (R)** This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.
200H	512	IA32_MTRR_PHYSBASE0	Shared	See Table 2-2.
201H	513	IA32_MTRR_PHYSMASK0	Shared	See Table 2-2.
202H	514	IA32_MTRR_PHYSBASE1	Shared	See Table 2-2.
203H	515	IA32_MTRR_PHYSMASK1	Shared	See Table 2-2.
204H	516	IA32_MTRR_PHYSBASE2	Shared	See Table 2-2.
205H	517	IA32_MTRR_PHYSMASK2	Shared	See Table 2-2.
206H	518	IA32_MTRR_PHYSBASE3	Shared	See Table 2-2.
207H	519	IA32_MTRR_PHYSMASK3	Shared	See Table 2-2.
208H	520	IA32_MTRR_PHYSBASE4	Shared	See Table 2-2.
209H	521	IA32_MTRR_PHYSMASK4	Shared	See Table 2-2.
20AH	522	IA32_MTRR_PHYSBASE5	Shared	See Table 2-2.
20BH	523	IA32_MTRR_PHYSMASK5	Shared	See Table 2-2.
20CH	524	IA32_MTRR_PHYSBASE6	Shared	See Table 2-2.
20DH	525	IA32_MTRR_PHYSMASK6	Shared	See Table 2-2.
20EH	526	IA32_MTRR_PHYSBASE7	Shared	See Table 2-2.
20FH	527	IA32_MTRR_PHYSMASK7	Shared	See Table 2-2.
250H	592	IA32_MTRR_FIX64K_ 00000	Shared	See Table 2-2.
258H	600	IA32_MTRR_FIX16K_ 80000	Shared	See Table 2-2.
259H	601	IA32_MTRR_FIX16K_ A0000	Shared	See Table 2-2.
268H	616	IA32_MTRR_FIX4K_C0000	Shared	See Table 2-2.
269H	617	IA32_MTRR_FIX4K_C8000	Shared	See Table 2-2.
26AH	618	IA32_MTRR_FIX4K_D0000	Shared	See Table 2-2.
26BH	619	IA32_MTRR_FIX4K_D8000	Shared	See Table 2-2.
26CH	620	IA32_MTRR_FIX4K_E0000	Shared	See Table 2-2.
26DH	621	IA32_MTRR_FIX4K_E8000	Shared	See Table 2-2.
26EH	622	IA32_MTRR_FIX4K_F0000	Shared	See Table 2-2.
26FH	623	IA32_MTRR_FIX4K_F8000	Shared	See Table 2-2.
277H	631	IA32_PAT	Unique	See Table 2-2.

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
309H	777	IA32_FIXED_CTR0	Unique	**Fixed-Function Performance Counter Register 0 (R/W)** See Table 2-2.
30AH	778	IA32_FIXED_CTR1	Unique	**Fixed-Function Performance Counter Register 1 (R/W)** See Table 2-2.
30BH	779	IA32_FIXED_CTR2	Unique	**Fixed-Function Performance Counter Register 2 (R/W)** See Table 2-2.
345H	837	IA32_PERF_CAPABILITIES	Shared	See Table 2-2. See Section 17.4.1, "IA32_DEBUGCTL MSR."
38DH	909	IA32_FIXED_CTR_CTRL	Unique	**Fixed-Function-Counter Control Register (R/W)** See Table 2-2.
38EH	910	IA32_PERF_GLOBAL_ STATUS	Unique	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
38FH	911	IA32_PERF_GLOBAL_CTRL	Unique	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
390H	912	IA32_PERF_GLOBAL_OVF_ CTRL	Unique	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
3F1H	1009	MSR_PEBS_ENABLE	Unique	See Table 2-2. See Section 18.6.2.4, "Processor Event Based Sampling (PEBS)."
		0		Enable PEBS on IA32_PMC0. (R/W)
400H	1024	IA32_MC0_CTL	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MC0_STATUS	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MC0_ADDR	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
408H	1032	IA32_MC2_CTL	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	IA32_MC3_CTL	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC3_STATUS	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
40EH	1038	IA32_MC3_ADDR	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	IA32_MC4_CTL	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC4_STATUS	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
412H	1042	IA32_MC4_ADDR	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
480H	1152	IA32_VMX_BASIC	Unique	**Reporting Register of Basic VMX Capabilities (R/O)** See Table 2-2. See Appendix A.1, "Basic VMX Information."
481H	1153	IA32_VMX_PINBASED_ CTLS	Unique	**Capability Reporting Register of Pin-based VM-execution Controls (R/O)** See Table 2-2. See Appendix A.3, "VM-Execution Controls."
482H	1154	IA32_VMX_PROCBASED_ CTLS	Unique	**Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls."
483H	1155	IA32_VMX_EXIT_CTLS	Unique	**Capability Reporting Register of VM-exit Controls (R/O)** See Table 2-2. See Appendix A.4, "VM-Exit Controls."
484H	1156	IA32_VMX_ENTRY_CTLS	Unique	**Capability Reporting Register of VM-entry Controls (R/O)** See Table 2-2. See Appendix A.5, "VM-Entry Controls."
485H	1157	IA32_VMX_MISC	Unique	**Reporting Register of Miscellaneous VMX Capabilities (R/O)** See Table 2-2. See Appendix A.6, "Miscellaneous Data."
486H	1158	IA32_VMX_CR0_FIXED0	Unique	**Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)** See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."
487H	1159	IA32_VMX_CR0_FIXED1	Unique	**Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)** See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."
488H	1160	IA32_VMX_CR4_FIXED0	Unique	**Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)** See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
489H	1161	IA32_VMX_CR4_FIXED1	Unique	**Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)** See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."
48AH	1162	IA32_VMX_VMCS_ENUM	Unique	**Capability Reporting Register of VMCS Field Enumeration (R/O)** See Table 2-2. See Appendix A.9, "VMCS Enumeration."
48BH	1163	IA32_VMX_PROCBASED_ CTLS2	Unique	**Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls."
600H	1536	IA32_DS_AREA	Unique	**DS Save Area (R/W)** See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
C000_ 0080H		IA32_EFER	Unique	**Extended Feature Enables** See Table 2-2.
C000_ 0081H		IA32_STAR	Unique	**System Call Target Address (R/W)** See Table 2-2.
C000_ 0082H		IA32_LSTAR	Unique	**IA-32e Mode System Call Target Address (R/W)** See Table 2-2.
C000_ 0084H		IA32_FMASK	Unique	**System Call Flag Mask (R/W)** See Table 2-2.
C000_ 0100H		IA32_FS_BASE	Unique	**Map of BASE Address of FS (R/W)** See Table 2-2.
C000_ 0101H		IA32_GS_BASE	Unique	**Map of BASE Address of GS (R/W)** See Table 2-2.
C000_ 0102H		IA32_KERNEL_GS_BASE	Unique	**Swap Target of BASE Address of GS (R/W)** See Table 2-2.

Table 2-5 lists model-specific registers (MSRs) that are specific to Intel® Atom™ processor with the CPUID signature with DisplayFamily_DisplayModel of 06_27H.

Table 2-5. MSRs Supported by Intel® Atom™ Processors with CPUID Signature 06_27H

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
3F8H	1016	MSR_PKG_C2_RESIDENCY	Package	**Package C2 Residency** Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States
		63:0	Package	Package C2 Residency Counter. (R/O) Time that this package is in processor-specific C2 states since last reset. Counts at 1 Mhz frequency.

Table 2-5. MSRs Supported by Intel® Atom™ Processors (Contd.)with CPUID Signature 06_27H

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
3F9H	1017	MSR_PKG_C4_RESIDENCY	Package	**Package C4 Residency** Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States
		63:0	Package	Package C4 Residency Counter. (R/O) Time that this package is in processor-specific C4 states since last reset. Counts at 1 Mhz frequency.
3FAH	1018	MSR_PKG_C6_RESIDENCY	Package	**Package C6 Residency** Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States
		63:0	Package	Package C6 Residency Counter. (R/O) Time that this package is in processor-specific C6 states since last reset. Counts at 1 Mhz frequency.

2.4 MSRS IN INTEL PROCESSORS BASED ON SILVERMONT MICROARCHITECTURE

Table 2-6 lists model-specific registers (MSRs) common to Intel processors based on the Silvermont microarchitecture. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_37H, 06_4AH, 06_4DH, 06_5AH, and 06_5DH; see Table 2-1. The MSRs listed in Table 2-6 are also common to processors based on the Airmont microarchitecture and newer microarchitectures for next generation Intel Atom processors.

Table 2-7 lists MSRs common to processors based on the Silvermont and Airmont microarchitectures, but not newer microarchitectures.

Table 2-8, Table 2-9, and Table 2-10 lists MSRs that are model-specific across processors based on the Silvermont microarchitecture.

In the Silvermont microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a pair of processor cores in the physical package. "Package" means all processor cores in the physical package share the same MSR or bit interface.

Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors

Address		Register Name	Scope	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Module	See Section 2.22, "MSRs in Pentium Processors."
1H	1	IA32_P5_MC_TYPE	Module	See Section 2.22, "MSRs in Pentium Processors."
6H	6	IA32_MONITOR_FILTER_SIZE	Core	See Section 8.10.5, "Monitor/Mwait Address Range Determination." andTable 2-2
10H	16	IA32_TIME_STAMP_COUNTER	Core	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
1BH	27	IA32_APIC_BASE	Core	See Section 10.4.4, "Local APIC Status and Location," and Table 2-2.
2AH	42	MSR_EBL_CR_POWERON	Module	**Processor Hard Power-On Configuration (R/W)** Writes ignored.
		63:0		Reserved **(R/O)**

Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors

Address		Register Name	Scope	Bit Description
Hex	Dec			
34H	52	MSR_SMI_COUNT	Core	**SMI Counter (R/O)**
		31:0		**SMI Count (R/O)** Running count of SMI events since last RESET.
		63:32		Reserved.
79H	121	IA32_BIOS_UPDT_TRIG	Core	**BIOS Update Trigger Register (W)** See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Core	**BIOS Update Signature ID (RO)** See Table 2-2.
C1H	193	IA32_PMC0	Core	**Performance counter register** See Table 2-2.
C2H	194	IA32_PMC1	Core	**Performance Counter Register** See Table 2-2.
E4H	228	MSR_PMG_IO_CAPTURE_BASE	Module	**Power Management IO Redirection in C-state (R/W)** See http://biosbits.org.
		15:0		**LVL_2 Base Address (R/W)** Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.
		18:16		**C-state Range (R/W)** Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 100b - C4 is the max C-State to include 110b - C6 is the max C-State to include 111b - C7 is the max C-State to include
		63:19		Reserved.
E7H	231	IA32_MPERF	Core	**Maximum Performance Frequency Clock Count (RW)** See Table 2-2.
E8H	232	IA32_APERF	Core	**Actual Performance Frequency Clock Count (RW)** See Table 2-2.
FEH	254	IA32_MTRRCAP	Core	**Memory Type Range Register (R)** See Table 2-2.
13CH	52	MSR_FEATURE_CONFIG	Core	**AES Configuration (RW-L)** Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.

Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors

Address		Register Name	Scope	Bit Description
Hex	Dec			
		1:0		**AES Configuration (RW-L)** Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instruction can be mis-configured if a privileged agent unintentionally writes 11b.
		63:2		Reserved.
174H	372	IA32_SYSENTER_CS	Core	See Table 2-2.
175H	373	IA32_SYSENTER_ESP	Core	See Table 2-2.
176H	374	IA32_SYSENTER_EIP	Core	See Table 2-2.
179H	377	IA32_MCG_CAP	Core	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Core	Global Machine Check Status
		0		**RIPV** When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted
		1		**EIPV** When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		**MCIP** When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved.
186H	390	IA32_PERFEVTSEL0	Core	See Table 2-2.
		7:0		**Event Select**
		15:8		**UMask**
		16		**USR**
		17		**OS**
		18		**Edge**
		19		**PC**
		20		**INT**
		21		**Reserved**
		22		**EN**
		23		**INV**
		31:24		**CMASK**

Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors

Address		Register Name	Scope	Bit Description
Hex	Dec			
		63:32		Reserved.
187H	391	IA32_PERFEVTSEL1	Core	See Table 2-2.
198H	408	IA32_PERF_STATUS	Module	See Table 2-2.
199H	409	IA32_PERF_CTL	Core	See Table 2-2.
19AH	410	IA32_CLOCK_MODULATION	Core	**Clock Modulation (R/W)** See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.
19BH	411	IA32_THERM_INTERRUPT	Core	**Thermal Interrupt Control (R/W)** See Table 2-2.
19CH	412	IA32_THERM_STATUS	Core	**Thermal Monitor Status (R/W)** See Table 2-2.
1A2H	418	MSR_ TEMPERATURE_TARGET	Package	Temperature Target
		15:0		Reserved.
		23:16		**Temperature Target (R)** The default thermal throttling or PROCHOT# activation temperature in degree C, The effective temperature for thermal throttling or PROCHOT# activation is “Temperature Target” + “Target Offset”
		29:24		**Target Offset (R/W)** Specifies an offset in degrees C to adjust the throttling and PROCHOT# activation temperature from the default target specified in TEMPERATURE_TARGET (bits 23:16).
		63:30		Reserved.
1A6H	422	MSR_OFFCORE_RSP_0	Module	**Offcore Response Event Select Register (R/W)**
1A7H	423	MSR_OFFCORE_RSP_1	Module	**Offcore Response Event Select Register (R/W)**
1B0H	432	IA32_ENERGY_PERF_BIAS	Core	See Table 2-2.
1D9H	473	IA32_DEBUGCTL	Core	**Debug Control (R/W)** See Table 2-2.
1DDH	477	MSR_LER_FROM_LIP	Core	**Last Exception Record From Linear IP (R)** Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.
1DEH	478	MSR_LER_TO_LIP	Core	**Last Exception Record To Linear IP (R)** This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.
1F2H	498	IA32_SMRR_PHYSBASE	Core	See Table 2-2.
1F3H	499	IA32_SMRR_PHYSMASK	Core	See Table 2-2.
200H	512	IA32_MTRR_PHYSBASE0	Core	See Table 2-2.

269H	617	IA32_MTRR_FIX4K_C8000	Core	See Table 2-2.
26AH	618	IA32_MTRR_FIX4K_D0000	Core	See Table 2-2.
26BH	619	IA32_MTRR_FIX4K_D8000	Core	See Table 2-2.
26CH	620	IA32_MTRR_FIX4K_E0000	Core	See Table 2-2.
26DH	621	IA32_MTRR_FIX4K_E8000	Core	See Table 2-2.
26EH	622	IA32_MTRR_FIX4K_F0000	Core	See Table 2-2.
26FH	623	IA32_MTRR_FIX4K_F8000	Core	See Table 2-2.
277H	631	IA32_PAT	Core	See Table 2-2.
2FFH	767	IA32_MTRR_DEF_TYPE	Core	**Default Memory Types (R/W)** See Table 2-2.
309H	777	IA32_FIXED_CTR0	Core	**Fixed-Function Performance Counter Register 0 (R/W)** See Table 2-2.
30AH	778	IA32_FIXED_CTR1	Core	**Fixed-Function Performance Counter Register 1 (R/W)** See Table 2-2.
30BH	779	IA32_FIXED_CTR2	Core	**Fixed-Function Performance Counter Register 2 (R/W)** See Table 2-2.

Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors

Address		Register Name	Scope	Bit Description
Hex	Dec			
345H	837	IA32_PERF_CAPABILITIES	Core	See Table 2-2. See Section 17.4.1, "IA32_DEBUGCTL MSR."
38DH	909	IA32_FIXED_CTR_CTRL	Core	**Fixed-Function-Counter Control Register (R/W)** See Table 2-2.
38FH	911	IA32_PERF_GLOBAL_CTRL	Core	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
3FDH	1021	MSR_CORE_C6_RESIDENCY	Core	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		CORE C6 Residency Counter. (R/O) Value since last reset that this core is in processor-specific C6 states. Counts at the TSC Frequency.
400H	1024	IA32_MC0_CTL	Module	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MC0_STATUS	Module	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MC0_ADDR	Module	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	Module	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Module	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
408H	1032	IA32_MC2_CTL	Module	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Module	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR	Module	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	IA32_MC3_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC3_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40EH	1038	IA32_MC3_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	IA32_MC4_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC4_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."

Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors

Address		Register Name	Scope	Bit Description
Hex	Dec			
412H	1042	IA32_MC4_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
414H	1044	IA32_MC5_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
415H	1045	IA32_MC5_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
416H	1046	IA32_MC5_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
480H	1152	IA32_VMX_BASIC	Core	**Reporting Register of Basic VMX Capabilities (R/O)** See Table 2-2. See Appendix A.1, "Basic VMX Information."
481H	1153	IA32_VMX_PINBASED_CTLS	Core	**Capability Reporting Register of Pin-based VM-execution Controls (R/O)** See Table 2-2. See Appendix A.3, "VM-Execution Controls."
482H	1154	IA32_VMX_PROCBASED_CTLS	Core	**Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls."
483H	1155	IA32_VMX_EXIT_CTLS	Core	**Capability Reporting Register of VM-exit Controls (R/O)** See Table 2-2. See Appendix A.4, "VM-Exit Controls."
484H	1156	IA32_VMX_ENTRY_CTLS	Core	**Capability Reporting Register of VM-entry Controls (R/O)** See Table 2-2. See Appendix A.5, "VM-Entry Controls."
485H	1157	IA32_VMX_MISC	Core	**Reporting Register of Miscellaneous VMX Capabilities (R/O)** See Table 2-2. See Appendix A.6, "Miscellaneous Data."
486H	1158	IA32_VMX_CR0_FIXED0	Core	**Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)** See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."
487H	1159	IA32_VMX_CR0_FIXED1	Core	**Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)** See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."
488H	1160	IA32_VMX_CR4_FIXED0	Core	**Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)** See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."

Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors

Address		Register Name	Scope	Bit Description
Hex	Dec			
489H	1161	IA32_VMX_CR4_FIXED1	Core	**Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)** See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."
48AH	1162	IA32_VMX_VMCS_ENUM	Core	**Capability Reporting Register of VMCS Field Enumeration (R/O)** See Table 2-2. See Appendix A.9, "VMCS Enumeration."
48BH	1163	IA32_VMX_PROCBASED_CTLS2	Core	**Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls."
48CH	1164	IA32_VMX_EPT_VPID_ENUM	Core	**Capability Reporting Register of EPT and VPID (R/O)** See Table 2-2
48DH	1165	IA32_VMX_TRUE_PINBASED_CTLS	Core	**Capability Reporting Register of Pin-based VM-execution Flex Controls (R/O)** See Table 2-2
48EH	1166	IA32_VMX_TRUE_PROCBASED_CTLS	Core	**Capability Reporting Register of Primary Processor-based VM-execution Flex Controls (R/O)** See Table 2-2
48FH	1167	IA32_VMX_TRUE_EXIT_CTLS	Core	**Capability Reporting Register of VM-exit Flex Controls (R/O)** See Table 2-2
490H	1168	IA32_VMX_TRUE_ENTRY_CTLS	Core	**Capability Reporting Register of VM-entry Flex Controls (R/O)** See Table 2-2
491H	1169	IA32_VMX_FMFUNC	Core	**Capability Reporting Register of VM-function Controls (R/O)** See Table 2-2
4C1H	1217	IA32_A_PMC0	Core	See Table 2-2.
4C2H	1218	IA32_A_PMC1	Core	See Table 2-2.
600H	1536	IA32_DS_AREA	Core	**DS Save Area (R/W)** See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
660H	1632	MSR_CORE_C1_RESIDENCY	Core	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		CORE C1 Residency Counter. (R/O) Value since last reset that this core is in processor-specific C1 states. Counts at the TSC frequency.
6E0H	1760	IA32_TSC_DEADLINE	Core	**TSC Target of Local APIC's TSC Deadline Mode (R/W)** See Table 2-2
C000_0080H		IA32_EFER	Core	**Extended Feature Enables** See Table 2-2.
C000_0081H		IA32_STAR	Core	**System Call Target Address (R/W)** See Table 2-2.

Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors

Address		Register Name	Scope	Bit Description
Hex	Dec			
C000_0082H		IA32_LSTAR	Core	**IA-32e Mode System Call Target Address (R/W)** See Table 2-2.
C000_0084H		IA32_FMASK	Core	**System Call Flag Mask (R/W)** See Table 2-2.
C000_0100H		IA32_FS_BASE	Core	**Map of BASE Address of FS (R/W)** See Table 2-2.
C000_0101H		IA32_GS_BASE	Core	**Map of BASE Address of GS (R/W)** See Table 2-2.
C000_0102H		IA32_KERNEL_GS_BASE	Core	**Swap Target of BASE Address of GS (R/W)** See Table 2-2.
C000_0103H		IA32_TSC_AUX	Core	**AUXILIARY TSC Signature. (R/W)** See Table 2-2

Table 2-7 lists model-specific registers (MSRs) that are common to Intel® Atom™ processors based on the Silvermont and Airmont microarchitectures but not newer microarchitectures.

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
17H	23	MSR_PLATFORM_ID	Module	**Model Specific Platform ID (R)**
		7:0		Reserved.
		13:8		**Maximum Qualified Ratio (R)** The maximum allowed bus ratio.
		49:13		Reserved.
		52:50		**See** Table 2-2
		63:33		Reserved.
3AH	58	IA32_FEATURE_CONTROL	Core	**Control Features in Intel 64Processor (R/W)** See Table 2-2.
		0		**Lock (R/WL)**
		1		**Reserved**
		2		**Enable VMX outside SMX operation (R/WL)**
40H	64	MSR_LASTBRANCH_0_FROM_IP	Core	**Last Branch Record 0 From IP (R/W)** One of eight pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the **source instruction**. See also: ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 17.5 and record format in Section 17.4.8.1
41H	65	MSR_LASTBRANCH_1_FROM_IP	Core	**Last Branch Record 1 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
42H	66	MSR_ LASTBRANCH_2_FROM_IP	Core	**Last Branch Record 2 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
43H	67	MSR_ LASTBRANCH_3_FROM_IP	Core	**Last Branch Record 3 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
44H	68	MSR_ LASTBRANCH_4_FROM_IP	Core	**Last Branch Record 4 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
45H	69	MSR_ LASTBRANCH_5_FROM_IP	Core	**Last Branch Record 5 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
46H	70	MSR_ LASTBRANCH_6_FROM_IP	Core	**Last Branch Record 6 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
47H	71	MSR_ LASTBRANCH_7_FROM_IP	Core	**Last Branch Record 7 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
60H	96	MSR_ LASTBRANCH_0_TO_IP	Core	**Last Branch Record 0 To IP (R/W)** One of eight pairs of last branch record registers on the last branch record stack. The To_IP part of the stack contains pointers to the destination instruction.
61H	97	MSR_ LASTBRANCH_1_TO_IP	Core	**Last Branch Record 1 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
62H	98	MSR_ LASTBRANCH_2_TO_IP	Core	**Last Branch Record 2 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
63H	99	MSR_ LASTBRANCH_3_TO_IP	Core	**Last Branch Record 3 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
64H	100	MSR_ LASTBRANCH_4_TO_IP	Core	**Last Branch Record 4 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
65H	101	MSR_ LASTBRANCH_5_TO_IP	Core	**Last Branch Record 5 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
66H	102	MSR_ LASTBRANCH_6_TO_IP	Core	**Last Branch Record 6 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
67H	103	MSR_ LASTBRANCH_7_TO_IP	Core	**Last Branch Record 7 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
E2H	226	MSR_PKG_CST_CONFIG_ CONTROL	Module	**C-State Configuration Control (R/W)** Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		2:0		**Package C-State Limit (R/W)** Specifies the lowest processor-specific C-state code name (consuming the least power). for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0 (no package C-sate support) 001b: C1 (Behavior is the same as 000b) 100b: C4 110b: C6 111b: C7 (Silvermont only).
		9:3		Reserved.
		10		**I/O MWAIT Redirection Enable (R/W)** When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions
		14:11		Reserved.
		15		**CFG Lock (R/WO)** When set, lock bits 15:0 of this register until next reset.
		63:16		Reserved.
11EH	281	MSR_BBL_CR_CTL3	Module	Control register 3. Used to configure the L2 Cache.
		0		**L2 Hardware Enabled (RO)** 1 = If the L2 is hardware-enabled 0 = Indicates if the L2 is hardware-disabled
		7:1		Reserved.
		8		**L2 Enabled. (R/W)** 1 = L2 cache has been initialized 0 = Disabled (default) Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9		Reserved.
		23		**L2 Not Present (RO)** 0 = L2 Present 1 = L2 Not Present
		63:24		Reserved.
1A0H	416	IA32_MISC_ENABLE		**Enable Misc. Processor Features (R/W)** Allows a variety of processor functions to be enabled and disabled.
		0	Core	**Fast-Strings Enable** See Table 2-2.
		2:1		Reserved.
		3	Module	**Automatic Thermal Control Circuit Enable (R/W)** See Table 2-2. Default value is 0.

2.5 MSRS IN INTEL ATOM PROCESSORS BASED ON GOLDMONT MICROARCHITECTURE

Intel Atom processors based on the Goldmont microarchitecture support MSRs listed in Table 2-6 and Table 2-12. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_5CH; see Table 2-1.

In the Goldmont microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a pair of processor cores in the physical package. "Package" means all processor cores in the physical package share the same MSR or bit interface.

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture

1AEH	430	MSR_TURBO_GROUP_CORE CNT	Package	**Group Size of Active Cores for Turbo Mode Operation (RW)** **Writes of 0 threshold is ignored**
		7:0	Package	**Group 0 Core Count Threshold** Maximum number of active cores to operate under Group 0 Max Turbo Ratio limit.
		15:8	Package	**Group 1 Core Count Threshold** Maximum number of active cores to operate under Group 1 Max Turbo Ratio limit. Must be greater than Group 0 Core Count.
		23:16	Package	**Group 2 Core Count Threshold** Maximum number of active cores to operate under Group 2 Max Turbo Ratio limit. Must be greater than Group 1 Core Count.
		31:24	Package	**Group 3 Core Count Threshold** Maximum number of active cores to operate under Group 3 Max Turbo Ratio limit. Must be greater than Group 2 Core Count.
		39:32	Package	**Group 4 Core Count Threshold** Maximum number of active cores to operate under Group 4 Max Turbo Ratio limit. Must be greater than Group 3 Core Count.
		47:40	Package	**Group 5 Core Count Threshold** Maximum number of active cores to operate under Group 5 Max Turbo Ratio limit. Must be greater than Group 4 Core Count.
		55:48	Package	**Group 6 Core Count Threshold** Maximum number of active cores to operate under Group 6 Max Turbo Ratio limit. Must be greater than Group 5 Core Count.
		63:56	Package	**Group 7 Core Count Threshold** Maximum number of active cores to operate under Group 7 Max Turbo Ratio limit. Must be greater than Group 6 Core Count and not less than the total number of processor cores in the package. E.g. specify 255.
1C8H	456	MSR_LBR_SELECT	Core	**Last Branch Record Filtering Select Register (R/W)** See Section 17.9.2, "Filtering of Last Branch Records."

392H	914	IA32_PERF_GLOBAL_INUSE		See Table 2-2.
3F1H	1009	MSR_PEBS_ENABLE	Core	See Table 2-2. See Section 18.6.2.4, "Processor Event Based Sampling (PEBS)."
		0		Enable PEBS trigger and recording for the programmed event (precise or otherwise) on IA32_PMC0. (R/W)
3F8H	1016	MSR_PKG_C3_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		Package C3 Residency Counter. (R/O) Value since last reset that this package is in processor-specific C3 states. Count at the same frequency as the TSC.
3F9H	1017	MSR_PKG_C6_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		Package C6 Residency Counter. (R/O) Value since last reset that this package is in processor-specific C6 states. Count at the same frequency as the TSC.
3FCH	1020	MSR_CORE_C3_RESIDENCY	Core	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		CORE C3 Residency Counter. (R/O) Value since last reset that this core is in processor-specific C3 states. Count at the same frequency as the TSC.
406H	1030	IA32_MC1_ADDR	Module	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
418H	1048	IA32_MC6_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
419H	1049	IA32_MC6_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16.
41AH	1050	IA32_MC6_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)

Address		Register Name	Scope	Bit Description
Hex	Dec			
4C3H	1219	IA32_A_PMC2	Core	See Table 2-2.
4C4H	1220	IA32_A_PMC3	Core	See Table 2-2.
4E0H	1248	MSR_SMM_FEATURE_CONTROL	Package	**Enhanced SMM Feature Control (SMM-RW)** Reports SMM capability Enhancement. Accessible only while in SMM.
		0		**Lock (SMM-RWO)** When set to '1' locks this register from further changes
		1		Reserved
		2		**SMM_Code_Chk_En (SMM-RW)** This control bit is available only if MSR_SMM_MCA_CAP[58] == 1. When set to '0' (default) none of the logical processors are prevented from executing SMM code outside the ranges defined by the SMRR. When set to '1' any logical processor in the package that attempts to execute SMM code not within the ranges defined by the SMRR will assert an unrecoverable MCE.
		63:3		Reserved
4E2H	1250	MSR_SMM_DELAYED	Package	**SMM Delayed (SMM-RO)** Reports the interruptible state of all logical processors in the package. Available only while in SMM and MSR_SMM_MCA_CAP[LONG_FLOW_INDICATION] == 1.
		N-1:0		**LOG_PROC_STATE (SMM-RO)** Each bit represents a processor core of its state in a long flow of internal operation which delays servicing an interrupt. The corresponding bit will be set at the start of long events such as: Microcode Update Load, C6, WBINVD, Ratio Change, Throttle. The bit is automatically cleared at the end of each long event. The reset value of this field is 0. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.
		63:N		Reserved
4E3H	1251	MSR_SMM_BLOCKED	Package	**SMM Blocked (SMM-RO)** Reports the blocked state of all logical processors in the package. Available only while in SMM.
		N-1:0		**LOG_PROC_STATE (SMM-RO)** Each bit represents a processor core of its blocked state to service an SMI. The corresponding bit will be set if the logical processor is in one of the following states: Wait For SIPI or SENTER Sleep. The reset value of this field is 0FFFH. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.
		63:N		Reserved
500H	1280	IA32_SGX_SVN_STATUS	Core	**Status and SVN Threshold of SGX Support for ACM (RO).**
		0		**Lock.** See Section 41.11.3, "Interactions with Authenticated Code Modules (ACMs)"

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)

Address		Register Name	Scope	Bit Description

		63:49		Reserved, MBZ.
572H	1394	IA32_RTIT_CR3_MATCH	Core	**Trace Filter CR3 Match Register (R/W)**
		4:0		Reserved
		63:5		CR3[63:5] value to match
580H	1408	IA32_RTIT_ADDR0_A	Core	**Region 0 Start Address (R/W)**
		63:0		See Table 2-2.
581H	1409	IA32_RTIT_ADDR0_B	Core	**Region 0 End Address (R/W)**
		63:0		See Table 2-2.
582H	1410	IA32_RTIT_ADDR1_A	Core	**Region 1 Start Address (R/W)**
		63:0		See Table 2-2.
583H	1411	IA32_RTIT_ADDR1_B	Core	**Region 1 End Address (R/W)**
		63:0		See Table 2-2.
606H	1542	MSR_RAPL_POWER_UNIT	Package	**Unit Multipliers used in RAPL Interfaces (R/O)** See Section 14.9.1, "RAPL Interfaces."
		3:0		Power Units. Power related information (in Watts) is in unit of, 1W/2^PU; where PU is an unsigned integer represented by bits 3:0. Default value is 1000b, indicating power unit is in 3.9 milliWatts increment.
		7:4		Reserved
		12:8		Energy Status Units. Energy related information (in Joules) is in unit of, 1Joule/ (2^ESU); where ESU is an unsigned integer represented by bits 12:8. Default value is 01110b, indicating energy unit is in 61 microJoules.
		15:13		Reserved
		19:16		Time Unit. Time related information (in seconds) is in unit of, 1S/2^TU; where TU is an unsigned integer represented by bits 19:16. Default value is 1010b, indicating power unit is in 0.977 millisecond.
		63:20		Reserved
60AH	1546	MSR_PKGC3_IRTL	Package	**Package C3 Interrupt Response Limit (R/W)** Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		**Interrupt response time limit (R/W)** Specifies the limit that should be used to decide if the package should be put into a package C3 state.
		12:10		**Time Unit (R/W)** Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-19 for supported time unit encodings.
		14:13		Reserved.

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)

Address		Register Name	Scope	Bit Description
Hex	Dec			
		15		**Valid (R/W)** Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.
		63:16		Reserved.
60BH	1547	MSR_PKGC_IRTL1	Package	**Package C6/C7S Interrupt Response Limit 1 (R/W)** This MSR defines the interrupt response time limit used by the processor to manage transition to package C6 or C7S state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		**Interrupt response time limit (R/W)** Specifies the limit that should be used to decide if the package should be put into a package C6 or C7S state.
		12:10		**Time Unit (R/W)** Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-19 for supported time unit encodings
		14:13		Reserved.
		15		**Valid (R/W)** Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.
		63:16		Reserved.
60CH	1548	MSR_PKGC_IRTL2	Package	**Package C7 Interrupt Response Limit 2 (R/W)** This MSR defines the interrupt response time limit used by the processor to manage transition to package C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		**Interrupt response time limit (R/W)** Specifies the limit that should be used to decide if the package should be put into a package C7 state.
		12:10		**Time Unit (R/W)** Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-19 for supported time unit encodings
		14:13		Reserved.
		15		**Valid (R/W)** Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.
		63:16		Reserved.
60DH	1549	MSR_PKG_C2_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		**Package C2 Residency Counter. (R/O)** Value since last reset that this package is in processor-specific C2 states. Count at the same frequency as the TSC.

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)

Address		Register Name	Scope	Bit Description
Hex	Dec			
610H	1552	MSR_PKG_POWER_LIMIT	Package	**PKG RAPL Power Limit Control (R/W)** See Section 14.9.3, "Package RAPL Domain."
611H	1553	MSR_PKG_ENERGY_STATUS	Package	**PKG Energy Status (R/O)** See Section 14.9.3, "Package RAPL Domain."
613H	1555	MSR_PKG_PERF_STATUS	Package	**PKG Perf Status (R/O)** See Section 14.9.3, "Package RAPL Domain."
614H	1556	MSR_PKG_POWER_INFO	Package	**PKG RAPL Parameters (R/W)**
		14:0		**Thermal Spec Power (R/W)** See Section 14.9.3, "Package RAPL Domain."
		15		Reserved.
		30:16		**Minimum Power (R/W)** See Section 14.9.3, "Package RAPL Domain."
		31		Reserved.
		46:32		**Maximum Power (R/W)** See Section 14.9.3, "Package RAPL Domain."
		47		Reserved.
		54:48		**Maximum Time Window (R/W)** Specified by 2^Y * (1.0 + Z/4.0) * Time_Unit, where "Y" is the unsigned integer value represented. by bits 52:48, "Z" is an unsigned integer represented by bits 54:53. "Time_Unit" is specified by the "Time Units" field of MSR_RAPL_POWER_UNIT
		63:55		Reserved.
618H	1560	MSR_DRAM_POWER_LIMIT	Package	**DRAM RAPL Power Limit Control (R/W)** See Section 14.9.5, "DRAM RAPL Domain."
619H	1561	MSR_DRAM_ENERGY_ STATUS	Package	**DRAM Energy Status (R/O)** See Section 14.9.5, "DRAM RAPL Domain."
61BH	1563	MSR_DRAM_PERF_STATUS	Package	**DRAM Performance Throttling Status (R/O)** See Section 14.9.5, "DRAM RAPL Domain."
61CH	1564	MSR_DRAM_POWER_INFO	Package	**DRAM RAPL Parameters (R/W)** See Section 14.9.5, "DRAM RAPL Domain."
632H	1586	MSR_PKG_C10_RESIDENCY	Package	Note: C-state values are processor specific C-state code names,
		63:0		**Package C10 Residency Counter. (R/O)** Value since last reset that the entire SOC is in an S0i3 state. Count at the same frequency as the TSC.
639H	1593	MSR_PP0_ENERGY_STATU S	Package	**PP0 Energy Status (R/O)** See Section 14.9.4, "PP0/PP1 RAPL Domains."
641H	1601	MSR_PP1_ENERGY_STATU S	Package	**PP1 Energy Status (R/O)** See Section 14.9.4, "PP0/PP1 RAPL Domains."
64CH	1612	MSR_TURBO_ACTIVATION_ RATIO	Package	**ConfigTDP Control (R/W)**

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)

Address		Register Name	Scope	Bit Description
Hex	Dec			
		7:0		**MAX_NON_TURBO_RATIO (RW/L)** System BIOS can program this field.
		30:8		Reserved.
		31		**TURBO_ACTIVATION_RATIO_Lock (RW/L)** When this bit is set, the content of this register is locked until a reset.
		63:32		Reserved.
64FH	1615	MSR_CORE_PERF_LIMIT_REASONS	Package	**Indicator of Frequency Clipping in Processor Cores (R/W)** **(frequency refers to processor core frequency)**
		0		**PROCHOT Status (R0)** When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.
		1		**Thermal Status (R0)** When set, frequency is reduced below the operating system request due to a thermal event.
		2		**Package-Level Power Limiting PL1 Status (R0)** When set, frequency is reduced below the operating system request due to package-level power limiting PL1.
		3		**Package-Level PL2 Power Limiting Status (R0)** When set, frequency is reduced below the operating system request due to package-level power limiting PL2.
		8:4		Reserved.
		9		**Core Power Limiting Status (R0)** When set, frequency is reduced below the operating system request due to domain-level power limiting.
		10		**VR Therm Alert Status (R0)** When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.
		11		**Max Turbo Limit Status (R0)** When set, frequency is reduced below the operating system request due to multi-core turbo limits.
		12		**Electrical Design Point Status (R0)** When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g. maximum electrical current consumption).
		13		**Turbo Transition Attenuation Status (R0)** When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.
		14		**Maximum Efficiency Frequency Status (R0)** When set, frequency is reduced below the maximum efficiency frequency.
		15		**Reserved**

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)

Address		Register Name	Scope	Bit Description
Hex	Dec			
		16		**PROCHOT Log** When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		17		**Thermal Log** When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		18		**Package-Level PL1 Power Limiting Log** When set, indicates that the Package Level PL1 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		19		**Package-Level PL2 Power Limiting Log** When set, indicates that the Package Level PL2 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		24:20		Reserved.
		25		**Core Power Limiting Log** When set, indicates that the Core Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		26		**VR Therm Alert Log** When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		27		**Max Turbo Limit Log** When set, indicates that the Max Turbo Limit Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		28		**Electrical Design Point Log** When set, indicates that the EDP Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		29		**Turbo Transition Attenuation Log** When set, indicates that the Turbo Transition Attenuation Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		30		**Maximum Efficiency Frequency Log** When set, indicates that the Maximum Efficiency Frequency Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		63:31		Reserved.

680H	1664	MSR_ LASTBRANCH_0_FROM_IP	Core	**Last Branch Record 0 From IP (R/W)** One of 32 pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the **source instruction** . See also: ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 17.6 and record format in Section 17.4.8.1
		0:47		**From Linear Address (R/W)**
		62:48		Signed extension of bits 47:0.
		63		Mispred
681H	1665	MSR_ LASTBRANCH_1_FROM_IP	Core	**Last Branch Record 1 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
682H	1666	MSR_ LASTBRANCH_2_FROM_IP	Core	**Last Branch Record 2 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
683H	1667	MSR_ LASTBRANCH_3_FROM_IP	Core	**Last Branch Record 3 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
684H	1668	MSR_ LASTBRANCH_4_FROM_IP	Core	**Last Branch Record 4 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
685H	1669	MSR_ LASTBRANCH_5_FROM_IP	Core	**Last Branch Record 5 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
686H	1670	MSR_ LASTBRANCH_6_FROM_IP	Core	**Last Branch Record 6 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
687H	1671	MSR_ LASTBRANCH_7_FROM_IP	Core	**Last Branch Record 7 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
688H	1672	MSR_ LASTBRANCH_8_FROM_IP	Core	**Last Branch Record 8 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
689H	1673	MSR_ LASTBRANCH_9_FROM_IP	Core	**Last Branch Record 9 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68AH	1674	MSR_ LASTBRANCH_10_FROM_IP	Core	**Last Branch Record 10 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68BH	1675	MSR_ LASTBRANCH_11_FROM_IP	Core	**Last Branch Record 11 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68CH	1676	MSR_ LASTBRANCH_12_FROM_IP	Core	**Last Branch Record 12 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68DH	1677	MSR_ LASTBRANCH_13_FROM_IP	Core	**Last Branch Record 13 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68EH	1678	MSR_ LASTBRANCH_14_FROM_IP	Core	**Last Branch Record 14 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68FH	1679	MSR_ LASTBRANCH_15_FROM_IP	Core	**Last Branch Record 15 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
690H	1680	MSR_ LASTBRANCH_16_FROM_IP	Core	**Last Branch Record 16 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)

Address		Register Name	Scope	Bit Description
Hex	Dec			
691H	1681	MSR_ LASTBRANCH_17_FROM_IP	Core	**Last Branch Record 17 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
692H	1682	MSR_ LASTBRANCH_18_FROM_IP	Core	**Last Branch Record 18 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
693H	1683	MSR_ LASTBRANCH_19_FROM_IP	Core	**Last Branch Record 19From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
694H	1684	MSR_ LASTBRANCH_20_FROM_IP	Core	**Last Branch Record 20 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
695H	1685	MSR_ LASTBRANCH_21_FROM_IP	Core	**Last Branch Record 21 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
696H	1686	MSR_ LASTBRANCH_22_FROM_IP	Core	**Last Branch Record 22 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
697H	1687	MSR_ LASTBRANCH_23_FROM_IP	Core	**Last Branch Record 23 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
698H	1688	MSR_ LASTBRANCH_24_FROM_IP	Core	**Last Branch Record 24 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
699H	1689	MSR_ LASTBRANCH_25_FROM_IP	Core	**Last Branch Record 25 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
69AH	1690	MSR_ LASTBRANCH_26_FROM_IP	Core	**Last Branch Record 26 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
69BH	1691	MSR_ LASTBRANCH_27_FROM_IP	Core	**Last Branch Record 27 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
69CH	1692	MSR_ LASTBRANCH_28_FROM_IP	Core	**Last Branch Record 28 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
69DH	1693	MSR_ LASTBRANCH_29_FROM_IP	Core	**Last Branch Record 29 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
69EH	1694	MSR_ LASTBRANCH_30_FROM_IP	Core	**Last Branch Record 30 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
69FH	1695	MSR_ LASTBRANCH_31_FROM_IP	Core	**Last Branch Record 31 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
6C0H	1728	MSR_ LASTBRANCH_0_TO_IP	Core	**Last Branch Record 0 To IP (R/W)** One of 32 pairs of last branch record registers on the last branch record stack. The To_IP part of the stack contains pointers to the **Destination instruction** and elapsed cycles from last LBR update. See also: ▪ Section 17.6
		0:47		**Target Linear Address (R/W)**
		63:48		Elapsed cycles from last update to the LBR.
6C1H	1729	MSR_ LASTBRANCH_1_TO_IP	Core	**Last Branch Record 1 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.

		0:7		**CBM: Bit vector of available L2 ways for COS 0 enforcement**
		63:8		**Reserved**
D13H	3347	IA32_L2_QOS_MASK_3	Package	**L2 Class Of Service Mask - COS 3 (R/W).** if CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=3
		0:19		**CBM: Bit vector of available L2 ways for COS 3 enforcement**
		63:20		**Reserved**
D90H	3472	IA32_BNDCFGS	Core	See Table 2-2.
DA0H	3488	IA32_XSS	Core	See Table 2-2.
See Table 2-6, and Table 2-12 for MSR definitions applicable to processors with CPUID signature 06_5CH.				

2.6 MSRS IN INTEL ATOM PROCESSORS BASED ON GOLDMONT PLUS MICROARCHITECTURE

Intel Atom processors based on the Goldmont Plus microarchitecture support MSRs listed in Table 2-6, Table 2-12 and Table 2-13. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_7AH; see Table 2-1. For an MSR listed in Table 2-13 that also appears in the model-specific tables of prior generations, Table 2-13 supercede prior generation tables.

In the Goldmont Plus microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a pair of processor cores in the physical package. "Package" means all processor cores in the physical package share the same MSR or bit interface.

Table 2-13. MSRs in Intel Atom Processors Based on the Goldmont Plus Microarchitecture

Address		Register Name	Scope	Bit Description
Hex	Dec			
3AH	58	IA32_FEATURE_CONTROL	Core	**Control Features in Intel 64Processor (R/W)** See Table 2-2.
		0		**Lock (R/WL)**
		1		**Enable VMX inside SMX operation (R/WL)**
		2		**Enable VMX outside SMX operation (R/WL)**
		14:8		**SENTER local functions enables (R/WL)**
		15		**SENTER global functions enable (R/WL)**
		17		**SGX Launch Control Enable (R/WL)** This bit must be set to enable runtime reconfiguration of SGX Launch Control via IA32_SGXLEPUBKEYHASHn MSR. Valid if CPUID.(EAX=07H, ECX=0H): ECX[30] = 1.
		18		**SGX global functions enable (R/WL)**
		63:19		Reserved.

Table 2-13. MSRs in Intel Atom Processors Based on the Goldmont Plus Microarchitecture (Contd.)

Address		Register Name	Scope	Bit Description
Hex	Dec			
8CH	140	IA32_SGXLEPUBKEYHASH0	Core	See Table 2-2.
8DH	141	IA32_SGXLEPUBKEYHASH1	Core	See Table 2-2.

See Table 2-6, Table 2-12 and Table 2-13 for MSR definitions applicable to processors with CPUID signature 06_7AH.				

2.7 MSRS IN THE INTEL® MICROARCHITECTURE CODE NAME NEHALEM

Table 2-14 lists model-specific registers (MSRs) that are common for Intel® microarchitecture code name Nehalem. These include Intel Core i7 and i5 processor family. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_1AH, 06_1EH, 06_1FH, 06_2EH, see Table 2-1. Additional MSRs specific to 06_1AH, 06_1EH, 06_1FH are listed in Table 2-15. Some MSRs listed in these tables are used by BIOS. More information about these MSR can be found at http://biosbits.org.

The column "Scope" represents the package/core/thread scope of individual bit field of an MSR. "Thread" means this bit field must be programmed on each logical processor independently. "Core" means the bit field must be programmed on each processor core independently, logical processors in the same core will be affected by change of this bit on the other logical processor in the same core. "Package" means the bit field must be programmed once for each physical package. Change of a bit filed with a package scope will affect all logical processors in that physical package.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Thread	See Section 2.22, "MSRs in Pentium Processors."
1H	1	IA32_P5_MC_TYPE	Thread	See Section 2.22, "MSRs in Pentium Processors."
6H	6	IA32_MONITOR_FILTER_SIZE	Thread	See Section 8.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.
10H	16	IA32_TIME_STAMP_COUNTER	Thread	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Package	**Platform ID (R)** See Table 2-2.
17H	23	MSR_PLATFORM_ID	Package	**Model Specific Platform ID (R)**
		49:0		Reserved.
		52:50		See Table 2-2.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		63:53		Reserved.
1BH	27	IA32_APIC_BASE	Thread	See Section 10.4.4, "Local APIC Status and Location," and Table 2-2.
34H	52	MSR_SMI_COUNT	Thread	**SMI Counter (R/O)**
		31:0		**SMI Count (R/O)** Running count of SMI events since last RESET.
		63:32		Reserved.
3AH	58	IA32_FEATURE_CONTROL	Thread	**Control Features in Intel 64Processor (R/W)** See Table 2-2.
79H	121	IA32_BIOS_ UPDT_TRIG	Core	**BIOS Update Trigger Register (W)** See Table 2-2.
8BH	139	IA32_BIOS_ SIGN_ID	Thread	**BIOS Update Signature ID (RO)** See Table 2-2.
C1H	193	IA32_PMC0	Thread	**Performance Counter Register** See Table 2-2.
C2H	194	IA32_PMC1	Thread	**Performance Counter Register** See Table 2-2.
C3H	195	IA32_PMC2	Thread	**Performance Counter Register** See Table 2-2.
C4H	196	IA32_PMC3	Thread	**Performance Counter Register** See Table 2-2.
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information; contains power management and other model specific features enumeration. See http://biosbits.org.
		7:0		Reserved.
		15:8	Package	**Maximum Non-Turbo Ratio (R/O)** The is the ratio of the frequency that invariant TSC runs at. The invariant TSC frequency can be computed by multiplying this ratio by 133.33 MHz.
		27:16		Reserved.
		28	Package	**Programmable Ratio Limit for Turbo Mode (R/O)** When set to 1, indicates that Programmable Ratio Limits for Turbo mode is enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo mode is disabled.
		29	Package	**Programmable TDC-TDP Limit for Turbo Mode (R/O)** When set to 1, indicates that TDC/TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDC and TDP Limits for Turbo mode are not programmable.
		39:30		Reserved.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		47:40	Package	**Maximum Efficiency Ratio (R/O)** The is the minimum ratio (maximum efficiency) that the processor can operates, in units of 133.33MHz.
		63:48		Reserved.
E2H	226	MSR_PKG_CST_CONFIG_ CONTROL	Core	**C-State Configuration Control (R/W)** Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.
		2:0		**Package C-State Limit (R/W)** Specifies the lowest processor-specific C-state code name (consuming the least power). for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0 (no package C-sate support) 001b: C1 (Behavior is the same as 000b) 010b: C3 011b: C6 100b: C7 101b and 110b: Reserved 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.
		9:3		Reserved.
		10		**I/O MWAIT Redirection Enable (R/W)** When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.
		14:11		Reserved.
		15		**CFG Lock (R/WO)** When set, lock bits 15:0 of this register until next reset.
		23:16		Reserved.
		24		**Interrupt filtering enable (R/W)** When set, processor cores in a deep C-State will wake only when the event message is destined for that core. When 0, all processor cores in a deep C-State will wake for an event message.
		25		**C3 state auto demotion enable (R/W)** When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.
		26		**C1 state auto demotion enable (R/W)** When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.
		27		**Enable C3 Undemotion (R/W)**
		28		**Enable C1 Undemotion (R/W)**

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		29		**Package C State Demotion Enable (R/W)**
		30		**Package C State UnDemotion Enable (R/W)**
		63:31		Reserved.
E4H	228	MSR_PMG_IO_CAPTURE_BASE	Core	**Power Management IO Redirection in C-state (R/W)** See http://biosbits.org.
		15:0		**LVL_2 Base Address (R/W)** Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.
		18:16		**C-state Range (R/W)** Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 000b - C3 is the max C-State to include 001b - C6 is the max C-State to include 010b - C7 is the max C-State to include
		63:19		Reserved.
E7H	231	IA32_MPERF	Thread	**Maximum Performance Frequency Clock Count (RW)** See Table 2-2.
E8H	232	IA32_APERF	Thread	**Actual Performance Frequency Clock Count (RW)** See Table 2-2.
FEH	254	IA32_MTRRCAP	Thread	See Table 2-2.
174H	372	IA32_SYSENTER_CS	Thread	See Table 2-2.
175H	373	IA32_SYSENTER_ESP	Thread	See Table 2-2.
176H	374	IA32_SYSENTER_EIP	Thread	See Table 2-2.
179H	377	IA32_MCG_CAP	Thread	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Thread	Global Machine Check Status
		0		**RIPV** When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.
		1		**EIPV** When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		2		**MCIP** When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved.
186H	390	IA32_PERFEVTSEL0	Thread	See Table 2-2.
		7:0		**Event Select**
		15:8		**UMask**

		63:32		Reserved.
187H	391	IA32_PERFEVTSEL1	Thread	See Table 2-2.
188H	392	IA32_PERFEVTSEL2	Thread	See Table 2-2.
189H	393	IA32_PERFEVTSEL3	Thread	See Table 2-2.
198H	408	IA32_PERF_STATUS	Core	See Table 2-2.
		15:0		Current Performance State Value.
		63:16		Reserved.
199H	409	IA32_PERF_CTL	Thread	See Table 2-2.
19AH	410	IA32_CLOCK_MODULATION	Thread	**Clock Modulation (R/W)** See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.
		0		Reserved.
		3:1		**On demand Clock Modulation Duty Cycle (R/W)**
		4		**On demand Clock Modulation Enable (R/W)**
		63:5		Reserved.
19BH	411	IA32_THERM_INTERRUPT	Core	**Thermal Interrupt Control (R/W)** See Table 2-2.
19CH	412	IA32_THERM_STATUS	Core	**Thermal Monitor Status (R/W)** See Table 2-2.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
1A0H	416	IA32_MISC_ENABLE		**Enable Misc. Processor Features (R/W)** Allows a variety of processor functions to be enabled and disabled.
		0	Thread	**Fast-Strings Enable** See Table 2-2.
		2:1		Reserved.
		3	Thread	**Automatic Thermal Control Circuit Enable (R/W)** See Table 2-2. Default value is 1.
		6:4		Reserved.
		7	Thread	**Performance Monitoring Available (R)** See Table 2-2.
		10:8		Reserved.
		11	Thread	**Branch Trace Storage Unavailable (RO)** See Table 2-2.
		12	Thread	**Processor Event Based Sampling Unavailable (RO)** See Table 2-2.
		15:13		Reserved.
		16	Package	**Enhanced Intel SpeedStep Technology Enable (R/W)** See Table 2-2.
		18	Thread	ENABLE MONITOR FSM. (R/W) See Table 2-2.
		21:19		Reserved.
		22	Thread	**Limit CPUID Maxval (R/W)** See Table 2-2.
		23	Thread	**xTPR Message Disable (R/W)** See Table 2-2.
		33:24		Reserved.
		34	Thread	**XD Bit Disable (R/W)** See Table 2-2.
		37:35		Reserved.
		38	Package	**Turbo Mode Disable (R/W)** When set to 1 on processors that support Intel Turbo Boost Technology, the turbo mode feature is disabled and the IDA_Enable feature flag will be clear (CPUID.06H: EAX[1]=0). When set to a 0 on processors that support IDA, CPUID.06H: EAX[1] reports the processor's support of turbo mode is enabled. **Note:** the power-on default value is used by BIOS to detect hardware support of turbo mode. If power-on default value is 1, turbo mode is available in the processor. If power-on default value is 0, turbo mode is not available.
		63:39		Reserved.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
1A2H	418	MSR_ TEMPERATURE_TARGET	Thread	Temperature Target
		15:0		Reserved.
		23:16		**Temperature Target (R)** The minimum temperature at which PROCHOT# will be asserted. The value is degree C.
		63:24		Reserved.
1A4H	420	MSR_MISC_FEATURE_ CONTROL		**Miscellaneous Feature Control (R/W)**
		0	Core	**L2 Hardware Prefetcher Disable (R/W)** If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.
		1	Core	**L2 Adjacent Cache Line Prefetcher Disable (R/W)** If 1, disables the adjacent cache line prefetcher, which fetches the cache line that comprises a cache line pair (128 bytes).
		2	Core	**DCU Hardware Prefetcher Disable (R/W)** If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.
		3	Core	**DCU IP Prefetcher Disable (R/W)** If 1, disables the L1 data cache IP prefetcher, which uses sequential load history (based on instruction Pointer of previous loads) to determine whether to prefetch additional lines.
		63:4		Reserved.
1A6H	422	MSR_OFFCORE_RSP_0	Thread	**Offcore Response Event Select Register (R/W)**
1AAH	426	MSR_MISC_PWR_MGMT		Miscellaneous Power Management Control; Various model specific features enumeration. See http://biosbits.org.
		0	Package	**EIST Hardware Coordination Disable (R/W)** When 0, enables hardware coordination of Enhanced Intel Speedstep Technology request from processor cores; When 1, disables hardware coordination of Enhanced Intel Speedstep Technology requests.
		1	Thread	**Energy/Performance Bias Enable (R/W)** This bit makes the IA32_ENERGY_PERF_BIAS register (MSR 1B0h) visible to software with Ring 0 privileges. This bit's status (1 or 0) is also reflected by CPUID.(EAX=06h):ECX[3].
		63:2		Reserved.
1ACH	428	MSR_TURBO_POWER_ CURRENT_LIMIT		See http://biosbits.org.
		14:0	Package	**TDP Limit (R/W)** TDP limit in 1/8 Watt granularity.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		15	Package	**TDP Limit Override Enable (R/W)** A value = 0 indicates override is not active, and a value = 1 indicates active.
		30:16	Package	**TDC Limit (R/W)** TDC limit in 1/8 Amp granularity.
		31	Package	**TDC Limit Override Enable (R/W)** A value = 0 indicates override is not active, and a value = 1 indicates active.
		63:32		Reserved.
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	**Maximum Ratio Limit of Turbo Mode** **RO** if MSR_PLATFORM_INFO.[28] = 0, **RW** if MSR_PLATFORM_INFO.[28] = 1
		7:0	Package	**Maximum Ratio Limit for 1C** Maximum turbo ratio limit of 1 core active.
		15:8	Package	**Maximum Ratio Limit for 2C** Maximum turbo ratio limit of 2 core active.
		23:16	Package	**Maximum Ratio Limit for 3C** Maximum turbo ratio limit of 3 core active.
		31:24	Package	**Maximum Ratio Limit for 4C** Maximum turbo ratio limit of 4 core active.
		63:32		Reserved.

26BH	619	IA32_MTRR_FIX4K_D8000	Thread	See Table 2-2.
26CH	620	IA32_MTRR_FIX4K_E0000	Thread	See Table 2-2.
26DH	621	IA32_MTRR_FIX4K_E8000	Thread	See Table 2-2.
26EH	622	IA32_MTRR_FIX4K_F0000	Thread	See Table 2-2.
26FH	623	IA32_MTRR_FIX4K_F8000	Thread	See Table 2-2.
277H	631	IA32_PAT	Thread	See Table 2-2.
280H	640	IA32_MC0_CTL2	Package	See Table 2-2.
281H	641	IA32_MC1_CTL2	Package	See Table 2-2.
282H	642	IA32_MC2_CTL2	Core	See Table 2-2.
283H	643	IA32_MC3_CTL2	Core	See Table 2-2.
284H	644	IA32_MC4_CTL2	Core	See Table 2-2.
285H	645	IA32_MC5_CTL2	Core	See Table 2-2.
286H	646	IA32_MC6_CTL2	Package	See Table 2-2.
287H	647	IA32_MC7_CTL2	Package	See Table 2-2.
288H	648	IA32_MC8_CTL2	Package	See Table 2-2.
2FFH	767	IA32_MTRR_DEF_TYPE	Thread	**Default Memory Types (R/W)** See Table 2-2.
309H	777	IA32_FIXED_CTR0	Thread	**Fixed-Function Performance Counter Register 0 (R/W)** See Table 2-2.
30AH	778	IA32_FIXED_CTR1	Thread	**Fixed-Function Performance Counter Register 1 (R/W)** See Table 2-2.
30BH	779	IA32_FIXED_CTR2	Thread	**Fixed-Function Performance Counter Register 2 (R/W)** See Table 2-2.
345H	837	IA32_PERF_CAPABILITIES	Thread	See Table 2-2. See Section 17.4.1, "IA32_DEBUGCTL MSR."
		5:0		LBR Format. See Table 2-2.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		6		PEBS Record Format.
		7		PEBSSaveArchRegs. See Table 2-2.
		11:8		PEBS_REC_FORMAT. See Table 2-2.
		12		SMM_FREEZE. See Table 2-2.
		63:13		Reserved.
38DH	909	IA32_FIXED_CTR_CTRL	Thread	**Fixed-Function-Counter Control Register (R/W)** See Table 2-2.
38EH	910	IA32_PERF_GLOBAL_ STATUS	Thread	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
38EH	910	MSR_PERF_GLOBAL_STATUS	Thread	Provides single-bit status used by software to query the overflow condition of each performance counter. (RO)
		61		**UNC_Ovf** Uncore overflowed if 1.
38FH	911	IA32_PERF_GLOBAL_CTRL	Thread	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
390H	912	IA32_PERF_GLOBAL_OVF_ CTRL	Thread	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities." Allows software to clear counter overflow conditions on any combination of fixed-function PMCs (MSR_PERF_FIXED_CTRx) or general-purpose PMCs via a single WRMSR.
390H	912	MSR_PERF_GLOBAL_OVF_ CTRL	Thread	**(R/W)**
		61		**CLR_UNC_Ovf** Set 1 to clear UNC_Ovf.
3F1H	1009	MSR_PEBS_ENABLE	Thread	See Section 18.3.1.1.1, "Processor Event Based Sampling (PEBS)."
		0		Enable PEBS on IA32_PMC0. (R/W)
		1		Enable PEBS on IA32_PMC1. (R/W)
		2		Enable PEBS on IA32_PMC2. (R/W)
		3		Enable PEBS on IA32_PMC3. (R/W)
		31:4		Reserved.
		32		Enable Load Latency on IA32_PMC0. (R/W)
		33		Enable Load Latency on IA32_PMC1. (R/W)
		34		Enable Load Latency on IA32_PMC2. (R/W)
		35		Enable Load Latency on IA32_PMC3. (R/W)
		63:36		Reserved.
3F6H	1014	MSR_PEBS_LD_LAT	Thread	See Section 18.3.1.1.2, "Load Latency Performance Monitoring Facility."
		15:0		Minimum threshold latency value of tagged load operation that will be counted. (R/W)
		63:36		Reserved.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
3F8H	1016	MSR_PKG_C3_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		Package C3 Residency Counter. (R/O) Value since last reset that this package is in processor-specific C3 states. Count at the same frequency as the TSC.
3F9H	1017	MSR_PKG_C6_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		Package C6 Residency Counter. (R/O) Value since last reset that this package is in processor-specific C6 states. Count at the same frequency as the TSC.
3FAH	1018	MSR_PKG_C7_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		Package C7 Residency Counter. (R/O) Value since last reset that this package is in processor-specific C7 states. Count at the same frequency as the TSC.
3FCH	1020	MSR_CORE_C3_RESIDENCY	Core	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		CORE C3 Residency Counter. (R/O) Value since last reset that this core is in processor-specific C3 states. Count at the same frequency as the TSC.
3FDH	1021	MSR_CORE_C6_RESIDENCY	Core	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		CORE C6 Residency Counter. (R/O) Value since last reset that this core is in processor-specific C6 states. Count at the same frequency as the TSC.
400H	1024	IA32_MC0_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MC0_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MC0_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
403H	1027	IA32_MC0_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
404H	1028	IA32_MC1_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
406H	1030	IA32_MC1_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
407H	1031	IA32_MC1_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
408H	1032	IA32_MC2_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40BH	1035	IA32_MC2_MISC	Core	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
40CH	1036	IA32_MC3_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC3_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40EH	1038	IA32_MC3_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40FH	1039	IA32_MC3_MISC	Core	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
410H	1040	IA32_MC4_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC4_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
412H	1042	IA32_MC4_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	IA32_MC4_MISC	Core	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
414H	1044	IA32_MC5_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
415H	1045	IA32_MC5_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
416H	1046	IA32_MC5_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
417H	1047	IA32_MC5_MISC	Core	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
418H	1048	IA32_MC6_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
419H	1049	IA32_MC6_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16.
41AH	1050	IA32_MC6_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description

41BH	1051	IA32_MC6_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
41CH	1052	IA32_MC7_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
41DH	1053	IA32_MC7_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16.
41EH	1054	IA32_MC7_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
41FH	1055	IA32_MC7_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
420H	1056	IA32_MC8_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
421H	1057	IA32_MC8_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16.
422H	1058	IA32_MC8_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
423H	1059	IA32_MC8_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
480H	1152	IA32_VMX_BASIC	Thread	**Reporting Register of Basic VMX Capabilities (R/O)** See Table 2-2. See Appendix A.1, "Basic VMX Information."
481H	1153	IA32_VMX_PINBASED_CTLS	Thread	**Capability Reporting Register of Pin-based VM-execution Controls (R/O)** See Table 2-2. See Appendix A.3, "VM-Execution Controls."
482H	1154	IA32_VMX_PROCBASED_CTLS	Thread	**Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls."
483H	1155	IA32_VMX_EXIT_CTLS	Thread	**Capability Reporting Register of VM-exit Controls (R/O)** See Table 2-2. See Appendix A.4, "VM-Exit Controls."
484H	1156	IA32_VMX_ENTRY_CTLS	Thread	**Capability Reporting Register of VM-entry Controls (R/O)** See Table 2-2. See Appendix A.5, "VM-Entry Controls."
485H	1157	IA32_VMX_MISC	Thread	**Reporting Register of Miscellaneous VMX Capabilities (R/O)** See Table 2-2. See Appendix A.6, "Miscellaneous Data."
486H	1158	IA32_VMX_CR0_FIXED0	Thread	**Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)** See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."
487H	1159	IA32_VMX_CR0_FIXED1	Thread	**Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)** See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."
488H	1160	IA32_VMX_CR4_FIXED0	Thread	**Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)** See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
489H	1161	IA32_VMX_CR4_FIXED1	Thread	**Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)** See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."
48AH	1162	IA32_VMX_VMCS_ENUM	Thread	**Capability Reporting Register of VMCS Field Enumeration (R/O).** See Table 2-2. See Appendix A.9, "VMCS Enumeration."
48BH	1163	IA32_VMX_PROCBASED_CTLS2	Thread	**Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls."
600H	1536	IA32_DS_AREA	Thread	**DS Save Area (R/W)** See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
680H	1664	MSR_LASTBRANCH_0_FROM_IP	Thread	**Last Branch Record 0 From IP (R/W)** One of sixteen pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the **source instruction**. See also: ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 17.9.1 and record format in Section 17.4.8.1
681H	1665	MSR_LASTBRANCH_1_FROM_IP	Thread	**Last Branch Record 1 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
682H	1666	MSR_LASTBRANCH_2_FROM_IP	Thread	**Last Branch Record 2 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
683H	1667	MSR_LASTBRANCH_3_FROM_IP	Thread	**Last Branch Record 3 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
684H	1668	MSR_LASTBRANCH_4_FROM_IP	Thread	**Last Branch Record 4 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
685H	1669	MSR_LASTBRANCH_5_FROM_IP	Thread	**Last Branch Record 5 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
686H	1670	MSR_LASTBRANCH_6_FROM_IP	Thread	**Last Branch Record 6 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
687H	1671	MSR_LASTBRANCH_7_FROM_IP	Thread	**Last Branch Record 7 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
688H	1672	MSR_LASTBRANCH_8_FROM_IP	Thread	**Last Branch Record 8 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
689H	1673	MSR_LASTBRANCH_9_FROM_IP	Thread	**Last Branch Record 9 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68AH	1674	MSR_LASTBRANCH_10_FROM_IP	Thread	**Last Branch Record 10 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
68BH	1675	MSR_ LASTBRANCH_11_FROM_IP	Thread	**Last Branch Record 11 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68CH	1676	MSR_ LASTBRANCH_12_FROM_IP	Thread	**Last Branch Record 12 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68DH	1677	MSR_ LASTBRANCH_13_FROM_IP	Thread	**Last Branch Record 13 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68EH	1678	MSR_ LASTBRANCH_14_FROM_IP	Thread	**Last Branch Record 14 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68FH	1679	MSR_ LASTBRANCH_15_FROM_IP	Thread	**Last Branch Record 15 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
6C0H	1728	MSR_ LASTBRANCH_0_TO_IP	Thread	**Last Branch Record 0 To IP (R/W)** One of sixteen pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the destination instruction.
6C1H	1729	MSR_ LASTBRANCH_1_TO_IP	Thread	**Last Branch Record 1 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6C2H	1730	MSR_ LASTBRANCH_2_TO_IP	Thread	**Last Branch Record 2 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6C3H	1731	MSR_ LASTBRANCH_3_TO_IP	Thread	**Last Branch Record 3 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6C4H	1732	MSR_ LASTBRANCH_4_TO_IP	Thread	**Last Branch Record 4 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6C5H	1733	MSR_ LASTBRANCH_5_TO_IP	Thread	**Last Branch Record 5 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6C6H	1734	MSR_ LASTBRANCH_6_TO_IP	Thread	**Last Branch Record 6 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6C7H	1735	MSR_ LASTBRANCH_7_TO_IP	Thread	**Last Branch Record 7 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6C8H	1736	MSR_ LASTBRANCH_8_TO_IP	Thread	**Last Branch Record 8 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6C9H	1737	MSR_ LASTBRANCH_9_TO_IP	Thread	**Last Branch Record 9 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6CAH	1738	MSR_ LASTBRANCH_10_TO_IP	Thread	**Last Branch Record 10 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6CBH	1739	MSR_ LASTBRANCH_11_TO_IP	Thread	**Last Branch Record 11 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6CCH	1740	MSR_ LASTBRANCH_12_TO_IP	Thread	**Last Branch Record 12 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
6CDH	1741	MSR_ LASTBRANCH_13_TO_IP	Thread	**Last Branch Record 13 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6CEH	1742	MSR_ LASTBRANCH_14_TO_IP	Thread	**Last Branch Record 14 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6CFH	1743	MSR_ LASTBRANCH_15_TO_IP	Thread	**Last Branch Record 15 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
802H	2050	IA32_X2APIC_APICID	Thread	x2APIC ID register (R/O) See x2APIC Specification.
803H	2051	IA32_X2APIC_VERSION	Thread	x2APIC Version register (R/O)
808H	2056	IA32_X2APIC_TPR	Thread	x2APIC Task Priority register (R/W)
80AH	2058	IA32_X2APIC_PPR	Thread	x2APIC Processor Priority register (R/O)
80BH	2059	IA32_X2APIC_EOI	Thread	x2APIC EOI register (W/O)
80DH	2061	IA32_X2APIC_LDR	Thread	x2APIC Logical Destination register (R/O)
80FH	2063	IA32_X2APIC_SIVR	Thread	x2APIC Spurious Interrupt Vector register (R/W)
810H	2064	IA32_X2APIC_ISR0	Thread	x2APIC In-Service register bits [31:0] (R/O)
811H	2065	IA32_X2APIC_ISR1	Thread	x2APIC In-Service register bits [63:32] (R/O)
812H	2066	IA32_X2APIC_ISR2	Thread	x2APIC In-Service register bits [95:64] (R/O)
813H	2067	IA32_X2APIC_ISR3	Thread	x2APIC In-Service register bits [127:96] (R/O)
814H	2068	IA32_X2APIC_ISR4	Thread	x2APIC In-Service register bits [159:128] (R/O)
815H	2069	IA32_X2APIC_ISR5	Thread	x2APIC In-Service register bits [191:160] (R/O)
816H	2070	IA32_X2APIC_ISR6	Thread	x2APIC In-Service register bits [223:192] (R/O)
817H	2071	IA32_X2APIC_ISR7	Thread	x2APIC In-Service register bits [255:224] (R/O)
818H	2072	IA32_X2APIC_TMR0	Thread	x2APIC Trigger Mode register bits [31:0] (R/O)
819H	2073	IA32_X2APIC_TMR1	Thread	x2APIC Trigger Mode register bits [63:32] (R/O)
81AH	2074	IA32_X2APIC_TMR2	Thread	x2APIC Trigger Mode register bits [95:64] (R/O)
81BH	2075	IA32_X2APIC_TMR3	Thread	x2APIC Trigger Mode register bits [127:96] (R/O)
81CH	2076	IA32_X2APIC_TMR4	Thread	x2APIC Trigger Mode register bits [159:128] (R/O)
81DH	2077	IA32_X2APIC_TMR5	Thread	x2APIC Trigger Mode register bits [191:160] (R/O)
81EH	2078	IA32_X2APIC_TMR6	Thread	x2APIC Trigger Mode register bits [223:192] (R/O)
81FH	2079	IA32_X2APIC_TMR7	Thread	x2APIC Trigger Mode register bits [255:224] (R/O)
820H	2080	IA32_X2APIC_IRR0	Thread	x2APIC Interrupt Request register bits [31:0] (R/O)
821H	2081	IA32_X2APIC_IRR1	Thread	x2APIC Interrupt Request register bits [63:32] (R/O)
822H	2082	IA32_X2APIC_IRR2	Thread	x2APIC Interrupt Request register bits [95:64] (R/O)
823H	2083	IA32_X2APIC_IRR3	Thread	x2APIC Interrupt Request register bits [127:96] (R/O)
824H	2084	IA32_X2APIC_IRR4	Thread	x2APIC Interrupt Request register bits [159:128] (R/O)
825H	2085	IA32_X2APIC_IRR5	Thread	x2APIC Interrupt Request register bits [191:160] (R/O)
826H	2086	IA32_X2APIC_IRR6	Thread	x2APIC Interrupt Request register bits [223:192] (R/O)

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
827H	2087	IA32_X2APIC_IRR7	Thread	x2APIC Interrupt Request register bits [255:224] (R/O)
828H	2088	IA32_X2APIC_ESR	Thread	x2APIC Error Status register (R/W)
82FH	2095	IA32_X2APIC_LVT_CMCI	Thread	x2APIC LVT Corrected Machine Check Interrupt register (R/W)
830H	2096	IA32_X2APIC_ICR	Thread	x2APIC Interrupt Command register (R/W)
832H	2098	IA32_X2APIC_LVT_TIMER	Thread	x2APIC LVT Timer Interrupt register (R/W)
833H	2099	IA32_X2APIC_LVT_THERMAL	Thread	x2APIC LVT Thermal Sensor Interrupt register (R/W)
834H	2100	IA32_X2APIC_LVT_PMI	Thread	x2APIC LVT Performance Monitor register (R/W)
835H	2101	IA32_X2APIC_LVT_LINT0	Thread	x2APIC LVT LINT0 register (R/W)
836H	2102	IA32_X2APIC_LVT_LINT1	Thread	x2APIC LVT LINT1 register (R/W)
837H	2103	IA32_X2APIC_LVT_ERROR	Thread	x2APIC LVT Error register (R/W)
838H	2104	IA32_X2APIC_INIT_COUNT	Thread	x2APIC Initial Count register (R/W)
839H	2105	IA32_X2APIC_CUR_COUNT	Thread	x2APIC Current Count register (R/O)
83EH	2110	IA32_X2APIC_DIV_CONF	Thread	x2APIC Divide Configuration register (R/W)
83FH	2111	IA32_X2APIC_SELF_IPI	Thread	x2APIC Self IPI register (W/O)
C000_0080H		IA32_EFER	Thread	**Extended Feature Enables** See Table 2-2.
C000_0081H		IA32_STAR	Thread	**System Call Target Address (R/W)** See Table 2-2.
C000_0082H		IA32_LSTAR	Thread	**IA-32e Mode System Call Target Address (R/W)** See Table 2-2.
C000_0084H		IA32_FMASK	Thread	**System Call Flag Mask (R/W)** See Table 2-2.
C000_0100H		IA32_FS_BASE	Thread	**Map of BASE Address of FS (R/W)** See Table 2-2.
C000_0101H		IA32_GS_BASE	Thread	**Map of BASE Address of GS (R/W)** See Table 2-2.
C000_0102H		IA32_KERNEL_GS_BASE	Thread	**Swap Target of BASE Address of GS (R/W)** See Table 2-2.
C000_0103H		IA32_TSC_AUX	Thread	**AUXILIARY TSC Signature. (R/W)** See Table 2-2 and Section 17.17.2, "IA32_TSC_AUX Register and RDTSCP Support."

2.7.1 Additional MSRs in the Intel® Xeon® Processor 5500 and 3400 Series

Intel Xeon Processor 5500 and 3400 series support additional model-specific registers listed in Table 2-15. These MSRs also apply to Intel Core i7 and i5 processor family CPUID signature with DisplayFamily_DisplayModel of 06_1AH, 06_1EH and 06_1FH, see Table 2-1.

Table 2-15. Additional MSRs in Intel® Xeon® Processor 5500 and 3400 Series

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	Actual maximum turbo frequency is multiplied by 133.33MHz. (not available to model 06_2EH)
		7:0		**Maximum Turbo Ratio Limit 1C (R/O)** Maximum Turbo mode ratio limit with 1 core active.
		15:8		**Maximum Turbo Ratio Limit 2C (R/O)** Maximum Turbo mode ratio limit with 2 cores active.
		23:16		**Maximum Turbo Ratio Limit 3C (R/O)** Maximum Turbo mode ratio limit with 3 cores active.
		31:24		**Maximum Turbo Ratio Limit 4C (R/O)** Maximum Turbo mode ratio limit with 4 cores active.
		63:32		Reserved.
301H	769	MSR_GQ_SNOOP_MESF	Package	
		0		**From M to S (R/W)**
		1		**From E to S (R/W)**
		2		**From S to S (R/W)**
		3		**From F to S (R/W)**
		4		**From M to I (R/W)**
		5		**From E to I (R/W)**
		6		**From S to I (R/W)**
		7		**From F to I (R/W)**
		63:8		Reserved.

2.7.2 Additional MSRs in the Intel® Xeon® Processor 7500 Series

Intel Xeon Processor 7500 series support MSRs listed in Table 2-14 (except MSR address 1ADH) and additional model-specific registers listed in Table 2-16. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_2EH.

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	**Reserved** Attempt to read/write will cause #UD.
289H	649	IA32_MC9_CTL2	Package	See Table 2-2.
28AH	650	IA32_MC10_CTL2	Package	See Table 2-2.
28BH	651	IA32_MC11_CTL2	Package	See Table 2-2.
28CH	652	IA32_MC12_CTL2	Package	See Table 2-2.

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
28DH	653	IA32_MC13_CTL2	Package	See Table 2-2.
28EH	654	IA32_MC14_CTL2	Package	See Table 2-2.
28FH	655	IA32_MC15_CTL2	Package	See Table 2-2.
290H	656	IA32_MC16_CTL2	Package	See Table 2-2.
291H	657	IA32_MC17_CTL2	Package	See Table 2-2.
292H	658	IA32_MC18_CTL2	Package	See Table 2-2.

E18H	3608	MSR_R0_PMON_EVNT_SEL4	Package	Uncore R-box 0 perfmon event select MSR.
E19H	3609	MSR_R0_PMON_CTR4	Package	Uncore R-box 0 perfmon counter MSR.
E1AH	3610	MSR_R0_PMON_EVNT_SEL5	Package	Uncore R-box 0 perfmon event select MSR.
E1BH	3611	MSR_R0_PMON_CTR5	Package	Uncore R-box 0 perfmon counter MSR.
E1CH	3612	MSR_R0_PMON_EVNT_SEL6	Package	Uncore R-box 0 perfmon event select MSR.
E1DH	3613	MSR_R0_PMON_CTR6	Package	Uncore R-box 0 perfmon counter MSR.
E1EH	3614	MSR_R0_PMON_EVNT_SEL7	Package	Uncore R-box 0 perfmon event select MSR.
E1FH	3615	MSR_R0_PMON_CTR7	Package	Uncore R-box 0 perfmon counter MSR.
E20H	3616	MSR_R1_PMON_BOX_CTRL	Package	Uncore R-box 1 perfmon local box control MSR.
E21H	3617	MSR_R1_PMON_BOX_STATUS	Package	Uncore R-box 1 perfmon local box status MSR.

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
E22H	3618	MSR_R1_PMON_BOX_OVF_CTRL	Package	Uncore R-box 1 perfmon local box overflow control MSR.
E24H	3620	MSR_R1_PMON_IPERF1_P8	Package	Uncore R-box 1 perfmon IPERF1 unit Port 8 select MSR.
E25H	3621	MSR_R1_PMON_IPERF1_P9	Package	Uncore R-box 1 perfmon IPERF1 unit Port 9 select MSR.
E26H	3622	MSR_R1_PMON_IPERF1_P10	Package	Uncore R-box 1 perfmon IPERF1 unit Port 10 select MSR.
E27H	3623	MSR_R1_PMON_IPERF1_P11	Package	Uncore R-box 1 perfmon IPERF1 unit Port 11 select MSR.
E28H	3624	MSR_R1_PMON_IPERF1_P12	Package	Uncore R-box 1 perfmon IPERF1 unit Port 12 select MSR.
E29H	3625	MSR_R1_PMON_IPERF1_P13	Package	Uncore R-box 1 perfmon IPERF1 unit Port 13 select MSR.
E2AH	3626	MSR_R1_PMON_IPERF1_P14	Package	Uncore R-box 1 perfmon IPERF1 unit Port 14 select MSR.
E2BH	3627	MSR_R1_PMON_IPERF1_P15	Package	Uncore R-box 1 perfmon IPERF1 unit Port 15 select MSR.
E2CH	3628	MSR_R1_PMON_QLX_P4	Package	Uncore R-box 1 perfmon QLX unit Port 4 select MSR.
E2DH	3629	MSR_R1_PMON_QLX_P5	Package	Uncore R-box 1 perfmon QLX unit Port 5 select MSR.
E2EH	3630	MSR_R1_PMON_QLX_P6	Package	Uncore R-box 1 perfmon QLX unit Port 6 select MSR.
E2FH	3631	MSR_R1_PMON_QLX_P7	Package	Uncore R-box 1 perfmon QLX unit Port 7 select MSR.
E30H	3632	MSR_R1_PMON_EVNT_SEL8	Package	Uncore R-box 1 perfmon event select MSR.
E31H	3633	MSR_R1_PMON_CTR8	Package	Uncore R-box 1 perfmon counter MSR.
E32H	3634	MSR_R1_PMON_EVNT_SEL9	Package	Uncore R-box 1 perfmon event select MSR.
E33H	3635	MSR_R1_PMON_CTR9	Package	Uncore R-box 1 perfmon counter MSR.
E34H	3636	MSR_R1_PMON_EVNT_SEL10	Package	Uncore R-box 1 perfmon event select MSR.
E35H	3637	MSR_R1_PMON_CTR10	Package	Uncore R-box 1 perfmon counter MSR.
E36H	3638	MSR_R1_PMON_EVNT_SEL11	Package	Uncore R-box 1 perfmon event select MSR.
E37H	3639	MSR_R1_PMON_CTR11	Package	Uncore R-box 1 perfmon counter MSR.
E38H	3640	MSR_R1_PMON_EVNT_SEL12	Package	Uncore R-box 1 perfmon event select MSR.
E39H	3641	MSR_R1_PMON_CTR12	Package	Uncore R-box 1 perfmon counter MSR.
E3AH	3642	MSR_R1_PMON_EVNT_SEL13	Package	Uncore R-box 1 perfmon event select MSR.
E3BH	3643	MSR_R1_PMON_CTR13	Package	Uncore R-box 1perfmon counter MSR.
E3CH	3644	MSR_R1_PMON_EVNT_SEL14	Package	Uncore R-box 1 perfmon event select MSR.

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
E3DH	3645	MSR_R1_PMON_CTR14	Package	Uncore R-box 1 perfmon counter MSR.
E3EH	3646	MSR_R1_PMON_EVNT_SEL15	Package	Uncore R-box 1 perfmon event select MSR.
E3FH	3647	MSR_R1_PMON_CTR15	Package	Uncore R-box 1 perfmon counter MSR.
E45H	3653	MSR_B0_PMON_MATCH	Package	Uncore B-box 0 perfmon local box match MSR.
E46H	3654	MSR_B0_PMON_MASK	Package	Uncore B-box 0 perfmon local box mask MSR.
E49H	3657	MSR_S0_PMON_MATCH	Package	Uncore S-box 0 perfmon local box match MSR.
E4AH	3658	MSR_S0_PMON_MASK	Package	Uncore S-box 0 perfmon local box mask MSR.
E4DH	3661	MSR_B1_PMON_MATCH	Package	Uncore B-box 1 perfmon local box match MSR.
E4EH	3662	MSR_B1_PMON_MASK	Package	Uncore B-box 1 perfmon local box mask MSR.
E54H	3668	MSR_M0_PMON_MM_CONFIG	Package	Uncore M-box 0 perfmon local box address match/mask config MSR.
E55H	3669	MSR_M0_PMON_ADDR_MATCH	Package	Uncore M-box 0 perfmon local box address match MSR.
E56H	3670	MSR_M0_PMON_ADDR_MASK	Package	Uncore M-box 0 perfmon local box address mask MSR.
E59H	3673	MSR_S1_PMON_MATCH	Package	Uncore S-box 1 perfmon local box match MSR.
E5AH	3674	MSR_S1_PMON_MASK	Package	Uncore S-box 1 perfmon local box mask MSR.
E5CH	3676	MSR_M1_PMON_MM_CONFIG	Package	Uncore M-box 1 perfmon local box address match/mask config MSR.
E5DH	3677	MSR_M1_PMON_ADDR_MATCH	Package	Uncore M-box 1 perfmon local box address match MSR.
E5EH	3678	MSR_M1_PMON_ADDR_MASK	Package	Uncore M-box 1 perfmon local box address mask MSR.
3B5H	965	MSR_UNCORE_PMC5	Package	See Section 18.3.1.2.2, "Uncore Performance Event Configuration Facility."

2.8 MSRS IN THE INTEL® XEON® PROCESSOR 5600 SERIES (BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE)

Intel® Xeon® Processor 5600 Series (based on Intel® microarchitecture code name Westmere) supports the MSR interfaces listed in Table 2-14, Table 2-15, plus additional MSR listed in Table 2-17. These MSRs apply to Intel Core i7, i5 and i3 processor family with CPUID signature DisplayFamily_DisplayModel of 06_25H and 06_2CH, see Table 2-1.

Table 2-17. Additional MSRs Supported by Intel Processors (Based on Intel® Microarchitecture Code Name Westmere)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
13CH	52	MSR_FEATURE_CONFIG	Core	**AES Configuration (RW-L)** Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.
		1:0		**AES Configuration (RW-L)** Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instruction can be mis-configured if a privileged agent unintentionally writes 11b.
		63:2		Reserved.
1A7H	423	MSR_OFFCORE_RSP_1	Thread	**Offcore Response Event Select Register (R/W)**
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	**Maximum Ratio Limit of Turbo Mode** **RO** if MSR_PLATFORM_INFO.[28] = 0, **RW** if MSR_PLATFORM_INFO.[28] = 1
		7:0	Package	**Maximum Ratio Limit for 1C** Maximum turbo ratio limit of 1 core active.
		15:8	Package	**Maximum Ratio Limit for 2C** Maximum turbo ratio limit of 2 core active.
		23:16	Package	**Maximum Ratio Limit for 3C** Maximum turbo ratio limit of 3 core active.
		31:24	Package	**Maximum Ratio Limit for 4C** Maximum turbo ratio limit of 4 core active.
		39:32	Package	**Maximum Ratio Limit for 5C** Maximum turbo ratio limit of 5 core active.
		47:40	Package	**Maximum Ratio Limit for 6C** Maximum turbo ratio limit of 6 core active.
		63:48		Reserved.
1B0H	432	IA32_ENERGY_PERF_BIAS	Package	See Table 2-2.

2.9 MSRS IN THE INTEL® XEON® PROCESSOR E7 FAMILY (BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE)

Intel® Xeon® Processor E7 Family (based on Intel® microarchitecture code name Westmere) supports the MSR interfaces listed in Table 2-14 (except MSR address 1ADH), Table 2-15, plus additional MSR listed in Table 2-18. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_2FH.

Table 2-18. Additional MSRs Supported by Intel® Xeon® Processor E7 Family

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
13CH	52	MSR_FEATURE_CONFIG	Core	**AES Configuration (RW-L)** Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.
		1:0		**AES Configuration (RW-L)** Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instruction can be mis-configured if a privileged agent unintentionally writes 11b.

FD1H	4049	MSR_C9_PMON_CTR0	Package	Uncore C-box 9 perfmon counter MSR.
FD2H	4050	MSR_C9_PMON_EVNT_ SEL1	Package	Uncore C-box 9 perfmon event select MSR.
FD3H	4051	MSR_C9_PMON_CTR1	Package	Uncore C-box 9 perfmon counter MSR.
FD4H	4052	MSR_C9_PMON_EVNT_ SEL2	Package	Uncore C-box 9 perfmon event select MSR.
FD5H	4053	MSR_C9_PMON_CTR2	Package	Uncore C-box 9 perfmon counter MSR.
FD6H	4054	MSR_C9_PMON_EVNT_ SEL3	Package	Uncore C-box 9 perfmon event select MSR.
FD7H	4055	MSR_C9_PMON_CTR3	Package	Uncore C-box 9 perfmon counter MSR.
FD8H	4056	MSR_C9_PMON_EVNT_ SEL4	Package	Uncore C-box 9 perfmon event select MSR.
FD9H	4057	MSR_C9_PMON_CTR4	Package	Uncore C-box 9 perfmon counter MSR.
FDAH	4058	MSR_C9_PMON_EVNT_ SEL5	Package	Uncore C-box 9 perfmon event select MSR.
FDBH	4059	MSR_C9_PMON_CTR5	Package	Uncore C-box 9 perfmon counter MSR.

2.10 MSRS IN INTEL® PROCESSOR FAMILY BASED ON INTEL® MICROARCHITECTURE CODE NAME SANDY BRIDGE

Table 2-19 lists model-specific registers (MSRs) that are common to Intel® processor family based on Intel micro-architecture code name Sandy Bridge. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_2AH, 06_2DH, see Table 2-1. Additional MSRs specific to 06_2AH are listed in Table 2-20.

Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Thread	See Section 2.22, "MSRs in Pentium Processors."
1H	1	IA32_P5_MC_TYPE	Thread	See Section 2.22, "MSRs in Pentium Processors."

Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
6H	6	IA32_MONITOR_FILTER_SIZE	Thread	See Section 8.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.
10H	16	IA32_TIME_STAMP_COUNTER	Thread	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Package	**Platform ID (R)** See Table 2-2.
1BH	27	IA32_APIC_BASE	Thread	See Section 10.4.4, "Local APIC Status and Location," and Table 2-2.
34H	52	MSR_SMI_COUNT	Thread	**SMI Counter (R/O)**
		31:0		**SMI Count (R/O)** Count SMIs.
		63:32		Reserved.
3AH	58	IA32_FEATURE_CONTROL	Thread	**Control Features in Intel 64 Processor (R/W)** See Table 2-2.
		0		**Lock (R/WL)**
		1		**Enable VMX inside SMX operation (R/WL)**
		2		**Enable VMX outside SMX operation (R/WL)**
		14:8		**SENTER local functions enables (R/WL)**
		15		**SENTER global functions enable (R/WL)**
79H	121	IA32_BIOS_UPDT_TRIG	Core	**BIOS Update Trigger Register (W)** See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Thread	**BIOS Update Signature ID (RO)** See Table 2-2.
C1H	193	IA32_PMC0	Thread	**Performance Counter Register** See Table 2-2.
C2H	194	IA32_PMC1	Thread	**Performance Counter Register** See Table 2-2.
C3H	195	IA32_PMC2	Thread	**Performance Counter Register** See Table 2-2.
C4H	196	IA32_PMC3	Thread	**Performance Counter Register** See Table 2-2.
C5H	197	IA32_PMC4	Core	**Performance Counter Register (if core not shared by threads)**
C6H	198	IA32_PMC5	Core	**Performance Counter Register (if core not shared by threads)**
C7H	199	IA32_PMC6	Core	**Performance Counter Register (if core not shared by threads)**
C8H	200	IA32_PMC7	Core	**Performance Counter Register (if core not shared by threads)**
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information; contains power management and other model specific features enumeration. See http://biosbits.org.
		7:0		Reserved.

Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		15:8	Package	**Maximum Non-Turbo Ratio (R/O)** The is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.
		27:16		Reserved.
		28	Package	**Programmable Ratio Limit for Turbo Mode (R/O)** When set to 1, indicates that Programmable Ratio Limits for Turbo mode is enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo mode is disabled.
		29	Package	**Programmable TDP Limit for Turbo Mode (R/O)** When set to 1, indicates that TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDP Limit for Turbo mode is not programmable.
		39:30		Reserved.
		47:40	Package	**Maximum Efficiency Ratio (R/O)** The is the minimum ratio (maximum efficiency) that the processor can operates, in units of 100MHz.
		63:48		Reserved.
E2H	226	MSR_PKG_CST_CONFIG_ CONTROL	Core	**C-State Configuration Control (R/W)** Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.
		2:0		**Package C-State Limit (R/W)** Specifies the lowest processor-specific C-state code name (consuming the least power). for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-sate support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.
		9:3		Reserved.
		10		**I/O MWAIT Redirection Enable (R/W)** When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions
		14:11		Reserved.
		15		**CFG Lock (R/WO)** When set, lock bits 15:0 of this register until next reset.

Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		24:16		Reserved.
		25		**C3 state auto demotion enable (R/W)** When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.
		26		**C1 state auto demotion enable (R/W)** When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.
		27		**Enable C3 undemotion (R/W)** When set, enables undemotion from demoted C3.
		28		**Enable C1 undemotion (R/W)** When set, enables undemotion from demoted C1.
		63:29		Reserved.
E4H	228	MSR_PMG_IO_CAPTURE_BASE	Core	**Power Management IO Redirection in C-state (R/W)** See http://biosbits.org.
		15:0		**LVL_2 Base Address (R/W)** Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.
		18:16		**C-state Range (R/W)** Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 000b - C3 is the max C-State to include 001b - C6 is the max C-State to include 010b - C7 is the max C-State to include
		63:19		Reserved.
E7H	231	IA32_MPERF	Thread	**Maximum Performance Frequency Clock Count (RW)** See Table 2-2.
E8H	232	IA32_APERF	Thread	**Actual Performance Frequency Clock Count (RW)** See Table 2-2.
FEH	254	IA32_MTRRCAP	Thread	See Table 2-2.
13CH	52	MSR_FEATURE_CONFIG	Core	**AES Configuration (RW-L)** Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.

Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		1:0		**AES Configuration (RW-L)** Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instruction can be mis-configured if a privileged agent unintentionally writes 11b.
		63:2		Reserved.
174H	372	IA32_SYSENTER_CS	Thread	See Table 2-2.
175H	373	IA32_SYSENTER_ESP	Thread	See Table 2-2.
176H	374	IA32_SYSENTER_EIP	Thread	See Table 2-2.
179H	377	IA32_MCG_CAP	Thread	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Thread	Global Machine Check Status
		0		**RIPV** When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.
		1		**EIPV** When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		**MCIP** When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved.
186H	390	IA32_ PERFEVTSEL0	Thread	See Table 2-2.
187H	391	IA32_ PERFEVTSEL1	Thread	See Table 2-2.
188H	392	IA32_ PERFEVTSEL2	Thread	See Table 2-2.
189H	393	IA32_ PERFEVTSEL3	Thread	See Table 2-2.
18AH	394	IA32_ PERFEVTSEL4	Core	See Table 2-2; If CPUID.0AH:EAX[15:8] = 8
18BH	395	IA32_ PERFEVTSEL5	Core	See Table 2-2; If CPUID.0AH:EAX[15:8] = 8
18CH	396	IA32_ PERFEVTSEL6	Core	See Table 2-2; If CPUID.0AH:EAX[15:8] = 8

		15:0		Current Performance State Value.
		63:16		Reserved.
198H	408	MSR_PERF_STATUS	Package	Performance Status
		47:32		Core Voltage (R/O) P-state core voltage can be computed by MSR_PERF_STATUS[37:32] * (float) 1/(2^13).
199H	409	IA32_PERF_CTL	Thread	See Table 2-2.
19AH	410	IA32_CLOCK_ MODULATION	Thread	**Clock Modulation (R/W)** See Table 2-2 IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.
		3:0		**On demand Clock Modulation Duty Cycle (R/W)** In 6.25% increment
		4		**On demand Clock Modulation Enable (R/W)**
		63:5		Reserved.
19BH	411	IA32_THERM_INTERRUPT	Core	**Thermal Interrupt Control (R/W)** See Table 2-2.
19CH	412	IA32_THERM_STATUS	Core	**Thermal Monitor Status (R/W)** See Table 2-2.
		0		**Thermal status (RO)** See Table 2-2.
		1		**Thermal status log (R/WC0)** See Table 2-2.
		2		**PROTCHOT # or FORCEPR# status (RO)** See Table 2-2.
		3		**PROTCHOT # or FORCEPR# log (R/WC0)** See Table 2-2.
		4		**Critical Temperature status (RO)** See Table 2-2.
		5		**Critical Temperature status log (R/WC0)** See Table 2-2.
		6		**Thermal threshold #1 status (RO)** See Table 2-2.
		7		**Thermal threshold #1 log (R/WC0)** See Table 2-2.

Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		8		**Thermal threshold #2 status (RO)** See Table 2-2.
		9		**Thermal threshold #2 log (R/WC0)** See Table 2-2.
		10		**Power Limitation status (RO)** See Table 2-2.
		11		**Power Limitation log (R/WC0)** See Table 2-2.
		15:12		Reserved.
		22:16		**Digital Readout (RO)** See Table 2-2.
		26:23		Reserved.
		30:27		**Resolution in degrees Celsius (RO)** See Table 2-2.
		31		**Reading Valid (RO)** See Table 2-2.
		63:32		Reserved.
1A0H	416	IA32_MISC_ENABLE		**Enable Misc. Processor Features (R/W)** Allows a variety of processor functions to be enabled and disabled.
		0	Thread	**Fast-Strings Enable** See Table 2-2
		6:1		Reserved.
		7	Thread	**Performance Monitoring Available (R)** See Table 2-2.
		10:8		Reserved.
		11	Thread	**Branch Trace Storage Unavailable (RO)** See Table 2-2.
		12	Thread	**Processor Event Based Sampling Unavailable (RO)** See Table 2-2.
		15:13		Reserved.
		16	Package	**Enhanced Intel SpeedStep Technology Enable (R/W)** See Table 2-2.
		18	Thread	ENABLE MONITOR FSM. (R/W) See Table 2-2.
		21:19		Reserved.
		22	Thread	**Limit CPUID Maxval (R/W)** See Table 2-2.
		23	Thread	**xTPR Message Disable (R/W)** See Table 2-2.

Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		33:24		Reserved.
		34	Thread	**XD Bit Disable (R/W)** See Table 2-2.
		37:35		Reserved.
		38	Package	**Turbo Mode Disable (R/W)** When set to 1 on processors that support Intel Turbo Boost Technology, the turbo mode feature is disabled and the IDA_Enable feature flag will be clear (CPUID.06H: EAX[1]=0). When set to a 0 on processors that support IDA, CPUID.06H: EAX[1] reports the processor's support of turbo mode is enabled. **Note:** the power-on default value is used by BIOS to detect hardware support of turbo mode. If power-on default value is 1, turbo mode is available in the processor. If power-on default value is 0, turbo mode is not available.
		63:39		Reserved.
1A2H	418	MSR_ TEMPERATURE_TARGET	Unique	Temperature Target
		15:0		Reserved.
		23:16		**Temperature Target (R)** The minimum temperature at which PROCHOT# will be asserted. The value is degree C.
		63:24		Reserved.
1A4H	420	MSR_MISC_FEATURE_ CONTROL		**Miscellaneous Feature Control (R/W)**
		0	Core	**L2 Hardware Prefetcher Disable (R/W)** If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.
		1	Core	**L2 Adjacent Cache Line Prefetcher Disable (R/W)** If 1, disables the adjacent cache line prefetcher, which fetches the cache line that comprises a cache line pair (128 bytes).
		2	Core	**DCU Hardware Prefetcher Disable (R/W)** If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.
		3	Core	**DCU IP Prefetcher Disable (R/W)** If 1, disables the L1 data cache IP prefetcher, which uses sequential load history (based on instruction Pointer of previous loads) to determine whether to prefetch additional lines.
		63:4		Reserved.
1A6H	422	MSR_OFFCORE_RSP_0	Thread	**Offcore Response Event Select Register (R/W)**
1A7H	422	MSR_OFFCORE_RSP_1	Thread	**Offcore Response Event Select Register (R/W)**
1AAH	426	MSR_MISC_PWR_MGMT		Miscellaneous Power Management Control; various model specific features enumeration. See http://biosbits.org.

Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge (Contd.)

48CH	1164	IA32_VMX_EPT_VPID_ENUM	Thread	**Capability Reporting Register of EPT and VPID (R/O)** See Table 2-2
48DH	1165	IA32_VMX_TRUE_PINBASED_CTLS	Thread	**Capability Reporting Register of Pin-based VM-execution Flex Controls (R/O)** See Table 2-2
48EH	1166	IA32_VMX_TRUE_PROCBASED_CTLS	Thread	**Capability Reporting Register of Primary Processor-based VM-execution Flex Controls (R/O)** See Table 2-2
48FH	1167	IA32_VMX_TRUE_EXIT_CTLS	Thread	**Capability Reporting Register of VM-exit Flex Controls (R/O)** See Table 2-2
490H	1168	IA32_VMX_TRUE_ENTRY_CTLS	Thread	**Capability Reporting Register of VM-entry Flex Controls (R/O)** See Table 2-2
4C1H	1217	IA32_A_PMC0	Thread	See Table 2-2.
4C2H	1218	IA32_A_PMC1	Thread	See Table 2-2.
4C3H	1219	IA32_A_PMC2	Thread	See Table 2-2.
4C4H	1220	IA32_A_PMC3	Thread	See Table 2-2.
4C5H	1221	IA32_A_PMC4	Core	See Table 2-2.
4C6H	1222	IA32_A_PMC5	Core	See Table 2-2.
4C7H	1223	IA32_A_PMC6	Core	See Table 2-2.
4C8H	1224	IA32_A_PMC7	Core	See Table 2-2.
600H	1536	IA32_DS_AREA	Thread	**DS Save Area (R/W)** See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
606H	1542	MSR_RAPL_POWER_UNIT	Package	**Unit Multipliers used in RAPL Interfaces (R/O)** See Section 14.9.1, "RAPL Interfaces."
60AH	1546	MSR_PKGC3_IRTL	Package	**Package C3 Interrupt Response Limit (R/W)** Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.

Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		9:0		**Interrupt response time limit (R/W)** Specifies the limit that should be used to decide if the package should be put into a package C3 state.
		12:10		**Time Unit (R/W)** Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns
		14:13		Reserved.
		15		**Valid (R/W)** Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.
		63:16		Reserved.
60BH	1547	MSR_PKGC6_IRTL	Package	**Package C6 Interrupt Response Limit (R/W)** This MSR defines the budget allocated for the package to exit from C6 to a C0 state, where interrupt request can be delivered to the core and serviced. Additional core-exit latency amy be applicable depending on the actual C-state the core is in. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		**Interrupt response time limit (R/W)** Specifies the limit that should be used to decide if the package should be put into a package C6 state.
		12:10		**Time Unit (R/W)** Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns
		14:13		Reserved.
		15		**Valid (R/W)** Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.
		63:16		Reserved.

Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
60DH	1549	MSR_PKG_C2_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		**Package C2 Residency Counter. (R/O)** Value since last reset that this package is in processor-specific C2 states. Count at the same frequency as the TSC.
610H	1552	MSR_PKG_POWER_LIMIT	Package	**PKG RAPL Power Limit Control (R/W)** See Section 14.9.3, "Package RAPL Domain."
611H	1553	MSR_PKG_ENERGY_STATUS	Package	**PKG Energy Status (R/O)** See Section 14.9.3, "Package RAPL Domain."
614H	1556	MSR_PKG_POWER_INFO	Package	**PKG RAPL Parameters (R/W)** See Section 14.9.3, "Package RAPL Domain."
638H	1592	MSR_PP0_POWER_LIMIT	Package	**PP0 RAPL Power Limit Control (R/W)** See Section 14.9.4, "PP0/PP1 RAPL Domains."
680H	1664	MSR_ LASTBRANCH_0_FROM_IP	Thread	**Last Branch Record 0 From IP (R/W)** One of sixteen pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the **source instruction**. See also: ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 17.9.1 and record format in Section 17.4.8.1
681H	1665	MSR_ LASTBRANCH_1_FROM_IP	Thread	**Last Branch Record 1 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
682H	1666	MSR_ LASTBRANCH_2_FROM_IP	Thread	**Last Branch Record 2 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
683H	1667	MSR_ LASTBRANCH_3_FROM_IP	Thread	**Last Branch Record 3 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
684H	1668	MSR_ LASTBRANCH_4_FROM_IP	Thread	**Last Branch Record 4 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
685H	1669	MSR_ LASTBRANCH_5_FROM_IP	Thread	**Last Branch Record 5 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
686H	1670	MSR_ LASTBRANCH_6_FROM_IP	Thread	**Last Branch Record 6 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
687H	1671	MSR_ LASTBRANCH_7_FROM_IP	Thread	**Last Branch Record 7 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
688H	1672	MSR_ LASTBRANCH_8_FROM_IP	Thread	**Last Branch Record 8 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
689H	1673	MSR_ LASTBRANCH_9_FROM_IP	Thread	**Last Branch Record 9 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.
68AH	1674	MSR_ LASTBRANCH_10_FROM_IP	Thread	**Last Branch Record 10 From IP (R/W)** See description of MSR_LASTBRANCH_0_FROM_IP.

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
6CDH	1741	MSR_ LASTBRANCH_13_TO_IP	Thread	**Last Branch Record 13 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6CEH	1742	MSR_ LASTBRANCH_14_TO_IP	Thread	**Last Branch Record 14 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6CFH	1743	MSR_ LASTBRANCH_15_TO_IP	Thread	**Last Branch Record 15 To IP (R/W)** See description of MSR_LASTBRANCH_0_TO_IP.
6E0H	1760	IA32_TSC_DEADLINE	Thread	See Table 2-2.
802H-83FH		X2APIC MSRs	Thread	See Table 2-2.
C000_0080H		IA32_EFER	Thread	**Extended Feature Enables** See Table 2-2.
C000_0081H		IA32_STAR	Thread	**System Call Target Address (R/W)** See Table 2-2.
C000_0082H		IA32_LSTAR	Thread	**IA-32e Mode System Call Target Address (R/W)** See Table 2-2.
C000_0084H		IA32_FMASK	Thread	**System Call Flag Mask (R/W)** See Table 2-2.
C000_0100H		IA32_FS_BASE	Thread	**Map of BASE Address of FS (R/W)** See Table 2-2.
C000_0101H		IA32_GS_BASE	Thread	**Map of BASE Address of GS (R/W)** See Table 2-2.
C000_0102H		IA32_KERNEL_GS_BASE	Thread	**Swap Target of BASE Address of GS (R/W)** See Table 2-2.
C000_0103H		IA32_TSC_AUX	Thread	**AUXILIARY TSC Signature (R/W)** See Table 2-2 and Section 17.17.2, "IA32_TSC_AUX Register and RDTSCP Support."

2.10.1 MSRs In 2nd Generation Intel® Core™ Processor Family (Based on Intel® Microarchitecture Code Name Sandy Bridge)

Table 2-20 and Table 2-21 list model-specific registers (MSRs) that are specific to the 2nd generation Intel® Core™ processor family (based on Intel microarchitecture code name Sandy Bridge). These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_2AH; see Table 2-1.

Table 2-20. MSRs Supported by 2nd Generation Intel® Core™ Processors (Intel® microarchitecture code name Sandy Bridge)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	**Maximum Ratio Limit of Turbo Mode** RO if MSR_PLATFORM_INFO.[28] = 0, RW if MSR_PLATFORM_INFO.[28] = 1
		7:0	Package	**Maximum Ratio Limit for 1C** Maximum turbo ratio limit of 1 core active.
		15:8	Package	**Maximum Ratio Limit for 2C** Maximum turbo ratio limit of 2 core active.
		23:16	Package	**Maximum Ratio Limit for 3C** Maximum turbo ratio limit of 3 core active.
		31:24	Package	**Maximum Ratio Limit for 4C** Maximum turbo ratio limit of 4 core active.
		63:32		Reserved.
60CH	1548	MSR_PKGC7_IRTL	Package	**Package C7 Interrupt Response Limit (R/W)** This MSR defines the budget allocated for the package to exit from C7 to a C0 state, where interrupt request can be delivered to the core and serviced. Additional core-exit latency amy be applicable depending on the actual C-state the core is in. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		**Interrupt response time limit (R/W)** Specifies the limit that should be used to decide if the package should be put into a package C7 state.
		12:10		**Time Unit (R/W)** Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns
		14:13		Reserved.
		15		**Valid (R/W)** Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.
		63:16		Reserved.
639H	1593	MSR_PP0_ENERGY_STATUS	Package	**PP0 Energy Status (R/O)** See Section 14.9.4, "PP0/PP1 RAPL Domains."

2.10.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 Family

Intel Xeon Processor E5 family is based on the Sandy Bridge microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-23. For complete detail of the uncore PMU, refer to Intel Xeon Processor E5 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_2DH

Table 2-23. Uncore PMU MSRs in Intel® Xeon® Processor E5 Family

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
C08H		MSR_U_PMON_UCLK_FIXED_CTL	Package	Uncore U-box UCLK fixed counter control
C09H		MSR_U_PMON_UCLK_FIXED_CTR	Package	Uncore U-box UCLK fixed counter

Table 2-23. Uncore PMU MSRs in Intel® Xeon® Processor E5 Family (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
C10H		MSR_U_PMON_EVNTSEL0	Package	Uncore U-box perfmon event select for U-box counter 0.
C11H		MSR_U_PMON_EVNTSEL1	Package	Uncore U-box perfmon event select for U-box counter 1.
C16H		MSR_U_PMON_CTR0	Package	Uncore U-box perfmon counter 0
C17H		MSR_U_PMON_CTR1	Package	Uncore U-box perfmon counter 1
C24H		MSR_PCU_PMON_BOX_CTL	Package	Uncore PCU perfmon for PCU-box-wide control
C30H		MSR_PCU_PMON_EVNTSEL0	Package	Uncore PCU perfmon event select for PCU counter 0.
C31H		MSR_PCU_PMON_EVNTSEL1	Package	Uncore PCU perfmon event select for PCU counter 1.
C32H		MSR_PCU_PMON_EVNTSEL2	Package	Uncore PCU perfmon event select for PCU counter 2.
C33H		MSR_PCU_PMON_EVNTSEL3	Package	Uncore PCU perfmon event select for PCU counter 3.
C34H		MSR_PCU_PMON_BOX_FILTER	Package	Uncore PCU perfmon box-wide filter.
C36H		MSR_PCU_PMON_CTR0	Package	Uncore PCU perfmon counter 0.
C37H		MSR_PCU_PMON_CTR1	Package	Uncore PCU perfmon counter 1.
C38H		MSR_PCU_PMON_CTR2	Package	Uncore PCU perfmon counter 2.
C39H		MSR_PCU_PMON_CTR3	Package	Uncore PCU perfmon counter 3.
D04H		MSR_C0_PMON_BOX_CTL	Package	Uncore C-box 0 perfmon local box wide control.
D10H		MSR_C0_PMON_EVNTSEL0	Package	Uncore C-box 0 perfmon event select for C-box 0 counter 0.
D11H		MSR_C0_PMON_EVNTSEL1	Package	Uncore C-box 0 perfmon event select for C-box 0 counter 1.

2.11 MSRS IN THE 3RD GENERATION INTEL® CORE™ PROCESSOR FAMILY (BASED ON INTEL® MICROARCHITECTURE CODE NAME IVY BRIDGE)

The 3rd generation Intel® Core™ processor family and the Intel® Xeon® processor E3-1200v2 product family (based on Intel microarchitecture code name Ivy Bridge) support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-21, and Table 2-24. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_3AH.

Table 2-24. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors (based on Intel® microarchitecture code name Ivy Bridge)

		7:0		Reserved.

Table 2-24. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors (based on Intel® microarchitecture code name Ivy Bridge) (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		15:8	Package	**Maximum Non-Turbo Ratio (R/O)** The is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.
		27:16		Reserved.
		28	Package	**Programmable Ratio Limit for Turbo Mode (R/O)** When set to 1, indicates that Programmable Ratio Limits for Turbo mode is enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo mode is disabled.
		29	Package	**Programmable TDP Limit for Turbo Mode (R/O)** When set to 1, indicates that TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDP Limit for Turbo mode is not programmable.
		31:30		Reserved.
		32	Package	**Low Power Mode Support (LPM) (R/O)** When set to 1, indicates that LPM is supported, and when set to 0, indicates LPM is not supported.
		34:33	Package	**Number of ConfigTDP Levels (R/O)** 00: Only Base TDP level available. 01: One additional TDP level available. 02: Two additional TDP level available. 11: Reserved
		39:35		Reserved.
		47:40	Package	**Maximum Efficiency Ratio (R/O)** The is the minimum ratio (maximum efficiency) that the processor can operates, in units of 100MHz.
		55:48	Package	**Minimum Operating Ratio (R/O)** Contains the minimum supported operating ratio in units of 100 MHz.
		63:56		Reserved.
E2H	226	MSR_PKG_CST_CONFIG_ CONTROL	Core	**C-State Configuration Control (R/W)** Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.

Table 2-24. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors (based on Intel® microarchitecture code name Ivy Bridge) (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		2:0		**Package C-State Limit (R/W)** Specifies the lowest processor-specific C-state code name (consuming the least power). for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-sate support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.
		9:3		Reserved.
		10		**I/O MWAIT Redirection Enable (R/W)** When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions
		14:11		Reserved.
		15		**CFG Lock (R/WO)** When set, lock bits 15:0 of this register until next reset.
		24:16		Reserved.
		25		**C3 state auto demotion enable (R/W)** When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.
		26		**C1 state auto demotion enable (R/W)** When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.
		27		**Enable C3 undemotion (R/W)** When set, enables undemotion from demoted C3.
		28		**Enable C1 undemotion (R/W)** When set, enables undemotion from demoted C1.
		63:29		Reserved.
639H	1593	MSR_PP0_ENERGY_STATUS	Package	**PP0 Energy Status (R/O)** See Section 14.9.4, "PP0/PP1 RAPL Domains."
648H	1608	MSR_CONFIG_TDP_ NOMINAL	Package	**Base TDP Ratio (R/O)**
		7:0		**Config_TDP_Base** Base TDP level ratio to be used for this specific processor (in units of 100 MHz).
		63:8		Reserved.

Table 2-24. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors (based on Intel® microarchitecture code name Ivy Bridge) (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
649H	1609	MSR_CONFIG_TDP_LEVEL1	Package	ConfigTDP Level 1 ratio and power level (R/O)
		14:0		PKG_TDP_LVL1. Power setting for ConfigTDP Level 1.
		15		Reserved
		23:16		Config_TDP_LVL1_Ratio. ConfigTDP level 1 ratio to be used for this specific processor.
		31:24		Reserved
		46:32		PKG_MAX_PWR_LVL1. Max Power setting allowed for ConfigTDP Level 1.
		47		Reserved
		62:48		PKG_MIN_PWR_LVL1. MIN Power setting allowed for ConfigTDP Level 1.
		63		Reserved.
64AH	1610	MSR_CONFIG_TDP_LEVEL2	Package	ConfigTDP Level 2 ratio and power level (R/O)
		14:0		PKG_TDP_LVL2. Power setting for ConfigTDP Level 2.
		15		Reserved
		23:16		Config_TDP_LVL2_Ratio. ConfigTDP level 2 ratio to be used for this specific processor.
		31:24		Reserved
		46:32		PKG_MAX_PWR_LVL2. Max Power setting allowed for ConfigTDP Level 2.
		47		Reserved
		62:48		PKG_MIN_PWR_LVL2. MIN Power setting allowed for ConfigTDP Level 2.
		63		Reserved.
64BH	1611	MSR_CONFIG_TDP_ CONTROL	Package	**ConfigTDP Control (R/W)**
		1:0		**TDP_LEVEL (RW/L)** System BIOS can program this field.
		30:2		Reserved.
		31		**Config_TDP_Lock (RW/L)** When this bit is set, the content of this register is locked until a reset.
		63:32		Reserved.
64CH	1612	MSR_TURBO_ACTIVATION_ RATIO	Package	**ConfigTDP Control (R/W)**
		7:0		**MAX_NON_TURBO_RATIO (RW/L)** System BIOS can program this field.
		30:8		Reserved.

Table 2-24. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors (based on Intel® microarchitecture code name Ivy Bridge) (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		31		**TURBO_ACTIVATION_RATIO_Lock (RW/L)** When this bit is set, the content of this register is locked until a reset.
		63:32		Reserved.
See Table 2-19, Table 2-20 and Table 2-21 for other MSR definitions applicable to processors with CPUID signature 06_3AH				

2.11.1 MSRs In Intel® Xeon® Processor E5 v2 Product Family (Based on Ivy Bridge-E Microarchitecture)

Table 2-25 lists model-specific registers (MSRs) that are specific to the Intel® Xeon® Processor E5 v2 Product Family (based on Ivy Bridge-E microarchitecture). These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_3EH, see Table 2-1. These processors supports the MSR interfaces listed in Table 2-19, and Table 2-25.

Table 2-25. MSRs Supported by Intel® Xeon® Processors E5 v2 Product Family (based on Ivy Bridge-E microarchitecture)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
4EH	78	MSR_PPIN_CTL	Package	Protected Processor Inventory Number Enable Control (R/W)
		0		LockOut (R/WO) Set 1to prevent further writes to MSR_PPIN_CTL. Writing 1 to MSR_PPINCTL[bit 0] is permitted only if MSR_PPIN_CTL[bit 1] is clear, Default is 0. BIOS should provide an opt-in menu to enable the user to turn on MSR_PPIN_CTL[bit 1] for privileged inventory initialization agent to access MSR_PPIN. After reading MSR_PPIN, the privileged inventory initialization agent should write '01b' to MSR_PPIN_CTL to disable further access to MSR_PPIN and prevent unauthorized modification to MSR_PPIN_CTL.
		1		Enable_PPIN (R/W) If 1, enables MSR_PPIN to be accessible using RDMSR. Once set, attempt to write 1 to MSR_PPIN_CTL[bit 0] will cause #GP. If 0, an attempt to read MSR_PPIN will cause #GP. Default is 0.
		63:2		Reserved.
4FH	79	MSR_PPIN	Package	Protected Processor Inventory Number (R/O)

Table 2-25. MSRs Supported by Intel® Xeon® Processors E5 v2 Product Family (based on Ivy Bridge-E microarchitecture) (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		63:0		**Protected Processor Inventory Number (R/O)** A unique value within a given CPUID family/model/stepping signature that a privileged inventory initialization agent can access to identify each physical processor, when access to MSR_PPIN is enabled. Access to MSR_PPIN is permitted only if MSR_PPIN_CTL[bits 1:0] = '10b'
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information; contains power management and other model specific features enumeration. See http://biosbits.org.
		7:0		Reserved.
		15:8	Package	**Maximum Non-Turbo Ratio (R/O)** The is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.
		22:16		Reserved.
		23	Package	**PPIN_CAP (R/O)** When set to 1, indicates that Protected Processor Inventory Number (PPIN) capability can be enabled for privileged system inventory agent to read PPIN from MSR_PPIN. When set to 0, PPIN capability is not supported. An attempt to access MSR_PPIN_CTL or MSR_PPIN will cause #GP.
		27:24		Reserved.
		28	Package	**Programmable Ratio Limit for Turbo Mode (R/O)** When set to 1, indicates that Programmable Ratio Limits for Turbo mode is enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo mode is disabled.
		29	Package	**Programmable TDP Limit for Turbo Mode (R/O)** When set to 1, indicates that TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDP Limit for Turbo mode is not programmable.
		30	Package	**Programmable TJ OFFSET (R/O)** When set to 1, indicates that MSR_TEMPERATURE_TARGET.[27:24] is valid and writable to specify an temperature offset.
		39:31		Reserved.
		47:40	Package	**Maximum Efficiency Ratio (R/O)** The is the minimum ratio (maximum efficiency) that the processor can operates, in units of 100MHz.
		63:48		Reserved.
E2H	226	MSR_PKG_CST_CONFIG_ CONTROL	Core	**C-State Configuration Control (R/W)** Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.

Table 2-25. MSRs Supported by Intel® Xeon® Processors E5 v2 Product Family (based on Ivy Bridge-E microarchitecture) (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		2:0		**Package C-State Limit (R/W)** Specifies the lowest processor-specific C-state code name (consuming the least power). for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-sate support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.
		9:3		Reserved.
		10		**I/O MWAIT Redirection Enable (R/W)** When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions
		14:11		Reserved.
		15		**CFG Lock (R/WO)** When set, lock bits 15:0 of this register until next reset.
		63:16		Reserved.
179H	377	IA32_MCG_CAP	Thread	**Global Machine Check Capability (R/O)**
		7:0		**Count**
		8		**MCG_CTL_P**
		9		**MCG_EXT_P**
		10		**MCP_CMCI_P**
		11		**MCG_TES_P**
		15:12		Reserved.
		23:16		**MCG_EXT_CNT**
		24		**MCG_SER_P**
		25		Reserved.
		26		**MCG_ELOG_P**
		63:27		Reserved.
17FH	383	MSR_ERROR_CONTROL	Package	**MC Bank Error Configuration (R/W)**
		0		Reserved
		1		**MemError Log Enable (R/W)** When set, enables IMC status bank to log additional info in bits 36:32.
		63:2		Reserved.

Table 2-25. MSRs Supported by Intel® Xeon® Processors E5 v2 Product Family (based on Ivy Bridge-E microarchitecture) (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
1A2H	418	MSR_ TEMPERATURE_TARGET	Package	Temperature Target
		15:0		Reserved.
		23:16		**Temperature Target (RO)** The minimum temperature at which PROCHOT# will be asserted. The value is degree C.
		27:24		**TCC Activation Offset (R/W)** Specifies a temperature offset in degrees C from the temperature target (bits 23:16). PROCHOT# will assert at the offset target temperature. Write is permitted only MSR_PLATFORM_INFO.[30] is set.
		63:28		Reserved.
1AEH	430	MSR_TURBO_RATIO_LIMIT 1	Package	**Maximum Ratio Limit of Turbo Mode** RO if MSR_PLATFORM_INFO.[28] = 0, RW if MSR_PLATFORM_INFO.[28] = 1
		7:0	Package	**Maximum Ratio Limit for 9C** Maximum turbo ratio limit of 9 core active.
		15:8	Package	**Maximum Ratio Limit for 10C** Maximum turbo ratio limit of 10core active.
		23:16	Package	**Maximum Ratio Limit for 11C** Maximum turbo ratio limit of 11 core active.
		31:24	Package	**Maximum Ratio Limit for 12C** Maximum turbo ratio limit of 12 core active.
		63:32		Reserved
285H	645	IA32_MC5_CTL2	Package	See Table 2-2.

47FH	1147	IA32_MC31_MISC	Package	
See Table 2-19, Table 2-25 for other MSR definitions applicable to Intel Xeon processor E7 v2 with CPUID signature 06_3AH.				

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.11.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v2 and E7 v2 Families

Intel Xeon Processor E5 v2 and E7 v2 families are based on the Ivy Bridge-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-23 and Table 2-27. For complete detail of the uncore PMU, refer to Intel Xeon Processor E5 v2 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_3EH.

Table 2-27. Uncore PMU MSRs in Intel® Xeon® Processor E5 v2 and E7 v2 Families

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
C00H		MSR_PMON_GLOBAL_CTL	Package	Uncore perfmon per-socket global control.

2.12 MSRS IN THE 4TH GENERATION INTEL® CORE™ PROCESSORS (BASED ON HASWELL MICROARCHITECTURE)

The 4th generation Intel® Core™ processor family and Intel® Xeon® processor E3-1200v3 product family (based on Haswell microarchitecture), with CPUID DisplayFamily_DisplayModel signature 06_3CH/06_45H/06_46H, support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-21, and Table 2-28. For an MSR listed in Table 2-19 that also appears in Table 2-28, Table 2-28 supercede Table 2-19.

The MSRs listed in Table 2-28 also apply to processors based on Haswell-E microarchitecture (see Section 2.13).

Table 2-28. Additional MSRs Supported by Processors based on the Haswell or Haswell-E microarchitectures

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
3BH	59	IA32_TSC_ADJUST	THREAD	**Per-Logical-Processor TSC ADJUST (R/W)** See Table 2-2.
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information; contains power management and other model specific features enumeration. See http://biosbits.org.

Table 2-28. Additional MSRs Supported by Processors based on the Haswell or Haswell-E microarchitectures

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		7:0		Reserved.
		15:8	Package	**Maximum Non-Turbo Ratio (R/O)** The is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.
		27:16		Reserved.
		28	Package	**Programmable Ratio Limit for Turbo Mode (R/O)** When set to 1, indicates that Programmable Ratio Limits for Turbo mode is enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo mode is disabled.
		29	Package	**Programmable TDP Limit for Turbo Mode (R/O)** When set to 1, indicates that TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDP Limit for Turbo mode is not programmable.
		31:30		Reserved.
		32	Package	**Low Power Mode Support (LPM) (R/O)** When set to 1, indicates that LPM is supported, and when set to 0, indicates LPM is not supported.
		34:33	Package	**Number of ConfigTDP Levels (R/O)** 00: Only Base TDP level available. 01: One additional TDP level available. 02: Two additional TDP level available. 11: Reserved
		39:35		Reserved.
		47:40	Package	**Maximum Efficiency Ratio (R/O)** The is the minimum ratio (maximum efficiency) that the processor can operates, in units of 100MHz.
		55:48	Package	**Minimum Operating Ratio (R/O)** Contains the minimum supported operating ratio in units of 100 MHz.
		63:56		Reserved.
186H	390	IA32_PERFEVTSEL0	THREAD	**Performance Event Select for Counter 0 (R/W)** Supports all fields described inTable 2-2 and the fields below.
		32		IN_TX: see Section 18.3.6.5.1 When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results
187H	391	IA32_PERFEVTSEL1	THREAD	**Performance Event Select for Counter 1 (R/W)** Supports all fields described inTable 2-2 and the fields below.
		32		IN_TX: see Section 18.3.6.5.1 When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results
188H	392	IA32_PERFEVTSEL2	THREAD	**Performance Event Select for Counter 2 (R/W)** Supports all fields described inTable 2-2 and the fields below.

Table 2-28. Additional MSRs Supported by Processors based on the Haswell or Haswell-E microarchitectures

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		32		IN_TX: see Section 18.3.6.5.1 When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results
		33		IN_TXCP: see Section 18.3.6.5.1 When IN_TXCP=1 & IN_TX=1 and in sampling, spurious PMI may occur and transactions may continuously abort near overflow conditions. Software should favor using IN_TXCP for counting over sampling. If sampling, software should use large "sample-after" value after clearing the counter configured to use IN_TXCP and also always reset the counter even when no overflow condition was reported.
189H	393	IA32_PERFEVTSEL3	THREAD	**Performance Event Select for Counter 3 (R/W)** Supports all fields described inTable 2-2 and the fields below.
		32		IN_TX: see Section 18.3.6.5.1 When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results

491H	1169	IA32_VMX_VMFUNC	THREAD	**Capability Reporting Register of VM-function Controls (R/O)** See Table 2-2
60BH	1548	MSR_PKGC_IRTL1	Package	**Package C6/C7 Interrupt Response Limit 1 (R/W)** This MSR defines the interrupt response time limit used by the processor to manage transition to package C6 or C7 state. The latency programmed in this register is for the shorter-latency sub C-states used by an MWAIT hint to C6 or C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		**Interrupt response time limit (R/W)** Specifies the limit that should be used to decide if the package should be put into a package C6 or C7 state.
		12:10		**Time Unit (R/W)** Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-19 for supported time unit encodings.
		14:13		Reserved.
		15		**Valid (R/W)** Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.
		63:16		Reserved.
60CH	1548	MSR_PKGC_IRTL2	Package	**Package C6/C7 Interrupt Response Limit 2 (R/W)** This MSR defines the interrupt response time limit used by the processor to manage transition to package C6 or C7 state. The latency programmed in this register is for the longer-latency sub C-states used by an MWAIT hint to C6 or C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		**Interrupt response time limit (R/W)** Specifies the limit that should be used to decide if the package should be put into a package C6 or C7 state.
		12:10		**Time Unit (R/W)** Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-19 for supported time unit encodings.
		14:13		Reserved.
		15		**Valid (R/W)** Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.
		63:16		Reserved.

2.12.1 MSRs in 4th Generation Intel® Core™ Processor Family (based on Haswell Microarchitecture)

Table 2-29 lists model-specific registers (MSRs) that are specific to 4th generation Intel® Core™ processor family and Intel® Xeon® processor E3-1200 v3 product family (based on Haswell microarchitecture). These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_3CH/06_45H/06_46H, see Table 2-1.

395H	917	MSR_UNC_PERF_FIXED_ CTR	Package	Uncore fixed counter
		47:0		Current count
		63:48		Reserved.
3B3H	945	MSR_UNC_ARB_ PERFEVTSEL1	Package	Uncore Arb unit, counter 1 event select MSR
4E0H	1248	MSR_SMM_FEATURE_CONTR OL	Package	**Enhanced SMM Feature Control (SMM-RW)** Reports SMM capability Enhancement. Accessible only while in SMM.
		0		**Lock (SMM-RWO)** When set to '1' locks this register from further changes
		1		Reserved
		2		**SMM_Code_Chk_En (SMM-RW)** This control bit is available only if MSR_SMM_MCA_CAP[58] == 1. When set to '0' (default) none of the logical processors are prevented from executing SMM code outside the ranges defined by the SMRR. When set to '1' any logical processor in the package that attempts to execute SMM code not within the ranges defined by the SMRR will assert an unrecoverable MCE.
		63:3		Reserved
4E2H	1250	MSR_SMM_DELAYED	Package	**SMM Delayed (SMM-RO)** Reports the interruptible state of all logical processors in the package. Available only while in SMM and MSR_SMM_MCA_CAP[LONG_FLOW_INDICATION] == 1.

Table 2-29. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell microarchitecture) (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		N-1:0		**LOG_PROC_STATE (SMM-RO)** Each bit represents a logical processor of its state in a long flow of internal operation which delays servicing an interrupt. The corresponding bit will be set at the start of long events such as: Microcode Update Load, C6, WBINVD, Ratio Change, Throttle. The bit is automatically cleared at the end of each long event. The reset value of this field is 0. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.
		63:N		Reserved
4E3H	1251	MSR_SMM_BLOCKED	Package	**SMM Blocked (SMM-RO)** Reports the blocked state of all logical processors in the package. Available only while in SMM.
		N-1:0		**LOG_PROC_STATE (SMM-RO)** Each bit represents a logical processor of its blocked state to service an SMI. The corresponding bit will be set if the logical processor is in one of the following states: Wait For SIPI or SENTER Sleep. The reset value of this field is 0FFFH. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.
		63:N		Reserved
606H	1542	MSR_RAPL_POWER_UNIT	Package	**Unit Multipliers used in RAPL Interfaces (R/O)**
		3:0	Package	**Power Units** See Section 14.9.1, "RAPL Interfaces."
		7:4	Package	**Reserved**
		12:8	Package	**Energy Status Units** Energy related information (in Joules) is based on the multiplier, 1/2^ESU; where ESU is an unsigned integer represented by bits 12:8. Default value is 0EH (or 61 micro-joules)
		15:13	Package	**Reserved**
		19:16	Package	**Time Units** See Section 14.9.1, "RAPL Interfaces."
		63:20		Reserved
639H	1593	MSR_PP0_ENERGY_STATUS	Package	**PP0 Energy Status (R/O)** See Section 14.9.4, "PP0/PP1 RAPL Domains."
640H	1600	MSR_PP1_POWER_LIMIT	Package	**PP1 RAPL Power Limit Control (R/W)** See Section 14.9.4, "PP0/PP1 RAPL Domains."
641H	1601	MSR_PP1_ENERGY_STATUS	Package	**PP1 Energy Status (R/O)** See Section 14.9.4, "PP0/PP1 RAPL Domains."
642H	1602	MSR_PP1_POLICY	Package	**PP1 Balance Policy (R/W)** See Section 14.9.4, "PP0/PP1 RAPL Domains."

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
690H	1680	MSR_CORE_PERF_LIMIT_REASONS	Package	**Indicator of Frequency Clipping in Processor Cores (R/W) (frequency refers to processor core frequency)**
		0		**PROCHOT Status (R0)** When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.
		1		**Thermal Status (R0)** When set, frequency is reduced below the operating system request due to a thermal event.
		3:2		Reserved.
		4		**Graphics Driver Status (R0)** When set, frequency is reduced below the operating system request due to Processor Graphics driver override.
		5		**Autonomous Utilization-Based Frequency Control Status (R0)** When set, frequency is reduced below the operating system request because the processor has detected that utilization is low.
		6		**VR Therm Alert Status (R0)** When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.
		7		Reserved.
		8		**Electrical Design Point Status (R0)** When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g. maximum electrical current consumption).
		9		**Core Power Limiting Status (R0)** When set, frequency is reduced below the operating system request due to domain-level power limiting.
		10		**Package-Level Power Limiting PL1 Status (R0)** When set, frequency is reduced below the operating system request due to package-level power limiting PL1.
		11		**Package-Level PL2 Power Limiting Status (R0)** When set, frequency is reduced below the operating system request due to package-level power limiting PL2.
		12		**Max Turbo Limit Status (R0)** When set, frequency is reduced below the operating system request due to multi-core turbo limits.
		13		**Turbo Transition Attenuation Status (R0)** When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.
		15:14		**Reserved**

2.13 MSRS IN INTEL® XEON® PROCESSOR E5 V3 AND E7 V3 PRODUCT FAMILY

Intel® Xeon® processor E5 v3 family and Intel® Xeon® processor E7 v3 family are based on Haswell-E microarchitecture (CPUID DisplayFamily_DisplayModel = 06_3F). These processors supports the MSR interfaces listed in Table 2-19, Table 2-28, and Table 2-31.

Table 2-31. Additional MSRs Supported by Intel® Xeon® Processor E5 v3 Family

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
35H	53	MSR_CORE_THREAD_COUNT	Package	**Configured State of Enabled Processor Core Count and Logical Processor Count (RO)** ▪ After a Power-On RESET, enumerates factory configuration of the number of processor cores and logical processors in the physical package. ▪ Following the sequence of (i) BIOS modified a Configuration Mask which selects a subset of processor cores to be active post RESET and (ii) a RESET event after the modification, enumerates the current configuration of enabled processor core count and logical processor count in the physical package.
		15:0		**Core_COUNT (RO)** The number of processor cores that are currently enabled (by either factory configuration or BIOS configuration) in the physical package.
		31:16		**THREAD_COUNT (RO)** The number of logical processors that are currently enabled (by either factory configuration or BIOS configuration) in the physical package.
		63:32		Reserved
53H	83	MSR_THREAD_ID_INFO	Thread	**A Hardware Assigned ID for the Logical Processor (RO)**
		7:0		**Logical_Processor_ID (RO)** An implementation-specific numerical. value physically assigned to each logical processor. This ID is not related to Initial APIC ID or x2APIC ID, it is unique within a physical package.
		63:8		Reserved

		1:0	Package	**PCIE Ratio (R/W)** 00b: Use 5:5 mapping for100MHz operation (default) 01b: Use 5:4 mapping for125MHz operation 10b: Use 5:3 mapping for166MHz operation 11b: Use 5:2 mapping for250MHz operation
		2	Package	**LPLL Select (R/W)** if 1, use configured setting of PCIE Ratio
		3	Package	**LONG RESET (R/W)** if 1, wait additional time-out before re-locking Gen2/Gen3 PLLs.
		63:4		Reserved
620H	1568	MSR UNCORE_RATIO_LIMIT	Package	Uncore Ratio Limit (R/W) Out of reset, the min_ratio and max_ratio fields represent the widest possible range of uncore frequencies. Writing to these fields allows software to control the minimum and the maximum frequency that hardware will select.
		63:15		Reserved.
		14:8		MIN_RATIO Writing to this field controls the minimum possible ratio of the LLC/Ring.
		7		Reserved.
		6:0		MAX_RATIO This field is used to limit the max ratio of the LLC/Ring.
639H	1593	MSR_PP0_ENERGY_STATUS	Package	**Reserved (R/O)** Reads return 0
690H	1680	MSR_CORE_PERF_LIMIT_RE ASONS	Package	**Indicator of Frequency Clipping in Processor Cores (R/W)** **(frequency refers to processor core frequency)**
		0		**PROCHOT Status (R0)** When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.

Table 2-31. Additional MSRs Supported by Intel® Xeon® Processor E5 v3 Family

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		1		**Thermal Status (R0)** When set, frequency is reduced below the operating system request due to a thermal event.
		2		**Power Budget Management Status (R0)** When set, frequency is reduced below the operating system request due to PBM limit
		3		**Platform Configuration Services Status (R0)** When set, frequency is reduced below the operating system request due to PCS limit
		4		Reserved.
		5		**Autonomous Utilization-Based Frequency Control Status (R0)** When set, frequency is reduced below the operating system request because the processor has detected that utilization is low
		6		**VR Therm Alert Status (R0)** When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.
		7		Reserved.
		8		**Electrical Design Point Status (R0)** When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g. maximum electrical current consumption).
		9		Reserved.
		10		**Multi-Core Turbo Status (R0)** When set, frequency is reduced below the operating system request due to Multi-Core Turbo limits
		12:11		Reserved.
		13		**Core Frequency P1 Status (R0)** When set, frequency is reduced below max non-turbo P1
		14		**Core Max n-core Turbo Frequency Limiting Status (R0)** When set, frequency is reduced below max n-core turbo frequency
		15		**Core Frequency Limiting Status (R0)** When set, frequency is reduced below the operating system request.
		16		**PROCHOT Log** When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		17		**Thermal Log** When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.

Table 2-31. Additional MSRs Supported by Intel® Xeon® Processor E5 v3 Family

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		18		**Power Budget Management Log** When set, indicates that the PBM Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		19		**Platform Configuration Services Log** When set, indicates that the PCS Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		20		Reserved.
		21		**Autonomous Utilization-Based Frequency Control Log** When set, indicates that the AUBFC Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		22		**VR Therm Alert Log** When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		23		Reserved.
		24		**Electrical Design Point Log** When set, indicates that the EDP Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		25		Reserved.
		26		**Multi-Core Turbo Log** When set, indicates that the Multi-Core Turbo Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		28:27		Reserved.
		29		**Core Frequency P1 Log** When set, indicates that the Core Frequency P1 Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		30		**Core Max n-core Turbo Frequency Limiting Log** When set, indicates that the Core Max n-core Turbo Frequency Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		31		**Core Frequency Limiting Log** When set, indicates that the Core Frequency Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		63:32		Reserved.

Table 2-31. Additional MSRs Supported by Intel® Xeon® Processor E5 v3 Family

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
C8DH	3213	IA32_QM_EVTSEL	THREAD	**Monitoring Event Select Register (R/W)** if CPUID.(EAX=07H, ECX=0):EBX.RDT-M[bit 12] = 1
		7:0		**EventID (RW)** **Event encoding:** **0x0: no monitoring** **0x1: L3 occupancy monitoring** **all other encoding reserved.**
		31:8		Reserved.
		41:32		**RMID (RW)**
		63:42		Reserved.
C8EH	3214	IA32_QM_CTR	THREAD	**Monitoring Counter Register (R/O).** if CPUID.(EAX=07H, ECX=0):EBX.RDT-M[bit 12] = 1
		61:0		**Resource Monitored Data**
		62		**Unavailable**: If 1, indicates data for this RMID is not available or not monitored for this resource or RMID.
		63		**Error:** If 1, indicates and unsupported RMID or event type was written to IA32_PQR_QM_EVTSEL.
C8FH	3215	IA32_PQR_ASSOC	THREAD	**Resource Association Register (R/W).**
		9:0		**RMID**
		63: 10		**Reserved**
See Table 2-19, Table 2-28 for other MSR definitions applicable to processors with CPUID signature 06_3FH.				

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.13.1 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v3 Family

Intel Xeon Processor E5 v3 and E7 v3 family are based on the Haswell-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-32. For complete detail of the uncore PMU, refer to Intel Xeon Processor E5 v3 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_3FH.

Table 2-32. Uncore PMU MSRs in Intel® Xeon® Processor E5 v3 Family

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
700H		MSR_PMON_GLOBAL_CTL	Package	Uncore perfmon per-socket global control.
701H		MSR_PMON_GLOBAL_STATUS	Package	Uncore perfmon per-socket global status.
702H		MSR_PMON_GLOBAL_CONFIG	Package	Uncore perfmon per-socket global configuration.
703H		MSR_U_PMON_UCLK_FIXED_CTL	Package	Uncore U-box UCLK fixed counter control
704H		MSR_U_PMON_UCLK_FIXED_CTR	Package	Uncore U-box UCLK fixed counter

Table 2-32. Uncore PMU MSRs in Intel® Xeon® Processor E5 v3 Family (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
705H		MSR_U_PMON_EVNTSEL0	Package	Uncore U-box perfmon event select for U-box counter 0.
706H		MSR_U_PMON_EVNTSEL1	Package	Uncore U-box perfmon event select for U-box counter 1.
708H		MSR_U_PMON_BOX_STATUS	Package	Uncore U-box perfmon U-box wide status.
709H		MSR_U_PMON_CTR0	Package	Uncore U-box perfmon counter 0
70AH		MSR_U_PMON_CTR1	Package	Uncore U-box perfmon counter 1
710H		MSR_PCU_PMON_BOX_CTL	Package	Uncore PCU perfmon for PCU-box-wide control
711H		MSR_PCU_PMON_EVNTSEL0	Package	Uncore PCU perfmon event select for PCU counter 0.
712H		MSR_PCU_PMON_EVNTSEL1	Package	Uncore PCU perfmon event select for PCU counter 1.
713H		MSR_PCU_PMON_EVNTSEL2	Package	Uncore PCU perfmon event select for PCU counter 2.
714H		MSR_PCU_PMON_EVNTSEL3	Package	Uncore PCU perfmon event select for PCU counter 3.
715H		MSR_PCU_PMON_BOX_FILTER	Package	Uncore PCU perfmon box-wide filter.
716H		MSR_PCU_PMON_BOX_STATUS	Package	Uncore PCU perfmon box wide status.
717H		MSR_PCU_PMON_CTR0	Package	Uncore PCU perfmon counter 0.
718H		MSR_PCU_PMON_CTR1	Package	Uncore PCU perfmon counter 1.
719H		MSR_PCU_PMON_CTR2	Package	Uncore PCU perfmon counter 2.
71AH		MSR_PCU_PMON_CTR3	Package	Uncore PCU perfmon counter 3.
720H		MSR_S0_PMON_BOX_CTL	Package	Uncore SBo 0 perfmon for SBo 0 box-wide control
721H		MSR_S0_PMON_EVNTSEL0	Package	Uncore SBo 0 perfmon event select for SBo 0 counter 0.
722H		MSR_S0_PMON_EVNTSEL1	Package	Uncore SBo 0 perfmon event select for SBo 0 counter 1.
723H		MSR_S0_PMON_EVNTSEL2	Package	Uncore SBo 0 perfmon event select for SBo 0 counter 2.
724H		MSR_S0_PMON_EVNTSEL3	Package	Uncore SBo 0 perfmon event select for SBo 0 counter 3.
725H		MSR_S0_PMON_BOX_FILTER	Package	Uncore SBo 0 perfmon box-wide filter.
726H		MSR_S0_PMON_CTR0	Package	Uncore SBo 0 perfmon counter 0.
727H		MSR_S0_PMON_CTR1	Package	Uncore SBo 0 perfmon counter 1.
728H		MSR_S0_PMON_CTR2	Package	Uncore SBo 0 perfmon counter 2.
729H		MSR_S0_PMON_CTR3	Package	Uncore SBo 0 perfmon counter 3.
72AH		MSR_S1_PMON_BOX_CTL	Package	Uncore SBo 1 perfmon for SBo 1 box-wide control
72BH		MSR_S1_PMON_EVNTSEL0	Package	Uncore SBo 1 perfmon event select for SBo 1 counter 0.
72CH		MSR_S1_PMON_EVNTSEL1	Package	Uncore SBo 1 perfmon event select for SBo 1 counter 1.
72DH		MSR_S1_PMON_EVNTSEL2	Package	Uncore SBo 1 perfmon event select for SBo 1 counter 2.
72EH		MSR_S1_PMON_EVNTSEL3	Package	Uncore SBo 1 perfmon event select for SBo 1 counter 3.
72FH		MSR_S1_PMON_BOX_FILTER	Package	Uncore SBo 1 perfmon box-wide filter.
730H		MSR_S1_PMON_CTR0	Package	Uncore SBo 1 perfmon counter 0.
731H		MSR_S1_PMON_CTR1	Package	Uncore SBo 1 perfmon counter 1.
732H		MSR_S1_PMON_CTR2	Package	Uncore SBo 1 perfmon counter 2.
733H		MSR_S1_PMON_CTR3	Package	Uncore SBo 1 perfmon counter 3.
734H		MSR_S2_PMON_BOX_CTL	Package	Uncore SBo 2 perfmon for SBo 2 box-wide control

Table 2-32. Uncore PMU MSRs in Intel® Xeon® Processor E5 v3 Family (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
735H		MSR_S2_PMON_EVNTSEL0	Package	Uncore SBo 2 perfmon event select for SBo 2 counter 0.
736H		MSR_S2_PMON_EVNTSEL1	Package	Uncore SBo 2 perfmon event select for SBo 2 counter 1.
737H		MSR_S2_PMON_EVNTSEL2	Package	Uncore SBo 2 perfmon event select for SBo 2 counter 2.
738H		MSR_S2_PMON_EVNTSEL3	Package	Uncore SBo 2 perfmon event select for SBo 2 counter 3.
739H		MSR_S2_PMON_BOX_FILTER	Package	Uncore SBo 2 perfmon box-wide filter.
73AH		MSR_S2_PMON_CTR0	Package	Uncore SBo 2 perfmon counter 0.
73BH		MSR_S2_PMON_CTR1	Package	Uncore SBo 2 perfmon counter 1.
73CH		MSR_S2_PMON_CTR2	Package	Uncore SBo 2 perfmon counter 2.
73DH		MSR_S2_PMON_CTR3	Package	Uncore SBo 2 perfmon counter 3.
73EH		MSR_S3_PMON_BOX_CTL	Package	Uncore SBo 3 perfmon for SBo 3 box-wide control
73FH		MSR_S3_PMON_EVNTSEL0	Package	Uncore SBo 3 perfmon event select for SBo 3 counter 0.
740H		MSR_S3_PMON_EVNTSEL1	Package	Uncore SBo 3 perfmon event select for SBo 3 counter 1.
741H		MSR_S3_PMON_EVNTSEL2	Package	Uncore SBo 3 perfmon event select for SBo 3 counter 2.
742H		MSR_S3_PMON_EVNTSEL3	Package	Uncore SBo 3 perfmon event select for SBo 3 counter 3.
743H		MSR_S3_PMON_BOX_FILTER	Package	Uncore SBo 3 perfmon box-wide filter.
744H		MSR_S3_PMON_CTR0	Package	Uncore SBo 3 perfmon counter 0.
745H		MSR_S3_PMON_CTR1	Package	Uncore SBo 3 perfmon counter 1.
746H		MSR_S3_PMON_CTR2	Package	Uncore SBo 3 perfmon counter 2.
747H		MSR_S3_PMON_CTR3	Package	Uncore SBo 3 perfmon counter 3.
E00H		MSR_C0_PMON_BOX_CTL	Package	Uncore C-box 0 perfmon for box-wide control
E01H		MSR_C0_PMON_EVNTSEL0	Package	Uncore C-box 0 perfmon event select for C-box 0 counter 0.
E02H		MSR_C0_PMON_EVNTSEL1	Package	Uncore C-box 0 perfmon event select for C-box 0 counter 1.
E03H		MSR_C0_PMON_EVNTSEL2	Package	Uncore C-box 0 perfmon event select for C-box 0 counter 2.
E04H		MSR_C0_PMON_EVNTSEL3	Package	Uncore C-box 0 perfmon event select for C-box 0 counter 3.
E05H		MSR_C0_PMON_BOX_FILTER0	Package	Uncore C-box 0 perfmon box wide filter 0.
E06H		MSR_C0_PMON_BOX_FILTER1	Package	Uncore C-box 0 perfmon box wide filter 1.
E07H		MSR_C0_PMON_BOX_STATUS	Package	Uncore C-box 0 perfmon box wide status.
E08H		MSR_C0_PMON_CTR0	Package	Uncore C-box 0 perfmon counter 0.
E09H		MSR_C0_PMON_CTR1	Package	Uncore C-box 0 perfmon counter 1.
E0AH		MSR_C0_PMON_CTR2	Package	Uncore C-box 0 perfmon counter 2.
E0BH		MSR_C0_PMON_CTR3	Package	Uncore C-box 0 perfmon counter 3.
E10H		MSR_C1_PMON_BOX_CTL	Package	Uncore C-box 1 perfmon for box-wide control
E11H		MSR_C1_PMON_EVNTSEL0	Package	Uncore C-box 1 perfmon event select for C-box 1 counter 0.
E12H		MSR_C1_PMON_EVNTSEL1	Package	Uncore C-box 1 perfmon event select for C-box 1 counter 1.
E13H		MSR_C1_PMON_EVNTSEL2	Package	Uncore C-box 1 perfmon event select for C-box 1 counter 2.
E14H		MSR_C1_PMON_EVNTSEL3	Package	Uncore C-box 1 perfmon event select for C-box 1 counter 3.
E15H		MSR_C1_PMON_BOX_FILTER0	Package	Uncore C-box 1 perfmon box wide filter 0.

Table 2-32. Uncore PMU MSRs in Intel® Xeon® Processor E5 v3 Family (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
E16H		MSR_C1_PMON_BOX_FILTER1	Package	Uncore C-box 1 perfmon box wide filter1.
E17H		MSR_C1_PMON_BOX_STATUS	Package	Uncore C-box 1 perfmon box wide status.
E18H		MSR_C1_PMON_CTR0	Package	Uncore C-box 1 perfmon counter 0.
E19H		MSR_C1_PMON_CTR1	Package	Uncore C-box 1 perfmon counter 1.
E1AH		MSR_C1_PMON_CTR2	Package	Uncore C-box 1 perfmon counter 2.
E1BH		MSR_C1_PMON_CTR3	Package	Uncore C-box 1 perfmon counter 3.
E20H		MSR_C2_PMON_BOX_CTL	Package	Uncore C-box 2 perfmon for box-wide control
E21H		MSR_C2_PMON_EVNTSEL0	Package	Uncore C-box 2 perfmon event select for C-box 2 counter 0.
E22H		MSR_C2_PMON_EVNTSEL1	Package	Uncore C-box 2 perfmon event select for C-box 2 counter 1.
E23H		MSR_C2_PMON_EVNTSEL2	Package	Uncore C-box 2 perfmon event select for C-box 2 counter 2.
E24H		MSR_C2_PMON_EVNTSEL3	Package	Uncore C-box 2 perfmon event select for C-box 2 counter 3.
E25H		MSR_C2_PMON_BOX_FILTER0	Package	Uncore C-box 2 perfmon box wide filter 0.
E26H		MSR_C2_PMON_BOX_FILTER1	Package	Uncore C-box 2 perfmon box wide filter1.
E27H		MSR_C2_PMON_BOX_STATUS	Package	Uncore C-box 2 perfmon box wide status.
E28H		MSR_C2_PMON_CTR0	Package	Uncore C-box 2 perfmon counter 0.
E29H		MSR_C2_PMON_CTR1	Package	Uncore C-box 2 perfmon counter 1.

2.14 MSRS IN INTEL® CORE™ M PROCESSORS AND 5TH GENERATION INTEL CORE PROCESSORS

The Intel® Core™ M-5xxx processors and 5th generation Intel® Core™ Processors, and Intel® Xeon® Processor E3-1200 v4 family are based on the Broadwell microarchitecture. The Intel® Core™ M-5xxx processors and 5th generation Intel® Core™ Processors have CPUID DisplayFamily_DisplayModel signature 06_3DH. Intel® Xeon® Processor E3-1200 v4 family and the 5th generation Intel® Core™ Processors have CPUID DisplayFamily_DisplayModel signature 06_47H. Processors with signatures 06_3DH and 06_47H support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-21, Table 2-24, Table 2-28, Table 2-29, Table 2-33, and Table 2-34. For an MSR listed in Table 2-34 that also appears in the model-specific tables of prior generations, Table 2-34 supercede prior generation tables.

Table 2-33 lists MSRs that are common to processors based on the Broadwell microarchitectures (including CPUID signatures 06_3DH, 06_47H, 06_4FH, and 06_56H).

Table 2-33. Additional MSRs Common to Processors Based the Broadwell Microarchitectures

Register Address		Register Name	Scope	Bit Description

		31:24	Package	**Maximum Ratio Limit for 4C** Maximum turbo ratio limit of 4 core active.
		39:32	Package	**Maximum Ratio Limit for 5C** Maximum turbo ratio limit of 5core active.
		47:40	Package	**Maximum Ratio Limit for 6C** Maximum turbo ratio limit of 6core active.
		63:48		Reserved.
639H	1593	MSR_PP0_ENERGY_STATUS	Package	**PP0 Energy Status (R/O)** See Section 14.9.4, "PP0/PP1 RAPL Domains."
See Table 2-19, Table 2-20, Table 2-21, Table 2-24, Table 2-28, Table 2-29, Table 2-33 for other MSR definitions applicable to processors with CPUID signature 06_3DH.				

2.15 MSRS IN INTEL® XEON® PROCESSORS E5 V4 FAMILY

The MSRs listed in Table 2-35 are available and common to Intel® Xeon® Processor D product Family (CPUID DisplayFamily_DisplayModel = 06_56H) and to Intel Xeon processors E5 v4, E7 v4 families (CPUID DisplayFamily_DisplayModel = 06_4FH). They are based on the Broadwell microarchitecture.

See Section 2.15.1 for lists of tables of MSRs that are supported by Intel® Xeon® Processor D Family.

See Table 2-19, Table 2-28, Table 2-33, and Table 2-35 for other MSR definitions applicable to processors with CPUID signature 06_56H.				

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.15.2 Additional MSRs Supported in Intel® Xeon® Processors E5 v4 and E7 v4 Families

The MSRs listed in Table 2-36 are available to Intel® Xeon® Processor E5 v4 and E7 v4 Families (CPUID DisplayFamily_DisplayModel = 06_4FH). The Intel® Xeon® processor E5 v4 family is based on the Broadwell

microarchitecture and supports the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-28, Table 2-33, Table 2-35, and Table 2-37.

Table 2-37. Additional MSRs Supported by Intel® Xeon® Processors with DisplayFamily_DisplayModel 06_4FH

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
1ACH	428	MSR_TURBO_RATIO_LIMIT3	Package	**Config Ratio Limit of Turbo Mode** RO if MSR_PLATFORM_INFO.[28] = 0, RW if MSR_PLATFORM_INFO.[28] = 1
		62:0	Package	Reserved
		63	Package	**Semaphore for Turbo Ratio Limit Configuration** If 1, the processor uses override configuration[1] specified in MSR_TURBO_RATIO_LIMIT, MSR_TURBO_RATIO_LIMIT1 and MSR_TURBO_RATIO_LIMIT2. If 0, the processor uses factory-set configuration (Default).
285H	645	IA32_MC5_CTL2	Package	See Table 2-2.
286H	646	IA32_MC6_CTL2	Package	See Table 2-2.
287H	647	IA32_MC7_CTL2	Package	See Table 2-2.
288H	648	IA32_MC8_CTL2	Package	See Table 2-2.
289H	649	IA32_MC9_CTL2	Package	See Table 2-2.
28AH	650	IA32_MC10_CTL2	Package	See Table 2-2.
28BH	651	IA32_MC11_CTL2	Package	See Table 2-2.

		0		CAT Enable. Set 1 to enable Cache Allocation Technology
		63:1		Reserved.
See Table 2-19, Table 2-20, Table 2-28, and Table 2-29 for other MSR definitions applicable to processors with CPUID signature 06_45H.				

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.16 MSRS IN THE 6TH GENERATION INTEL® CORE™ PROCESSORS, INTEL® XEON® PROCESSOR SCALABLE FAMILY, 7TH GENERATION INTEL® CORE™ PROCESSORS, AND FUTURE INTEL® CORE™ PROCESSORS

6th generation Intel® Core™ processors and the Intel® Xeon® Processor Scalable Family are based on the Skylake microarchitecture and have CPUID DisplayFamily_DisplayModel signatures of 06_4EH, 06_5EH, and 06_55H. 7th Generation Intel® Core™ processors are based on the Kaby Lake microarchitecture and have CPUID DisplayFamily_DisplayModel signatures of 06_8EH and 06_9EH. Future Intel® Core™ processors are based on Cannon Lake microarchitecture and have a CPUID DisplayFamily_DisplayModel signature of 06_66H. These processors support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-24, Table 2-28, Table 2-34, Table 2-38, and Table 2-39. For an MSR listed in Table 2-38 that also appears in the model-specific tables of prior generations, Table 2-38 supercede prior generation tables.

The notation of "Platform" in the Scope column (with respect to MSR_PLATFORM_ENERGY_COUNTER and MSR_PLATFORM_POWER_LIMIT) is limited to the power-delivery domain and the specifics of the power delivery integration may vary by platform vendor's implementation.

Table 2-38. Additional MSRs Supported by 6th Generation Intel® Core™ Processors and the Intel® Xeon® Processor Scalable Family Based on Skylake Microarchitecture, 7th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture, and Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Additional MSRs Supported by 6th Generation Intel® Core™ Processors and the Intel® Xeon® Processor Scalable Family Based on Skylake Microarchitecture, 7th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture, and Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		0		Reserved.
		1	Package	**C1E Enable (R/W)** When set to '1', will enable the CPU to switch to the Minimum Enhanced Intel SpeedStep Technology operating point when all execution cores enter MWAIT (C1).
		18:2		Reserved.
		19		**Disable Race to Halt Optimization (R/W)** Setting this bit disables the Race to Halt optimization and avoid this optimization limitation to execute below the most efficient frequency ratio. Default value is 0 for processors that support Race to Halt optimization. Default value is 1 for processors that do not support Race to Halt optimization.
		20		**Disable Energy Efficiency Optimization (R/W)** Setting this bit disables the P-States energy efficiency optimization. Default value is 0. Disable/enable the energy efficiency optimization in P-State legacy mode (when IA32_PM_ENABLE[HWP_ENABLE] = 0), has an effect only in the turbo range or into PERF_MIN_CTL value if it is not zero set. In HWP mode (IA32_PM_ENABLE[HWP_ENABLE] == 1), has an effect between the OS desired or OS maximize to the OS minimize performance setting.
		63:21		Reserved.
300H	768	MSR_SGXOWNEREPOCH0	Package	**Lower 64 Bit CR_SGXOWNEREPOCH (W)** Writes do not update CR_SGXOWNEREPOCH if CPUID.(EAX=12H, ECX=0):EAX.SGX1 is 1 on any thread in the package.
		63:0		Lower 64 bits of an 128-bit external entropy value for key derivation of an enclave.
301H	768	MSR_SGXOWNEREPOCH1	Package	**Upper 64 Bit CR_SGXOWNEREPOCH (W)** Writes do not update CR_SGXOWNEREPOCH if CPUID.(EAX=12H, ECX=0):EAX.SGX1 is 1 on any thread in the package.
		63:0		Upper 64 bits of an 128-bit external entropy value for key derivation of an enclave.

658H	1624	MSR_WEIGHTED_CORE_C0	Package	Core-count Weighted C0 Residency. (R/O).
		63:0		Increment at the same rate as the TSC. The increment each cycle is weighted by the number of processor cores in the package that reside in C0. If N cores are simultaneously in C0, then each cycle the counter increments by N.
659H	1625	MSR_ANY_CORE_C0	Package	Any Core C0 Residency. (R/O)
		63:0		Increment at the same rate as the TSC. The increment each cycle is one if any processor core in the package is in C0.
65AH	1626	MSR_ANY_GFXE_C0	Package	Any Graphics Engine C0 Residency. (R/O)
		63:0		Increment at the same rate as the TSC. The increment each cycle is one if any processor graphic device's compute engines are in C0.
65BH	1627	MSR_CORE_GFXE_OVERLAP_C0	Package	Core and Graphics Engine Overlapped C0 Residency. (R/O)
		63:0		Increment at the same rate as the TSC. The increment each cycle is one if at least one compute engine of the processor graphics is in C0 and at least one processor core in the package is also in C0.
65CH	1628	MSR_PLATFORM_POWER_LIMIT	Platform*	**Platform Power Limit Control (R/W-L)** Allows platform BIOS to limit power consumption of the platform devices to the specified values. The Long Duration power consumption is specified via Platform_Power_Limit_1 and Platform_Power_Limit_1_Time. The Short Duration power consumption limit is specified via the Platform_Power_Limit_2 with duration chosen by the processor. The processor implements an exponential-weighted algorithm in the placement of the time windows.

Table 2-38. Additional MSRs Supported by 6th Generation Intel® Core™ Processors and the Intel® Xeon® Processor Scalable Family Based on Skylake Microarchitecture, 7th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture, and Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		14:0		Platform Power Limit #1. Average Power limit value which the platform must not exceed over a time window as specified by Power_Limit_1_TIME field. The default value is the Thermal Design Power (TDP) and varies with product skus. The unit is specified in MSR_RAPLPOWER_UNIT.
		15		Enable Platform Power Limit #1. When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit #1 over the time window specified by Power Limit #1 Time Window.
		16		Platform Clamping Limitation #1. When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit #1 value. This bit is writeable only when CPUID (EAX=6):EAX[4] is set.
		23:17		Time Window for Platform Power Limit #1. Specifies the duration of the time window over which Platform Power Limit 1 value should be maintained for sustained long duration. This field is made up of two numbers from the following equation: Time Window = (float) ((1+(X/4))*(2^Y)), where: X = POWER_LIMIT_1_TIME[23:22] Y = POWER_LIMIT_1_TIME[21:17]. The maximum allowed value in this field is defined in MSR_PKG_POWER_INFO[PKG_MAX_WIN]. The default value is 0DH, The unit is specified in MSR_RAPLPOWER_UNIT[Time Unit].
		31:24		Reserved
		46:32		Platform Power Limit #2. Average Power limit value which the platform must not exceed over the Short Duration time window chosen by the processor. The recommended default value is 1.25 times the Long Duration Power Limit (i.e. Platform Power Limit # 1)
		47		Enable Platform Power Limit #2. When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit #2 over the Short Duration time window.
		48		Platform Clamping Limitation #2. When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit #2 value.
		62:49		Reserved
		63		Lock. Setting this bit will lock all other bits of this MSR until system RESET.

DB1H	3505	IA32_PM_CTL1	Thread	See Section 14.5.

Table 2-39. Uncore PMU MSRs Supported by 6th Generation Intel® Core™ Processors, 7th Generation Intel® Core™ Processors, and Future Intel® Core™ Processors

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
737H	1847	MSR_UNC_CBO_3_PERFCTR1	Package	Uncore C-Box 3, performance counter 1.
E01H	3585	MSR_UNC_PERF_GLOBAL_ CTRL	Package	Uncore PMU global control
		0		Slice 0 select
		1		Slice 1 select
		2		Slice 2 select
		3		Slice 3 select
		4		Slice 4select
		18:5		Reserved.
		29		Enable all uncore counters
		30		Enable wake on PMI
		31		Enable Freezing counter when overflow
		63:32		Reserved.
E02H	3586	MSR_UNC_PERF_GLOBAL_ STATUS	Package	Uncore PMU main status
		0		Fixed counter overflowed
		1		An ARB counter overflowed
		2		Reserved
		3		A CBox counter overflowed (on any slice)
		63:4		Reserved.

2.16.1 MSRs Specific to 7th Generation Intel® Core™ Processors based on Kaby Lake Microarchitecture

Table 2-41 lists additional MSRs for 7th generation Intel Core processors with a CPUID DisplayFamily_DisplayModel signature of 06_8EH and 06_9EH. For an MSR listed in Table 2-41 that also appears in the model-specific tables of prior generations, Table 2-41 supersedes prior generation tables.

Table 2-40. Additional MSRs Supported by 7th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
80H	128	MSR_TRACE_HUB_STH_ACPIBAR_BASE	Package	NPK address used by AET messages (R/W)
		0		Lock Bit If set then this MSR cannot be re-written anymore. Lock bit has to be set in order for the AET packets to be directed to NPK MMIO.
		17:1		Reserved.
		63:18		ACPIBAR_BASE_ADDRESS AET target address in NPK MMIO space.
1F4H	500	MSR_PRMRR_PHYS_BASE	Core	Processor Reserved Memory Range Register - Physical Base Control Register (R/W)
		2:0		MemType PRMRR BASE MemType.
		11:3		Reserved.
		45:12		Base PRMRR Base Address.
		63:46		Reserved.
1F5H	501	MSR_PRMRR_PHYS_MASK	Core	Processor Reserved Memory Range Register - Physical Mask Control Register (R/W)
		9:0		Reserved.
		10		Lock Lock bit for the PRMRR.
		11		VLD Enable bit for the PRMRR.
		45:12		Mask PRMRR MASK bits.
		63:46		Reserved.
1FBH	507	MSR_PRMRR_VALID_CONFIG	Core	Valid PRMRR Configurations (R/W)
		0		1M supported MEE size.
		4:1		Reserved.
		5		32M supported MEE size.
		6		64M supported MEE size.
		7		128M supported MEE size.

Table 2-40. Additional MSRs Supported by 7th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		31:8		Reserved.
2F4H	756	MSR_UNCORE_PRMRR_PHYS_BASE	Package	(R/W) The PRMRR range is used to protect Xucode memory from unauthorized reads and writes. Any IO access to this range is aborted. This register controls the location of the PRMRR range by indicating its starting address. It functions in tandem with the PRMRR mask register.
		11:0		Reserved.
		38:12		Range Base This field corresponds to bits 38:12 of the base address memory range which is allocated to PRMRR memory.
		63:39		Reserved.
2F5H	757	MSR_UNCORE_PRMRR_PHYS_MASK	Package	(R/W) This register controls the size of the PRMRR range by indicating which address bits must match the PRMRR base register value.
		9:0		Reserved.
		10		Lock Setting this bit locks all writeable settings in this register, including itself.
		11		Range_En Indicates whether the PRMRR range is enabled and valid.
		38:12		Range_Mask This field indicates which address bits must match PRMRR base in order to qualify as an PRMRR access.
		63:39		Reserved.
620H	1568	MSR_RING_RATIO_LIMIT	Package	Ring Ratio Limit (R/W) This register provides Min/Max Ratio Limits for the LLC and Ring.
		6:0		MAX_Ratio This field is used to limit the max ratio of the LLC/Ring.
		7		Reserved.
		14:8		MIN_Ratio Writing to this field controls the minimum possible ratio of the LLC/Ring.
		63:15		Reserved.

2.16.2 MSRs Specific to Future Intel® Core™ Processors

Table 2-41 lists additional MSRs for Future Intel Core processors with a CPUID DisplayFamily_DisplayModel signature of 06_66H. For an MSR listed in Table 2-41 that also appears in the model-specific tables of prior generations, Table 2-41 supersede prior generation tables.

Table 2-41. Additional MSRs Supported by Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
3AH	58	IA32_FEATURE_CONTROL	Thread	**Control Features in Intel 64 Processor (R/W)** See Table 2-2.
		0		**Lock (R/WL)**
		1		**Enable VMX inside SMX operation (R/WL)**
		2		**Enable VMX outside SMX operation (R/WL)**
		14:8		**SENTER local functions enables (R/WL)**
		15		**SENTER global functions enable (R/WL)**
		17		**SGX Launch Control Enable (R/WL)** This bit must be set to enable runtime reconfiguration of SGX Launch Control via IA32_SGXLEPUBKEYHASHn MSR. Available only if CPUID.(EAX=07H, ECX=0H): ECX[30] = 1.
		18		**SGX global functions enable (R/WL)**
		63:21		Reserved.
350H	848	MSR_BR_DETECT_CTRL		Branch Monitoring Global Control (R/W)
		0		EnMonitoring Global enable for branch monitoring.
		1		EnExcept Enable branch monitoring event signaling on threshold trip. The branch monitoring event handler is signaled via the existing PMI signaling mechanism as programmed from the corresponding local APIC LVT entry.
		2		EnLBRFrz Enable LBR freeze on threshold trip. This will result in causing the LBR frozen bit 58 to be set in IA32_PERF_GLOBAL_STATUS when a triggering condition occurs and this bit is enabled.
		3		DisableInGuest When set to '1', branch monitoring, event triggering and LBR freeze actions are disabled when operating at VMX non-root operation.
		7:4		Reserved.
		17:8		WindowSize Window size defined by WindowCntSel. Values 0 – 1023 are supported. Once the Window counter reaches the WindowSize count both the Window Counter and all Branch Monitoring Counters are cleared.
		23:18		Reserved.

Table 2-41. Additional MSRs Supported by Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		25:24		WindowCntSel Window event count select: '00 = Instructions retired. '01 = Branch instructions retired '10 = Return instructions retired. '11 = Indirect branch instructions retired.
		26		CntAndMode When set to '1', overall branch monitoring event triggering condition is true only if all enabled counters' threshold conditions are true. When '0', the threshold tripping condition is true if any enabled counters' threshold is true.
		63:27		Reserved.
351H	849	MSR_BR_DETECT_STATUS		Branch Monitoring Global Status (R/W)
		0		Branch Monitoring Event Signaled When set to '1', Branch Monitoring event signaling is blocked until this bit is cleared by software.
		1		LBRsValid This status bit is set to '1' if the LBR state is considered valid for sampling by branch monitoring software.
		7:2		Reserved.
		8		CntrHit0 Branch monitoring counter #0 threshold hit. This status bit is sticky and once set requires clearing by software. Counter operation continues independent of the state of the bit.
		9		CntrHit1 Branch monitoring counter #1 threshold hit. This status bit is sticky and once set requires clearing by software. Counter operation continues independent of the state of the bit.
		15:10		Reserved. Reserved for additional branch monitoring counters threshold hit status.
		25:16		CountWindow The current value of window counter. The count value is frozen on a valid branch monitoring triggering condition. This is an 10-bit unsigned value.
		31:26		Reserved. Reserved for future extension of CountWindow.

Table 2-41. Additional MSRs Supported by Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		39:32		Count0 The current value of counter 0 updated after each occurrence of the event being counted. The count value is frozen on a valid branch monitoring triggering condition (in which case CntrHit0 will also be set). This is an 8-bit signed value (2's complement). Heuristic events which only increment will saturate and freeze at maximum value 0xFF (256). RET-CALL event counter saturate at maximum value 0x7F (+127) and minimum value 0x80 (-128).
		47:40		Count1 The current value of counter 1 updated after each occurrence of the event being counted. The count value is frozen on a valid branch monitoring triggering condition (in which case CntrHit1 will also be set). This is an 8-bit signed value (2's complement). Heuristic events which only increment will saturate and freeze at maximum value 0xFF (256). RET-CALL event counter saturate at maximum value 0x7F (+127) and minimum value 0x80 (-128).
		63:48		Reserved.
354H - 355H	852 - 853	MSR_BR_DETECT_COUNTER_CONFIG_i		Branch Monitoring Detect Counter Configuration (R/W)
		0		CntrEn Enable counter.
		7:1		CntrEvSel Event select (other values #GP) '0000000 = RETs. '0000001 = RET-CALL bias. '0000010 = RET mispredicts. '0000011 = Branch (all) mispredicts. '0000100 = Indirect branch mispredicts. '0000101 = Far branch instructions.
		14:8		CntrThreshold Threshold (an unsigned value of 0 to 127 supported). The value 0 of counter threshold will result in event signaled after every instruction. #GP if threshold is < 2.
		15		MispredEventCnt Mispredict events counting behavior: '0 = Mispredict events are counted in a window. '1 = Mispredict events are counted based on a consecutive occurrence. CntrThreshold is treated as # of consecutive mispredicts. This control bit only applies to events specified by CntrEvSel that involve a prediction (0000010, 0000011, 0000100). Setting this bit for other events is ignored.
		63:16		Reserved.

Table 2-41. Additional MSRs Supported by Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
3F8H	1016	MSR_PKG_C3_RESIDENCY	Package	Package C3 Residency Counter (R/O)
		63:0		Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
620H	1568	MSR_RING_RATIO_LIMIT	Package	Ring Ratio Limit (R/W) This register provides Min/Max Ratio Limits for the LLC and Ring.
		6:0		MAX_Ratio This field is used to limit the max ratio of the LLC/Ring.
		7		Reserved.
		14:8		MIN_Ratio Writing to this field controls the minimum possible ratio of the LLC/Ring.
		63:15		Reserved.
660H	1632	MSR_CORE_C1_RESIDENCY	Core	Core C1 Residency Counter (R/O)
		63:0		Value since last reset for the Core C1 residency. Counter rate is the Max Non-Turbo frequency (same as TSC). This counter count in case that both of the core's thread are in idle state and at least one of the core's thread residency in C1 state or in one of its sub state. The counter is updated only after core C state exit. Note: Always reads 0 if core C1 is unsupported. A value of zero indicates that this processor does not support core C1 or never entered core C1 level state.
662H	1634	MSR_CORE_C3_RESIDENCY	Core	Core C3 Residency Counter (R/O)
		63:0		Will always return 0.

2.16.3 MSRs Specific to Intel® Xeon® Processor Scalable Family

Intel® Xeon® Processor Scalable Family (CPUID DisplayFamily_DisplayModel = 06_55H) support the MSRs listed in Table 2-42.

Table 2-42. MSRs Supported by Intel® Xeon® Processor Scalable Family with DisplayFamily_DisplayModel 06_55H

Register Address		Register Name	Scope	Bit Description

2.17 MSRS IN INTEL® XEON PHI™ PROCESSOR 3200/5200/7200 SERIES AND FUTURE INTEL® XEON PHI™ PROCESSOR

Intel® Xeon Phi™ processor 3200, 5200, 7200 series, with CPUID DisplayFamily_DisplayModel signature 06_57H, supports the MSR interfaces listed in Table 2-43. These processors are based on the Knights Landing microarchitecture. Future Intel® Xeon Phi™ Processor, with CPUID DisplayFamily_DisplayModel signature 06_85H, supports the MSR interfaces listed in Table 2-43 and Table 2-44. Some MSRs are shared between a pair of processor cores, the scope is marked as module.

Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily_DisplayModel Signatures 06_57H and 06_85H

Address		Register Name	Scope	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Module	See Section 2.22, "MSRs in Pentium Processors."
1H	1	IA32_P5_MC_TYPE	Module	See Section 2.22, "MSRs in Pentium Processors."

Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily_DisplayModel Signatures 06_57H and 06_85H

Address		Register Name	Scope	Bit Description
Hex	Dec			
6H	6	IA32_MONITOR_FILTER_ SIZE	Thread	See Section 8.10.5, "Monitor/Mwait Address Range Determination." andTable 2-2
10H	16	IA32_TIME_STAMP_ COUNTER	Thread	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Package	**Platform ID (R)** See Table 2-2.
1BH	27	IA32_APIC_BASE	Thread	See Section 10.4.4, "Local APIC Status and Location," and Table 2-2.
34H	52	MSR_SMI_COUNT	Thread	**SMI Counter (R/O)**
		31:0		**SMI Count (R/O)**
		63:32		Reserved.
3AH	58	IA32_FEATURE_CONTROL	Thread	**Control Features in Intel 64Processor (R/W)** See Table 2-2.
		0		**Lock (R/WL)**
		1		**Reserved**
		2		**Enable VMX outside SMX operation (R/WL)**
3BH	59	IA32_TSC_ADJUST	THREAD	**Per-Logical-Processor TSC ADJUST (R/W)** See Table 2-2.
4EH	78	MSR_PPIN_CTL	Package	Protected Processor Inventory Number Enable Control (R/W)
		0		LockOut (R/WO) Set 1to prevent further writes to MSR_PPIN_CTL. Writing 1 to MSR_PPINCTL[bit 0] is permitted only if MSR_PPIN_CTL[bit 1] is clear, Default is 0. BIOS should provide an opt-in menu to enable the user to turn on MSR_PPIN_CTL[bit 1] for privileged inventory initialization agent to access MSR_PPIN. After reading MSR_PPIN, the privileged inventory initialization agent should write '01b' to MSR_PPIN_CTL to disable further access to MSR_PPIN and prevent unauthorized modification to MSR_PPIN_CTL.
		1		Enable_PPIN (R/W) If 1, enables MSR_PPIN to be accessible using RDMSR. Once set, attempt to write 1 to MSR_PPIN_CTL[bit 0] will cause #GP. If 0, an attempt to read MSR_PPIN will cause #GP. Default is 0.
		63:2		Reserved.
4FH	79	MSR_PPIN	Package	Protected Processor Inventory Number (R/O)
		63:0		**Protected Processor Inventory Number (R/O)** A unique value within a given CPUID family/model/stepping signature that a privileged inventory initialization agent can access to identify each physical processor, when access to MSR_PPIN is enabled. Access to MSR_PPIN is permitted only if MSR_PPIN_CTL[bits 1:0] = '10b'

Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily_DisplayModel Signatures 06_57H and 06_85H

Address		Register Name	Scope	Bit Description
Hex	Dec			
79H	121	IA32_BIOS_UPDT_TRIG	Core	**BIOS Update Trigger Register (W)** See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	THREAD	**BIOS Update Signature ID (RO)** See Table 2-2.
C1H	193	IA32_PMC0	THREAD	**Performance counter register** See Table 2-2.
C2H	194	IA32_PMC1	THREAD	**Performance Counter Register** See Table 2-2.
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information; contains power management and other model specific features enumeration. See http://biosbits.org.
		7:0		Reserved.
		15:8	Package	**Maximum Non-Turbo Ratio (R/O)** The is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.
		27:16		Reserved.
		28	Package	**Programmable Ratio Limit for Turbo Mode (R/O)** When set to 1, indicates that Programmable Ratio Limits for Turbo mode is enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo mode is disabled.
		29	Package	**Programmable TDP Limit for Turbo Mode (R/O)** When set to 1, indicates that TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDP Limit for Turbo mode is not programmable.
		39:30		Reserved.
		47:40	Package	**Maximum Efficiency Ratio (R/O)** The is the minimum ratio (maximum efficiency) that the processor can operates, in units of 100MHz.
		63:48		Reserved.
E2H	226	MSR_PKG_CST_CONFIG_ CONTROL	Package	**C-State Configuration Control (R/W)**

Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily_DisplayModel Signatures 06_57H and 06_85H

Address		Register Name	Scope	Bit Description
Hex	Dec			
		2:0		**Package C-State Limit (R/W)** Specifies the lowest C-state for the package. This feature does not limit the processor core C-state. The power-on default value from bit[2:0] of this register reports the deepest package C-state the processor is capable to support when manufactured. It is recommended that BIOS always read the power-on default value reported from this bit field to determine the supported deepest C-state on the processor and leave it as default without changing it. 000b - C0/C1 (No package C-state support) 001b - C2 010b - C6 (non retention)* 011b - C6 (Retention)* 100b - Reserved 101b - Reserved 110b - Reserved 111b - No package C-state limit. All C-States supported by the processor are available. Note: C6 retention mode provides more power saving than C6 non-retention mode. Limiting the package to C6 non retention mode does prevent the MSR_PKG_C6_RESIDENCY counter (MSR 3F9h) from being incremented.
		9:3		Reserved.
		10		**I/O MWAIT Redirection Enable (R/W)** When set, will map IO_read instructions sent to IO registers at MSR_PMG_IO_CAPTURE_BASE[15:0] to MWAIT instructions.
		14:11		Reserved.
		15		**CFG Lock (RO)** When set, locks bits [15:0] of this register for further writes until the next reset occurs.
		25		Reserved.
		26		**C1 State Auto Demotion Enable (R/W)** When set, processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.
		27		Reserved.
		28		**C1 State Auto Undemotion Enable (R/W)** When set, enables Undemotion from Demoted C1.
		29		**PKG C-State Auto Demotion Enable (R/W)** When set, enables Package C state demotion.
		63:30		Reserved.
E4H	228	MSR_PMG_IO_CAPTURE_BASE	Tile	**Power Management IO Capture Base (R/W)**

Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily_DisplayModel Signatures 06_57H and 06_85H

Address		Register Name	Scope	Bit Description
Hex	Dec			
		15:0		**LVL_2 Base Address (R/W)** Microcode will compare IO-read zone to this base address to determine if an MWAIT(C2/3/4) needs to be issued instead of the IO-read. Should be programmed to the chipset Plevel_2 IO address.
		22:16		**C-State Range (R/W)** The IO-port block size in which IO-redirection will be executed (0-127). Should be programmed based on the number of LVLx registers existing in the chipset.
		63:23		Reserved.
E7H	231	IA32_MPERF	Thread	**Maximum Performance Frequency Clock Count (RW)** See Table 2-2.
E8H	232	IA32_APERF	Thread	**Actual Performance Frequency Clock Count (RW)** See Table 2-2.
FEH	254	IA32_MTRRCAP	Core	**Memory Type Range Register (R)** See Table 2-2.
13CH	52	MSR_FEATURE_CONFIG	Core	**AES Configuration (RW-L)** Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.
		1:0		**AES Configuration (RW-L)** Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instruction can be mis-configured if a privileged agent unintentionally writes 11b.
		63:2		Reserved.
140H	320	MISC_FEATURE_ENABLES	Thread	**MISC_FEATURE_ENABLES**
		0		Reserved.
		1		**User Mode MONITOR and MWAIT (R/W)** If set to 1, the MONITOR and MWAIT instructions do not cause invalid-opcode exceptions when executed with CPL > 0 or in virtual-8086 mode. If MWAIT is executed when CPL > 0 or in virtual-8086 mode, and if EAX indicates a C-state other than C0 or C1, the instruction operates as if EAX indicated the C-state C1.

1C9H	457	MSR_LASTBRANCH_TOS	Thread	**Last Branch Record Stack TOS (R/W)** Contains an index (bits 0-2) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP.
1D9H	473	IA32_DEBUGCTL	Thread	**Debug Control (R/W)**
		0		**LBR** Setting this bit to 1 enables the processor to record a running trace of the most recent branches taken by the processor in the LBR stack.
		1		**BTF** Setting this bit to 1 enables the processor to treat EFLAGS.TF as single-step on branches instead of single-step on instructions.
		5:2		Reserved.
		6		**TR** Setting this bit to 1 enables branch trace messages to be sent.
		7		**BTS** Setting this bit enables branch trace messages (BTMs) to be logged in a BTS buffer.
		8		**BTINT** When clear, BTMs are logged in a BTS buffer in circular fashion. When this bit is set, an interrupt is generated by the BTS facility when the BTS buffer is full.
		9		**BTS_OFF_OS** When set, BTS or BTM is skipped if CPL = 0.
		10		**BTS_OFF_USR** When set, BTS or BTM is skipped if CPL > 0.
		11		**FREEZE_LBRS_ON_PMI** When set, the LBR stack is frozen on a PMI request.
		12		**FREEZE_PERFMON_ON_PMI** When set, each ENABLE bit of the global counter control MSR are frozen (address 3BFH) on a PMI request.
		13		Reserved.

803H	2051	IA32_X2APIC_VERSION	Thread	x2APIC Version register (R/O)
808H	2056	IA32_X2APIC_TPR	Thread	x2APIC Task Priority register (R/W)
80AH	2058	IA32_X2APIC_PPR	Thread	x2APIC Processor Priority register (R/O)
80BH	2059	IA32_X2APIC_EOI	Thread	x2APIC EOI register (W/O)
80DH	2061	IA32_X2APIC_LDR	Thread	x2APIC Logical Destination register (R/O)
80FH	2063	IA32_X2APIC_SIVR	Thread	x2APIC Spurious Interrupt Vector register (R/W)
810H	2064	IA32_X2APIC_ISR0	Thread	x2APIC In-Service register bits [31:0] (R/O)
811H	2065	IA32_X2APIC_ISR1	Thread	x2APIC In-Service register bits [63:32] (R/O)
812H	2066	IA32_X2APIC_ISR2	Thread	x2APIC In-Service register bits [95:64] (R/O)
813H	2067	IA32_X2APIC_ISR3	Thread	x2APIC In-Service register bits [127:96] (R/O)
814H	2068	IA32_X2APIC_ISR4	Thread	x2APIC In-Service register bits [159:128] (R/O)
815H	2069	IA32_X2APIC_ISR5	Thread	x2APIC In-Service register bits [191:160] (R/O)
816H	2070	IA32_X2APIC_ISR6	Thread	x2APIC In-Service register bits [223:192] (R/O)
817H	2071	IA32_X2APIC_ISR7	Thread	x2APIC In-Service register bits [255:224] (R/O)
818H	2072	IA32_X2APIC_TMR0	Thread	x2APIC Trigger Mode register bits [31:0] (R/O)
819H	2073	IA32_X2APIC_TMR1	Thread	x2APIC Trigger Mode register bits [63:32] (R/O)
81AH	2074	IA32_X2APIC_TMR2	Thread	x2APIC Trigger Mode register bits [95:64] (R/O)
81BH	2075	IA32_X2APIC_TMR3	Thread	x2APIC Trigger Mode register bits [127:96] (R/O)
81CH	2076	IA32_X2APIC_TMR4	Thread	x2APIC Trigger Mode register bits [159:128] (R/O)
81DH	2077	IA32_X2APIC_TMR5	Thread	x2APIC Trigger Mode register bits [191:160] (R/O)
81EH	2078	IA32_X2APIC_TMR6	Thread	x2APIC Trigger Mode register bits [223:192] (R/O)
81FH	2079	IA32_X2APIC_TMR7	Thread	x2APIC Trigger Mode register bits [255:224] (R/O)
820H	2080	IA32_X2APIC_IRR0	Thread	x2APIC Interrupt Request register bits [31:0] (R/O)
821H	2081	IA32_X2APIC_IRR1	Thread	x2APIC Interrupt Request register bits [63:32] (R/O)
822H	2082	IA32_X2APIC_IRR2	Thread	x2APIC Interrupt Request register bits [95:64] (R/O)
823H	2083	IA32_X2APIC_IRR3	Thread	x2APIC Interrupt Request register bits [127:96] (R/O)
824H	2084	IA32_X2APIC_IRR4	Thread	x2APIC Interrupt Request register bits [159:128] (R/O)
825H	2085	IA32_X2APIC_IRR5	Thread	x2APIC Interrupt Request register bits [191:160] (R/O)
826H	2086	IA32_X2APIC_IRR6	Thread	x2APIC Interrupt Request register bits [223:192] (R/O)
827H	2087	IA32_X2APIC_IRR7	Thread	x2APIC Interrupt Request register bits [255:224] (R/O)
828H	2088	IA32_X2APIC_ESR	Thread	x2APIC Error Status register (R/W)

Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily_DisplayModel Signatures 06_57H and 06_85H

Address		Register Name	Scope	Bit Description
Hex	Dec			
82FH	2095	IA32_X2APIC_LVT_CMCI	Thread	x2APIC LVT Corrected Machine Check Interrupt register (R/W)
830H	2096	IA32_X2APIC_ICR	Thread	x2APIC Interrupt Command register (R/W)
832H	2098	IA32_X2APIC_LVT_TIMER	Thread	x2APIC LVT Timer Interrupt register (R/W)
833H	2099	IA32_X2APIC_LVT_THERMAL	Thread	x2APIC LVT Thermal Sensor Interrupt register (R/W)
834H	2100	IA32_X2APIC_LVT_PMI	Thread	x2APIC LVT Performance Monitor register (R/W)
835H	2101	IA32_X2APIC_LVT_LINT0	Thread	x2APIC LVT LINT0 register (R/W)
836H	2102	IA32_X2APIC_LVT_LINT1	Thread	x2APIC LVT LINT1 register (R/W)
837H	2103	IA32_X2APIC_LVT_ERROR	Thread	x2APIC LVT Error register (R/W)
838H	2104	IA32_X2APIC_INIT_COUNT	Thread	x2APIC Initial Count register (R/W)
839H	2105	IA32_X2APIC_CUR_COUNT	Thread	x2APIC Current Count register (R/O)
83EH	2110	IA32_X2APIC_DIV_CONF	Thread	x2APIC Divide Configuration register (R/W)
83FH	2111	IA32_X2APIC_SELF_IPI	Thread	x2APIC Self IPI register (W/O)
C000_0080H		IA32_EFER	Thread	**Extended Feature Enables** See Table 2-2.
C000_0081H		IA32_STAR	Thread	**System Call Target Address (R/W)** See Table 2-2.
C000_0082H		IA32_LSTAR	Thread	**IA-32e Mode System Call Target Address (R/W)** See Table 2-2.
C000_0084H		IA32_FMASK	Thread	**System Call Flag Mask (R/W)** See Table 2-2.
C000_0100H		IA32_FS_BASE	Thread	**Map of BASE Address of FS (R/W)** See Table 2-2.
C000_0101H		IA32_GS_BASE	Thread	**Map of BASE Address of GS (R/W)** See Table 2-2.
C000_0102H		IA32_KERNEL_GS_BASE	Thread	**Swap Target of BASE Address of GS (R/W)** See Table 2-2.
C000_0103H		IA32_TSC_AUX	Thread	**AUXILIARY TSC Signature. (R/W)** See Table 2-2

Table 2-44 lists model-specific registers that are supported by future Intel® Xeon Phi™ Processors based on the Knights Mill microarchitecture.

Table 2-44. Additional MSRs Supported by Future Intel® Xeon Phi™ Processors with DisplayFamily_DisplayModel Signature 06_85H

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
9BH	155	IA32_SMM_MONITOR_CTL	Core	SMM Monitor Configuration (R/W). This MSR is readable only if VMX is enabled, and writeable only if VMX is enabled and in SMM mode, and is used to configure the VMX MSEG base address. See Table 2-2.
480H	1152	IA32_VMX_BASIC	Core	Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2.
481H	1153	IA32_VMX_PINBASED_CTLS	Core	Capability Reporting Register of Pin-based VM-execution Controls (R/O) See Table 2-2.
482H	1154	IA32_VMX_PROCBASED_CTLS	Core	Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)
483H	1155	IA32_VMX_EXIT_CTLS	Core	Capability Reporting Register of VM-exit Controls (R/O) See Table 2-2.
484H	1156	IA32_VMX_ENTRY_CTLS	Core	Capability Reporting Register of VM-entry Controls (R/O) See Table 2-2.
485H	1157	IA32_VMX_MISC	Core	Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2.
486H	1158	IA32_VMX_CR0_FIXED0	Core	Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Table 2-2.
487H	1159	IA32_VMX_CR0_FIXED1	Core	Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Table 2-2.
488H	1160	IA32_VMX_CR4_FIXED0	Core	Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2.
489H	1161	IA32_VMX_CR4_FIXED1	Core	Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2.
48AH	1162	IA32_VMX_VMCS_ENUM	Core	Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2.
48BH	1163	IA32_VMX_PROCBASED_CTLS2	Core	Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O) See Table 2-2.
48CH	1164	IA32_VMX_EPT_VPID_ENUM	Core	Capability Reporting Register of EPT and VPID (R/O) See Table 2-2.
48DH	1165	IA32_VMX_TRUE_PINBASED_CTLS	Core	Capability Reporting Register of Pin-based VM-execution Flex Controls (R/O) See Table 2-2.
48EH	1166	IA32_VMX_TRUE_PROCBASED_CTLS	Core	Capability Reporting Register of Primary Processor-based VM-execution Flex Controls (R/O) See Table 2-2.
48FH	1167	IA32_VMX_TRUE_EXIT_CTLS	Core	Capability Reporting Register of VM-exit Flex Controls (R/O) See Table 2-2.

Table 2-44. Additional MSRs Supported by Future Intel® Xeon Phi™ Processors with DisplayFamily_DisplayModel Signature 06_85H

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
490H	1168	IA32_VMX_TRUE_ENTRY_CTLS	Core	Capability Reporting Register of VM-entry Flex Controls (R/O) See Table 2-2.
491H	1169	IA32_VMX_FMFUNC	Core	Capability Reporting Register of VM-function Controls (R/O) See Table 2-2.

2.18 MSRS IN THE PENTIUM® 4 AND INTEL® XEON® PROCESSORS

Table 2-45 lists MSRs (architectural and model-specific) that are defined across processor generations based on Intel NetBurst microarchitecture. The processor can be identified by its CPUID signatures of DisplayFamily encoding of 0FH, see Table 2-1.

- MSRs with an "IA32_" prefix are designated as "architectural." This means that the functions of these MSRs and their addresses remain the same for succeeding families of IA-32 processors.
- MSRs with an "MSR_" prefix are model specific with respect to address functionalities. The column "Model Availability" lists the model encoding value(s) within the Pentium 4 and Intel Xeon processor family at the specified register address. The model encoding value of a processor can be queried using CPUID. See "CPUID—CPU Identification" in Chapter 3 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A*.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
0H	0	IA32_P5_MC_ADDR	0, 1, 2, 3, 4, 6	Shared	See Section 2.22, "MSRs in Pentium Processors."
1H	1	IA32_P5_MC_TYPE	0, 1, 2, 3, 4, 6	Shared	See Section 2.22, "MSRs in Pentium Processors."
6H	6	IA32_MONITOR_FILTER_LINE_SIZE	3, 4, 6	Shared	See Section 8.10.5, "Monitor/Mwait Address Range Determination."
10H	16	IA32_TIME_STAMP_COUNTER	0, 1, 2, 3, 4, 6	Unique	**Time Stamp Counter** See Table 2-2.
					On earlier processors, only the lower 32 bits are writable. On any write to the lower 32 bits, the upper 32 bits are cleared. For processor family 0FH, models 3 and 4: all 64 bits are writable.
17H	23	IA32_PLATFORM_ID	0, 1, 2, 3, 4, 6	Shared	**Platform ID (R)** See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.
1BH	27	IA32_APIC_BASE	0, 1, 2, 3, 4, 6	Unique	**APIC Location and Status (R/W)** See Table 2-2. See Section 10.4.4, "Local APIC Status and Location."

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
2AH	42	MSR_EBC_HARD_POWERON	0, 1, 2, 3, 4, 6	Shared	**Processor Hard Power-On Configuration** **(R/W)** Enables and disables processor features; **(R)** indicates current processor configuration.
		0			**Output Tri-state Enabled (R)** Indicates whether tri-state output is enabled (1) or disabled (0) as set by the strapping of SMI#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		1			**Execute BIST (R)** Indicates whether the execution of the BIST is enabled (1) or disabled (0) as set by the strapping of INIT#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		2			**In Order Queue Depth (R)** Indicates whether the in order queue depth for the system bus is 1 (1) or up to 12 (0) as set by the strapping of A7#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		3			**MCERR# Observation Disabled (R)** Indicates whether MCERR# observation is enabled (0) or disabled (1) as determined by the strapping of A9#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		4			**BINIT# Observation Enabled (R)** Indicates whether BINIT# observation is enabled (0) or disabled (1) as determined by the strapping of A10#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		6:5			**APIC Cluster ID (R)** Contains the logical APIC cluster ID value as set by the strapping of A12# and A11#. The logical cluster ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.
		7			**Bus Park Disable (R)** Indicates whether bus park is enabled (0) or disabled (1) as set by the strapping of A15#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		11:8			Reserved.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
		13:12			**Agent ID (R)** Contains the logical agent ID value as set by the strapping of BR[3:0]. The logical ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.
		63:14			Reserved.
2BH	43	MSR_EBC_SOFT_POWERON	0, 1, 2, 3, 4, 6	Shared	**Processor Soft Power-On Configuration (R/W)** Enables and disables processor features.
		0			**RCNT/SCNT On Request Encoding Enable (R/W)** Controls the driving of RCNT/SCNT on the request encoding. Set to enable (1); clear to disabled (0, default).
		1			**Data Error Checking Disable (R/W)** Set to disable system data bus parity checking; clear to enable parity checking.
		2			**Response Error Checking Disable (R/W)** Set to disable (default); clear to enable.
		3			**Address/Request Error Checking Disable (R/W)** Set to disable (default); clear to enable.
		4			**Initiator MCERR# Disable (R/W)** Set to disable MCERR# driving for initiator bus requests (default); clear to enable.
		5			**Internal MCERR# Disable (R/W)** Set to disable MCERR# driving for initiator internal errors (default); clear to enable.
		6			**BINIT# Driver Disable (R/W)** Set to disable BINIT# driver (default); clear to enable driver.
		63:7			Reserved.
2CH	44	MSR_EBC_FREQUENCY_ID	2,3, 4, 6	Shared	**Processor Frequency Configuration** The bit field layout of this MSR varies according to the MODEL value in the CPUID version information. The following bit field layout applies to Pentium 4 and Xeon Processors with MODEL encoding equal or greater than 2. (R) The field Indicates the current processor frequency configuration.
		15:0			Reserved.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
		18:16			**Scalable Bus Speed (R/W)** Indicates the intended scalable bus speed: Encoding Scalable Bus Speed 000B 100 MHz (Model 2) 000B 266 MHz (Model 3 or 4) 001B 133 MHz 010B 200 MHz 011B 166 MHz 100B 333 MHz (Model 6)
					133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.
					266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 000B and model encoding = 3 or 4. 333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 100B and model encoding = 6. All other values are reserved.
		23:19			Reserved.
		31:24			**Core Clock Frequency to System Bus Frequency Ratio (R)** The processor core clock frequency to system bus frequency ratio observed at the de-assertion of the reset pin.
		63:25			Reserved.
2CH	44	MSR_EBC_FREQUENCY_ID	0, 1	Shared	**Processor Frequency Configuration (R)** The bit field layout of this MSR varies according to the MODEL value of the CPUID version information. This bit field layout applies to Pentium 4 and Xeon Processors with MODEL encoding less than 2. Indicates current processor frequency configuration.
		20:0			Reserved.
		23:21			**Scalable Bus Speed (R/W)** Indicates the intended scalable bus speed: Encoding Scalable Bus Speed 000B 100 MHz All others values reserved.
		63:24			Reserved.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
3AH	58	IA32_FEATURE_CONTROL	3, 4, 6	Unique	**Control Features in IA-32 Processor (R/W)** See Table 2-2 (If CPUID.01H:ECX.[bit 5])
79H	121	IA32_BIOS_UPDT_TRIG	0, 1, 2, 3, 4, 6	Shared	**BIOS Update Trigger Register (W)** See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	0, 1, 2, 3, 4, 6	Unique	**BIOS Update Signature ID (R/W)** See Table 2-2.
9BH	155	IA32_SMM_MONITOR_CTL	3, 4, 6	Unique	**SMM Monitor Configuration (R/W)** See Table 2-2.
FEH	254	IA32_MTRRCAP	0, 1, 2, 3, 4, 6	Unique	**MTRR Information** See Section 11.11.1, "MTRR Feature Identification.".
174H	372	IA32_SYSENTER_CS	0, 1, 2, 3, 4, 6	Unique	**CS register target for CPL 0 code (R/W)** See Table 2-2. See Section 5.8.7, "Performing Fast Calls to System Procedures with the SYSENTER and SYSEXIT Instructions."
175H	373	IA32_SYSENTER_ESP	0, 1, 2, 3, 4, 6	Unique	**Stack pointer for CPL 0 stack (R/W)** See Table 2-2. See Section 5.8.7, "Performing Fast Calls to System Procedures with the SYSENTER and SYSEXIT Instructions."
176H	374	IA32_SYSENTER_EIP	0, 1, 2, 3, 4, 6	Unique	**CPL 0 code entry point (R/W)** See Table 2-2. See Section 5.8.7, "Performing Fast Calls to System Procedures with the SYSENTER and SYSEXIT Instructions."
179H	377	IA32_MCG_CAP	0, 1, 2, 3, 4, 6	Unique	**Machine Check Capabilities (R)** See Table 2-2. See Section 15.3.1.1, "IA32_MCG_CAP MSR."
17AH	378	IA32_MCG_STATUS	0, 1, 2, 3, 4, 6	Unique	**Machine Check Status. (R)** See Table 2-2. See Section 15.3.1.2, "IA32_MCG_STATUS MSR."
17BH	379	IA32_MCG_CTL			**Machine Check Feature Enable (R/W)** See Table 2-2. See Section 15.3.1.3, "IA32_MCG_CTL MSR."
180H	384	MSR_MCG_RAX	0, 1, 2, 3, 4, 6	Unique	**Machine Check EAX/RAX Save State** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
181H	385	MSR_MCG_RBX	0, 1, 2, 3, 4, 6	Unique	**Machine Check EBX/RBX Save State** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
182H	386	MSR_MCG_RCX	0, 1, 2, 3, 4, 6	Unique	**Machine Check ECX/RCX Save State** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
183H	387	MSR_MCG_RDX	0, 1, 2, 3, 4, 6	Unique	**Machine Check EDX/RDX Save State** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
184H	388	MSR_MCG_RSI	0, 1, 2, 3, 4, 6	Unique	**Machine Check ESI/RSI Save State** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
185H	389	MSR_MCG_RDI	0, 1, 2, 3, 4, 6	Unique	**Machine Check EDI/RDI Save State** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
186H	390	MSR_MCG_RBP	0, 1, 2, 3, 4, 6	Unique	**Machine Check EBP/RBP Save State** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
187H	391	MSR_MCG_RSP	0, 1, 2, 3, 4, 6	Unique	**Machine Check ESP/RSP Save State** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
188H	392	MSR_MCG_RFLAGS	0, 1, 2, 3, 4, 6	Unique	**Machine Check EFLAGS/RFLAG Save State** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
189H	393	MSR_MCG_RIP	0, 1, 2, 3, 4, 6	Unique	**Machine Check EIP/RIP Save State** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
18AH	394	MSR_MCG_MISC	0, 1, 2, 3, 4, 6	Unique	**Machine Check Miscellaneous** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		0			**DS** When set, the bit indicates that a page assist or page fault occurred during DS normal operation. The processors response is to shut down. The bit is used as an aid for debugging DS handling code. It is the responsibility of the user (BIOS or operating system) to clear this bit for normal operation.
		63:1			Reserved.
18BH - 18FH	395	MSR_MCG_RESERVED1 - MSR_MCG_RESERVED5			Reserved.
190H	400	MSR_MCG_R8	0, 1, 2, 3, 4, 6	Unique	**Machine Check R8** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
191H	401	MSR_MCG_R9	0, 1, 2, 3, 4, 6	Unique	**Machine Check R9D/R9** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
192H	402	MSR_MCG_R10	0, 1, 2, 3, 4, 6	Unique	**Machine Check R10** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description

		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
193H	403	MSR_MCG_R11	0, 1, 2, 3, 4, 6	Unique	**Machine Check R11** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
194H	404	MSR_MCG_R12	0, 1, 2, 3, 4, 6	Unique	**Machine Check R12** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
195H	405	MSR_MCG_R13	0, 1, 2, 3, 4, 6	Unique	**Machine Check R13** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
196H	406	MSR_MCG_R14	0, 1, 2, 3, 4, 6	Unique	**Machine Check R14** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
197H	407	MSR_MCG_R15	0, 1, 2, 3, 4, 6	Unique	**Machine Check R15** See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
198H	408	IA32_PERF_STATUS	3, 4, 6	Unique	See Table 2-2. See Section 14.1, "Enhanced Intel Speedstep® Technology."

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
199H	409	IA32_PERF_CTL	3, 4, 6	Unique	See Table 2-2. See Section 14.1, "Enhanced Intel Speedstep® Technology."
19AH	410	IA32_CLOCK_MODULATION	0, 1, 2, 3, 4, 6	Unique	**Thermal Monitor Control (R/W)** See Table 2-2. See Section 14.7.3, "Software Controlled Clock Modulation."
19BH	411	IA32_THERM_INTERRUPT	0, 1, 2, 3, 4, 6	Unique	**Thermal Interrupt Control (R/W)** See Section 14.7.2, "Thermal Monitor," and see Table 2-2.
19CH	412	IA32_THERM_STATUS	0, 1, 2, 3, 4, 6	Shared	**Thermal Monitor Status (R/W)** See Section 14.7.2, "Thermal Monitor," and see Table 2-2.
19DH	413	MSR_THERM2_CTL			Thermal Monitor 2 Control.
			3,	Shared	For Family F, Model 3 processors: When read, specifies the value of the target TM2 transition last written. When set, it sets the next target value for TM2 transition.
			4, 6	Shared	For Family F, Model 4 and Model 6 processors: When read, specifies the value of the target TM2 transition last written. Writes may cause #GP exceptions.
1A0H	416	IA32_MISC_ENABLE	0, 1, 2, 3, 4, 6	Shared	**Enable Miscellaneous Processor Features (R/W)**
		0			Fast-Strings Enable. See Table 2-2.
		1			Reserved.
		2			**x87 FPU Fopcode Compatibility Mode Enable**
		3			**Thermal Monitor 1 Enable** See Section 14.7.2, "Thermal Monitor," and see Table 2-2.
		4			**Split-Lock Disable** When set, the bit causes an #AC exception to be issued instead of a split-lock cycle. Operating systems that set this bit must align system structures to avoid split-lock scenarios. When the bit is clear (default), normal split-locks are issued to the bus.
					This debug feature is specific to the Pentium 4 processor.
		5			Reserved.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
		6			**Third-Level Cache Disable (R/W)** When set, the third-level cache is disabled; when clear (default) the third-level cache is enabled. This flag is reserved for processors that do not have a third-level cache. Note that the bit controls only the third-level cache; and only if overall caching is enabled through the CD flag of control register CR0, the page-level cache controls, and/or the MTRRs. See Section 11.5.4, "Disabling and Enabling the L3 Cache."
		7			**Performance Monitoring Available (R)** See Table 2-2.
		8			**Suppress Lock Enable** When set, assertion of LOCK on the bus is suppressed during a Split Lock access. When clear (default), LOCK is not suppressed.
		9			**Prefetch Queue Disable** When set, disables the prefetch queue. When clear (default), enables the prefetch queue.
		10			**FERR# Interrupt Reporting Enable (R/W)** When set, interrupt reporting through the FERR# pin is enabled; when clear, this interrupt reporting function is disabled.
					When this flag is set and the processor is in the stop-clock state (STPCLK# is asserted), asserting the FERR# pin signals to the processor that an interrupt (such as, INIT#, BINIT#, INTR, NMI, SMI#, or RESET#) is pending and that the processor should return to normal operation to handle the interrupt.
					This flag does not affect the normal operation of the FERR# pin (to indicate an unmasked floating-point error) when the STPCLK# pin is not asserted.
		11			**Branch Trace Storage Unavailable (BTS_UNAVILABLE) (R)** See Table 2-2. When set, the processor does not support branch trace storage (BTS); when clear, BTS is supported.
		12			**PEBS_UNAVILABLE: Processor Event Based Sampling Unavailable (R)** See Table 2-2. When set, the processor does not support processor event-based sampling (PEBS); when clear, PEBS is supported.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
		13	3		**TM2 Enable (R/W)** When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state. If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.
		17:14			Reserved.
		18	3, 4, 6		**ENABLE MONITOR FSM (R/W)** See Table 2-2.
		19			**Adjacent Cache Line Prefetch Disable (R/W)** When set to 1, the processor fetches the cache line of the 128-byte sector containing currently required data. When set to 0, the processor fetches both cache lines in the sector.
					Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing. BIOS may contain a setup option that controls the setting of this bit.
		21:20			Reserved.
		22	3, 4, 6		**Limit CPUID MAXVAL (R/W)** See Table 2-2. Setting this can cause unexpected behavior to software that depends on the availability of CPUID leaves greater than 3.
		23		Shared	**xTPR Message Disable (R/W)** See Table 2-2.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
		24			**L1 Data Cache Context Mode (R/W)** When set, the L1 data cache is placed in shared mode; when clear (default), the cache is placed in adaptive mode. This bit is only enabled for IA-32 processors that support Intel Hyper-Threading Technology. See Section 11.5.6, "L1 Data Cache Context Mode." When L1 is running in adaptive mode and CR3s are identical, data in L1 is shared across logical processors. Otherwise, L1 is not shared and cache use is competitive. If the Context ID feature flag (ECX[10]) is set to 0 after executing CPUID with EAX = 1, the ability to switch modes is not supported. BIOS must not alter the contents of IA32_MISC_ENABLE[24].
		33:25			Reserved.
		34		Unique	**XD Bit Disable (R/W)** See Table 2-2.
		63:35			Reserved.
1A1H	417	MSR_PLATFORM_BRV	3, 4, 6	Shared	**Platform Feature Requirements (R)**
		17:0			Reserved.
		18			**PLATFORM Requirements** When set to 1, indicates the processor has specific platform requirements. The details of the platform requirements are listed in the respective data sheets of the processor.
		63:19			Reserved.
1D7H	471	MSR_LER_FROM_LIP	0, 1, 2, 3, 4, 6	Unique	**Last Exception Record From Linear IP (R)** Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 17.13.3, "Last Exception Records."
		31:0			**From Linear IP** Linear address of the last branch instruction.
		63:32			Reserved.
1D7H	471	63:0		Unique	**From Linear IP** Linear address of the last branch instruction (If IA-32e mode is active).
1D8H	472	MSR_LER_TO_LIP	0, 1, 2, 3, 4, 6	Unique	**Last Exception Record To Linear IP (R)** This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 17.13.3, "Last Exception Records."

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
		31:0			**From Linear IP** Linear address of the target of the last branch instruction.
		63:32			Reserved.
1D8H	472	63:0		Unique	**From Linear IP** Linear address of the target of the last branch instruction (If IA-32e mode is active).
1D9H	473	MSR_DEBUGCTLA	0, 1, 2, 3, 4, 6	Unique	**Debug Control (R/W)** Controls how several debug features are used. Bit definitions are discussed in the referenced section. See Section 17.13.1, "MSR_DEBUGCTLA MSR."
1DAH	474	MSR_LASTBRANCH _TOS	0, 1, 2, 3, 4, 6	Unique	**Last Branch Record Stack TOS (R/O)** Contains an index (0-3 or 0-15) that points to the top of the last branch record stack (that is, that points the index of the MSR containing the most recent branch record). See Section 17.13.2, "LBR Stack for Processors Based on Intel NetBurst® Microarchitecture"; and addresses 1DBH-1DEH and 680H-68FH.
1DBH	475	MSR_LASTBRANCH_0	0, 1, 2	Unique	**Last Branch Record 0 (R/O)** One of four last branch record registers on the last branch record stack. It contains pointers to the source and destination instruction for one of the last four branches, exceptions, or interrupts that the processor took. MSR_LASTBRANCH_0 through MSR_LASTBRANCH_3 at 1DBH-1DEH are available only on family 0FH, models 0H-02H. They have been replaced by the MSRs at 680H-68FH and 6C0H-6CFH.
					See Section 17.12, "Last Branch, Call Stack, Interrupt, and Exception Recording for Processors based on Skylake Microarchitecture."
1DCH	477	MSR_LASTBRANCH_1	0, 1, 2	Unique	**Last Branch Record 1** See description of the MSR_LASTBRANCH_0 MSR at 1DBH.
1DDH	477	MSR_LASTBRANCH_2	0, 1, 2	Unique	**Last Branch Record 2** See description of the MSR_LASTBRANCH_0 MSR at 1DBH.
1DEH	478	MSR_LASTBRANCH_3	0, 1, 2	Unique	**Last Branch Record 3** See description of the MSR_LASTBRANCH_0 MSR at 1DBH.
200H	512	IA32_MTRR_PHYSBASE0	0, 1, 2, 3, 4, 6	Shared	**Variable Range Base MTRR** See Section 11.11.2.3, "Variable Range MTRRs."

36BH	875	MSR_FLAME_CCCR3	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.3, "CCCR MSRs."
36CH	876	MSR_IQ_CCCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.3, "CCCR MSRs."
36DH	877	MSR_IQ_CCCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.3, "CCCR MSRs."
36EH	878	MSR_IQ_CCCR2	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.3, "CCCR MSRs."

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
36FH	879	MSR_IQ_CCCR3	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.3, "CCCR MSRs."
370H	880	MSR_IQ_CCCR4	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.3, "CCCR MSRs."
371H	881	MSR_IQ_CCCR5	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.3, "CCCR MSRs."
3A0H	928	MSR_BSU_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3A1H	929	MSR_BSU_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3A2H	930	MSR_FSB_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3A3H	931	MSR_FSB_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3A4H	932	MSR_FIRM_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3A5H	933	MSR_FIRM_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3A6H	934	MSR_FLAME_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3A7H	935	MSR_FLAME_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3A8H	936	MSR_DAC_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3A9H	937	MSR_DAC_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3AAH	938	MSR_MOB_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3ABH	939	MSR_MOB_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3ACH	940	MSR_PMH_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3ADH	941	MSR_PMH_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3AEH	942	MSR_SAAT_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3AFH	943	MSR_SAAT_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3B0H	944	MSR_U2L_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3B1H	945	MSR_U2L_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3B2H	946	MSR_BPU_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
3B3H	947	MSR_BPU_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3B4H	948	MSR_IS_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3B5H	949	MSR_IS_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3B6H	950	MSR_ITLB_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3B7H	951	MSR_ITLB_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3B8H	952	MSR_CRU_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3B9H	953	MSR_CRU_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3BAH	954	MSR_IQ_ESCR0	0, 1, 2	Shared	See Section 18.6.3.1, "ESCR MSRs." This MSR is not available on later processors. It is only available on processor family 0FH, models 01H-02H.
3BBH	955	MSR_IQ_ESCR1	0, 1, 2	Shared	See Section 18.6.3.1, "ESCR MSRs." This MSR is not available on later processors. It is only available on processor family 0FH, models 01H-02H.
3BCH	956	MSR_RAT_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3BDH	957	MSR_RAT_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3BEH	958	MSR_SSU_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3C0H	960	MSR_MS_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3C1H	961	MSR_MS_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3C2H	962	MSR_TBPU_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3C3H	963	MSR_TBPU_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3C4H	964	MSR_TC_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3C5H	965	MSR_TC_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3C8H	968	MSR_IX_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3C9H	969	MSR_IX_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
3CAH	970	MSR_ALF_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3CBH	971	MSR_ALF_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3CCH	972	MSR_CRU_ESCR2	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3CDH	973	MSR_CRU_ESCR3	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3E0H	992	MSR_CRU_ESCR4	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3E1H	993	MSR_CRU_ESCR5	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3F0H	1008	MSR_TC_PRECISE_EVENT	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3F1H	1009	MSR_PEBS_ENABLE	0, 1, 2, 3, 4, 6	Shared	**Processor Event Based Sampling (PEBS) (R/W)** Controls the enabling of processor event sampling and replay tagging.
		12:0			See Table 19-36.
		23:13			Reserved.
		24			**UOP Tag** Enables replay tagging when set.
		25			**ENABLE_PEBS_MY_THR (R/W)** Enables PEBS for the target logical processor when set; disables PEBS when clear (default). See Section 18.6.4.3, "IA32_PEBS_ENABLE MSR," for an explanation of the target logical processor. This bit is called ENABLE_PEBS in IA-32 processors that do not support Intel Hyper-Threading Technology.
		26			**ENABLE_PEBS_OTH_THR (R/W)** Enables PEBS for the target logical processor when set; disables PEBS when clear (default). See Section 18.6.4.3, "IA32_PEBS_ENABLE MSR," for an explanation of the target logical processor. This bit is reserved for IA-32 processors that do not support Intel Hyper-Threading Technology.
		63:27			Reserved.
3F2H	1010	MSR_PEBS_MATRIX_VERT	0, 1, 2, 3, 4, 6	Shared	See Table 19-36.
400H	1024	IA32_MC0_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MC0_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
402H	1026	IA32_MC0_ADDR	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
403H	1027	IA32_MC0_MISC	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC0_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
406H	1030	IA32_MC1_ADDR	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
407H	1031	IA32_MC1_MISC		Shared	See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC1_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR			See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
40BH	1035	IA32_MC2_MISC			See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC2_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	IA32_MC3_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC3_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40EH	1038	IA32_MC3_ADDR	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40FH	1039	IA32_MC3_MISC	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC3_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	IA32_MC4_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC4_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
412H	1042	IA32_MC4_ADDR			See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	IA32_MC4_MISC			See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC2_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
480H	1152	IA32_VMX_BASIC	3, 4, 6	Unique	**Reporting Register of Basic VMX Capabilities (R/O)** See Table 2-2. See Appendix A.1, "Basic VMX Information."
481H	1153	IA32_VMX_PINBASED_CTLS	3, 4, 6	Unique	**Capability Reporting Register of Pin-based VM-execution Controls (R/O)** See Table 2-2. See Appendix A.3, "VM-Execution Controls."
482H	1154	IA32_VMX_PROCBASED_CTLS	3, 4, 6	Unique	**Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls," and see Table 2-2.
483H	1155	IA32_VMX_EXIT_CTLS	3, 4, 6	Unique	**Capability Reporting Register of VM-exit Controls (R/O)** See Appendix A.4, "VM-Exit Controls," and see Table 2-2.
484H	1156	IA32_VMX_ENTRY_CTLS	3, 4, 6	Unique	**Capability Reporting Register of VM-entry Controls (R/O)** See Appendix A.5, "VM-Entry Controls," and see Table 2-2.
485H	1157	IA32_VMX_MISC	3, 4, 6	Unique	**Reporting Register of Miscellaneous VMX Capabilities (R/O)** See Appendix A.6, "Miscellaneous Data," and see Table 2-2.
486H	1158	IA32_VMX_CR0_FIXED0	3, 4, 6	Unique	**Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)** See Appendix A.7, "VMX-Fixed Bits in CR0," and see Table 2-2.
487H	1159	IA32_VMX_CR0_FIXED1	3, 4, 6	Unique	**Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)** See Appendix A.7, "VMX-Fixed Bits in CR0," and see Table 2-2.
488H	1160	IA32_VMX_CR4_FIXED0	3, 4, 6	Unique	**Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)** See Appendix A.8, "VMX-Fixed Bits in CR4," and see Table 2-2.
489H	1161	IA32_VMX_CR4_FIXED1	3, 4, 6	Unique	**Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)** See Appendix A.8, "VMX-Fixed Bits in CR4," and see Table 2-2.
48AH	1162	IA32_VMX_VMCS_ENUM	3, 4, 6	Unique	**Capability Reporting Register of VMCS Field Enumeration (R/O)** See Appendix A.9, "VMCS Enumeration," and see Table 2-2.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
48BH	1163	IA32_VMX_PROCBASED_CTLS2	3, 4, 6	Unique	**Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls," and see Table 2-2.
600H	1536	IA32_DS_AREA	0, 1, 2, 3, 4, 6	Unique	**DS Save Area (R/W)** See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
680H	1664	MSR_LASTBRANCH_0_FROM_IP	3, 4, 6	Unique	**Last Branch Record 0 (R/W)** One of 16 pairs of last branch record registers on the last branch record stack (680H-68FH). This part of the stack contains pointers to the **source instruction** for one of the last 16 branches, exceptions, or interrupts taken by the processor.
					The MSRs at 680H-68FH, 6C0H-6CfH are not available in processor releases before family 0FH, model 03H. These MSRs replace MSRs previously located at 1DBH-1DEH.which performed the same function for early releases. See Section 17.12, "Last Branch, Call Stack, Interrupt, and Exception Recording for Processors based on Skylake Microarchitecture."
681H	1665	MSR_LASTBRANCH_1_FROM_IP	3, 4, 6	Unique	**Last Branch Record 1** See description of MSR_LASTBRANCH_0 at 680H.
682H	1666	MSR_LASTBRANCH_2_FROM_IP	3, 4, 6	Unique	**Last Branch Record 2** See description of MSR_LASTBRANCH_0 at 680H.
683H	1667	MSR_LASTBRANCH_3_FROM_IP	3, 4, 6	Unique	**Last Branch Record 3** See description of MSR_LASTBRANCH_0 at 680H.
684H	1668	MSR_LASTBRANCH_4_FROM_IP	3, 4, 6	Unique	**Last Branch Record 4** See description of MSR_LASTBRANCH_0 at 680H.
685H	1669	MSR_LASTBRANCH_5_FROM_IP	3, 4, 6	Unique	**Last Branch Record 5** See description of MSR_LASTBRANCH_0 at 680H.
686H	1670	MSR_LASTBRANCH_6_FROM_IP	3, 4, 6	Unique	**Last Branch Record 6** See description of MSR_LASTBRANCH_0 at 680H.
687H	1671	MSR_LASTBRANCH_7_FROM_IP	3, 4, 6	Unique	**Last Branch Record 7** See description of MSR_LASTBRANCH_0 at 680H.
688H	1672	MSR_LASTBRANCH_8_FROM_IP	3, 4, 6	Unique	**Last Branch Record 8** See description of MSR_LASTBRANCH_0 at 680H.
689H	1673	MSR_LASTBRANCH_9_FROM_IP	3, 4, 6	Unique	**Last Branch Record 9** See description of MSR_LASTBRANCH_0 at 680H.
68AH	1674	MSR_LASTBRANCH_10_FROM_IP	3, 4, 6	Unique	**Last Branch Record 10** See description of MSR_LASTBRANCH_0 at 680H.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
68BH	1675	MSR_LASTBRANCH_11_FROM_IP	3, 4, 6	Unique	**Last Branch Record 11** See description of MSR_LASTBRANCH_0 at 680H.
68CH	1676	MSR_LASTBRANCH_12_FROM_IP	3, 4, 6	Unique	**Last Branch Record 12** See description of MSR_LASTBRANCH_0 at 680H.
68DH	1677	MSR_LASTBRANCH_13_FROM_IP	3, 4, 6	Unique	**Last Branch Record 13** See description of MSR_LASTBRANCH_0 at 680H.
68EH	1678	MSR_LASTBRANCH_14_FROM_IP	3, 4, 6	Unique	**Last Branch Record 14** See description of MSR_LASTBRANCH_0 at 680H.
68FH	1679	MSR_LASTBRANCH_15_FROM_IP	3, 4, 6	Unique	**Last Branch Record 15** See description of MSR_LASTBRANCH_0 at 680H.
6C0H	1728	MSR_LASTBRANCH_0_TO_IP	3, 4, 6	Unique	**Last Branch Record 0 (R/W)** One of 16 pairs of last branch record registers on the last branch record stack (6C0H-6CFH). This part of the stack contains pointers to the destination instruction for one of the last 16 branches, exceptions, or interrupts that the processor took. See Section 17.12, "Last Branch, Call Stack, Interrupt, and Exception Recording for Processors based on Skylake Microarchitecture."
6C1H	1729	MSR_LASTBRANCH_1_TO_IP	3, 4, 6	Unique	**Last Branch Record 1** See description of MSR_LASTBRANCH_0 at 6C0H.
6C2H	1730	MSR_LASTBRANCH_2_TO_IP	3, 4, 6	Unique	**Last Branch Record 2** See description of MSR_LASTBRANCH_0 at 6C0H.
6C3H	1731	MSR_LASTBRANCH_3_TO_IP	3, 4, 6	Unique	**Last Branch Record 3** See description of MSR_LASTBRANCH_0 at 6C0H.
6C4H	1732	MSR_LASTBRANCH_4_TO_IP	3, 4, 6	Unique	**Last Branch Record 4** See description of MSR_LASTBRANCH_0 at 6C0H.
6C5H	1733	MSR_LASTBRANCH_5_TO_IP	3, 4, 6	Unique	**Last Branch Record 5** See description of MSR_LASTBRANCH_0 at 6C0H.
6C6H	1734	MSR_LASTBRANCH_6_TO_IP	3, 4, 6	Unique	**Last Branch Record 6** See description of MSR_LASTBRANCH_0 at 6C0H.
6C7H	1735	MSR_LASTBRANCH_7_TO_IP	3, 4, 6	Unique	**Last Branch Record 7** See description of MSR_LASTBRANCH_0 at 6C0H.
6C8H	1736	MSR_LASTBRANCH_8_TO_IP	3, 4, 6	Unique	**Last Branch Record 8** See description of MSR_LASTBRANCH_0 at 6C0H.
6C9H	1737	MSR_LASTBRANCH_9_TO_IP	3, 4, 6	Unique	**Last Branch Record 9** See description of MSR_LASTBRANCH_0 at 6C0H.
6CAH	1738	MSR_LASTBRANCH_10_TO_IP	3, 4, 6	Unique	**Last Branch Record 10** See description of MSR_LASTBRANCH_0 at 6C0H.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail-ability	Shared/ Unique[1]	Bit Description
Hex	Dec				
6CBH	1739	MSR_LASTBRANCH_11_TO_IP	3, 4, 6	Unique	**Last Branch Record 11** See description of MSR_LASTBRANCH_0 at 6C0H.
6CCH	1740	MSR_LASTBRANCH_12_TO_IP	3, 4, 6	Unique	**Last Branch Record 12** See description of MSR_LASTBRANCH_0 at 6C0H.
6CDH	1741	MSR_LASTBRANCH_13_TO_IP	3, 4, 6	Unique	**Last Branch Record 13** See description of MSR_LASTBRANCH_0 at 6C0H.
6CEH	1742	MSR_LASTBRANCH_14_TO_IP	3, 4, 6	Unique	**Last Branch Record 14** See description of MSR_LASTBRANCH_0 at 6C0H.
6CFH	1743	MSR_LASTBRANCH_15_TO_IP	3, 4, 6	Unique	**Last Branch Record 15** See description of MSR_LASTBRANCH_0 at 6C0H.
C000_0080H		IA32_EFER	3, 4, 6	Unique	**Extended Feature Enables** See Table 2-2.
C000_0081H		IA32_STAR	3, 4, 6	Unique	**System Call Target Address (R/W)** See Table 2-2.
C000_0082H		IA32_LSTAR	3, 4, 6	Unique	**IA-32e Mode System Call Target Address (R/W)** See Table 2-2.
C000_0084H		IA32_FMASK	3, 4, 6	Unique	**System Call Flag Mask (R/W)** See Table 2-2.
C000_0100H		IA32_FS_BASE	3, 4, 6	Unique	**Map of BASE Address of FS (R/W)** See Table 2-2.
C000_0101H		IA32_GS_BASE	3, 4, 6	Unique	**Map of BASE Address of GS (R/W)** See Table 2-2.
C000_0102H		IA32_KERNEL_GS_BASE	3, 4, 6	Unique	**Swap Target of BASE Address of GS (R/W)** See Table 2-2.

NOTES

1. For HT-enabled processors, there may be more than one logical processors per physical unit. If an MSR is Shared, this means that one MSR is shared between logical processors. If an MSR is unique, this means that each logical processor has its own MSR.

2.18.1 MSRs Unique to Intel® Xeon® Processor MP with L3 Cache

The MSRs listed in Table 2-46 apply to Intel® Xeon® Processor MP with up to 8MB level three cache. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 3 or 4 (see CPUID instruction for more details).

Table 2-46. MSRs Unique to 64-bit Intel® Xeon® Processor MP with Up to an 8 MB L3 Cache

Register Address		Register Name Fields and Flags	Model Availability	Shared/ Unique	Bit Description
107CCH		MSR_IFSB_BUSQ0	3, 4	Shared	**IFSB BUSQ Event Control and Counter Register (R/W)** See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107CDH		MSR_IFSB_BUSQ1	3, 4	Shared	**IFSB BUSQ Event Control and Counter Register (R/W)**
107CEH		MSR_IFSB_SNPQ0	3, 4	Shared	**IFSB SNPQ Event Control and Counter Register (R/W)** See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107CFH		MSR_IFSB_SNPQ1	3, 4	Shared	**IFSB SNPQ Event Control and Counter Register (R/W)**
107D0H		MSR_EFSB_DRDY0	3, 4	Shared	**EFSB DRDY Event Control and Counter Register (R/W)** See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107D1H		MSR_EFSB_DRDY1	3, 4	Shared	**EFSB DRDY Event Control and Counter Register (R/W)**
107D2H		MSR_IFSB_CTL6	3, 4	Shared	**IFSB Latency Event Control Register (R/W)** See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107D3H		MSR_IFSB_CNTR7	3, 4	Shared	**IFSB Latency Event Counter Register (R/W)** See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."

The MSRs listed in Table 2-47 apply to Intel® Xeon® Processor 7100 series. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 6 (See CPUID instruction for more details.). The performance monitoring MSRs listed in Table 2-47 are shared between logical processors in the same core, but are replicated for each core.

Table 2-47. MSRs Unique to Intel® Xeon® Processor 7100 Series

Register Address		Register Name Fields and Flags	Model Availability	Shared/ Unique	Bit Description
107CCH		MSR_EMON_L3_CTR_CTL0	6	Shared	**GBUSQ Event Control and Counter Register (R/W)** See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107CDH		MSR_EMON_L3_CTR_CTL1	6	Shared	**GBUSQ Event Control and Counter Register (R/W)**
107CEH		MSR_EMON_L3_CTR_CTL2	6	Shared	**GSNPQ Event Control and Counter Register (R/W)** See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107CFH		MSR_EMON_L3_CTR_CTL3	6	Shared	**GSNPQ Event Control and Counter Register (R/W)**
107D0H		MSR_EMON_L3_CTR_CTL4	6	Shared	**FSB Event Control and Counter Register (R/W)** See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107D1H		MSR_EMON_L3_CTR_CTL5	6	Shared	**FSB Event Control and Counter Register (R/W)**
107D2H		MSR_EMON_L3_CTR_CTL6	6	Shared	**FSB Event Control and Counter Register (R/W)**
107D3H		MSR_EMON_L3_CTR_CTL7	6	Shared	**FSB Event Control and Counter Register (R/W)**

2.19 MSRS IN INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Model-specific registers (MSRs) for Intel Core Solo, Intel Core Duo processors, and Dual-core Intel Xeon processor LV are listed in Table 2-48. The column "Shared/Unique" applies to Intel Core Duo processor. "Unique" means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. "Shared" means the MSR or the bit field in an MSR address governs the operation of both processor cores.

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
0H	0	P5_MC_ADDR	Unique	See Section 2.22, "MSRs in Pentium Processors," and see Table 2-2.
1H	1	P5_MC_TYPE	Unique	See Section 2.22, "MSRs in Pentium Processors," and see Table 2-2.
6H	6	IA32_MONITOR_FILTER_SIZE	Unique	See Section 8.10.5, "Monitor/Mwait Address Range Determination," and see Table 2-2.
10H	16	IA32_TIME_STAMP_COUNTER	Unique	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
17H	23	IA32_PLATFORM_ID	Shared	**Platform ID (R)** See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.
1BH	27	IA32_APIC_BASE	Unique	See Section 10.4.4, "Local APIC Status and Location," and see Table 2-2.
2AH	42	MSR_EBL_CR_POWERON	Shared	**Processor Hard Power-On Configuration (R/W)** Enables and disables processor features; (R) indicates current processor configuration.
		0		Reserved.
		1		**Data Error Checking Enable (R/W)** 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		2		**Response Error Checking Enable (R/W)** 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		3		**MCERR# Drive Enable (R/W)** 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		4		**Address Parity Enable (R/W)** 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		6: 5		Reserved
		7		**BINIT# Driver Enable (R/W)** 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		8		**Output Tri-state Enabled (R/O)** 1 = Enabled; 0 = Disabled
		9		**Execute BIST (R/O)** 1 = Enabled; 0 = Disabled
		10		**MCERR# Observation Enabled (R/O)** 1 = Enabled; 0 = Disabled
		11		Reserved
		12		**BINIT# Observation Enabled (R/O)** 1 = Enabled; 0 = Disabled
		13		Reserved
		14		**1 MByte Power on Reset Vector (R/O)** 1 = 1 MByte; 0 = 4 GBytes
		15		Reserved
		17:16		**APIC Cluster ID (R/O)**

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		18		**System Bus Frequency (R/O)** 0 = 100 MHz 1 = Reserved
		19		Reserved.
		21: 20		**Symmetric Arbitration ID (R/O)**
		26:22		**Clock Frequency Ratio (R/O)**
3AH	58	IA32_FEATURE_CONTROL	Unique	**Control Features in IA-32 Processor (R/W)** See Table 2-2.
40H	64	MSR_LASTBRANCH_0	Unique	**Last Branch Record 0 (R/W)** One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the 'to' address. See also: ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."
41H	65	MSR_LASTBRANCH_1	Unique	**Last Branch Record 1 (R/W)** See description of MSR_LASTBRANCH_0.
42H	66	MSR_LASTBRANCH_2	Unique	**Last Branch Record 2 (R/W)** See description of MSR_LASTBRANCH_0.
43H	67	MSR_LASTBRANCH_3	Unique	**Last Branch Record 3 (R/W)** See description of MSR_LASTBRANCH_0.
44H	68	MSR_LASTBRANCH_4	Unique	**Last Branch Record 4 (R/W)** See description of MSR_LASTBRANCH_0.
45H	69	MSR_LASTBRANCH_5	Unique	**Last Branch Record 5 (R/W)** See description of MSR_LASTBRANCH_0.
46H	70	MSR_LASTBRANCH_6	Unique	**Last Branch Record 6 (R/W)** See description of MSR_LASTBRANCH_0.
47H	71	MSR_LASTBRANCH_7	Unique	**Last Branch Record 7 (R/W)** See description of MSR_LASTBRANCH_0.
79H	121	IA32_BIOS_UPDT_TRIG	Unique	**BIOS Update Trigger Register (W)** See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Unique	**BIOS Update Signature ID (RO)** See Table 2-2.
C1H	193	IA32_PMC0	Unique	**Performance counter register** See Table 2-2.
C2H	194	IA32_PMC1	Unique	**Performance counter register** See Table 2-2.
CDH	205	MSR_FSB_FREQ	Shared	**Scaleable Bus Speed (RO)** This field indicates the scaleable bus clock speed:

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		2:0		▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) 133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 101B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B.
		63:3		Reserved.
E7H	231	IA32_MPERF	Unique	**Maximum Performance Frequency Clock Count. (RW)** See Table 2-2.
E8H	232	IA32_APERF	Unique	**Actual Performance Frequency Clock Count. (RW)** See Table 2-2.
FEH	254	IA32_MTRRCAP	Unique	See Table 2-2.
11EH	281	MSR_BBL_CR_CTL3	Shared	Control register 3. Used to configure the L2 Cache.
		0		**L2 Hardware Enabled (RO)** 1 = If the L2 is hardware-enabled 0 = Indicates if the L2 is hardware-disabled
		7:1		Reserved.
		8		**L2 Enabled (R/W)** 1 = L2 cache has been initialized 0 = Disabled (default) Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9		Reserved.
		23		**L2 Not Present (RO)** 0 = L2 Present 1 = L2 Not Present
		63:24		Reserved.
174H	372	IA32_SYSENTER_CS	Unique	See Table 2-2.
175H	373	IA32_SYSENTER_ESP	Unique	See Table 2-2.
176H	374	IA32_SYSENTER_EIP	Unique	See Table 2-2.
179H	377	IA32_MCG_CAP	Unique	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Unique	Global Machine Check Status
		0		**RIPV** When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted.

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		1		**EIPV** When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		**MCIP** When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved.
186H	390	IA32_PERFEVTSEL0	Unique	See Table 2-2.
187H	391	IA32_PERFEVTSEL1	Unique	See Table 2-2.
198H	408	IA32_PERF_STATUS	Shared	See Table 2-2.
199H	409	IA32_PERF_CTL	Unique	See Table 2-2.
19AH	410	IA32_CLOCK_ MODULATION	Unique	**Clock Modulation (R/W)** See Table 2-2.
19BH	411	IA32_THERM_ INTERRUPT	Unique	**Thermal Interrupt Control (R/W)** See Table 2-2. See Section 14.7.2, "Thermal Monitor."
19CH	412	IA32_THERM_STATUS	Unique	**Thermal Monitor Status (R/W)** See Table 2-2. See Section 14.7.2, "Thermal Monitor".
19DH	413	MSR_THERM2_CTL	Unique	Thermal Monitor 2 Control
		15:0		Reserved.
		16		**TM_SELECT (R/W)** Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.
		63:16		Reserved.
1A0H	416	IA32_MISC_ENABLE		**Enable Miscellaneous Processor Features (R/W)** Allows a variety of processor functions to be enabled and disabled.
		2:0		Reserved.
		3	Unique	**Automatic Thermal Control Circuit Enable (R/W)** See Table 2-2.
		6:4		Reserved.
		7	Shared	**Performance Monitoring Available (R)** See Table 2-2.

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		9:8		Reserved.
		10	Shared	**FERR# Multiplexing Enable (R/W)** 1 = FERR# asserted by the processor to indicate a pending break event within the processor 0 = Indicates compatible FERR# signaling behavior This bit must be set to 1 to support XAPIC interrupt model usage.
		11	Shared	**Branch Trace Storage Unavailable (RO)** See Table 2-2.
		12		Reserved.
		13	Shared	**TM2 Enable (R/W)** When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state. If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.
		15:14		Reserved.
		16	Shared	**Enhanced Intel SpeedStep Technology Enable (R/W)** 1 = Enhanced Intel SpeedStep Technology enabled
		18	Shared	**ENABLE MONITOR FSM (R/W)** See Table 2-2.
		19		**Reserved.**
		22	Shared	**Limit CPUID Maxval (R/W)** See Table 2-2. Setting this bit may cause behavior in software that depends on the availability of CPUID leaves greater than 2.
		33:23		Reserved.
		34	Shared	**XD Bit Disable (R/W)** See Table 2-2.
		63:35		Reserved.
1C9H	457	MSR_LASTBRANCH_TOS	Unique	**Last Branch Record Stack TOS (R/W)** Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
1D9H	473	IA32_DEBUGCTL	Unique	**Debug Control (R/W)** Controls how several debug features are used. Bit definitions are discussed in Table 2-2.
1DDH	477	MSR_LER_FROM_LIP	Unique	**Last Exception Record From Linear IP (R)** Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.
1DEH	478	MSR_LER_TO_LIP	Unique	**Last Exception Record To Linear IP (R)** This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
2FFH	767	IA32_MTRR_DEF_TYPE	Unique	**Default Memory Types (R/W)** See Table 2-2. See Section 11.11.2.1, "IA32_MTRR_DEF_TYPE MSR."
400H	1024	IA32_MC0_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MC0_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MC0_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
406H	1030	IA32_MC1_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	MSR_MC4_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	MSR_MC4_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40EH	1038	MSR_MC4_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	IA32_MC3_CTL		See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC3_STATUS		See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
412H	1042	MSR_MC3_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	MSR_MC3_MISC	Unique	Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCi_STATUS register is set.
414H	1044	MSR_MC5_CTL	Unique	Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
415H	1045	MSR_MC5_STATUS	Unique	Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.
416H	1046	MSR_MC5_ADDR	Unique	Machine Check Error Reporting Register - contains the address of the code or data memory location that produced the machine-check error if the ADDRV flag in the IA32_MCi_STATUS register is set.
417H	1047	MSR_MC5_MISC	Unique	Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCi_STATUS register is set.
480H	1152	IA32_VMX_BASIC	Unique	**Reporting Register of Basic VMX Capabilities (R/O)** See Table 2-2. See Appendix A.1, "Basic VMX Information" (If CPUID.01H:ECX.[bit 9])
481H	1153	IA32_VMX_PINBASED_ CTLS	Unique	**Capability Reporting Register of Pin-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls" (If CPUID.01H:ECX.[bit 9])
482H	1154	IA32_VMX_PROCBASED_ CTLS	Unique	**Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls" (If CPUID.01H:ECX.[bit 9])
483H	1155	IA32_VMX_EXIT_CTLS	Unique	**Capability Reporting Register of VM-exit Controls (R/O)** See Appendix A.4, "VM-Exit Controls" (If CPUID.01H:ECX.[bit 9])
484H	1156	IA32_VMX_ENTRY_CTLS	Unique	**Capability Reporting Register of VM-entry Controls (R/O)** See Appendix A.5, "VM-Entry Controls" (If CPUID.01H:ECX.[bit 9])
485H	1157	IA32_VMX_MISC	Unique	**Reporting Register of Miscellaneous VMX Capabilities (R/O)** See Appendix A.6, "Miscellaneous Data" (If CPUID.01H:ECX.[bit 9])
486H	1158	IA32_VMX_CR0_FIXED0	Unique	**Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)** See Appendix A.7, "VMX-Fixed Bits in CR0" (If CPUID.01H:ECX.[bit 9])
487H	1159	IA32_VMX_CR0_FIXED1	Unique	**Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)** See Appendix A.7, "VMX-Fixed Bits in CR0" (If CPUID.01H:ECX.[bit 9])
488H	1160	IA32_VMX_CR4_FIXED0	Unique	**Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)** See Appendix A.8, "VMX-Fixed Bits in CR4" (If CPUID.01H:ECX.[bit 9])

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
489H	1161	IA32_VMX_CR4_FIXED1	Unique	**Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)** See Appendix A.8, "VMX-Fixed Bits in CR4" (If CPUID.01H:ECX.[bit 9])
48AH	1162	IA32_VMX_VMCS_ENUM	Unique	**Capability Reporting Register of VMCS Field Enumeration (R/O)** See Appendix A.9, "VMCS Enumeration" (If CPUID.01H:ECX.[bit 9])
48BH	1163	IA32_VMX_PROCBASED_ CTLS2	Unique	**Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)** See Appendix A.3, "VM-Execution Controls" (If CPUID.01H:ECX.[bit 9] and IA32_VMX_PROCBASED_CTLS[bit 63])
600H	1536	IA32_DS_AREA	Unique	**DS Save Area (R/W)** See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
		31:0		**DS Buffer Management Area** Linear address of the first byte of the DS buffer management area.
		63:32		Reserved.
C000_ 0080H		IA32_EFER	Unique	See Table 2-2.
		10:0		Reserved.
		11		**Execute Disable Bit Enable**
		63:12		Reserved.

2.20 MSRS IN THE PENTIUM M PROCESSOR

Model-specific registers (MSRs) for the Pentium M processor are similar to those described in Section 2.21 for P6 family processors. The following table describes new MSRs and MSRs whose behavior has changed on the Pentium M processor.

Table 2-49. MSRs in Pentium M Processors

Register Address		Register Name	Bit Description
Hex	Dec		
0H	0	P5_MC_ADDR	See Section 2.22, "MSRs in Pentium Processors."
1H	1	P5_MC_TYPE	See Section 2.22, "MSRs in Pentium Processors."
10H	16	IA32_TIME_STAMP_COUNTER	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
17H	23	IA32_PLATFORM_ID	**Platform ID (R)** See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
2AH	42	MSR_EBL_CR_POWERON	**Processor Hard Power-On Configuration** **(R/W)** Enables and disables processor features. **(R)** Indicates current processor configuration.
		0	Reserved.
		1	**Data Error Checking Enable (R)** 0 = Disabled Always 0 on the Pentium M processor.
		2	**Response Error Checking Enable (R)** 0 = Disabled Always 0 on the Pentium M processor.
		3	**MCERR# Drive Enable (R)** 0 = Disabled Always 0 on the Pentium M processor.
		4	**Address Parity Enable (R)** 0 = Disabled Always 0 on the Pentium M processor.
		6:5	Reserved.
		7	**BINIT# Driver Enable (R)** 1 = Enabled; 0 = Disabled Always 0 on the Pentium M processor.
		8	**Output Tri-state Enabled (R/O)** 1 = Enabled; 0 = Disabled
		9	**Execute BIST (R/O)** 1 = Enabled; 0 = Disabled
		10	**MCERR# Observation Enabled (R/O)** 1 = Enabled; 0 = Disabled Always 0 on the Pentium M processor.
		11	Reserved.
		12	**BINIT# Observation Enabled (R/O)** 1 = Enabled; 0 = Disabled Always 0 on the Pentium M processor.
		13	Reserved.
		14	**1 MByte Power on Reset Vector (R/O)** 1 = 1 MByte; 0 = 4 GBytes Always 0 on the Pentium M processor.
		15	Reserved.
		17:16	**APIC Cluster ID (R/O)** Always 00B on the Pentium M processor.

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		18	**System Bus Frequency (R/O)** 0 = 100 MHz 1 = Reserved Always 0 on the Pentium M processor.
		19	Reserved.
		21: 20	**Symmetric Arbitration ID (R/O)** Always 00B on the Pentium M processor.
		26:22	Clock Frequency Ratio (R/O)
40H	64	MSR_LASTBRANCH_0	**Last Branch Record 0 (R/W)** One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the to address. See also: ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)"
41H	65	MSR_LASTBRANCH_1	**Last Branch Record 1 (R/W)** See description of MSR_LASTBRANCH_0.
42H	66	MSR_LASTBRANCH_2	**Last Branch Record 2 (R/W)** See description of MSR_LASTBRANCH_0.
43H	67	MSR_LASTBRANCH_3	**Last Branch Record 3 (R/W)** See description of MSR_LASTBRANCH_0.
44H	68	MSR_LASTBRANCH_4	**Last Branch Record 4 (R/W)** See description of MSR_LASTBRANCH_0.
45H	69	MSR_LASTBRANCH_5	**Last Branch Record 5 (R/W)** See description of MSR_LASTBRANCH_0.
46H	70	MSR_LASTBRANCH_6	**Last Branch Record 6 (R/W)** See description of MSR_LASTBRANCH_0.
47H	71	MSR_LASTBRANCH_7	**Last Branch Record 7 (R/W)** See description of MSR_LASTBRANCH_0.
119H	281	MSR_BBL_CR_CTL	Control register Used to program L2 commands to be issued via cache configuration accesses mechanism. Also receives L2 lookup response.
		63:0	Reserved.
11EH	281	MSR_BBL_CR_CTL3	Control register 3 Used to configure the L2 Cache.
		0	**L2 Hardware Enabled (RO)** 1 = If the L2 is hardware-enabled 0 = Indicates if the L2 is hardware-disabled
		4:1	Reserved.

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		5	**ECC Check Enable (RO)** This bit enables ECC checking on the cache data bus. ECC is always generated on write cycles. 0 = Disabled (default) 1 = Enabled For the Pentium M processor, ECC checking on the cache data bus is always enabled.
		7:6	Reserved.
		8	**L2 Enabled (R/W)** 1 = L2 cache has been initialized 0 = Disabled (default) Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9	Reserved.
		23	**L2 Not Present (RO)** 0 = L2 Present 1 = L2 Not Present
		63:24	Reserved.
179H	377	IA32_MCG_CAP	Read-only register that provides information about the machine-check architecture of the processor.
		7:0	**Count (RO)** Indicates the number of hardware unit error reporting banks available in the processor.
		8	**IA32_MCG_CTL Present (RO)** 1 = Indicates that the processor implements the MSR_MCG_CTL register found at MSR 17BH. 0 = Not supported.
		63:9	Reserved.
17AH	378	IA32_MCG_STATUS	Global Machine Check Status
		0	**RIPV** When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted.
		1	**EIPV** When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2	**MCIP** When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		63:3	Reserved.
198H	408	IA32_PERF_STATUS	See Table 2-2.
199H	409	IA32_PERF_CTL	See Table 2-2.
19AH	410	IA32_CLOCK_MODULATION	**Clock Modulation (R/W).** See Table 2-2. See Section 14.7.3, "Software Controlled Clock Modulation."
19BH	411	IA32_THERM_INTERRUPT	**Thermal Interrupt Control (R/W)** See Table 2-2. See Section 14.7.2, "Thermal Monitor."
19CH	412	IA32_THERM_STATUS	**Thermal Monitor Status (R/W)** See Table 2-2. See Section 14.7.2, "Thermal Monitor."
19DH	413	MSR_THERM2_CTL	Thermal Monitor 2 Control
		15:0	Reserved.
		16	**TM_SELECT (R/W)** Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.
		63:16	Reserved.
1A0H	416	IA32_MISC_ENABLE	**Enable Miscellaneous Processor Features (R/W)** Allows a variety of processor functions to be enabled and disabled.
		2:0	Reserved.
		3	**Automatic Thermal Control Circuit Enable (R/W)** 1 = Setting this bit enables the thermal control circuit (TCC) portion of the Intel Thermal Monitor feature. This allows processor clocks to be automatically modulated based on the processor's thermal sensor operation. 0 = Disabled (default). The automatic thermal control circuit enable bit determines if the thermal control circuit (TCC) will be activated when the processor's internal thermal sensor determines the processor is about to exceed its maximum operating temperature. When the TCC is activated and TM1 is enabled, the processors clocks will be forced to a 50% duty cycle. BIOS must enable this feature. The bit should not be confused with the on-demand thermal control circuit enable bit.
		6:4	Reserved.

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		7	**Performance Monitoring Available (R)** 1 = Performance monitoring enabled 0 = Performance monitoring disabled
		9:8	Reserved.
		10	**FERR# Multiplexing Enable (R/W)** 1 = FERR# asserted by the processor to indicate a pending break event within the processor 0 = Indicates compatible FERR# signaling behavior This bit must be set to 1 to support XAPIC interrupt model usage.
			Branch Trace Storage Unavailable (RO) 1 = Processor doesn't support branch trace storage (BTS) 0 = BTS is supported
		12	**Processor Event Based Sampling Unavailable (RO)** 1 = Processor does not support processor event based sampling (PEBS); 0 = PEBS is supported. The Pentium M processor does not support PEBS.
		15:13	Reserved.
		16	**Enhanced Intel SpeedStep Technology Enable (R/W)** 1 = Enhanced Intel SpeedStep Technology enabled. On the Pentium M processor, this bit may be configured to be read-only.
		22:17	Reserved.
		23	**xTPR Message Disable (R/W)** When set to 1, xTPR messages are disabled. xTPR messages are optional messages that allow the processor to inform the chipset of its priority. The default is processor specific.
		63:24	Reserved.
1C9H	457	MSR_LASTBRANCH_TOS	**Last Branch Record Stack TOS (R/W)** Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See also: ▪ MSR_LASTBRANCH_0_FROM_IP (at 40H) ▪ Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)"
1D9H	473	MSR_DEBUGCTLB	**Debug Control (R/W)** Controls how several debug features are used. Bit definitions are discussed in the referenced section. See Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
1DDH	477	MSR_LER_TO_LIP	**Last Exception Record To Linear IP (R)** This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)" and Section 17.16.2, "Last Branch and Last Exception MSRs."
1DEH	478	MSR_LER_FROM_LIP	**Last Exception Record From Linear IP (R)** Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)" and Section 17.16.2, "Last Branch and Last Exception MSRs."
2FFH	767	IA32_MTRR_DEF_TYPE	**Default Memory Types (R/W)** Sets the memory type for the regions of physical memory that are not mapped by the MTRRs. See Section 11.11.2.1, "IA32_MTRR_DEF_TYPE MSR."
400H	1024	IA32_MC0_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MC0_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MC0_ADDR	See Section 14.3.2.3., "IA32_MCi_ADDR MSRs". The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
406H	1030	IA32_MC1_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	See Chapter 15.3.2.2, "IA32_MCi_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	MSR_MC4_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	MSR_MC4_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
40EH	1038	MSR_MC4_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	MSR_MC3_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	MSR_MC3_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
412H	1042	MSR_MC3_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
600H	1536	IA32_DS_AREA	**DS Save Area (R/W)** See Table 2-2. Points to the DS buffer management area, which is used to manage the BTS and PEBS buffers. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
		31:0	**DS Buffer Management Area** Linear address of the first byte of the DS buffer management area.
		63:32	Reserved.

2.21 MSRS IN THE P6 FAMILY PROCESSORS

The following MSRs are defined for the P6 family processors. The MSRs in this table that are shaded are available only in the Pentium II and Pentium III processors. Beginning with the Pentium 4 processor, some of the MSRs in this list have been designated as "architectural" and have had their names changed. See Table 2-2 for a list of the architectural MSRs.

Table 2-50. MSRs in the P6 Family Processors

Register Address		Register Name	Bit Description
Hex	Dec		
0H	0	P5_MC_ADDR	See Section 2.22, "MSRs in Pentium Processors."
1H	1	P5_MC_TYPE	See Section 2.22, "MSRs in Pentium Processors."
10H	16	TSC	See Section 17.17, "Time-Stamp Counter."
17H	23	IA32_PLATFORM_ID	**Platform ID (R)** The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.
		49:0	Reserved.

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		52:50	**Platform Id (R)** Contains information concerning the intended platform for the processor. 52 51 50 0 0 0 Processor Flag 0 0 0 1 Processor Flag 1 0 1 0 Processor Flag 2 0 1 1 Processor Flag 3 1 0 0 Processor Flag 4 1 0 1 Processor Flag 5 1 1 0 Processor Flag 6 1 1 1 Processor Flag 7
		56:53	L2 Cache Latency Read.
		59:57	Reserved.
		60	Clock Frequency Ratio Read.
		63:61	Reserved.
1BH	27	APIC_BASE	Section 10.4.4, "Local APIC Status and Location."
		7:0	Reserved.
		8	**Boot Strap Processor indicator Bit** 1 = BSP
		10:9	Reserved.
		11	**APIC Global Enable Bit - Permanent till reset** 1 = Enabled 0 = Disabled
		31:12	APIC Base Address.
		63:32	Reserved.
2AH	42	EBL_CR_POWERON	**Processor Hard Power-On Configuration** **(R/W)** Enables and disables processor features; **(R)** indicates current processor configuration.
		0	Reserved.[1]
		1	**Data Error Checking Enable (R/W)** 1 = Enabled 0 = Disabled
		2	**Response Error Checking Enable FRCERR Observation Enable (R/W)** 1 = Enabled 0 = Disabled
		3	**AERR# Drive Enable (R/W)** 1 = Enabled 0 = Disabled
		4	**BERR# Enable for Initiator Bus Requests (R/W)** 1 = Enabled 0 = Disabled
		5	Reserved.

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		6	**BERR# Driver Enable for Initiator Internal Errors (R/W)** 1 = Enabled 0 = Disabled
		7	**BINIT# Driver Enable (R/W)** 1 = Enabled 0 = Disabled
		8	**Output Tri-state Enabled (R)** 1 = Enabled 0 = Disabled
		9	**Execute BIST (R)** 1 = Enabled 0 = Disabled
		10	**AERR# Observation Enabled (R)** 1 = Enabled 0 = Disabled
		11	Reserved.
		12	**BINIT# Observation Enabled (R)** 1 = Enabled 0 = Disabled
		13	**In Order Queue Depth (R)** 1 = 1 0 = 8
		14	**1-MByte Power on Reset Vector (R)** 1 = 1MByte 0 = 4GBytes
		15	**FRC Mode Enable (R)** 1 = Enabled 0 = Disabled
		17:16	**APIC Cluster ID (R)**
		19:18	**System Bus Frequency (R)** 00 = 66MHz 10 = 100Mhz 01 = 133MHz 11 = Reserved
		21: 20	**Symmetric Arbitration ID (R)**
		25:22	**Clock Frequency Ratio (R)**
		26	**Low Power Mode Enable (R/W)**
		27	**Clock Frequency Ratio**
		63:28	Reserved.[1]
33H	51	TEST_CTL	**Test Control Register**

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		29:0	Reserved.
		30	**Streaming Buffer Disable**
		31	**Disable LOCK#** Assertion for split locked access.
79H	121	BIOS_UPDT_TRIG	BIOS Update Trigger Register.
88H	136	BBL_CR_D0[63:0]	Chunk 0 data register D[63:0]: used to write to and read from the L2
89H	137	BBL_CR_D1[63:0]	Chunk 1 data register D[63:0]: used to write to and read from the L2
8AH	138	BBL_CR_D2[63:0]	Chunk 2 data register D[63:0]: used to write to and read from the L2
8BH	139	BIOS_SIGN/BBL_CR_D3[63:0]	**BIOS Update Signature Register or Chunk 3 data register D[63:0]** Used to write to and read from the L2 depending on the usage model.
C1H	193	PerfCtr0 (PERFCTR0)	Performance Counter Register See Table 2-2.
C2H	194	PerfCtr1 (PERFCTR1)	Performance Counter Register See Table 2-2.
FEH	254	MTRRcap	Memory Type Range Registers
116H	278	BBL_CR_ADDR [63:0] BBL_CR_ADDR [63:32] BBL_CR_ADDR [31:3] BBL_CR_ADDR [2:0]	Address register: used to send specified address (A31-A3) to L2 during cache initialization accesses. Reserved, Address bits [35:3] Reserved Set to 0.
118H	280	BBL_CR_DECC[63:0]	Data ECC register D[7:0]: used to write ECC and read ECC to/from L2
119H	281	BBL_CR_CTL BL_CR_CTL[63:22] BBL_CR_CTL[21]	Control register: used to program L2 commands to be issued via cache configuration accesses mechanism. Also receives L2 lookup response Reserved Processor number[2] Disable = 1 Enable = 0 Reserved
		BBL_CR_CTL[20:19] BBL_CR_CTL[18] BBL_CR_CTL[17] BBL_CR_CTL[16] BBL_CR_CTL[15:14] BBL_CR_CTL[13:12] BBL_CR_CTL[11:10] BBL_CR_CTL[9:8] BBL_CR_CTL[7] BBL_CR_CTL[6:5]	User supplied ECC Reserved L2 Hit Reserved State from L2 Modified - 11,Exclusive - 10, Shared - 01, Invalid - 00 Way from L2 Way 0 - 00, Way 1 - 01, Way 2 - 10, Way 3 - 11 Way to L2 Reserved State to L2

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		BBL_CR_CTL[4:0] 01100 01110 01111 00010 00011 010 + MESI encode 111 + MESI encode 100 + MESI encode	L2 Command Data Read w/ LRU update (RLU) Tag Read w/ Data Read (TRR) Tag Inquire (TI) L2 Control Register Read (CR) L2 Control Register Write (CW) Tag Write w/ Data Read (TWR) Tag Write w/ Data Write (TWW) Tag Write (TW)
11AH	282	BBL_CR_TRIG	Trigger register: used to initiate a cache configuration accesses access, Write only with Data = 0.
11BH	283	BBL_CR_BUSY	Busy register: indicates when a cache configuration accesses L2 command is in progress. D[0] = 1 = BUSY
11EH	286	BBL_CR_CTL3 BBL_CR_CTL3[63:26] BBL_CR_CTL3[25] BBL_CR_CTL3[24] BBL_CR_CTL3[23] BBL_CR_CTL3[22:20] 111 110 101 100 011 010 001 000 BBL_CR_CTL3[19] BBL_CR_CTL3[18]	Control register 3: used to configure the L2 Cache Reserved Cache bus fraction (read only) Reserved L2 Hardware Disable (read only) L2 Physical Address Range support 64GBytes 32GBytes 16GBytes 8GBytes 4GBytes 2GBytes 1GBytes 512MBytes Reserved Cache State error checking enable (read/write)

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		BBL_CR_CTL3[17:13 00001 00010 00100 01000 10000 BBL_CR_CTL3[12:11] BBL_CR_CTL3[10:9] 00 01 10 11 BBL_CR_CTL3[8] BBL_CR_CTL3[7] BBL_CR_CTL3[6] BBL_CR_CTL3[5] BBL_CR_CTL3[4:1] BBL_CR_CTL3[0]	Cache size per bank (read/write) 256KBytes 512KBytes 1MByte 2MByte 4MBytes Number of L2 banks (read only) L2 Associativity (read only) Direct Mapped 2 Way 4 Way Reserved L2 Enabled (read/write) CRTN Parity Check Enable (read/write) Address Parity Check Enable (read/write) ECC Check Enable (read/write) L2 Cache Latency (read/write) L2 Configured (read/write)
174H	372	SYSENTER_CS_MSR	CS register target for CPL 0 code
175H	373	SYSENTER_ESP_MSR	Stack pointer for CPL 0 stack
176H	374	SYSENTER_EIP_MSR	CPL 0 code entry point
179H	377	MCG_CAP	Machine Check Global Control Register
17AH	378	MCG_STATUS	Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.
17BH	379	MCG_CTL	Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).
186H	390	PerfEvtSel0 (EVNTSEL0)	Performance Event Select Register 0 (R/W)
		7:0	**Event Select** Refer to Performance Counter section for a list of event encodings.
		15:8	**UMASK (Unit Mask)** Unit mask register set to 0 to enable all count options.
		16	**USER** Controls the counting of events at Privilege levels of 1, 2, and 3.
		17	**OS** Controls the counting of events at Privilege level of 0.

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		18	**E** Occurrence/Duration Mode Select 1 = Occurrence 0 = Duration
		19	**PC** Enabled the signaling of performance counter overflow via BP0 pin
		20	**INT** Enables the signaling of counter overflow via input to APIC 1 = Enable 0 = Disable
		22	**ENABLE** Enables the counting of performance events in both counters 1 = Enable 0 = Disable
		23	**INV** Inverts the result of the CMASK condition 1 = Inverted 0 = Non-Inverted
		31:24	CMASK (Counter Mask).
187H	391	PerfEvtSel1 (EVNTSEL1)	Performance Event Select for Counter 1 (R/W)
		7:0	**Event Select** Refer to Performance Counter section for a list of event encodings.
		15:8	**UMASK (Unit Mask)** Unit mask register set to 0 to enable all count options.
		16	**USER** Controls the counting of events at Privilege levels of 1, 2, and 3.
		17	**OS** Controls the counting of events at Privilege level of 0
		18	**E** Occurrence/Duration Mode Select 1 = Occurrence 0 = Duration
		19	**PC** Enabled the signaling of performance counter overflow via BP0 pin.

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		20	**INT** Enables the signaling of counter overflow via input to APIC 1 = Enable 0 = Disable
		23	**INV** Inverts the result of the CMASK condition 1 = Inverted 0 = Non-Inverted
		31:24	**CMASK (Counter Mask)**
1D9H	473	DEBUGCTLMSR	Enables last branch, interrupt, and exception recording; taken branch breakpoints; the breakpoint reporting pins; and trace messages. This register can be written to using the WRMSR instruction, when operating at privilege level 0 or when in real-address mode.
		0	Enable/Disable Last Branch Records
		1	Branch Trap Flag
		2	Performance Monitoring/Break Point Pins
		3	Performance Monitoring/Break Point Pins
		4	Performance Monitoring/Break Point Pins
		5	Performance Monitoring/Break Point Pins
		6	Enable/Disable Execution Trace Messages
		31:7	Reserved
1DBH	475	LASTBRANCHFROMIP	32-bit register for recording the instruction pointers for the last branch, interrupt, or exception that the processor took prior to a debug exception being generated.
1DCH	476	LASTBRANCHTOIP	32-bit register for recording the instruction pointers for the last branch, interrupt, or exception that the processor took prior to a debug exception being generated.
1DDH	477	LASTINTFROMIP	Last INT from IP
1DEH	478	LASTINTTOIP	Last INT to IP
200H	512	MTRRphysBase0	Memory Type Range Registers
201H	513	MTRRphysMask0	Memory Type Range Registers
202H	514	MTRRphysBase1	Memory Type Range Registers
203H	515	MTRRphysMask1	Memory Type Range Registers
204H	516	MTRRphysBase2	Memory Type Range Registers
205H	517	MTRRphysMask2	Memory Type Range Registers
206H	518	MTRRphysBase3	Memory Type Range Registers
207H	519	MTRRphysMask3	Memory Type Range Registers
208H	520	MTRRphysBase4	Memory Type Range Registers
209H	521	MTRRphysMask4	Memory Type Range Registers
20AH	522	MTRRphysBase5	Memory Type Range Registers

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
20BH	523	MTRRphysMask5	Memory Type Range Registers
20CH	524	MTRRphysBase6	Memory Type Range Registers
20DH	525	MTRRphysMask6	Memory Type Range Registers
20EH	526	MTRRphysBase7	Memory Type Range Registers
20FH	527	MTRRphysMask7	Memory Type Range Registers
250H	592	MTRRfix64K_00000	Memory Type Range Registers
258H	600	MTRRfix16K_80000	Memory Type Range Registers
259H	601	MTRRfix16K_A0000	Memory Type Range Registers
268H	616	MTRRfix4K_C0000	Memory Type Range Registers
269H	617	MTRRfix4K_C8000	Memory Type Range Registers
26AH	618	MTRRfix4K_D0000	Memory Type Range Registers
26BH	619	MTRRfix4K_D8000	Memory Type Range Registers
26CH	620	MTRRfix4K_E0000	Memory Type Range Registers
26DH	621	MTRRfix4K_E8000	Memory Type Range Registers
26EH	622	MTRRfix4K_F0000	Memory Type Range Registers
26FH	623	MTRRfix4K_F8000	Memory Type Range Registers
2FFH	767	MTRRdefType	Memory Type Range Registers
		2:0	Default memory type
		10	Fixed MTRR enable
		11	MTRR Enable
400H	1024	MC0_CTL	Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).
401H	1025	MC0_STATUS	Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.
		15:0	MC_STATUS_MCACOD
		31:16	MC_STATUS_MSCOD
		57	MC_STATUS_DAM
		58	MC_STATUS_ADDRV
		59	MC_STATUS_MISCV
		60	MC_STATUS_EN. (Note: For MC0_STATUS only, this bit is hardcoded to 1.)
		61	MC_STATUS_UC
		62	MC_STATUS_O
		63	MC_STATUS_V
402H	1026	MC0_ADDR	
403H	1027	MC0_MISC	Defined in MCA architecture but not implemented in the P6 family processors.

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
404H	1028	MC1_CTL	
405H	1029	MC1_STATUS	Bit definitions same as MC0_STATUS.
406H	1030	MC1_ADDR	
407H	1031	MC1_MISC	Defined in MCA architecture but not implemented in the P6 family processors.
408H	1032	MC2_CTL	
409H	1033	MC2_STATUS	Bit definitions same as MC0_STATUS.
40AH	1034	MC2_ADDR	
40BH	1035	MC2_MISC	Defined in MCA architecture but not implemented in the P6 family processors.
40CH	1036	MC4_CTL	
40DH	1037	MC4_STATUS	Bit definitions same as MC0_STATUS, except bits 0, 4, 57, and 61 are hardcoded to 1.
40EH	1038	MC4_ADDR	Defined in MCA architecture but not implemented in P6 Family processors.
40FH	1039	MC4_MISC	Defined in MCA architecture but not implemented in the P6 family processors.
410H	1040	MC3_CTL	
411H	1041	MC3_STATUS	Bit definitions same as MC0_STATUS.
412H	1042	MC3_ADDR	
413H	1043	MC3_MISC	Defined in MCA architecture but not implemented in the P6 family processors.

NOTES

1. Bit 0 of this register has been redefined several times, and is no longer used in P6 family processors.
2. The processor number feature may be disabled by setting bit 21 of the BBL_CR_CTL MSR (model-specific register address 119h) to "1". Once set, bit 21 of the BBL_CR_CTL may not be cleared. This bit is write-once. The processor number feature will be disabled until the processor is reset.
3. The Pentium III processor will prevent FSB frequency overclocking with a new shutdown mechanism. If the FSB frequency selected is greater than the internal FSB frequency the processor will shutdown. If the FSB selected is less than the internal FSB frequency the BIOS may choose to use bit 11 to implement its own shutdown policy.

2.22 MSRS IN PENTIUM PROCESSORS

The following MSRs are defined for the Pentium processors. The P5_MC_ADDR, P5_MC_TYPE, and TSC MSRs (named IA32_P5_MC_ADDR, IA32_P5_MC_TYPE, and IA32_TIME_STAMP_COUNTER in the Pentium 4 processor) are architectural; that is, code that accesses these registers will run on Pentium 4 and P6 family processors without generating exceptions (see Section 2.1, "Architectural MSRs"). The CESR, CTR0, and CTR1 MSRs are unique to Pentium processors; code that accesses these registers will generate exceptions on Pentium 4 and P6 family processors.

Table 2-51. MSRs in the Pentium Processor

Register Address		Register Name	Bit Description
Hex	Dec		
0H	0	P5_MC_ADDR	See Section 15.10.2, "Pentium Processor Machine-Check Exception Handling."
1H	1	P5_MC_TYPE	See Section 15.10.2, "Pentium Processor Machine-Check Exception Handling."
10H	16	TSC	See Section 17.17, "Time-Stamp Counter."
11H	17	CESR	See Section 18.6.9.1, "Control and Event Select Register (CESR)."
12H	18	CTR0	Section 18.6.9.3, "Events Counted."
13H	19	CTR1	Section 18.6.9.3, "Events Counted."

2.23 MSR INDEX

MSRs of recent processors are indexed here for convenience. IA32 MSRs are excluded from this index.

MSR Name and CPUID DisplayFamily_DisplayModel	Location
MSR_B0_PMON_EVNT_SEL2	
06_2EH	See Table 2-16
MSR_B0_PMON_EVNT_SEL3	
06_2EH	See Table 2-16
MSR_B0_PMON_MASK	
06_2EH	See Table 2-16
MSR_B0_PMON_MATCH	
06_2EH	See Table 2-16
MSR_B1_PMON_BOX_CTRL	
06_2EH	See Table 2-16
MSR_B1_PMON_BOX_OVF_CTRL	
06_2EH	See Table 2-16
MSR_B1_PMON_BOX_STATUS	
06_2EH	See Table 2-16
MSR_B1_PMON_CTR0	
06_2EH	See Table 2-16

06_0FH, 06_17H	See Table 2-3
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	See Table 2-4
06_37H, 06_4AH, 06_4DH, 06_5AH, 06_5DH	See Table 2-7
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_30_FROM_IP	
06_5CH, 06_7AH	See Table 2-12
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
MSR_LASTBRANCH_30_TO_IP	
06_5CH, 06_7AH	See Table 2-12
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
MSR_LASTBRANCH_31_FROM_IP	
06_5CH, 06_7AH	See Table 2-12
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
MSR_LASTBRANCH_31_TO_IP	
06_5CH, 06_7AH	See Table 2-12
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
MSR_LASTBRANCH_4	
06_0EH	See Table 2-48
06_09H	See Table 2-49
MSR_LASTBRANCH_4_FROM_IP	
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	See Table 2-4

MSR Name and CPUID DisplayFamily_DisplayModel	Location
06_37H, 06_4AH, 06_4DH, 06_5AH, 06_5DH	See Table 2-7
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_4_TO_IP	
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	See Table 2-4
06_37H, 06_4AH, 06_4DH, 06_5AH, 06_5DH	See Table 2-7
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_5	
06_0EH	See Table 2-48
06_09H	See Table 2-49
MSR_LASTBRANCH_5_FROM_IP	
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	See Table 2-4
06_37H, 06_4AH, 06_4DH, 06_5AH, 06_5DH	See Table 2-7
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_5_TO_IP	
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	See Table 2-4
06_37H, 06_4AH, 06_4DH, 06_5AH, 06_5DH	See Table 2-7
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_6	
06_0EH	See Table 2-48
06_09H	See Table 2-49
MSR_LASTBRANCH_6_FROM_IP	
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	See Table 2-4
06_37H, 06_4AH, 06_4DH, 06_5AH, 06_5DH	See Table 2-7
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_6_TO_IP	
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	See Table 2-4
06_37H, 06_4AH, 06_4DH, 06_5AH, 06_5DH	See Table 2-7

MSR Name and CPUID DisplayFamily_DisplayModel	Location
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_7	
06_0EH	See Table 2-48
06_09H	See Table 2-49
MSR_LASTBRANCH_7_FROM_IP	
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	See Table 2-4
06_37H, 06_4AH, 06_4DH, 06_5AH, 06_5DH	See Table 2-7
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_7_TO_IP	
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	See Table 2-4
06_37H, 06_4AH, 06_4DH, 06_5AH, 06_5DH	See Table 2-7
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_8_FROM_IP	
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_8_TO_IP	
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_9_FROM_IP	
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_9_TO_IP	
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
0FH	See Table 2-45
MSR_LASTBRANCH_TOS	

MSR Name and CPUID DisplayFamily_DisplayModel	Location
06_0FH, 06_17H	See Table 2-3
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	See Table 2-4
06_37H, 06_4AH, 06_4DH, 06_5AH, 06_5DH	See Table 2-7
06_5CH, 06_7AH	See Table 2-12
06_1AH, 06_1EH, 06_1FH, 06_2EH	See Table 2-14
06_2AH, 06_2DH	See Table 2-19
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
06_57H	See Table 2-43
06_0EH	See Table 2-48
06_09H	See Table 2-49
MSR_LASTBRANCH_INFO_0	
06_7AH	See Table 2-13
MSR_LBR_INFO_1	
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
06_7AH	See Table 2-13
MSR_LBR_INFO_10	
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
06_7AH	See Table 2-13
MSR_LBR_INFO_11	
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
06_7AH	See Table 2-13
MSR_LBR_INFO_12	
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
06_7AH	See Table 2-13
MSR_LBR_INFO_13	
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
06_7AH	See Table 2-13
MSR_LBR_INFO_14	
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
06_7AH	See Table 2-13
MSR_LBR_INFO_15	
06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H	See Table 2-38
