CBH	10H	MEM_LOAD_RETIRED.L3_MISS	Counts number of retired loads that miss the L3 cache. The load was satisfied by a remote socket, local memory or an IOH.	
CBH	40H	MEM_LOAD_RETIRED.HIT_LFB	Counts number of retired loads that miss the L1D and the address is located in an allocated line fill buffer and will soon be committed to cache. This is counting secondary L1D misses.	
CBH	80H	MEM_LOAD_RETIRED.DTLB_MISS	Counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault. This event counts loads from cacheable memory only. The event does not count loads by software prefetches. Counts both primary and secondary misses to the TLB.	
CCH	01H	FP_MMX_TRANS.TO_FP	Counts the first floating-point instruction following any MMX instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	
CCH	02H	FP_MMX_TRANS.TO_MMX	Counts the first MMX instruction following a floating-point instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	
CCH	03H	FP_MMX_TRANS.ANY	Counts all transitions from floating point to MMX instructions and from MMX instructions to floating point instructions. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	

Table A-4. Non-Architectural Performance Events In the Processor Core for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D0H	01H	MACRO_INSTS.DECODED	Counts the number of instructions decoded, (but not necessarily executed or retired).	
D1H	02H	UOPS_DECODED.MS	Counts the number of Uops decoded by the Microcode Sequencer, MS. The MS delivers uops when the instruction is more than 4 uops long or a microcode assist is occurring.	
D1H	04H	UOPS_DECODED.ESP_FOLDING	Counts number of stack pointer (ESP) instructions decoded: push , pop , call , ret, etc. ESP instructions do not generate a Uop to increment or decrement ESP. Instead, they update an ESP_Offset register that keeps track of the delta to the current value of the ESP register.	
D1H	08H	UOPS_DECODED.ESP_SYNC	Counts number of stack pointer (ESP) sync operations where an ESP instruction is corrected by adding the ESP offset register to the current value of the ESP register.	
D2H	01H	RAT_STALLS.FLAGS	Counts the number of cycles during which execution stalled due to several reasons, one of which is a partial flag register stall. A partial register stall may occur when two conditions are met: 1) an instruction modifies some, but not all, of the flags in the flag register and 2) the next instruction, which depends on flags, depends on flags that were not modified by this instruction.	
D2H	02H	RAT_STALLS.REGISTERS	This event counts the number of cycles instruction execution latency became longer than the defined latency because the instruction used a register that was partially written by previous instruction.	

Table A-4. Non-Architectural Performance Events In the Processor Core for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D2H	04H	RAT_STALLS.ROB_READ_PORT	Counts the number of cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the out-of-order pipeline. Note that, at this stage in the pipeline, additional stalls may occur at the same cycle and prevent the stalled micro-ops from entering the pipe. In such a case, micro-ops retry entering the execution pipe in the next cycle and the ROB-read port stall is counted again.	
D2H	08H	RAT_STALLS.SCOREBOARD	Counts the cycles where we stall due to microarchitecturally required serialization. Microcode scoreboarding stalls.	
D2H	0FH	RAT_STALLS.ANY	Counts all Register Allocation Table stall cycles due to: Cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the execution pipe. Cycles when partial register stalls occurred Cycles when flag stalls occurred Cycles floating-point unit (FPU) status word stalls occurred. To count each of these conditions separately use the events: RAT_STALLS.ROB_READ_PORT, RAT_STALLS.PARTIAL, RAT_STALLS.FLAGS, and RAT_STALLS.FPSW.	
D4H	01H	SEG_RENAME_STALLS	Counts the number of stall cycles due to the lack of renaming resources for the ES, DS, FS, and GS segment registers. If a segment is renamed but not retired and a second update to the same segment occurs, a stall occurs in the front-end of the pipeline until the renamed segment retires.	

Table A-4. Non-Architectural Performance Events In the Processor Core for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D5H	01H	ES_REG_RENAMES	Counts the number of times the ES segment register is renamed.	
DBH	01H	UOP_UNFUSION	Counts unfusion events due to floating point exception to a fused uop.	
E0H	01H	BR_INST_DECODED	Counts the number of branch instructions decoded.	
E5H	01H	BPU_MISSED_CALL_RET	Counts number of times the Branch Prediction Unit missed predicting a call or return branch.	
E6H	01H	BACLEAR.CLEAR	Counts the number of times the front end is resteeered, mainly when the Branch Prediction Unit cannot provide a correct prediction and this is corrected by the Branch Address Calculator at the front end. This can occur if the code has many branches such that they cannot be consumed by the BPU. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline. The effect on total execution time depends on the surrounding code.	
E6H	02H	BACLEAR.BAD_TARGET	Counts number of Branch Address Calculator clears (BACLEAR) asserted due to conditional branch instructions in which there was a target hit but the direction was wrong. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline.	
E8H	01H	BPU_CLEARS.EARLY	Counts early (normal) Branch Prediction Unit clears: BPU predicted a taken branch after incorrectly assuming that it was not taken.	The BPU clear leads to 2 cycle bubble in the Front End.

Table A-4. Non-Architectural Performance Events In the Processor Core for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
E8H	02H	BPU_CLEAR.S.LATE	Counts late Branch Prediction Unit clears due to Most Recently Used conflicts. The PBU clear leads to a 3 cycle bubble in the Front End.	
FOH	01H	L2_TRANSACTION.S.LOAD	Counts L2 load operations due to HW prefetch or demand loads.	
FOH	02H	L2_TRANSACTION.S.RFO	Counts L2 RFO operations due to HW prefetch or demand RFOs.	
FOH	04H	L2_TRANSACTION.S.FETCH	Counts L2 instruction fetch operations due to HW prefetch or demand ifetch.	
FOH	08H	L2_TRANSACTION.S.PREFETCH	Counts L2 prefetch operations.	
FOH	10H	L2_TRANSACTION.S.L1D_WB	Counts L1D writeback operations to the L2.	
FOH	20H	L2_TRANSACTION.S.FILL	Counts L2 cache line fill operations due to load, RFO, L1D writeback or prefetch.	
FOH	40H	L2_TRANSACTION.S.WB	Counts L2 writeback operations to the L3.	
FOH	80H	L2_TRANSACTION.S.ANY	Counts all L2 cache operations.	
F1H	02H	L2_LINES_IN.S.STATE	Counts the number of cache lines allocated in the L2 cache in the S (shared) state.	
F1H	04H	L2_LINES_IN.E.STATE	Counts the number of cache lines allocated in the L2 cache in the E (exclusive) state.	
F1H	07H	L2_LINES_IN.ANY	Counts the number of cache lines allocated in the L2 cache.	
F2H	01H	L2_LINES_OUT.DEMAND_CLEAN	Counts L2 clean cache lines evicted by a demand request.	
F2H	02H	L2_LINES_OUT.DEMAND_DIRTY	Counts L2 dirty (modified) cache lines evicted by a demand request.	
F2H	04H	L2_LINES_OUT.PREFETCH_CLEAN	Counts L2 clean cache line evicted by a prefetch request.	

Table A-4. Non-Architectural Performance Events In the Processor Core for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
F2H	08H	L2_LINES_OUT.PREFETCH_DIRTY	Counts L2 modified cache line evicted by a prefetch request.	
F2H	0FH	L2_LINES_OUT.ANY	Counts all L2 cache lines evicted for any reason.	
F4H	10H	SQ_MISC.SPLIT_LOCK	Counts the number of SQ lock splits across a cache line.	
F6H	01H	SQ_FULL_STALL_CYCLES	Counts cycles the Super Queue is full. Neither of the threads on this core will be able to access the uncore.	
F7H	01H	FP_ASSIST.ALL	Counts the number of floating point operations executed that required micro-code assist intervention. Assists are required in the following cases: SSE instructions, (Denormal input when the DAZ flag is off or Underflow result when the FTZ flag is off); x87 instructions, (NaN or denormal are loaded to a register or used as input from memory, Division by 0 or Underflow output).	
F7H	02H	FP_ASSIST.OUTPUT	Counts number of floating point micro-code assist when the output value (destination register) is invalid.	
F7H	04H	FP_ASSIST.INPUT	Counts number of floating point micro-code assist when the input value (one of the source operands to an FP instruction) is invalid.	
FDH	01H	SIMD_INT_64.PACKED_MPY	Counts number of SIMD integer 64 bit packed multiply operations.	
FDH	02H	SIMD_INT_64.PACKED_SHIFT	Counts number of SIMD integer 64 bit packed shift operations.	
FDH	04H	SIMD_INT_64.PACK	Counts number of SIMD integer 64 bit pack operations.	
FDH	08H	SIMD_INT_64.UNPACK	Counts number of SIMD integer 64 bit unpack operations.	

Table A-4. Non-Architectural Performance Events In the Processor Core for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
FDH	10H	SIMD_INT_64.PACKED_LOGICAL	Counts number of SIMD integer 64 bit logical operations.	
FDH	20H	SIMD_INT_64.PACKED_ARITH	Counts number of SIMD integer 64 bit arithmetic operations.	
FDH	40H	SIMD_INT_64.SHUFFLE_MOVE	Counts number of SIMD integer 64 bit shift or move operations.	

Non-architectural Performance monitoring events that are located in the uncore subsystem are implementation specific between different platforms using processors based on Intel microarchitecture code name Nehalem. Processors with CPUID signature of DisplayFamily_DisplayModel 06_1AH, 06_1EH, and 06_1FH support performance events listed in Table A-5.

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
00H	01H	UNC_GQ_CYCLES_FULL.READ_TRACKER	Uncore cycles Global Queue read tracker is full.	
00H	02H	UNC_GQ_CYCLES_FULL.WRITE_TRACKER	Uncore cycles Global Queue write tracker is full.	
00H	04H	UNC_GQ_CYCLES_FULL.PEER_PROBE_TRACKER	Uncore cycles Global Queue peer probe tracker is full. The peer probe tracker queue tracks snoops from the IOH and remote sockets.	
01H	01H	UNC_GQ_CYCLES_NOT_EMPTY.READ_TRACKER	Uncore cycles were Global Queue read tracker has at least one valid entry.	
01H	02H	UNC_GQ_CYCLES_NOT_EMPTY.WRITE_TRACKER	Uncore cycles were Global Queue write tracker has at least one valid entry.	
01H	04H	UNC_GQ_CYCLES_NOT_EMPTY.PEER_PROBE_TRACKER	Uncore cycles were Global Queue peer probe tracker has at least one valid entry. The peer probe tracker queue tracks IOH and remote socket snoops.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	01H	UNC_GQ_ALLOC.REA D_TRACKER	Counts the number of tread tracker allocate to deallocate entries. The GQ read tracker allocate to deallocate occupancy count is divided by the count to obtain the average read tracker latency.	
03H	02H	UNC_GQ_ALLOC.RT_ L3_MISS	Counts the number GQ read tracker entries for which a full cache line read has missed the L3. The GQ read tracker L3 miss to fill occupancy count is divided by this count to obtain the average cache line read L3 miss latency. The latency represents the time after which the L3 has determined that the cache line has missed. The time between a GQ read tracker allocation and the L3 determining that the cache line has missed is the average L3 hit latency. The total L3 cache line read miss latency is the hit latency + L3 miss latency.	
03H	04H	UNC_GQ_ALLOC.RT_ TO_L3_RESP	Counts the number of GQ read tracker entries that are allocated in the read tracker queue that hit or miss the L3. The GQ read tracker L3 hit occupancy count is divided by this count to obtain the average L3 hit latency.	
03H	08H	UNC_GQ_ALLOC.RT_ TO_RTID_ACQUIRED	Counts the number of GQ read tracker entries that are allocated in the read tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ read tracker L3 miss to RTID acquired occupancy count is divided by this count to obtain the average latency for a read L3 miss to acquire an RTID.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	10H	UNC_GQ_ALLOC.WT_TO_RTID_ACQUIRED	Counts the number of GQ write tracker entries that are allocated in the write tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ write tracker L3 miss to RTID occupancy count is divided by this count to obtain the average latency for a write L3 miss to acquire an RTID.	
03H	20H	UNC_GQ_ALLOC.WRITE_TRACKER	Counts the number of GQ write tracker entries that are allocated in the write tracker queue that miss the L3. The GQ write tracker occupancy count is divided by the this count to obtain the average L3 write miss latency.	
03H	40H	UNC_GQ_ALLOC.PEER_PROBE_TRACKER	Counts the number of GQ peer probe tracker (snoop) entries that are allocated in the peer probe tracker queue that miss the L3. The GQ peer probe occupancy count is divided by this count to obtain the average L3 peer probe miss latency.	
04H	01H	UNC_GQ_DATA.FROM_QPI	Cycles Global Queue Quickpath Interface input data port is busy importing data from the Quickpath Interface. Each cycle the input port can transfer 8 or 16 bytes of data.	
04H	02H	UNC_GQ_DATA.FROM_QMC	Cycles Global Queue Quickpath Memory Interface input data port is busy importing data from the Quickpath Memory Interface. Each cycle the input port can transfer 8 or 16 bytes of data.	
04H	04H	UNC_GQ_DATA.FROM_L3	Cycles GQ L3 input data port is busy importing data from the Last Level Cache. Each cycle the input port can transfer 32 bytes of data.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
04H	08H	UNC_GQ_DATA.FROM_CORES_02	Cycles GQ Core 0 and 2 input data port is busy importing data from processor cores 0 and 2. Each cycle the input port can transfer 32 bytes of data.	
04H	10H	UNC_GQ_DATA.FROM_CORES_13	Cycles GQ Core 1 and 3 input data port is busy importing data from processor cores 1 and 3. Each cycle the input port can transfer 32 bytes of data.	
05H	01H	UNC_GQ_DATA.TO_QPI_QMC	Cycles GQ QPI and QMC output data port is busy sending data to the Quickpath Interface or Quickpath Memory Interface. Each cycle the output port can transfer 32 bytes of data.	
05H	02H	UNC_GQ_DATA.TO_L3	Cycles GQ L3 output data port is busy sending data to the Last Level Cache. Each cycle the output port can transfer 32 bytes of data.	
05H	04H	UNC_GQ_DATA.TO_CORES	Cycles GQ Core output data port is busy sending data to the Cores. Each cycle the output port can transfer 32 bytes of data.	
06H	01H	UNC_SNP_RESP_TO_LOCAL_HOME.I_STATE	Number of snoop responses to the local home that L3 does not have the referenced cache line.	
06H	02H	UNC_SNP_RESP_TO_LOCAL_HOME.S_STATE	Number of snoop responses to the local home that L3 has the referenced line cached in the S state.	
06H	04H	UNC_SNP_RESP_TO_LOCAL_HOME.FWD_S_STATE	Number of responses to code or data read snoops to the local home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the local home in the S state.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
06H	08H	UNC_SNP_RESP_TO_LOCAL_HOME.FWD_I_STATE	Number of responses to read invalidate snoops to the local home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the local home in the M state.	
06H	10H	UNC_SNP_RESP_TO_LOCAL_HOME.CONFLICT	Number of conflict snoop responses sent to the local home.	
06H	20H	UNC_SNP_RESP_TO_LOCAL_HOME.WB	Number of responses to code or data read snoops to the local home that the L3 has the referenced line cached in the M state.	
07H	01H	UNC_SNP_RESP_TO_REMOTE_HOME.I_STATE	Number of snoop responses to a remote home that L3 does not have the referenced cache line.	
07H	02H	UNC_SNP_RESP_TO_REMOTE_HOME.S_STATE	Number of snoop responses to a remote home that L3 has the referenced line cached in the S state.	
07H	04H	UNC_SNP_RESP_TO_REMOTE_HOME.FWD_S_STATE	Number of responses to code or data read snoops to a remote home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the remote home in the S state.	
07H	08H	UNC_SNP_RESP_TO_REMOTE_HOME.FWD_I_STATE	Number of responses to read invalidate snoops to a remote home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the remote home in the M state.	
07H	10H	UNC_SNP_RESP_TO_REMOTE_HOME.CONFLICT	Number of conflict snoop responses sent to the local home.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
07H	20H	UNC_SNP_RESP_TO_REMOTE_HOME.WB	Number of responses to code or data read snoops to a remote home that the L3 has the referenced line cached in the M state.	
07H	24H	UNC_SNP_RESP_TO_REMOTE_HOME.HITM	Number of HITM snoop responses to a remote home	
08H	01H	UNC_L3_HITS.READ	Number of code read, data read and RFO requests that hit in the L3	
08H	02H	UNC_L3_HITS.WRITE	Number of writeback requests that hit in the L3. Writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.	
08H	04H	UNC_L3_HITS.PROBE	Number of snoops from IOH or remote sockets that hit in the L3.	
08H	03H	UNC_L3_HITS.ANY	Number of reads and writes that hit the L3.	
09H	01H	UNC_L3_MISS.READ	Number of code read, data read and RFO requests that miss the L3.	
09H	02H	UNC_L3_MISS.WRITE	Number of writeback requests that miss the L3. Should always be zero as writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.	
09H	04H	UNC_L3_MISS.PROBE	Number of snoops from IOH or remote sockets that miss the L3.	
09H	03H	UNC_L3_MISS.ANY	Number of reads and writes that miss the L3.	
0AH	01H	UNC_L3_LINES_IN.M_STATE	Counts the number of L3 lines allocated in M state. The only time a cache line is allocated in the M state is when the line was forwarded in M state is forwarded due to a Snoop Read Invalidate Own request.	
0AH	02H	UNC_L3_LINES_IN.E_STATE	Counts the number of L3 lines allocated in E state.	
0AH	04H	UNC_L3_LINES_IN.S_STATE	Counts the number of L3 lines allocated in S state.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0AH	08H	UNC_L3_LINES_IN.F_STATE	Counts the number of L3 lines allocated in F state.	
0AH	0FH	UNC_L3_LINES_IN.ANY	Counts the number of L3 lines allocated in any state.	
0BH	01H	UNC_L3_LINES_OUT.M_STATE	Counts the number of L3 lines victimized that were in the M state. When the victim cache line is in M state, the line is written to its home cache agent which can be either local or remote.	
0BH	02H	UNC_L3_LINES_OUT.E_STATE	Counts the number of L3 lines victimized that were in the E state.	
0BH	04H	UNC_L3_LINES_OUT.S_STATE	Counts the number of L3 lines victimized that were in the S state.	
0BH	08H	UNC_L3_LINES_OUT.I_STATE	Counts the number of L3 lines victimized that were in the I state.	
0BH	10H	UNC_L3_LINES_OUT.F_STATE	Counts the number of L3 lines victimized that were in the F state.	
0BH	1FH	UNC_L3_LINES_OUT.ANY	Counts the number of L3 lines victimized in any state.	
20H	01H	UNC_QHL_REQUEST_S.IOH_READS	Counts number of Quickpath Home Logic read requests from the IOH.	
20H	02H	UNC_QHL_REQUEST_S.IOH_WRITES	Counts number of Quickpath Home Logic write requests from the IOH.	
20H	04H	UNC_QHL_REQUEST_S.REMOTE_READS	Counts number of Quickpath Home Logic read requests from a remote socket.	
20H	08H	UNC_QHL_REQUEST_S.REMOTE_WRITES	Counts number of Quickpath Home Logic write requests from a remote socket.	
20H	10H	UNC_QHL_REQUEST_S.LOCAL_READS	Counts number of Quickpath Home Logic read requests from the local socket.	
20H	20H	UNC_QHL_REQUEST_S.LOCAL_WRITES	Counts number of Quickpath Home Logic write requests from the local socket.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
21H	01H	UNC_QHL_CYCLES_FULL.IOH	Counts uclk cycles all entries in the Quickpath Home Logic IOH are full.	
21H	02H	UNC_QHL_CYCLES_FULL.REMOTE	Counts uclk cycles all entries in the Quickpath Home Logic remote tracker are full.	
21H	04H	UNC_QHL_CYCLES_FULL.LOCAL	Counts uclk cycles all entries in the Quickpath Home Logic local tracker are full.	
22H	01H	UNC_QHL_CYCLES_NOT_EMPTY.IOH	Counts uclk cycles all entries in the Quickpath Home Logic IOH is busy.	
22H	02H	UNC_QHL_CYCLES_NOT_EMPTY.REMOTE	Counts uclk cycles all entries in the Quickpath Home Logic remote tracker is busy.	
22H	04H	UNC_QHL_CYCLES_NOT_EMPTY.LOCAL	Counts uclk cycles all entries in the Quickpath Home Logic local tracker is busy.	
23H	01H	UNC_QHL_OCCUPANCY.IOH	QHL IOH tracker allocate to deallocate read occupancy.	
23H	02H	UNC_QHL_OCCUPANCY.REMOTE	QHL remote tracker allocate to deallocate read occupancy.	
23H	04H	UNC_QHL_OCCUPANCY.LOCAL	QHL local tracker allocate to deallocate read occupancy.	
24H	02H	UNC_QHL_ADDRESS_CONFLICTS.2WAY	Counts number of QHL Active Address Table (AAT) entries that saw a max of 2 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates.	
24H	04H	UNC_QHL_ADDRESS_CONFLICTS.3WAY	Counts number of QHL Active Address Table (AAT) entries that saw a max of 3 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
25H	01H	UNC_QHL_CONFLICT_CYCLES.IOH	Counts cycles the Quickpath Home Logic IOH Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
25H	02H	UNC_QHL_CONFLICT_CYCLES.REMOTE	Counts cycles the Quickpath Home Logic Remote Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
25H	04H	UNC_QHL_CONFLICT_CYCLES.LOCAL	Counts cycles the Quickpath Home Logic Local Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
26H	01H	UNC_QHL_TO_QMC_BYPASS	Counts number or requests to the Quickpath Memory Controller that bypass the Quickpath Home Logic. All local accesses can be bypassed. For remote requests, only read requests can be bypassed.	
27H	01H	UNC_QMC_NORMAL_FULL.READ.CH0	Uncore cycles all the entries in the DRAM channel 0 medium or low priority queue are occupied with read requests.	
27H	02H	UNC_QMC_NORMAL_FULL.READ.CH1	Uncore cycles all the entries in the DRAM channel 1 medium or low priority queue are occupied with read requests.	
27H	04H	UNC_QMC_NORMAL_FULL.READ.CH2	Uncore cycles all the entries in the DRAM channel 2 medium or low priority queue are occupied with read requests.	
27H	08H	UNC_QMC_NORMAL_FULL.WRITE.CH0	Uncore cycles all the entries in the DRAM channel 0 medium or low priority queue are occupied with write requests.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
27H	10H	UNC_QMC_NORMAL_FULL.WRITE.CH1	Counts cycles all the entries in the DRAM channel 1 medium or low priority queue are occupied with write requests.	
27H	20H	UNC_QMC_NORMAL_FULL.WRITE.CH2	Uncore cycles all the entries in the DRAM channel 2 medium or low priority queue are occupied with write requests.	
28H	01H	UNC_QMC_ISOC_FULL.READ.CH0	Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous read requests.	
28H	02H	UNC_QMC_ISOC_FULL.READ.CH1	Counts cycles all the entries in the DRAM channel 1 high priority queue are occupied with isochronous read requests.	
28H	04H	UNC_QMC_ISOC_FULL.READ.CH2	Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous read requests.	
28H	08H	UNC_QMC_ISOC_FULL.WRITE.CH0	Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous write requests.	
28H	10H	UNC_QMC_ISOC_FULL.WRITE.CH1	Counts cycles all the entries in the DRAM channel 1 high priority queue are occupied with isochronous write requests.	
28H	20H	UNC_QMC_ISOC_FULL.WRITE.CH2	Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous write requests.	
29H	01H	UNC_QMC_BUSY.READ.CH0	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 0.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
29H	02H	UNC_QMC_BUSY.REA D.CH1	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 1.	
29H	04H	UNC_QMC_BUSY.REA D.CH2	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 2.	
29H	08H	UNC_QMC_BUSY.WRI TE.CH0	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 0.	
29H	10H	UNC_QMC_BUSY.WRI TE.CH1	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 1.	
29H	20H	UNC_QMC_BUSY.WRI TE.CH2	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 2.	
2AH	01H	UNC_QMC_OCCUPAN CY.CH0	IMC channel 0 normal read request occupancy.	
2AH	02H	UNC_QMC_OCCUPAN CY.CH1	IMC channel 1 normal read request occupancy.	
2AH	04H	UNC_QMC_OCCUPAN CY.CH2	IMC channel 2 normal read request occupancy.	
2BH	01H	UNC_QMC_ISSOC_OC CUPANCY.CH0	IMC channel 0 issoc read request occupancy.	
2BH	02H	UNC_QMC_ISSOC_OC CUPANCY.CH1	IMC channel 1 issoc read request occupancy.	
2BH	04H	UNC_QMC_ISSOC_OC CUPANCY.CH2	IMC channel 2 issoc read request occupancy.	
2BH	07H	UNC_QMC_ISSOC_RE ADS.ANY	IMC issoc read request occupancy.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
2CH	01H	UNC_QMC_NORMAL_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 medium and low priority read requests. The QMC channel 0 normal read occupancy divided by this count provides the average QMC channel 0 read latency.	
2CH	02H	UNC_QMC_NORMAL_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 medium and low priority read requests. The QMC channel 1 normal read occupancy divided by this count provides the average QMC channel 1 read latency.	
2CH	04H	UNC_QMC_NORMAL_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 medium and low priority read requests. The QMC channel 2 normal read occupancy divided by this count provides the average QMC channel 2 read latency.	
2CH	07H	UNC_QMC_NORMAL_READS.ANY	Counts the number of Quickpath Memory Controller medium and low priority read requests. The QMC normal read occupancy divided by this count provides the average QMC read latency.	
2DH	01H	UNC_QMC_HIGH_PRIORITY_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 high priority isochronous read requests.	
2DH	02H	UNC_QMC_HIGH_PRIORITY_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 high priority isochronous read requests.	
2DH	04H	UNC_QMC_HIGH_PRIORITY_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 high priority isochronous read requests.	
2DH	07H	UNC_QMC_HIGH_PRIORITY_READS.ANY	Counts the number of Quickpath Memory Controller high priority isochronous read requests.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
2EH	01H	UNC_QMC_CRITICAL_PRIORITY_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 critical priority isochronous read requests.	
2EH	02H	UNC_QMC_CRITICAL_PRIORITY_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 critical priority isochronous read requests.	
2EH	04H	UNC_QMC_CRITICAL_PRIORITY_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 critical priority isochronous read requests.	
2EH	07H	UNC_QMC_CRITICAL_PRIORITY_READS.ANY	Counts the number of Quickpath Memory Controller critical priority isochronous read requests.	
2FH	01H	UNC_QMC_WRITES.FULL.CH0	Counts number of full cache line writes to DRAM channel 0.	
2FH	02H	UNC_QMC_WRITES.FULL.CH1	Counts number of full cache line writes to DRAM channel 1.	
2FH	04H	UNC_QMC_WRITES.FULL.CH2	Counts number of full cache line writes to DRAM channel 2.	
2FH	07H	UNC_QMC_WRITES.FULL.ANY	Counts number of full cache line writes to DRAM.	
2FH	08H	UNC_QMC_WRITES.PARTIAL.CH0	Counts number of partial cache line writes to DRAM channel 0.	
2FH	10H	UNC_QMC_WRITES.PARTIAL.CH1	Counts number of partial cache line writes to DRAM channel 1.	
2FH	20H	UNC_QMC_WRITES.PARTIAL.CH2	Counts number of partial cache line writes to DRAM channel 2.	
2FH	38H	UNC_QMC_WRITES.PARTIAL.ANY	Counts number of partial cache line writes to DRAM.	
30H	01H	UNC_QMC_CANCEL.CH0	Counts number of DRAM channel 0 cancel requests.	
30H	02H	UNC_QMC_CANCEL.CH1	Counts number of DRAM channel 1 cancel requests.	
30H	04H	UNC_QMC_CANCEL.CH2	Counts number of DRAM channel 2 cancel requests.	
30H	07H	UNC_QMC_CANCEL.ANY	Counts number of DRAM cancel requests.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
31H	01H	UNC_QMC_PRIORITY_UPDATES.CHO	Counts number of DRAM channel 0 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	02H	UNC_QMC_PRIORITY_UPDATES.CH1	Counts number of DRAM channel 1 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	04H	UNC_QMC_PRIORITY_UPDATES.CH2	Counts number of DRAM channel 2 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	07H	UNC_QMC_PRIORITY_UPDATES.ANY	Counts number of DRAM priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
33H	04H	UNC_QHL_FRC_ACK_CNFLTS.LOCAL	Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the local home.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
40H	01H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.HOME.LINK_0	Counts cycles the Quickpath outbound link 0 HOME virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	02H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.SNOOP.LINK_0	Counts cycles the Quickpath outbound link 0 SNOOP virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	04H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.NDR.LINK_0	Counts cycles the Quickpath outbound link 0 non-data response virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	08H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.HOME.LINK_1	Counts cycles the Quickpath outbound link 1 HOME virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	10H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.SNOOP.LINK_1	Counts cycles the Quickpath outbound link 1 SNOOP virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
40H	20H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.NDR. LINK_1	Counts cycles the Quickpath outbound link 1 non-data response virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	07H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.LIN K_0	Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	38H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.LIN K_1	Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	01H	UNC_QPI_TX_STALL ED_MULTI_FLIT.DRS. LINK_0	Counts cycles the Quickpath outbound link 0 Data ResponSe virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	02H	UNC_QPI_TX_STALL ED_MULTI_FLIT.NCB. LINK_0	Counts cycles the Quickpath outbound link 0 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
41H	04H	UNC_QPI_TX_STALL ED_MULTI_FLIT.NCS. LINK_0	Counts cycles the Quickpath outbound link 0 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	08H	UNC_QPI_TX_STALL ED_MULTI_FLIT.DRS. LINK_1	Counts cycles the Quickpath outbound link 1 Data ResponSe virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	10H	UNC_QPI_TX_STALL ED_MULTI_FLIT.NCB. LINK_1	Counts cycles the Quickpath outbound link 1 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	20H	UNC_QPI_TX_STALL ED_MULTI_FLIT.NCS. LINK_1	Counts cycles the Quickpath outbound link 1 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	07H	UNC_QPI_TX_STALL ED_MULTI_FLIT.LINK _0	Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
41H	38H	UNC_QPI_TX_STALL ED_MULTI_FLIT.LINK_1	Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
42H	02H	UNC_QPI_TX_HEADE R.BUSY.LINK_0	Number of cycles that the header buffer in the Quickpath Interface outbound link 0 is busy.	
42H	08H	UNC_QPI_TX_HEADE R.BUSY.LINK_1	Number of cycles that the header buffer in the Quickpath Interface outbound link 1 is busy.	
43H	01H	UNC_QPI_RX_NO_PP T_CREDIT.STALLS.LIN K_0	Number of cycles that snoop packets incoming to the Quickpath Interface link 0 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.	
43H	02H	UNC_QPI_RX_NO_PP T_CREDIT.STALLS.LIN K_1	Number of cycles that snoop packets incoming to the Quickpath Interface link 1 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.	
60H	01H	UNC_DRAM_OPEN.C H0	Counts number of DRAM Channel 0 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	
60H	02H	UNC_DRAM_OPEN.C H1	Counts number of DRAM Channel 1 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
60H	04H	UNC_DRAM_OPEN.C H2	Counts number of DRAM Channel 2 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	
61H	01H	UNC_DRAM_PAGE_C LOSE.CH0	DRAM channel 0 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	
61H	02H	UNC_DRAM_PAGE_C LOSE.CH1	DRAM channel 1 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	
61H	04H	UNC_DRAM_PAGE_C LOSE.CH2	DRAM channel 2 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	
62H	01H	UNC_DRAM_PAGE_M ISS.CH0	Counts the number of precharges (PRE) that were issued to DRAM channel 0 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
62H	02H	UNC_DRAM_PAGE_M ISS.CH1	Counts the number of precharges (PRE) that were issued to DRAM channel 1 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
62H	04H	UNC_DRAM_PAGE_MISS.CH2	Counts the number of precharges (PRE) that were issued to DRAM channel 2 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
63H	01H	UNC_DRAM_READ_CAS.CH0	Counts the number of times a read CAS command was issued on DRAM channel 0.	
63H	02H	UNC_DRAM_READ_CAS.AUTOPRE_CH0	Counts the number of times a read CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.	
63H	04H	UNC_DRAM_READ_CAS.CH1	Counts the number of times a read CAS command was issued on DRAM channel 1.	
63H	08H	UNC_DRAM_READ_CAS.AUTOPRE_CH1	Counts the number of times a read CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.	
63H	10H	UNC_DRAM_READ_CAS.CH2	Counts the number of times a read CAS command was issued on DRAM channel 2.	
63H	20H	UNC_DRAM_READ_CAS.AUTOPRE_CH2	Counts the number of times a read CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.	
64H	01H	UNC_DRAM_WRITE_CAS.CH0	Counts the number of times a write CAS command was issued on DRAM channel 0.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
64H	02H	UNC_DRAM_WRITE_CAS.AUTOPRE_CH0	Counts the number of times a write CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.	
64H	04H	UNC_DRAM_WRITE_CAS.CH1	Counts the number of times a write CAS command was issued on DRAM channel 1.	
64H	08H	UNC_DRAM_WRITE_CAS.AUTOPRE_CH1	Counts the number of times a write CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.	
64H	10H	UNC_DRAM_WRITE_CAS.CH2	Counts the number of times a write CAS command was issued on DRAM channel 2.	
64H	20H	UNC_DRAM_WRITE_CAS.AUTOPRE_CH2	Counts the number of times a write CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.	
65H	01H	UNC_DRAM_REFRES H.CH0	Counts number of DRAM channel 0 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
65H	02H	UNC_DRAM_REFRES H.CH1	Counts number of DRAM channel 1 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
65H	04H	UNC_DRAM_REFRES H.CH2	Counts number of DRAM channel 2 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	

Table A-5. Non-Architectural Performance Events In the Processor Uncore for Intel Core i7 Processor and Intel Xeon Processor 5500 Series

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
66H	01H	UNC_DRAM_PRE_AL L.CH0	Counts number of DRAM Channel 0 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	
66H	02H	UNC_DRAM_PRE_AL L.CH1	Counts number of DRAM Channel 1 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	
66H	04H	UNC_DRAM_PRE_AL L.CH2	Counts number of DRAM Channel 2 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	

Intel Xeon processors with CPUID signature of DisplayFamily_DisplayModel 06_2EH have a distinct uncore sub-system that is significantly different from the uncore found in processors with CPUID signature 06_1AH, 06_1EH, and 06_1FH. Non-architectural Performance monitoring events for its uncore will be available in future documentation.

A.4 PERFORMANCE MONITORING EVENTS FOR PROCESSORS BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE

Intel 64 processors based on Intel® microarchitecture code name Westmere support the architectural and non-architectural performance-monitoring events listed in Table A-1 and Table A-6. Table A-6 applies to processors with CPUID signature of DisplayFamily_DisplayModel encoding with the following values: 06_25H, 06_2CH. In addition, these processors (CPUID signature of DisplayFamily_DisplayModel 06_25H, 06_2CH) also support the following non-architectural, product-specific uncore performance-monitoring events listed in Table A-7. Fixed counters support the architecture events defined in Table A-9.

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	02H	LOAD_BLOCK.OVERLAP_STORE	Loads that partially overlap an earlier store.	
04H	07H	SB_DRAIN.ANY	All Store buffer stall cycles.	
05H	02H	MISALIGN_MEMORY_STORE	All store referenced with misaligned address.	
06H	04H	STORE_BLOCKS.AT_RET	Counts number of loads delayed with at-Retirement block code. The following loads need to be executed at retirement and wait for all senior stores on the same thread to be drained: load splitting across 4K boundary (page split), load accessing uncacheable (UC or USWC) memory, load lock, and load with page table in UC or USWC memory region.	
06H	08H	STORE_BLOCKS.L1D_BLOCK	Cacheable loads delayed with L1D block code.	
07H	01H	PARTIAL_ADDRESS_ALIAS	Counts false dependency due to partial address aliasing.	
08H	01H	DTLB_LOAD_MISSES.ANY	Counts all load misses that cause a page walk.	
08H	02H	DTLB_LOAD_MISSES.WALK_COMPLETED	Counts number of completed page walks due to load miss in the STLB.	
08H	04H	DTLB_LOAD_MISSES.WALK_CYCLES	Cycles PMH is busy with a page walk due to a load miss in the STLB.	
08H	10H	DTLB_LOAD_MISSES.STLB_HIT	Number of cache load STLB hits.	
08H	20H	DTLB_LOAD_MISSES.PDE_MISS	Number of DTLB cache load misses where the low part of the linear to physical address translation was missed.	
0BH	01H	MEM_INST_RETIRED.LOADS	Counts the number of instructions with an architecturally-visible load retired on the architected path.	
0BH	02H	MEM_INST_RETIRED.STORES	Counts the number of instructions with an architecturally-visible store retired on the architected path.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
OBH	10H	MEM_INST_RETIRED.LATENCY_ABOVE_THRESHOLD	Counts the number of instructions exceeding the latency specified with <code>ld_lat</code> facility.	In conjunction with <code>ld_lat</code> facility
OCH	01H	MEM_STORE_RETIRED.DTLB_MISS	The event counts the number of retired stores that missed the DTLB. The DTLB miss is not counted if the store operation causes a fault. Does not counter prefetches. Counts both primary and secondary misses to the TLB.	
OEH	01H	UOPS_ISSUED.ANY	Counts the number of Uops issued by the Register Allocation Table to the Reservation Station, i.e. the UOPs issued from the front end to the back end.	
OEH	01H	UOPS_ISSUED.STALLED_CYCLES	Counts the number of cycles no Uops issued by the Register Allocation Table to the Reservation Station, i.e. the UOPs issued from the front end to the back end.	set "invert=1, cmask = 1"
OEH	02H	UOPS_ISSUED.FUSED	Counts the number of fused Uops that were issued from the Register Allocation Table to the Reservation Station.	
OFH	01H	MEM_UNCORE_RETIRED.UNKNOWN_SOURCE	Load instructions retired with unknown LLC miss (Precise Event).	Applicable to one and two sockets
OFH	02H	MEM_UNCORE_RETIRED.OTHER_CORE_L2_HIT	Load instructions retired that HIT modified data in sibling core (Precise Event).	Applicable to one and two sockets
OFH	04H	MEM_UNCORE_RETIRED.REMOTE_HITM	Load instructions retired that HIT modified data in remote socket (Precise Event).	Applicable to two sockets only
OFH	08H	MEM_UNCORE_RETIRED.LOCAL_DRAM_AND_REMOTE_CACHE_HIT	Load instructions retired local dram and remote cache HIT data sources (Precise Event).	Applicable to one and two sockets

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0FH	10H	MEM_UNCORE_RETIRE.REMOTE_DRAM	Load instructions retired remote DRAM and remote home-remote cache HITM (Precise Event).	Applicable to two sockets only
0FH	20H	MEM_UNCORE_RETIRE.OTHER_LLC_MISSES	Load instructions retired other LLC miss (Precise Event).	Applicable to two sockets only
0FH	80H	MEM_UNCORE_RETIRE.UNCACHEABLE	Load instructions retired I/O (Precise Event).	Applicable to one and two sockets
10H	01H	FP_COMP_OPS_EXE.X87	Counts the number of FP Computational Uops Executed. The number of FADD, FSUB, FCOM, FMULs, integer MULs and IMULs, FDIVs, FPREMs, FSQRTS, integer DIVs, and IDIVs. This event does not distinguish an FADD used in the middle of a transcendental flow from a separate FADD instruction.	
10H	02H	FP_COMP_OPS_EXE.MMX	Counts number of MMX Uops executed.	
10H	04H	FP_COMP_OPS_EXE.SSE_FP	Counts number of SSE and SSE2 FP uops executed.	
10H	08H	FP_COMP_OPS_EXE.SSE2_INTEGER	Counts number of SSE2 integer uops executed.	
10H	10H	FP_COMP_OPS_EXE.SSE_FP_PACKED	Counts number of SSE FP packed uops executed.	
10H	20H	FP_COMP_OPS_EXE.SSE_FP_SCALAR	Counts number of SSE FP scalar uops executed.	
10H	40H	FP_COMP_OPS_EXE.SSE_SINGLE_PRECISION	Counts number of SSE* FP single precision uops executed.	
10H	80H	FP_COMP_OPS_EXE.SSE_DOUBLE_PRECISION	Counts number of SSE* FP double precision uops executed.	
12H	01H	SIMD_INT_128.PACKED_MPY	Counts number of 128 bit SIMD integer multiply operations.	
12H	02H	SIMD_INT_128.PACKED_SHIFT	Counts number of 128 bit SIMD integer shift operations.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
12H	04H	SIMD_INT_128.PACK	Counts number of 128 bit SIMD integer pack operations.	
12H	08H	SIMD_INT_128.UNPACK	Counts number of 128 bit SIMD integer unpack operations.	
12H	10H	SIMD_INT_128.PACKED_LOGICAL	Counts number of 128 bit SIMD integer logical operations.	
12H	20H	SIMD_INT_128.PACKED_ARITH	Counts number of 128 bit SIMD integer arithmetic operations.	
12H	40H	SIMD_INT_128.SHUFFLE_MOVE	Counts number of 128 bit SIMD integer shuffle and move operations.	
13H	01H	LOAD_DISPATCH.RS	Counts number of loads dispatched from the Reservation Station that bypass the Memory Order Buffer.	
13H	02H	LOAD_DISPATCH.RS_DELAYED	Counts the number of delayed RS dispatches at the stage latch. If an RS dispatch can not bypass to LB, it has another chance to dispatch from the one-cycle delayed staging latch before it is written into the LB.	
13H	04H	LOAD_DISPATCH.MOB	Counts the number of loads dispatched from the Reservation Station to the Memory Order Buffer.	
13H	07H	LOAD_DISPATCH.ANY	Counts all loads dispatched from the Reservation Station.	
14H	01H	ARITH.CYCLES_DIV_BUSY	Counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE. Set 'edge =1, invert=1, cmask=1' to count the number of divides.	Count may be incorrect When SMT is on

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
14H	02H	ARITH.MUL	Counts the number of multiply operations executed. This includes integer as well as floating point multiply operations but excludes DPPS mul and MPSAD.	Count may be incorrect When SMT is on
17H	01H	INST_QUEUE_WRITES	Counts the number of instructions written into the instruction queue every cycle.	
18H	01H	INST_DECODED.DECO	Counts number of instructions that require decoder 0 to be decoded. Usually, this means that the instruction maps to more than 1 uop.	
19H	01H	TWO_UOP_INSTS_DECODED	An instruction that generates two uops was decoded.	
1EH	01H	INST_QUEUE_WRITE_CYCLES	This event counts the number of cycles during which instructions are written to the instruction queue. Dividing this counter by the number of instructions written to the instruction queue (INST_QUEUE_WRITES) yields the average number of instructions decoded each cycle. If this number is less than four and the pipe stalls, this indicates that the decoder is failing to decode enough instructions per cycle to sustain the 4-wide pipeline.	If SSE* instructions that are 6 bytes or longer arrive one after another, then front end throughput may limit execution speed.
20H	01H	LSD_OVERFLOW	Number of loops that can not stream from the instruction queue.	
24H	01H	L2_RQSTS.LD_HIT	Counts number of loads that hit the L2 cache. L2 loads include both L1D demand misses as well as L1D prefetches. L2 loads can be rejected for various reasons. Only non rejected loads are counted.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
24H	02H	L2_RQSTS.LD_MISS	Counts the number of loads that miss the L2 cache. L2 loads include both L1D demand misses as well as L1D prefetches.	
24H	03H	L2_RQSTS.LOADS	Counts all L2 load requests. L2 loads include both L1D demand misses as well as L1D prefetches.	
24H	04H	L2_RQSTS.RFO_HIT	Counts the number of store RFO requests that hit the L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches. Count includes WC memory requests, where the data is not fetched but the permission to write the line is required.	
24H	08H	L2_RQSTS.RFO_MISS	Counts the number of store RFO requests that miss the L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.	
24H	0CH	L2_RQSTS.RFOS	Counts all L2 store RFO requests. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches..	
24H	10H	L2_RQSTS.IFETCH_HIT	Counts number of instruction fetches that hit the L2 cache. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.	
24H	20H	L2_RQSTS.IFETCH_MISS	Counts number of instruction fetches that miss the L2 cache. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.	
24H	30H	L2_RQSTS.IFETCHES	Counts all instruction fetches. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
24H	40H	L2_RQSTS.PREFETCH_HIT	Counts L2 prefetch hits for both code and data.	
24H	80H	L2_RQSTS.PREFETCH_MISS	Counts L2 prefetch misses for both code and data.	
24H	C0H	L2_RQSTS.PREFETCHES	Counts all L2 prefetches for both code and data.	
24H	AAH	L2_RQSTS.MISS	Counts all L2 misses for both code and data.	
24H	FFH	L2_RQSTS.REFERENCES	Counts all L2 requests for both code and data.	
26H	01H	L2_DATA_RQSTS.DEMAND.I_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the I (invalid) state, i.e. a cache miss. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	02H	L2_DATA_RQSTS.DEMAND.S_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the S (shared) state. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	04H	L2_DATA_RQSTS.DEMAND.E_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the E (exclusive) state. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	08H	L2_DATA_RQSTS.DEMAND.M_STATE	Counts number of L2 data demand loads where the cache line to be loaded is in the M (modified) state. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	0FH	L2_DATA_RQSTS.DEMAND.MESI	Counts all L2 data demand requests. L2 demand loads are both L1D demand misses and L1D prefetches.	
26H	10H	L2_DATA_RQSTS.PREFETCH.I_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the I (invalid) state, i.e. a cache miss.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
26H	20H	L2_DATA_RQSTS.PREFETCH.S_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the S (shared) state. A prefetch RFO will miss on an S state line, while a prefetch read will hit on an S state line.	
26H	40H	L2_DATA_RQSTS.PREFETCH.E_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the E (exclusive) state.	
26H	80H	L2_DATA_RQSTS.PREFETCH.M_STATE	Counts number of L2 prefetch data loads where the cache line to be loaded is in the M (modified) state.	
26H	FOH	L2_DATA_RQSTS.PREFETCH.MESI	Counts all L2 prefetch requests.	
26H	FFH	L2_DATA_RQSTS.ANY	Counts all L2 data requests.	
27H	01H	L2_WRITE.RFO.INVALID_STATE	Counts number of L2 demand store RFO requests where the cache line to be loaded is in the I (invalid) state, i.e, a cache miss. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request
27H	02H	L2_WRITE.RFO.SHARED_STATE	Counts number of L2 store RFO requests where the cache line to be loaded is in the S (shared) state. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request
27H	08H	L2_WRITE.RFO.MODIFIED_STATE	Counts number of L2 store RFO requests where the cache line to be loaded is in the M (modified) state. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request
27H	0EH	L2_WRITE.RFO.HIT	Counts number of L2 store RFO requests where the cache line to be loaded is in either the S, E or M states. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request
27H	0FH	L2_WRITE.RFO.MESI	Counts all L2 store RFO requests. The L1D prefetcher does not issue a RFO prefetch.	This is a demand RFO request

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
27H	10H	L2_WRITE.LOCK.I_ST ATE	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the I (invalid) state, i.e. a cache miss.	
27H	20H	L2_WRITE.LOCK.S_S TATE	Counts number of L2 lock RFO requests where the cache line to be loaded is in the S (shared) state.	
27H	40H	L2_WRITE.LOCK.E_S TATE	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the E (exclusive) state.	
27H	80H	L2_WRITE.LOCK.M_S TATE	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the M (modified) state.	
27H	E0H	L2_WRITE.LOCK.HIT	Counts number of L2 demand lock RFO requests where the cache line to be loaded is in either the S, E, or M state.	
27H	F0H	L2_WRITE.LOCK.MESI	Counts all L2 demand lock RFO requests.	
28H	01H	L1D_WB_L2.I_STATE	Counts number of L1 writebacks to the L2 where the cache line to be written is in the I (invalid) state, i.e. a cache miss.	
28H	02H	L1D_WB_L2.S_STAT E	Counts number of L1 writebacks to the L2 where the cache line to be written is in the S state.	
28H	04H	L1D_WB_L2.E_STAT E	Counts number of L1 writebacks to the L2 where the cache line to be written is in the E (exclusive) state.	
28H	08H	L1D_WB_L2.M_STAT E	Counts number of L1 writebacks to the L2 where the cache line to be written is in the M (modified) state.	
28H	0FH	L1D_WB_L2.MESI	Counts all L1 writebacks to the L2 .	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
2EH	02H	L3_LAT_CACHE.REFERENCE	Counts uncore Last Level Cache references. Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.	see Table A-1
2EH	01H	L3_LAT_CACHE.MISS	Counts uncore Last Level Cache misses. Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.	see Table A-1
3CH	00H	CPU_CLK_UNHALTED.THREAD_P	Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling.	see Table A-1
3CH	01H	CPU_CLK_UNHALTED.REF_P	Increments at the frequency of TSC when not halted.	see Table A-1
49H	01H	DTLB_MISSES.ANY	Counts the number of misses in the STLB which causes a page walk.	
49H	02H	DTLB_MISSES.WALK_COMPLETED	Counts number of misses in the STLB which resulted in a completed page walk.	
49H	04H	DTLB_MISSES.WALK_CYCLES	Counts cycles of page walk due to misses in the STLB.	
49H	10H	DTLB_MISSES.STLB_HIT	Counts the number of DTLB first level misses that hit in the second level TLB. This event is only relevant if the core contains multiple DTLB levels.	
49H	20H	DTLB_MISSES.PDE_MISS	Number of DTLB misses caused by low part of address, includes references to 2M pages because 2M pages do not use the PDE.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
49H	80H	DTLB_MISSES.LARGE_WALK_COMPLETED	Counts number of completed large page walks due to misses in the STLB.	
4CH	01H	LOAD_HIT_PRE	Counts load operations sent to the L1 data cache while a previous SSE prefetch instruction to the same cache line has started prefetching but has not yet finished.	Counter 0, 1 only
4EH	01H	L1D_PREFETCH.REQUESTS	Counts number of hardware prefetch requests dispatched out of the prefetch FIFO.	Counter 0, 1 only
4EH	02H	L1D_PREFETCH.MISS	Counts number of hardware prefetch requests that miss the L1D. There are two prefetchers in the L1D. A streamer, which predicts lines sequentially after this one should be fetched, and the IP prefetcher that remembers access patterns for the current instruction. The streamer prefetcher stops on an L1D hit, while the IP prefetcher does not.	Counter 0, 1 only
4EH	04H	L1D_PREFETCH.TRIGGERS	Counts number of prefetch requests triggered by the Finite State Machine and pushed into the prefetch FIFO. Some of the prefetch requests are dropped due to overwrites or competition between the IP index prefetcher and streamer prefetcher. The prefetch FIFO contains 4 entries.	Counter 0, 1 only
4FH	10H	EPT.WALK_CYCLES	Counts Extended Page walk cycles.	
51H	01H	L1D.REPL	Counts the number of lines brought into the L1 data cache.	Counter 0, 1 only
51H	02H	L1D.M_REPL	Counts the number of modified lines brought into the L1 data cache.	Counter 0, 1 only
51H	04H	L1D.M_EVICT	Counts the number of modified lines evicted from the L1 data cache due to replacement.	Counter 0, 1 only

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
51H	08H	L1D.M_SNOOP_EVICT	Counts the number of modified lines evicted from the L1 data cache due to snoop HITM intervention.	Counter 0, 1 only
52H	01H	L1D_CACHE_PREFETCH_LOCK_FB_HIT	Counts the number of cacheable load lock speculated instructions accepted into the fill buffer.	
60H	01H	OFFCORE_REQUESTS_OUTSTANDING_DEMAND_READ_DATA	Counts weighted cycles of offcore demand data read requests. Does not include L2 prefetch requests.	counter 0
60H	02H	OFFCORE_REQUESTS_OUTSTANDING_DEMAND_READ_CODE	Counts weighted cycles of offcore demand code read requests. Does not include L2 prefetch requests.	counter 0
60H	04H	OFFCORE_REQUESTS_OUTSTANDING_DEMAND_RFO	Counts weighted cycles of offcore demand RFO requests. Does not include L2 prefetch requests.	counter 0
60H	08H	OFFCORE_REQUESTS_OUTSTANDING_ANY_READ	Counts weighted cycles of offcore read requests of any kind. Include L2 prefetch requests.	counter 0
63H	01H	CACHE_LOCK_CYCLE_S.L1D_L2	Cycle count during which the L1D and L2 are locked. A lock is asserted when there is a locked memory access, due to uncacheable memory, a locked operation that spans two cache lines, or a page walk from an uncacheable page table. This event does not cause locks, it merely detects them.	Counter 0, 1 only. L1D and L2 locks have a very high performance penalty and it is highly recommended to avoid such accesses.
63H	02H	CACHE_LOCK_CYCLE_S.L1D	Counts the number of cycles that cacheline in the L1 data cache unit is locked.	Counter 0, 1 only.
6CH	01H	IO_TRANSACTIONS	Counts the number of completed I/O transactions.	
80H	01H	L1I.HITS	Counts all instruction fetches that hit the L1 instruction cache.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
80H	02H	L1I.MISSES	Counts all instruction fetches that miss the L1I cache. This includes instruction cache misses, streaming buffer misses, victim cache misses and uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.	
80H	03H	L1I.READS	Counts all instruction fetches, including uncacheable fetches that bypass the L1I.	
80H	04H	L1I.CYCLES_STALLED	Cycle counts for which an instruction fetch stalls due to a L1I cache miss, ITLB miss or ITLB fault.	
82H	01H	LARGE_ITLB.HIT	Counts number of large ITLB hits.	
85H	01H	ITLB_MISSES.ANY	Counts the number of misses in all levels of the ITLB which causes a page walk.	
85H	02H	ITLB_MISSES.WALK_COMPLETED	Counts number of misses in all levels of the ITLB which resulted in a completed page walk.	
85H	04H	ITLB_MISSES.WALK_CYCLES	Counts ITLB miss page walk cycles.	
85H	80H	ITLB_MISSES.LARGE_WALK_COMPLETED	Counts number of completed large page walks due to misses in the STLB.	
87H	01H	ILD_STALL.LCP	Cycles Instruction Length Decoder stalls due to length changing prefixes: 66, 67 or REX.W (for EM64T) instructions which change the length of the decoded instruction.	
87H	02H	ILD_STALL.MRU	Instruction Length Decoder stall cycles due to Branch Prediction Unit (PBU) Most Recently Used (MRU) bypass.	
87H	04H	ILD_STALL.IQ_FULL	Stall cycles due to a full instruction queue.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
87H	08H	ILD_STALL.REGEN	Counts the number of regen stalls.	
87H	0FH	ILD_STALL.ANY	Counts any cycles the Instruction Length Decoder is stalled.	
88H	01H	BR_INST_EXEC.COND	Counts the number of conditional near branch instructions executed, but not necessarily retired.	
88H	02H	BR_INST_EXEC.DIRECT	Counts all unconditional near branch instructions excluding calls and indirect branches.	
88H	04H	BR_INST_EXEC.INDIRECT_NON_CALL	Counts the number of executed indirect near branch instructions that are not calls.	
88H	07H	BR_INST_EXEC.NON_CALLS	Counts all non call near branch instructions executed, but not necessarily retired.	
88H	08H	BR_INST_EXEC.RETURN_NEAR	Counts indirect near branches that have a return mnemonic.	
88H	10H	BR_INST_EXEC.DIRECT_NEAR_CALL	Counts unconditional near call branch instructions, excluding non call branch, executed.	
88H	20H	BR_INST_EXEC.INDIRECT_NEAR_CALL	Counts indirect near calls, including both register and memory indirect, executed.	
88H	30H	BR_INST_EXEC.NEAR_CALLS	Counts all near call branches executed, but not necessarily retired.	
88H	40H	BR_INST_EXEC.TAKEN	Counts taken near branches executed, but not necessarily retired.	
88H	7FH	BR_INST_EXEC.ANY	Counts all near executed branches (not necessarily retired). This includes only instructions and not micro-op branches. Frequent branching is not necessarily a major performance issue. However frequent branch mispredictions may be a problem.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
89H	01H	BR_MISP_EXEC.COND	Counts the number of mispredicted conditional near branch instructions executed, but not necessarily retired.	
89H	02H	BR_MISP_EXEC.DIRECT	Counts mispredicted macro unconditional near branch instructions, excluding calls and indirect branches (should always be 0).	
89H	04H	BR_MISP_EXEC.INDIRECT_NON_CALL	Counts the number of executed mispredicted indirect near branch instructions that are not calls.	
89H	07H	BR_MISP_EXEC.NON_CALLS	Counts mispredicted non call near branches executed, but not necessarily retired.	
89H	08H	BR_MISP_EXEC.RETURN_NEAR	Counts mispredicted indirect branches that have a rear return mnemonic.	
89H	10H	BR_MISP_EXEC.DIRECT_NEAR_CALL	Counts mispredicted non-indirect near calls executed, (should always be 0).	
89H	20H	BR_MISP_EXEC.INDIRECT_NEAR_CALL	Counts mispredicted indirect near calls executed, including both register and memory indirect.	
89H	30H	BR_MISP_EXEC.NEAR_CALLS	Counts all mispredicted near call branches executed, but not necessarily retired.	
89H	40H	BR_MISP_EXEC.TAKEN	Counts executed mispredicted near branches that are taken, but not necessarily retired.	
89H	7FH	BR_MISP_EXEC.ANY	Counts the number of mispredicted near branch instructions that were executed, but not necessarily retired.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
A2H	01H	RESOURCE_STALLS.ANY	Counts the number of Allocator resource related stalls. Includes register renaming buffer entries, memory buffer entries. In addition to resource related stalls, this event counts some other events. Includes stalls arising during branch misprediction recovery, such as if retirement of the mispredicted branch is delayed and stalls arising while store buffer is draining from synchronizing operations.	Does not include stalls due to SuperQ (off core) queue full, too many cache misses, etc.
A2H	02H	RESOURCE_STALLS.LOAD	Counts the cycles of stall due to lack of load buffer for load operation.	
A2H	04H	RESOURCE_STALLS.RES_FULL	This event counts the number of cycles when the number of instructions in the pipeline waiting for execution reaches the limit the processor can handle. A high count of this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, or instructions dependent upon instructions further down the pipeline that have yet to retire.	When RS is full, new instructions can not enter the reservation station and start execution.
A2H	08H	RESOURCE_STALLS.STORE	This event counts the number of cycles that a resource related stall will occur due to the number of store instructions reaching the limit of the pipeline, (i.e. all store buffers are used). The stall ends when a store instruction commits its data to the cache or memory.	
A2H	10H	RESOURCE_STALLS.REORDER_FULL	Counts the cycles of stall due to re-order buffer full.	
A2H	20H	RESOURCE_STALLS.FPCW	Counts the number of cycles while execution was stalled due to writing the floating-point unit (FPU) control word.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
A2H	40H	RESOURCE_STALLS.MXCSR	Stalls due to the MXCSR register rename occurring to close to a previous MXCSR rename. The MXCSR provides control and status for the MMX registers.	
A2H	80H	RESOURCE_STALLS.OTHER	Counts the number of cycles while execution was stalled due to other resource issues.	
A6H	01H	MACRO_INSTS.FUSIONS_DECODED	Counts the number of instructions decoded that are macro-fused but not necessarily executed or retired.	
A7H	01H	BACLEAR_FORCE_IQ	Counts number of times a BACLEAR was forced by the Instruction Queue. The IQ is also responsible for providing conditional branch prediction direction based on a static scheme and dynamic data provided by the L2 Branch Prediction Unit. If the conditional branch target is not found in the Target Array and the IQ predicts that the branch is taken, then the IQ will force the Branch Address Calculator to issue a BACLEAR. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline.	
A8H	01H	LSD.UOPS	Counts the number of micro-ops delivered by loop stream detector.	Use cmask=1 and invert to count cycles
AEH	01H	ITLB_FLUSH	Counts the number of ITLB flushes.	
BOH	01H	OFFCORE_REQUESTS.DEMAND.READ_DATA	Counts number of offcore demand data read requests. Does not count L2 prefetch requests.	
BOH	02H	OFFCORE_REQUESTS.DEMAND.READ_CODE	Counts number of offcore demand code read requests. Does not count L2 prefetch requests.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
BOH	04H	OFFCORE_REQUEST S.DEMAND.RFO	Counts number of offcore demand RFO requests. Does not count L2 prefetch requests.	
BOH	08H	OFFCORE_REQUEST S.ANY.READ	Counts number of offcore read requests. Includes L2 prefetch requests.	
BOH	10H	OFFCORE_REQUEST S.ANY.RFO	Counts number of offcore RFO requests. Includes L2 prefetch requests.	
BOH	40H	OFFCORE_REQUEST S.L1D_WRITEBACK	Counts number of L1D writebacks to the uncore.	
BOH	80H	OFFCORE_REQUEST S.ANY	Counts all offcore requests.	
B1H	01H	UOPS_EXECUTED.PO RT0	Counts number of Uops executed that were issued on port 0. Port 0 handles integer arithmetic, SIMD and FP add Uops.	
B1H	02H	UOPS_EXECUTED.PO RT1	Counts number of Uops executed that were issued on port 1. Port 1 handles integer arithmetic, SIMD, integer shift, FP multiply and FP divide Uops.	
B1H	04H	UOPS_EXECUTED.PO RT2_CORE	Counts number of Uops executed that were issued on port 2. Port 2 handles the load Uops. This is a core count only and can not be collected per thread.	
B1H	08H	UOPS_EXECUTED.PO RT3_CORE	Counts number of Uops executed that were issued on port 3. Port 3 handles store Uops. This is a core count only and can not be collected per thread.	
B1H	10H	UOPS_EXECUTED.PO RT4_CORE	Counts number of Uops executed that where issued on port 4. Port 4 handles the value to be stored for the store Uops issued on port 3. This is a core count only and can not be collected per thread.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
B1H	1FH	UOPS_EXECUTED.CO RE_ACTIVE_CYCLES_ NO_PORTS	Counts number of cycles there are one or more uops being executed and were issued on ports 0-4. This is a core count only and can not be collected per thread.	
B1H	20H	UOPS_EXECUTED.PO RT5	Counts number of Uops executed that where issued on port 5.	
B1H	3FH	UOPS_EXECUTED.CO RE_ACTIVE_CYCLES	Counts number of cycles there are one or more uops being executed on any ports. This is a core count only and can not be collected per thread.	
B1H	40H	UOPS_EXECUTED.PO RT015	Counts number of Uops executed that where issued on port 0, 1, or 5.	use cmask=1, invert=1 to count stall cycles
B1H	80H	UOPS_EXECUTED.PO RT234	Counts number of Uops executed that where issued on port 2, 3, or 4.	
B2H	01H	OFFCORE_REQUEST S_SQ_FULL	Counts number of cycles the SQ is full to handle off-core requests.	
B3H	01H	SNOOPQ_REQUESTS _OUTSTANDING.DAT A	Counts weighted cycles of snoopq requests for data. Counter 0 only.	Use cmask=1 to count cycles not empty.
B3H	02H	SNOOPQ_REQUESTS _OUTSTANDING.INVA LIDATE	Counts weighted cycles of snoopq invalidate requests. Counter 0 only.	Use cmask=1 to count cycles not empty.
B3H	04H	SNOOPQ_REQUESTS _OUTSTANDING.COD E	Counts weighted cycles of snoopq requests for code. Counter 0 only.	Use cmask=1 to count cycles not empty.
B4H	01H	SNOOPQ_REQUESTS. CODE	Counts the number of snoop code requests.	
B4H	02H	SNOOPQ_REQUESTS. DATA	Counts the number of snoop data requests.	
B4H	04H	SNOOPQ_REQUESTS. INVALIDATE	Counts the number of snoop invalidate requests.	
B7H	01H	OFF_CORE_RESPONS E_0	see Section 30.6.1.3, "Off-core Response Performance Monitoring in the Processor Core"	Requires programming MSR 01A6H

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
B8H	01H	SNOOP_RESPONSE.HIT	Counts HIT snoop response sent by this thread in response to a snoop request.	
B8H	02H	SNOOP_RESPONSE.HITE	Counts HIT E snoop response sent by this thread in response to a snoop request.	
B8H	04H	SNOOP_RESPONSE.HITM	Counts HIT M snoop response sent by this thread in response to a snoop request.	
BBH	01H	OFF_CORE_RESPONSE_1	see Section 30.6.1.3, "Off-core Response Performance Monitoring in the Processor Core"	Use MSR 01A7H
COH	01H	INST_RETIRED.ANY_P	See Table A-1 Notes: INST_RETIRED.ANY is counted by a designated fixed counter. INST_RETIRED.ANY_P is counted by a programmable counter and is an architectural performance event. Event is supported if CPUID.A.EBX[1] = 0.	Counting: Faulting executions of GETSEC/VM entry/VM Exit/MWait will not count as retired instructions.
COH	02H	INST_RETIRED.X87	Counts the number of floating point computational operations retired: floating point computational operations executed by the assist handler and sub-operations of complex floating point instructions like transcendental instructions.	
COH	04H	INST_RETIRED.MMX	Counts the number of retired: MMX instructions.	
C2H	01H	UOPS_RETIRED.ANY	Counts the number of micro-ops retired, (macro-fused=1, micro-fused=2, others=1; maximum count of 8 per cycle). Most instructions are composed of one or two micro-ops. Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists.	Use cmask=1 and invert to count active cycles or stalled cycles

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C2H	02H	UOPS_RETIRE.RETI RE_SLOTS	Counts the number of retirement slots used each cycle	
C2H	04H	UOPS_RETIRE.MAC RO_FUSED	Counts number of macro-fused uops retired.	
C3H	01H	MACHINE_CLEAR.CY CLES	Counts the cycles machine clear is asserted.	
C3H	02H	MACHINE_CLEAR.M EM_ORDER	Counts the number of machine clears due to memory order conflicts.	
C3H	04H	MACHINE_CLEAR.S MC	Counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel 64 and IA-32 processors. The modified cache line is written back to the L2 and L3 caches.	
C4H	00H	BR_INST_RETIRE.A LL_BRANCHES	Branch instructions at retirement	See Table A-1
C4H	01H	BR_INST_RETIRE.C ONDITIONAL	Counts the number of conditional branch instructions retired.	
C4H	02H	BR_INST_RETIRE.N EAR_CALL	Counts the number of direct & indirect near unconditional calls retired.	
C4H	04H	BR_INST_RETIRE.A LL_BRANCHES	Counts the number of branch instructions retired.	
C5H	00H	BR_MISP_RETIRE.A LL_BRANCHES	Mispredicted branch instructions at retirement	See Table A-1
C5H	01H	BR_MISP_RETIRE.C ONDITIONAL	Counts mispredicted conditional retired calls.	
C5H	02H	BR_MISP_RETIRE.N EAR_CALL	Counts mispredicted direct & indirect near unconditional retired calls.	
C5H	04H	BR_MISP_RETIRE.A LL_BRANCHES	Counts all mispredicted retired calls.	
C7H	01H	SSEX_UOPS_RETIRE D.PACKED_SINGLE	Counts SIMD packed single-precision floating point Uops retired.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
C7H	02H	SSEX_UOPS_RETIRE D.SCALAR_SINGLE	Counts SIMD calar single-precision floating point Uops retired.	
C7H	04H	SSEX_UOPS_RETIRE D.PACKED_DOUBLE	Counts SIMD packed double-precision floating point Uops retired.	
C7H	08H	SSEX_UOPS_RETIRE D.SCALAR_DOUBLE	Counts SIMD scalar double-precision floating point Uops retired.	
C7H	10H	SSEX_UOPS_RETIRE D.VECTOR_INTEGER	Counts 128-bit SIMD vector integer Uops retired.	
C8H	20H	ITLB_MISS_RETIRED	Counts the number of retired instructions that missed the ITLB when the instruction was fetched.	
CBH	01H	MEM_LOAD_RETIRED .L1D_HIT	Counts number of retired loads that hit the L1 data cache.	
CBH	02H	MEM_LOAD_RETIRED .L2_HIT	Counts number of retired loads that hit the L2 data cache.	
CBH	04H	MEM_LOAD_RETIRED .L3_UNSHARED_HIT	Counts number of retired loads that hit their own, unshared lines in the L3 cache.	
CBH	08H	MEM_LOAD_RETIRED .OTHER_CORE_L2_HIT_HITM	Counts number of retired loads that hit in a sibling core's L2 (on die core). Since the L3 is inclusive of all cores on the package, this is an L3 hit. This counts both clean or modified hits.	
CBH	10H	MEM_LOAD_RETIRED .L3_MISS	Counts number of retired loads that miss the L3 cache. The load was satisfied by a remote socket, local memory or an IOH.	
CBH	40H	MEM_LOAD_RETIRED .HIT_LFB	Counts number of retired loads that miss the L1D and the address is located in an allocated line fill buffer and will soon be committed to cache. This is counting secondary L1D misses.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
CBH	80H	MEM_LOAD_RETIRED.DTLB_MISS	Counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault. This event counts loads from cacheable memory only. The event does not count loads by software prefetches. Counts both primary and secondary misses to the TLB.	
CCH	01H	FP_MMX_TRANS.TO_FP	Counts the first floating-point instruction following any MMX instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	
CCH	02H	FP_MMX_TRANS.TO_MMX	Counts the first MMX instruction following a floating-point instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	
CCH	03H	FP_MMX_TRANS.ANY	Counts all transitions from floating point to MMX instructions and from MMX instructions to floating point instructions. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.	
DOH	01H	MACRO_INSTS.DECODED	Counts the number of instructions decoded, (but not necessarily executed or retired).	
D1H	01H	UOPS_DECODED.STALL_CYCLES	Counts the cycles of decoder stalls. INV=1, Cmask= 1	
D1H	02H	UOPS_DECODED.MS	Counts the number of Uops decoded by the Microcode Sequencer, MS. The MS delivers uops when the instruction is more than 4 uops long or a microcode assist is occurring.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D1H	04H	UOPS_DECODED.ESP_FOLDING	Counts number of stack pointer (ESP) instructions decoded: push , pop , call , ret, etc. ESP instructions do not generate a Uop to increment or decrement ESP. Instead, they update an ESP_Offset register that keeps track of the delta to the current value of the ESP register.	
D1H	08H	UOPS_DECODED.ESP_SYNC	Counts number of stack pointer (ESP) sync operations where an ESP instruction is corrected by adding the ESP offset register to the current value of the ESP register.	
D2H	01H	RAT_STALLS.FLAGS	Counts the number of cycles during which execution stalled due to several reasons, one of which is a partial flag register stall. A partial register stall may occur when two conditions are met: 1) an instruction modifies some, but not all, of the flags in the flag register and 2) the next instruction, which depends on flags, depends on flags that were not modified by this instruction.	
D2H	02H	RAT_STALLS.REGISTERS	This event counts the number of cycles instruction execution latency became longer than the defined latency because the instruction used a register that was partially written by previous instruction.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D2H	04H	RAT_STALLS.ROB_READ_PORT	Counts the number of cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the out-of-order pipeline. Note that, at this stage in the pipeline, additional stalls may occur at the same cycle and prevent the stalled micro-ops from entering the pipe. In such a case, micro-ops retry entering the execution pipe in the next cycle and the ROB-read port stall is counted again.	
D2H	08H	RAT_STALLS.SCOREBOARD	Counts the cycles where we stall due to microarchitecturally required serialization. Microcode scoreboarding stalls.	
D2H	0FH	RAT_STALLS.ANY	Counts all Register Allocation Table stall cycles due to: Cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the execution pipe. Cycles when partial register stalls occurred Cycles when flag stalls occurred Cycles floating-point unit (FPU) status word stalls occurred. To count each of these conditions separately use the events: RAT_STALLS.ROB_READ_PORT, RAT_STALLS.PARTIAL, RAT_STALLS.FLAGS, and RAT_STALLS.FPSW.	
D4H	01H	SEG_RENAME_STALLS	Counts the number of stall cycles due to the lack of renaming resources for the ES, DS, FS, and GS segment registers. If a segment is renamed but not retired and a second update to the same segment occurs, a stall occurs in the front-end of the pipeline until the renamed segment retires.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
D5H	01H	ES_REG_RENAMES	Counts the number of times the ES segment register is renamed.	
DBH	01H	UOP_UNFUSION	Counts unfusion events due to floating point exception to a fused uop.	
E0H	01H	BR_INST_DECODED	Counts the number of branch instructions decoded.	
E5H	01H	BPU_MISSED_CALL_RET	Counts number of times the Branch Prediction Unit missed predicting a call or return branch.	
E6H	01H	BACLEAR.CLEAR	Counts the number of times the front end is resteeered, mainly when the Branch Prediction Unit cannot provide a correct prediction and this is corrected by the Branch Address Calculator at the front end. This can occur if the code has many branches such that they cannot be consumed by the BPU. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline. The effect on total execution time depends on the surrounding code.	
E6H	02H	BACLEAR.BAD_TARGET	Counts number of Branch Address Calculator clears (BACLEAR) asserted due to conditional branch instructions in which there was a target hit but the direction was wrong. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline.	
E8H	01H	BPU_CLEARS.EARLY	Counts early (normal) Branch Prediction Unit clears: BPU predicted a taken branch after incorrectly assuming that it was not taken.	The BPU clear leads to 2 cycle bubble in the Front End.

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
E8H	02H	BPU_CLEARS.LATE	Counts late Branch Prediction Unit clears due to Most Recently Used conflicts. The PBU clear leads to a 3 cycle bubble in the Front End.	
ECH	01H	THREAD_ACTIVE	Counts cycles threads are active.	
FOH	01H	L2_TRANSACTIONS.LOAD	Counts L2 load operations due to HW prefetch or demand loads.	
FOH	02H	L2_TRANSACTIONS.RFO	Counts L2 RFO operations due to HW prefetch or demand RFOs.	
FOH	04H	L2_TRANSACTIONS.IFETCH	Counts L2 instruction fetch operations due to HW prefetch or demand ifetch.	
FOH	08H	L2_TRANSACTIONS.PREFETCH	Counts L2 prefetch operations.	
FOH	10H	L2_TRANSACTIONS.L1D_WB	Counts L1D writeback operations to the L2.	
FOH	20H	L2_TRANSACTIONS.FILL	Counts L2 cache line fill operations due to load, RFO, L1D writeback or prefetch.	
FOH	40H	L2_TRANSACTIONS.WB	Counts L2 writeback operations to the L3.	
FOH	80H	L2_TRANSACTIONS.ANY	Counts all L2 cache operations.	
F1H	02H	L2_LINES_IN.S_STATE	Counts the number of cache lines allocated in the L2 cache in the S (shared) state.	
F1H	04H	L2_LINES_IN.E_STATE	Counts the number of cache lines allocated in the L2 cache in the E (exclusive) state.	
F1H	07H	L2_LINES_IN.ANY	Counts the number of cache lines allocated in the L2 cache.	
F2H	01H	L2_LINES_OUT.DEMAND_CLEAN	Counts L2 clean cache lines evicted by a demand request.	
F2H	02H	L2_LINES_OUT.DEMAND_DIRTY	Counts L2 dirty (modified) cache lines evicted by a demand request.	
F2H	04H	L2_LINES_OUT.PREFETCH_CLEAN	Counts L2 clean cache line evicted by a prefetch request.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
F2H	08H	L2_LINES_OUT.PREFETCH_DIRTY	Counts L2 modified cache line evicted by a prefetch request.	
F2H	0FH	L2_LINES_OUT.ANY	Counts all L2 cache lines evicted for any reason.	
F4H	04H	SQ_MISC.LRU_HINTS	Counts number of Super Queue LRU hints sent to L3.	
F4H	10H	SQ_MISC.SPLIT_LOCK	Counts the number of SQ lock splits across a cache line.	
F6H	01H	SQ_FULL_STALL_CYCLES	Counts cycles the Super Queue is full. Neither of the threads on this core will be able to access the uncore.	
F7H	01H	FP_ASSIST.ALL	Counts the number of floating point operations executed that required micro-code assist intervention. Assists are required in the following cases: SSE instructions, (Denormal input when the DAZ flag is off or Underflow result when the FTZ flag is off); x87 instructions, (NaN or denormal are loaded to a register or used as input from memory, Division by 0 or Underflow output).	
F7H	02H	FP_ASSIST.OUTPUT	Counts number of floating point micro-code assist when the output value (destination register) is invalid.	
F7H	04H	FP_ASSIST.INPUT	Counts number of floating point micro-code assist when the input value (one of the source operands to an FP instruction) is invalid.	
FDH	01H	SIMD_INT_64.PACKED_MPY	Counts number of SIMD integer 64 bit packed multiply operations.	
FDH	02H	SIMD_INT_64.PACKED_SHIFT	Counts number of SIMD integer 64 bit packed shift operations.	
FDH	04H	SIMD_INT_64.PACK	Counts number of SIMD integer 64 bit pack operations.	
FDH	08H	SIMD_INT_64.UNPACK	Counts number of SIMD integer 64 bit unpack operations.	

Table A-6. Non-Architectural Performance Events In the Processor Core for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
FDH	10H	SIMD_INT_64.PACKED_LOGICAL	Counts number of SIMD integer 64 bit logical operations.	
FDH	20H	SIMD_INT_64.PACKED_ARITH	Counts number of SIMD integer 64 bit arithmetic operations.	
FDH	40H	SIMD_INT_64.SHUFFLE_MOVE	Counts number of SIMD integer 64 bit shift or move operations.	

Non-architectural Performance monitoring events of the uncore sub-system for Processors with CPUID signature of DisplayFamily_DisplayModel 06_25H, 06_2CH, and 06_1FH support performance events listed in Table A-7.

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
00H	01H	UNC_GQ_CYCLES_FULL.READ_TRACKER	Uncore cycles Global Queue read tracker is full.	
00H	02H	UNC_GQ_CYCLES_FULL.WRITE_TRACKER	Uncore cycles Global Queue write tracker is full.	
00H	04H	UNC_GQ_CYCLES_FULL.PEER_PROBE_TRACKER	Uncore cycles Global Queue peer probe tracker is full. The peer probe tracker queue tracks snoops from the IOH and remote sockets.	
01H	01H	UNC_GQ_CYCLES_NOT_EMPTY.READ_TRACKER	Uncore cycles were Global Queue read tracker has at least one valid entry.	
01H	02H	UNC_GQ_CYCLES_NOT_EMPTY.WRITE_TRACKER	Uncore cycles were Global Queue write tracker has at least one valid entry.	
01H	04H	UNC_GQ_CYCLES_NOT_EMPTY.PEER_PROBE_TRACKER	Uncore cycles were Global Queue peer probe tracker has at least one valid entry. The peer probe tracker queue tracks IOH and remote socket snoops.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
02H	01H	UNC_GQ_OCCUPANCY.READ_TRACKER	Increments the number of queue entries (code read, data read, and RFOs) in the tread tracker. The GQ read tracker allocate to deallocate occupancy count is divided by the count to obtain the average read tracker latency.	
03H	01H	UNC_GQ_ALLOC.READ_TRACKER	Counts the number of tread tracker allocate to deallocate entries. The GQ read tracker allocate to deallocate occupancy count is divided by the count to obtain the average read tracker latency.	
03H	02H	UNC_GQ_ALLOC.RT_L3_MISS	Counts the number of GQ read tracker entries for which a full cache line read has missed the L3. The GQ read tracker L3 miss to fill occupancy count is divided by this count to obtain the average cache line read L3 miss latency. The latency represents the time after which the L3 has determined that the cache line has missed. The time between a GQ read tracker allocation and the L3 determining that the cache line has missed is the average L3 hit latency. The total L3 cache line read miss latency is the hit latency + L3 miss latency.	
03H	04H	UNC_GQ_ALLOC.RT_TO_L3_RESP	Counts the number of GQ read tracker entries that are allocated in the read tracker queue that hit or miss the L3. The GQ read tracker L3 hit occupancy count is divided by this count to obtain the average L3 hit latency.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
03H	08H	UNC_GQ_ALLOC.RT_TO_RTID_ACQUIRED	Counts the number of GQ read tracker entries that are allocated in the read tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ read tracker L3 miss to RTID acquired occupancy count is divided by this count to obtain the average latency for a read L3 miss to acquire an RTID.	
03H	10H	UNC_GQ_ALLOC.WT_TO_RTID_ACQUIRED	Counts the number of GQ write tracker entries that are allocated in the write tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ write tracker L3 miss to RTID occupancy count is divided by this count to obtain the average latency for a write L3 miss to acquire an RTID.	
03H	20H	UNC_GQ_ALLOC.WRITE_TRACKER	Counts the number of GQ write tracker entries that are allocated in the write tracker queue that miss the L3. The GQ write tracker occupancy count is divided by the this count to obtain the average L3 write miss latency.	
03H	40H	UNC_GQ_ALLOC.PEER_PROBE_TRACKER	Counts the number of GQ peer probe tracker (snoop) entries that are allocated in the peer probe tracker queue that miss the L3. The GQ peer probe occupancy count is divided by this count to obtain the average L3 peer probe miss latency.	
04H	01H	UNC_GQ_DATA.FROM_QPI	Cycles Global Queue Quickpath Interface input data port is busy importing data from the Quickpath Interface. Each cycle the input port can transfer 8 or 16 bytes of data.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
04H	02H	UNC_GQ_DATA.FROM_QMC	Cycles Global Queue Quickpath Memory Interface input data port is busy importing data from the Quickpath Memory Interface. Each cycle the input port can transfer 8 or 16 bytes of data.	
04H	04H	UNC_GQ_DATA.FROM_L3	Cycles GQ L3 input data port is busy importing data from the Last Level Cache. Each cycle the input port can transfer 32 bytes of data.	
04H	08H	UNC_GQ_DATA.FROM_CORES_02	Cycles GQ Core 0 and 2 input data port is busy importing data from processor cores 0 and 2. Each cycle the input port can transfer 32 bytes of data.	
04H	10H	UNC_GQ_DATA.FROM_CORES_13	Cycles GQ Core 1 and 3 input data port is busy importing data from processor cores 1 and 3. Each cycle the input port can transfer 32 bytes of data.	
05H	01H	UNC_GQ_DATA.TO_QPI_QMC	Cycles GQ QPI and QMC output data port is busy sending data to the Quickpath Interface or Quickpath Memory Interface. Each cycle the output port can transfer 32 bytes of data.	
05H	02H	UNC_GQ_DATA.TO_L3	Cycles GQ L3 output data port is busy sending data to the Last Level Cache. Each cycle the output port can transfer 32 bytes of data.	
05H	04H	UNC_GQ_DATA.TO_CORES	Cycles GQ Core output data port is busy sending data to the Cores. Each cycle the output port can transfer 32 bytes of data.	
06H	01H	UNC_SNP_RESP_TO_LOCAL_HOME.I_STAT	Number of snoop responses to the local home that L3 does not have the referenced cache line.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
06H	02H	UNC_SNP_RESP_TO_LOCAL_HOME.S_STATE	Number of snoop responses to the local home that L3 has the referenced line cached in the S state.	
06H	04H	UNC_SNP_RESP_TO_LOCAL_HOME.FWD_S_STATE	Number of responses to code or data read snoops to the local home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the local home in the S state.	
06H	08H	UNC_SNP_RESP_TO_LOCAL_HOME.FWD_I_STATE	Number of responses to read invalidate snoops to the local home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the local home in the M state.	
06H	10H	UNC_SNP_RESP_TO_LOCAL_HOME.CONFLICT	Number of conflict snoop responses sent to the local home.	
06H	20H	UNC_SNP_RESP_TO_LOCAL_HOME.WB	Number of responses to code or data read snoops to the local home that the L3 has the referenced line cached in the M state.	
07H	01H	UNC_SNP_RESP_TO_REMOTE_HOME.I_STATE	Number of snoop responses to a remote home that L3 does not have the referenced cache line.	
07H	02H	UNC_SNP_RESP_TO_REMOTE_HOME.S_STATE	Number of snoop responses to a remote home that L3 has the referenced line cached in the S state.	
07H	04H	UNC_SNP_RESP_TO_REMOTE_HOME.FWD_S_STATE	Number of responses to code or data read snoops to a remote home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the remote home in the S state.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
07H	08H	UNC_SNP_RESP_TO_REMOTE_HOME.FWD_I_STATE	Number of responses to read invalidate snoops to a remote home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the remote home in the M state.	
07H	10H	UNC_SNP_RESP_TO_REMOTE_HOME.CONFLICT	Number of conflict snoop responses sent to the local home.	
07H	20H	UNC_SNP_RESP_TO_REMOTE_HOME.WB	Number of responses to code or data read snoops to a remote home that the L3 has the referenced line cached in the M state.	
07H	24H	UNC_SNP_RESP_TO_REMOTE_HOME.HITM	Number of HITM snoop responses to a remote home	
08H	01H	UNC_L3_HITS.READ	Number of code read, data read and RFO requests that hit in the L3	
08H	02H	UNC_L3_HITS.WRITE	Number of writeback requests that hit in the L3. Writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.	
08H	04H	UNC_L3_HITS.PROBE	Number of snoops from IOH or remote sockets that hit in the L3.	
08H	03H	UNC_L3_HITS.ANY	Number of reads and writes that hit the L3.	
09H	01H	UNC_L3_MISS.READ	Number of code read, data read and RFO requests that miss the L3.	
09H	02H	UNC_L3_MISS.WRITE	Number of writeback requests that miss the L3. Should always be zero as writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.	
09H	04H	UNC_L3_MISS.PROBE	Number of snoops from IOH or remote sockets that miss the L3.	
09H	03H	UNC_L3_MISS.ANY	Number of reads and writes that miss the L3.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0AH	01H	UNC_L3_LINES_IN.M_STATE	Counts the number of L3 lines allocated in M state. The only time a cache line is allocated in the M state is when the line was forwarded in M state is forwarded due to a Snoop Read Invalidate Own request.	
0AH	02H	UNC_L3_LINES_IN.E_STATE	Counts the number of L3 lines allocated in E state.	
0AH	04H	UNC_L3_LINES_IN.S_STATE	Counts the number of L3 lines allocated in S state.	
0AH	08H	UNC_L3_LINES_IN.F_STATE	Counts the number of L3 lines allocated in F state.	
0AH	0FH	UNC_L3_LINES_IN.ANY	Counts the number of L3 lines allocated in any state.	
0BH	01H	UNC_L3_LINES_OUT.M_STATE	Counts the number of L3 lines victimized that were in the M state. When the victim cache line is in M state, the line is written to its home cache agent which can be either local or remote.	
0BH	02H	UNC_L3_LINES_OUT.E_STATE	Counts the number of L3 lines victimized that were in the E state.	
0BH	04H	UNC_L3_LINES_OUT.S_STATE	Counts the number of L3 lines victimized that were in the S state.	
0BH	08H	UNC_L3_LINES_OUT.I_STATE	Counts the number of L3 lines victimized that were in the I state.	
0BH	10H	UNC_L3_LINES_OUT.F_STATE	Counts the number of L3 lines victimized that were in the F state.	
0BH	1FH	UNC_L3_LINES_OUT.ANY	Counts the number of L3 lines victimized in any state.	
0CH	01H	UNC_GQ_SNOOP.GOTO_S	Counts the number of remote snoops that have requested a cache line be set to the S state.	
0CH	02H	UNC_GQ_SNOOP.GOTO_I	Counts the number of remote snoops that have requested a cache line be set to the I state.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
0CH	04H	UNC_GQ_SNOOP.GOT O_S_HIT_E	Counts the number of remote snoops that have requested a cache line be set to the S state from E state.	Requires writing MSR 301H with mask = 2H
0CH	04H	UNC_GQ_SNOOP.GOT O_S_HIT_F	Counts the number of remote snoops that have requested a cache line be set to the S state from F (forward) state.	Requires writing MSR 301H with mask = 8H
0CH	04H	UNC_GQ_SNOOP.GOT O_S_HIT_M	Counts the number of remote snoops that have requested a cache line be set to the S state from M state.	Requires writing MSR 301H with mask = 1H
0CH	04H	UNC_GQ_SNOOP.GOT O_S_HIT_S	Counts the number of remote snoops that have requested a cache line be set to the S state from S state.	Requires writing MSR 301H with mask = 4H
0CH	08H	UNC_GQ_SNOOP.GOT O_I_HIT_E	Counts the number of remote snoops that have requested a cache line be set to the I state from E state.	Requires writing MSR 301H with mask = 2H
0CH	08H	UNC_GQ_SNOOP.GOT O_I_HIT_F	Counts the number of remote snoops that have requested a cache line be set to the I state from F (forward) state.	Requires writing MSR 301H with mask = 8H
0CH	08H	UNC_GQ_SNOOP.GOT O_I_HIT_M	Counts the number of remote snoops that have requested a cache line be set to the I state from M state.	Requires writing MSR 301H with mask = 1H
0CH	08H	UNC_GQ_SNOOP.GOT O_I_HIT_S	Counts the number of remote snoops that have requested a cache line be set to the I state from S state.	Requires writing MSR 301H with mask = 4H
20H	01H	UNC_QHL_REQUEST S.IOH_READS	Counts number of Quickpath Home Logic read requests from the IOH.	
20H	02H	UNC_QHL_REQUEST S.IOH_WRITES	Counts number of Quickpath Home Logic write requests from the IOH.	
20H	04H	UNC_QHL_REQUEST S.REMOTE_READS	Counts number of Quickpath Home Logic read requests from a remote socket.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
20H	08H	UNC_QHL_REQUEST S.REMOTE_WRITES	Counts number of Quickpath Home Logic write requests from a remote socket.	
20H	10H	UNC_QHL_REQUEST S.LOCAL_READS	Counts number of Quickpath Home Logic read requests from the local socket.	
20H	20H	UNC_QHL_REQUEST S.LOCAL_WRITES	Counts number of Quickpath Home Logic write requests from the local socket.	
21H	01H	UNC_QHL_CYCLES_F ULL.IOH	Counts uclk cycles all entries in the Quickpath Home Logic IOH are full.	
21H	02H	UNC_QHL_CYCLES_F ULL.REMOTE	Counts uclk cycles all entries in the Quickpath Home Logic remote tracker are full.	
21H	04H	UNC_QHL_CYCLES_F ULL.LOCAL	Counts uclk cycles all entries in the Quickpath Home Logic local tracker are full.	
22H	01H	UNC_QHL_CYCLES_N OT_EMPTY.IOH	Counts uclk cycles all entries in the Quickpath Home Logic IOH is busy.	
22H	02H	UNC_QHL_CYCLES_N OT_EMPTY.REMOTE	Counts uclk cycles all entries in the Quickpath Home Logic remote tracker is busy.	
22H	04H	UNC_QHL_CYCLES_N OT_EMPTY.LOCAL	Counts uclk cycles all entries in the Quickpath Home Logic local tracker is busy.	
23H	01H	UNC_QHL_OCCUPAN CY.IOH	QHL IOH tracker allocate to deallocate read occupancy.	
23H	02H	UNC_QHL_OCCUPAN CY.REMOTE	QHL remote tracker allocate to deallocate read occupancy.	
23H	04H	UNC_QHL_OCCUPAN CY.LOCAL	QHL local tracker allocate to deallocate read occupancy.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
24H	02H	UNC_QHL_ADDRESS_CONFLICTS.2WAY	Counts number of QHL Active Address Table (AAT) entries that saw a max of 2 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates.	
24H	04H	UNC_QHL_ADDRESS_CONFLICTS.3WAY	Counts number of QHL Active Address Table (AAT) entries that saw a max of 3 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates.	
25H	01H	UNC_QHL_CONFLICT_CYCLES.IOH	Counts cycles the Quickpath Home Logic IOH Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
25H	02H	UNC_QHL_CONFLICT_CYCLES.REMOTE	Counts cycles the Quickpath Home Logic Remote Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
25H	04H	UNC_QHL_CONFLICT_CYCLES.LOCAL	Counts cycles the Quickpath Home Logic Local Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.	
26H	01H	UNC_QHL_TO_QMC_BYPASS	Counts number or requests to the Quickpath Memory Controller that bypass the Quickpath Home Logic. All local accesses can be bypassed. For remote requests, only read requests can be bypassed.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
28H	01H	UNC_QMC_ISOC_FUL L.READ.CH0	Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous read requests.	
28H	02H	UNC_QMC_ISOC_FUL L.READ.CH1	Counts cycles all the entries in the DRAM channel 1 high priority queue are occupied with isochronous read requests.	
28H	04H	UNC_QMC_ISOC_FUL L.READ.CH2	Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous read requests.	
28H	08H	UNC_QMC_ISOC_FUL L.WRITE.CH0	Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous write requests.	
28H	10H	UNC_QMC_ISOC_FUL L.WRITE.CH1	Counts cycles all the entries in the DRAM channel 1 high priority queue are occupied with isochronous write requests.	
28H	20H	UNC_QMC_ISOC_FUL L.WRITE.CH2	Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous write requests.	
29H	01H	UNC_QMC_BUSY.REA D.CH0	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 0.	
29H	02H	UNC_QMC_BUSY.REA D.CH1	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 1.	
29H	04H	UNC_QMC_BUSY.REA D.CH2	Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 2.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
29H	08H	UNC_QMC_BUSY.WRITE.CH0	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 0.	
29H	10H	UNC_QMC_BUSY.WRITE.CH1	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 1.	
29H	20H	UNC_QMC_BUSY.WRITE.CH2	Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 2.	
2AH	01H	UNC_QMC_OCCUPANCY.CH0	IMC channel 0 normal read request occupancy.	
2AH	02H	UNC_QMC_OCCUPANCY.CH1	IMC channel 1 normal read request occupancy.	
2AH	04H	UNC_QMC_OCCUPANCY.CH2	IMC channel 2 normal read request occupancy.	
2AH	07H	UNC_QMC_OCCUPANCY.ANY	Normal read request occupancy for any channel.	
2BH	01H	UNC_QMC_ISSOC_OCCUPANCY.CH0	IMC channel 0 issoc read request occupancy.	
2BH	02H	UNC_QMC_ISSOC_OCCUPANCY.CH1	IMC channel 1 issoc read request occupancy.	
2BH	04H	UNC_QMC_ISSOC_OCCUPANCY.CH2	IMC channel 2 issoc read request occupancy.	
2BH	07H	UNC_QMC_ISSOC_READS.ANY	IMC issoc read request occupancy.	
2CH	01H	UNC_QMC_NORMAL_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 medium and low priority read requests. The QMC channel 0 normal read occupancy divided by this count provides the average QMC channel 0 read latency.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
2CH	02H	UNC_QMC_NORMAL_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 medium and low priority read requests. The QMC channel 1 normal read occupancy divided by this count provides the average QMC channel 1 read latency.	
2CH	04H	UNC_QMC_NORMAL_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 medium and low priority read requests. The QMC channel 2 normal read occupancy divided by this count provides the average QMC channel 2 read latency.	
2CH	07H	UNC_QMC_NORMAL_READS.ANY	Counts the number of Quickpath Memory Controller medium and low priority read requests. The QMC normal read occupancy divided by this count provides the average QMC read latency.	
2DH	01H	UNC_QMC_HIGH_PRIORITY_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 high priority isochronous read requests.	
2DH	02H	UNC_QMC_HIGH_PRIORITY_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 high priority isochronous read requests.	
2DH	04H	UNC_QMC_HIGH_PRIORITY_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 high priority isochronous read requests.	
2DH	07H	UNC_QMC_HIGH_PRIORITY_READS.ANY	Counts the number of Quickpath Memory Controller high priority isochronous read requests.	
2EH	01H	UNC_QMC_CRITICAL_PRIORITY_READS.CH0	Counts the number of Quickpath Memory Controller channel 0 critical priority isochronous read requests.	
2EH	02H	UNC_QMC_CRITICAL_PRIORITY_READS.CH1	Counts the number of Quickpath Memory Controller channel 1 critical priority isochronous read requests.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
2EH	04H	UNC_QMC_CRITICAL_PRIORITY_READS.CH2	Counts the number of Quickpath Memory Controller channel 2 critical priority isochronous read requests.	
2EH	07H	UNC_QMC_CRITICAL_PRIORITY_READS.ANY	Counts the number of Quickpath Memory Controller critical priority isochronous read requests.	
2FH	01H	UNC_QMC_WRITES.FULL.CH0	Counts number of full cache line writes to DRAM channel 0.	
2FH	02H	UNC_QMC_WRITES.FULL.CH1	Counts number of full cache line writes to DRAM channel 1.	
2FH	04H	UNC_QMC_WRITES.FULL.CH2	Counts number of full cache line writes to DRAM channel 2.	
2FH	07H	UNC_QMC_WRITES.FULL.ANY	Counts number of full cache line writes to DRAM.	
2FH	08H	UNC_QMC_WRITES.PARTIAL.CH0	Counts number of partial cache line writes to DRAM channel 0.	
2FH	10H	UNC_QMC_WRITES.PARTIAL.CH1	Counts number of partial cache line writes to DRAM channel 1.	
2FH	20H	UNC_QMC_WRITES.PARTIAL.CH2	Counts number of partial cache line writes to DRAM channel 2.	
2FH	38H	UNC_QMC_WRITES.PARTIAL.ANY	Counts number of partial cache line writes to DRAM.	
30H	01H	UNC_QMC_CANCEL.CH0	Counts number of DRAM channel 0 cancel requests.	
30H	02H	UNC_QMC_CANCEL.CH1	Counts number of DRAM channel 1 cancel requests.	
30H	04H	UNC_QMC_CANCEL.CH2	Counts number of DRAM channel 2 cancel requests.	
30H	07H	UNC_QMC_CANCEL.ANY	Counts number of DRAM cancel requests.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
31H	01H	UNC_QMC_PRIORITY_UPDATES.CHO	Counts number of DRAM channel 0 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	02H	UNC_QMC_PRIORITY_UPDATES.CH1	Counts number of DRAM channel 1 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	04H	UNC_QMC_PRIORITY_UPDATES.CH2	Counts number of DRAM channel 2 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
31H	07H	UNC_QMC_PRIORITY_UPDATES.ANY	Counts number of DRAM priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.	
32H	01H	UNC_IMC_RETRY.CH0	Counts number of IMC DRAM channel 0 retries. DRAM retry only occurs when configured in RAS mode.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
32H	02H	UNC_IMC_RETRY.CH1	Counts number of IMC DRAM channel 1 retries. DRAM retry only occurs when configured in RAS mode.	
32H	04H	UNC_IMC_RETRY.CH2	Counts number of IMC DRAM channel 2 retries. DRAM retry only occurs when configured in RAS mode.	
32H	07H	UNC_IMC_RETRY.ANY	Counts number of IMC DRAM retries from any channel. DRAM retry only occurs when configured in RAS mode.	
33H	01H	UNC_QHL_FRC_ACK_CNFLTS.IOH	Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the IOH.	
33H	02H	UNC_QHL_FRC_ACK_CNFLTS.REMOTE	Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the remote home.	
33H	04H	UNC_QHL_FRC_ACK_CNFLTS.LOCAL	Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the local home.	
33H	07H	UNC_QHL_FRC_ACK_CNFLTS.ANY	Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic.	
34H	01H	UNC_QHL_SLEEPS.IOH_ORDER	Counts number of occurrences a request was put to sleep due to IOH ordering (write after read) conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	
34H	02H	UNC_QHL_SLEEPS.REMOTE_ORDER	Counts number of occurrences a request was put to sleep due to remote socket ordering (write after read) conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
34H	04H	UNC_QHL_SLEEPS.L OCAL_ORDER	Counts number of occurrences a request was put to sleep due to local socket ordering (write after read) conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	
34H	08H	UNC_QHL_SLEEPS.IO H_CONFLICT	Counts number of occurrences a request was put to sleep due to IOH address conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	
34H	10H	UNC_QHL_SLEEPS.R EMOTE_CONFLICT	Counts number of occurrences a request was put to sleep due to remote socket address conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	
34H	20H	UNC_QHL_SLEEPS.L OCAL_CONFLICT	Counts number of occurrences a request was put to sleep due to local socket address conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.	
35H	01H	UNC_ADDR_OPCODE _MATCH.IOH	Counts number of requests from the IOH, address/opcode of request is qualified by mask value written to MSR 396H. The following mask values are supported: 0: NONE 40000000_00000000H:RSPFWDI 40001A00_00000000H:RSPFWDS 40001D00_00000000H:RSPiWB	Match opcode/addresses by writing MSR 396H with mask supported mask value

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
35H	02H	UNC_ADDR_OPCODE_MATCH.REMOTE	Counts number of requests from the remote socket, address/opcode of request is qualified by mask value written to MSR 396H. The following mask values are supported: 0: NONE 40000000_00000000H:RSPFWDI 40001A00_00000000H:RSPFWD5 40001D00_00000000H:RSPIWB	Match opcode/addresses by writing MSR 396H with mask supported mask value
35H	04H	UNC_ADDR_OPCODE_MATCH.LOCAL	Counts number of requests from the local socket, address/opcode of request is qualified by mask value written to MSR 396H. The following mask values are supported: 0: NONE 40000000_00000000H:RSPFWDI 40001A00_00000000H:RSPFWD5 40001D00_00000000H:RSPIWB	Match opcode/addresses by writing MSR 396H with mask supported mask value
40H	01H	UNC_QPI_TX_STALL_SINGLE_FLIT.HOME.LINK_0	Counts cycles the Quickpath outbound link 0 HOME virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	02H	UNC_QPI_TX_STALL_SINGLE_FLIT.SNOOP.LINK_0	Counts cycles the Quickpath outbound link 0 SNOOP virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
40H	04H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.NDR .LINK_0	Counts cycles the Quickpath outbound link 0 non-data response virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	08H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.HO ME.LINK_1	Counts cycles the Quickpath outbound link 1 HOME virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	10H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.SNO OP.LINK_1	Counts cycles the Quickpath outbound link 1 SNOOP virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	20H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.NDR .LINK_1	Counts cycles the Quickpath outbound link 1 non-data response virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
40H	07H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.LIN K_0	Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
40H	38H	UNC_QPI_TX_STALL ED_SINGLE_FLIT.LINK_1	Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	01H	UNC_QPI_TX_STALL ED_MULTI_FLIT.DRS. LINK_0	Counts cycles the Quickpath outbound link 0 Data ResponSe virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	02H	UNC_QPI_TX_STALL ED_MULTI_FLIT.NCB. LINK_0	Counts cycles the Quickpath outbound link 0 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	04H	UNC_QPI_TX_STALL ED_MULTI_FLIT.NCS. LINK_0	Counts cycles the Quickpath outbound link 0 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	08H	UNC_QPI_TX_STALL ED_MULTI_FLIT.DRS. LINK_1	Counts cycles the Quickpath outbound link 1 Data ResponSe virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
41H	10H	UNC_QPI_TX_STALL ED_MULTI_FLIT.NCB. LINK_1	Counts cycles the Quickpath outbound link 1 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	20H	UNC_QPI_TX_STALL ED_MULTI_FLIT.NCS. LINK_1	Counts cycles the Quickpath outbound link 1 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	07H	UNC_QPI_TX_STALL ED_MULTI_FLIT.LINK _0	Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
41H	38H	UNC_QPI_TX_STALL ED_MULTI_FLIT.LINK _1	Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.	
42H	01H	UNC_QPI_TX_HEADE R.FULL.LINK_0	Number of cycles that the header buffer in the Quickpath Interface outbound link 0 is full.	
42H	02H	UNC_QPI_TX_HEADE R.BUSY.LINK_0	Number of cycles that the header buffer in the Quickpath Interface outbound link 0 is busy.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
42H	04H	UNC_QPI_TX_HEADE R.FULL.LINK_1	Number of cycles that the header buffer in the Quickpath Interface outbound link 1 is full.	
42H	08H	UNC_QPI_TX_HEADE R.BUSY.LINK_1	Number of cycles that the header buffer in the Quickpath Interface outbound link 1 is busy.	
43H	01H	UNC_QPI_RX_NO_PP T_CREDIT.STALLS.LIN K_0	Number of cycles that snoop packets incoming to the Quickpath Interface link 0 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.	
43H	02H	UNC_QPI_RX_NO_PP T_CREDIT.STALLS.LIN K_1	Number of cycles that snoop packets incoming to the Quickpath Interface link 1 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.	
60H	01H	UNC_DRAM_OPEN.C H0	Counts number of DRAM Channel 0 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	
60H	02H	UNC_DRAM_OPEN.C H1	Counts number of DRAM Channel 1 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	
60H	04H	UNC_DRAM_OPEN.C H2	Counts number of DRAM Channel 2 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.	
61H	01H	UNC_DRAM_PAGE_C LOSE.CHO	DRAM channel 0 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
61H	02H	UNC_DRAM_PAGE_C LOSE.CH1	DRAM channel 1 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	
61H	04H	UNC_DRAM_PAGE_C LOSE.CH2	DRAM channel 2 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.	
62H	01H	UNC_DRAM_PAGE_M ISS.CHO	Counts the number of precharges (PRE) that were issued to DRAM channel 0 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
62H	02H	UNC_DRAM_PAGE_M ISS.CH1	Counts the number of precharges (PRE) that were issued to DRAM channel 1 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
62H	04H	UNC_DRAM_PAGE_M ISS.CH2	Counts the number of precharges (PRE) that were issued to DRAM channel 2 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge.	
63H	01H	UNC_DRAM_READ_C AS.CHO	Counts the number of times a read CAS command was issued on DRAM channel 0.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
63H	02H	UNC_DRAM_READ_CAS.AUTOPRE_CH0	Counts the number of times a read CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.	
63H	04H	UNC_DRAM_READ_CAS.CH1	Counts the number of times a read CAS command was issued on DRAM channel 1.	
63H	08H	UNC_DRAM_READ_CAS.AUTOPRE_CH1	Counts the number of times a read CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.	
63H	10H	UNC_DRAM_READ_CAS.CH2	Counts the number of times a read CAS command was issued on DRAM channel 2.	
63H	20H	UNC_DRAM_READ_CAS.AUTOPRE_CH2	Counts the number of times a read CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.	
64H	01H	UNC_DRAM_WRITE_CAS.CH0	Counts the number of times a write CAS command was issued on DRAM channel 0.	
64H	02H	UNC_DRAM_WRITE_CAS.AUTOPRE_CH0	Counts the number of times a write CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.	
64H	04H	UNC_DRAM_WRITE_CAS.CH1	Counts the number of times a write CAS command was issued on DRAM channel 1.	
64H	08H	UNC_DRAM_WRITE_CAS.AUTOPRE_CH1	Counts the number of times a write CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
64H	10H	UNC_DRAM_WRITE_CAS.CH2	Counts the number of times a write CAS command was issued on DRAM channel 2.	
64H	20H	UNC_DRAM_WRITE_CAS.AUTOPRE_CH2	Counts the number of times a write CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.	
65H	01H	UNC_DRAM_REFRES H.CH0	Counts number of DRAM channel 0 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
65H	02H	UNC_DRAM_REFRES H.CH1	Counts number of DRAM channel 1 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
65H	04H	UNC_DRAM_REFRES H.CH2	Counts number of DRAM channel 2 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.	
66H	01H	UNC_DRAM_PRE_AL L.CH0	Counts number of DRAM Channel 0 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	
66H	02H	UNC_DRAM_PRE_AL L.CH1	Counts number of DRAM Channel 1 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
66H	04H	UNC_DRAM_PRE_AL L.CH2	Counts number of DRAM Channel 2 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode.	
67H	01H	UNC_DRAM_THERM AL_THROTTLED	Uncore cycles DRAM was throttled due to its temperature being above the thermal throttling threshold.	
80H	01H	UNC_THERMAL_THR OTTILING_TEMP.CORE _0	Cycles that the PCU records that core 0 is above the thermal throttling threshold temperature.	
80H	02H	UNC_THERMAL_THR OTTILING_TEMP.CORE _1	Cycles that the PCU records that core 1 is above the thermal throttling threshold temperature.	
80H	04H	UNC_THERMAL_THR OTTILING_TEMP.CORE _2	Cycles that the PCU records that core 2 is above the thermal throttling threshold temperature.	
80H	08H	UNC_THERMAL_THR OTTILING_TEMP.CORE _3	Cycles that the PCU records that core 3 is above the thermal throttling threshold temperature.	
81H	01H	UNC_THERMAL_THR OTTLED_TEMP.CORE _0	Cycles that the PCU records that core 0 is in the power throttled state due to core's temperature being above the thermal throttling threshold.	
81H	02H	UNC_THERMAL_THR OTTLED_TEMP.CORE _1	Cycles that the PCU records that core 1 is in the power throttled state due to core's temperature being above the thermal throttling threshold.	
81H	04H	UNC_THERMAL_THR OTTLED_TEMP.CORE _2	Cycles that the PCU records that core 2 is in the power throttled state due to core's temperature being above the thermal throttling threshold.	
81H	08H	UNC_THERMAL_THR OTTLED_TEMP.CORE _3	Cycles that the PCU records that core 3 is in the power throttled state due to core's temperature being above the thermal throttling threshold.	

Table A-7. Non-Architectural Performance Events In the Processor Uncore for Processors Based on Intel Microarchitecture Code Name Westmere

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
82H	01H	UNC_PROCHOT_ASSERTION	Number of system assertions of PROCHOT indicating the entire processor has exceeded the thermal limit.	
83H	01H	UNC_THERMAL_THROTTLING_PROCHOT.CORE_0	Cycles that the PCU records that core 0 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit.	
83H	02H	UNC_THERMAL_THROTTLING_PROCHOT.CORE_1	Cycles that the PCU records that core 1 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit.	
83H	04H	UNC_THERMAL_THROTTLING_PROCHOT.CORE_2	Cycles that the PCU records that core 2 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit.	
83H	08H	UNC_THERMAL_THROTTLING_PROCHOT.CORE_3	Cycles that the PCU records that core 3 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit.	
84H	01H	UNC_TURBO_MODE.CORE_0	Uncore cycles that core 0 is operating in turbo mode.	
84H	02H	UNC_TURBO_MODE.CORE_1	Uncore cycles that core 1 is operating in turbo mode.	
84H	04H	UNC_TURBO_MODE.CORE_2	Uncore cycles that core 2 is operating in turbo mode.	
84H	08H	UNC_TURBO_MODE.CORE_3	Uncore cycles that core 3 is operating in turbo mode.	
85H	02H	UNC_CYCLES_UNHALTED_L3_FLL_ENABLE	Uncore cycles that at least one core is unhalted and all L3 ways are enabled.	
86H	01H	UNC_CYCLES_UNHALTED_L3_FLL_DISABLE	Uncore cycles that at least one core is unhalted and all L3 ways are disabled.	

A.5 PERFORMANCE MONITORING EVENTS FOR INTEL® XEON® PROCESSOR 5200, 5400 SERIES AND INTEL® CORE™ 2 EXTREME PROCESSORS QX 9000 SERIES

Processors based on the Enhanced Intel Core microarchitecture support the architectural and non-architectural performance-monitoring events listed in Table A-1 and Table A-10. In addition, they also support the following non-architectural performance-monitoring events listed in Table A-8. Fixed counters support the architecture events defined in Table A-9.

Table A-8. Non-Architectural Performance Events for Processors Based on Enhanced Intel Core Microarchitecture

Event Num.	Umask Value	Event Mask Mnemonic	Description	Comment
COH	08H	INST_RETIRED.VM_H OST	Instruction retired while in VMX root operations.	
D2H	10H	RAT_STAALS.OTHER _SERIALIZATION_ST ALLS	This events counts the number of stalls due to other RAT resource serialization not counted by Umask value 0FH.	

A.6 PERFORMANCE MONITORING EVENTS FOR INTEL® XEON® PROCESSOR 3000, 3200, 5100, 5300 SERIES AND INTEL® CORE™ 2 DUO PROCESSORS

Processors based on the Intel Core microarchitecture support architectural and non-architectural performance-monitoring events.

Fixed-function performance counters are introduced first on processors based on Intel Core microarchitecture. Table A-9 lists pre-defined performance events that can be counted using fixed-function performance counters.

Table A-9. Fixed-Function Performance Counter and Pre-defined Performance Events

Fixed-Function Performance Counter	Address	Event Mask Mnemonic	Description
MSR_PERF_FIXED_CTR0/IA32_PERF_FIXED_CTR0	309H	Inst_Retired.Any	This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continue counting during hardware interrupts, traps, and inside interrupt handlers.
MSR_PERF_FIXED_CTR1/IA32_PERF_FIXED_CTR1	30AH	CPU_CLK_UNHALTED.CORE	<p>This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios.</p> <p>The core frequency may change from time to time due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason this event may have a changing ratio with regards to time.</p> <p>When the core frequency is constant, this event can approximate elapsed time while the core was not in halt state.</p>
MSR_PERF_FIXED_CTR2/IA32_PERF_FIXED_CTR2	30BH	CPU_CLK_UNHALTED.REF	<p>This event counts the number of reference cycles when the core is not in a halt state and not in a TM stop-clock state. The core enters the halt state when it is running the HLT instruction or the MWAIT instruction.</p> <p>This event is not affected by core frequency changes (e.g., P states) but counts at the same frequency as the time stamp counter. This event can approximate elapsed time while the core was not in halt state and not in a TM stop-clock state.</p> <p>This event has a constant ratio with the CPU_CLK_UNHALTED.BUS event.</p>

Table A-10 lists general-purpose non-architectural performance-monitoring events supported in processors based on Intel Core microarchitecture. For convenience,

Table A-10 also includes architectural events and describes minor model-specific behavior where applicable. Software must use a general-purpose performance counter to count events listed in Table A-10.

Table A-10. Non-Architectural Performance Events in Processors Based on Intel Core Microarchitecture

Event Num	Umask Value	Event Name	Definition	Description and Comment
03H	02H	LOAD_BLOCK.STA	Loads blocked by a preceding store with unknown address	<p>This event indicates that loads are blocked by preceding stores. A load is blocked when there is a preceding store to an address that is not yet calculated. The number of events is greater or equal to the number of load operations that were blocked.</p> <p>If the load and the store are always to different addresses, check why the memory disambiguation mechanism is not working. To avoid such blocks, increase the distance between the store and the following load so that the store address is known at the time the load is dispatched.</p>
03H	04H	LOAD_BLOCK.STD	Loads blocked by a preceding store with unknown data	<p>This event indicates that loads are blocked by preceding stores. A load is blocked when there is a preceding store to the same address and the stored data value is not yet known. The number of events is greater or equal to the number of load operations that were blocked.</p> <p>To avoid such blocks, increase the distance between the store and the dependant load, so that the store data is known at the time the load is dispatched.</p>
03H	08H	LOAD_BLOCK.OVERLAP_STORE	Loads that partially overlap an earlier store, or 4-Kbyte aliased with a previous store	<p>This event indicates that loads are blocked due to a variety of reasons. Some of the triggers for this event are when a load is blocked by a preceding store, in one of the following:</p> <ul style="list-style-type: none"> ▪ Some of the loaded byte locations are written by the preceding store and some are not. ▪ The load is from bytes written by the preceding store, the store is aligned to its size and either:

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
				<ul style="list-style-type: none"> ▪ The load's data size is one or two bytes and it is not aligned to the store. ▪ The load's data size is of four or eight bytes and the load is misaligned.
				<ul style="list-style-type: none"> ▪ The load is from bytes written by the preceding store, the store is misaligned and the load is not aligned on the beginning of the store. ▪ The load is split over an eight byte boundary (excluding 16-byte loads). ▪ The load and store have the same offset relative to the beginning of different 4-KByte pages. This case is also called 4-KByte aliasing. ▪ In all these cases the load is blocked until after the blocking store retires and the stored data is committed to the cache hierarchy.
03H	10H	LOAD_BLOCK. UNTIL_RETIRE	Loads blocked until retirement	<p>This event indicates that load operations were blocked until retirement. The number of events is greater or equal to the number of load operations that were blocked.</p> <p>This includes mainly uncacheable loads and split loads (loads that cross the cache line boundary) but may include other cases where loads are blocked until retirement.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
03H	20H	LOAD_BLOCK.L1D	Loads blocked by the L1 data cache	<p>This event indicates that loads are blocked due to one or more reasons. Some triggers for this event are:</p> <ul style="list-style-type: none"> ▪ The number of L1 data cache misses exceeds the maximum number of outstanding misses supported by the processor. This includes misses generated as result of demand fetches, software prefetches or hardware prefetches. ▪ Cache line split loads. ▪ Partial reads, such as reads to un-cacheable memory, I/O instructions and more. ▪ A locked load operation is in progress. The number of events is greater or equal to the number of load operations that were blocked.
04H	01H	SB_DRAIN_CYCLES	Cycles while stores are blocked due to store buffer drain	<p>This event counts every cycle during which the store buffer is draining. This includes:</p> <ul style="list-style-type: none"> ▪ Serializing operations such as CPUID ▪ Synchronizing operations such as XCHG ▪ Interrupt acknowledgment ▪ Other conditions, such as cache flushing
04H	02H	STORE_BLOCK.ORDER	Cycles while store is waiting for a preceding store to be globally observed	<p>This event counts the total duration, in number of cycles, which stores are waiting for a preceding stored cache line to be observed by other cores. This situation happens as a result of the strong store ordering behavior, as defined in "Memory Ordering," Chapter 8, <i>Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A</i>.</p> <p>The stall may occur and be noticeable if there are many cases when a store either misses the L1 data cache or hits a cache line in the Shared state. If the store requires a bus transaction to read the cache line then the stall ends when snoop response for the bus transaction arrives.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
04H	08H	STORE_BLOCK.SNOOP	A store is blocked due to a conflict with an external or internal snoop.	This event counts the number of cycles the store port was used for snooping the L1 data cache and a store was stalled by the snoop. The store is typically resubmitted one cycle later.
06H	00H	SEGMENT_REG_LOADS	Number of segment register loads	This event counts the number of segment register load operations. Instructions that load new values into segment registers cause a penalty.
				<p>This event indicates performance issues in 16-bit code. If this event occurs frequently, it may be useful to calculate the number of instructions retired per segment register load. If the resulting calculation is low (on average a small number of instructions are executed between segment register loads), then the code's segment register usage should be optimized.</p> <p>As a result of branch misprediction, this event is speculative and may include segment register loads that do not actually occur. However, most segment register loads are internally serialized and such speculative effects are minimized.</p>
07H	00H	SSE_PRE_EXEC.NTA	Streaming SIMD Extensions (SSE) Prefetch NTA instructions executed	<p>This event counts the number of times the SSE instruction prefetchNTA is executed. This instruction prefetches the data to the L1 data cache.</p>
07H	01H	SSE_PRE_EXEC.L1	Streaming SIMD Extensions (SSE) PrefetchT0 instructions executed	<p>This event counts the number of times the SSE instruction prefetchT0 is executed. This instruction prefetches the data to the L1 data cache and L2 cache.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
07H	02H	SSE_PRE_EXEC.L2	Streaming SIMD Extensions (SSE) PrefetchT1 and PrefetchT2 instructions executed	This event counts the number of times the SSE instructions prefetchT1 and prefetchT2 are executed. These instructions prefetch the data to the L2 cache.
07H	03H	SSE_PRE_EXEC.STORES	Streaming SIMD Extensions (SSE) Weakly-ordered store instructions executed	This event counts the number of times SSE non-temporal store instructions are executed.
08H	01H	DTLB_MISSES.ANY	Memory accesses that missed the DTLB	This event counts the number of Data Table Lookaside Buffer (DTLB) misses. The count includes misses detected as a result of speculative accesses. Typically a high count for this event indicates that the code accesses a large number of data pages.
08H	02H	DTLB_MISSES.MISS_LD	DTLB misses due to load operations	This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to load operations. This count includes misses detected as a result of speculative accesses.
08H	04H	DTLB_MISSES.LO_MISS_LD	LO DTLB misses due to load operations	This event counts the number of level 0 Data Table Lookaside Buffer (DTLB0) misses due to load operations. This count includes misses detected as a result of speculative accesses. Loads that miss that DTLB0 and hit the DTLB1 can incur two-cycle penalty.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
08H	08H	DTLB_MISSES. MISS_ST	TLB misses due to store operations	<p>This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to store operations.</p> <p>This count includes misses detected as a result of speculative accesses. Address translation for store operations is performed in the DTLB1.</p>
09H	01H	MEMORY_ DISAMBIGUATION. RESET	Memory disambiguation reset cycles	<p>This event counts the number of cycles during which memory disambiguation misprediction occurs. As a result the execution pipeline is cleaned and execution of the mispredicted load instruction and all succeeding instructions restarts.</p> <p>This event occurs when the data address accessed by a load instruction, collides infrequently with preceding stores, but usually there is no collision. It happens rarely, and may have a penalty of about 20 cycles.</p>
09H	02H	MEMORY_DISAMBI GUATION.SUCCESS	Number of loads successfully disambiguated.	This event counts the number of load operations that were successfully disambiguated. Loads are preceded by a store with an unknown address, but they are not blocked.
0CH	01H	PAGE_WALKS .COUNT	Number of page-walks executed	<p>This event counts the number of page-walks executed due to either a DTLB or ITLB miss.</p> <p>The page walk duration, PAGE_WALKS.CYCLES, divided by number of page walks is the average duration of a page walk. The average can hint whether most of the page-walks are satisfied by the caches or cause an L2 cache miss.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
0CH	02H	PAGE_WALKS. CYCLES	Duration of page-walks in core cycles	This event counts the duration of page-walks in core cycles. The paging mode in use typically affects the duration of page walks. Page walk duration divided by number of page walks is the average duration of page-walks. The average can hint at whether most of the page-walks are satisfied by the caches or cause an L2 cache miss.
10H	00H	FP_COMP_OPS _EXE	Floating point computational micro-ops executed	This event counts the number of floating point computational micro-ops executed. Use IA32_PMC0 only.
11H	00H	FP_ASSIST	Floating point assists	This event counts the number of floating point operations executed that required micro-code assist intervention. Assists are required in the following cases: <ul style="list-style-type: none"> ▪ Streaming SIMD Extensions (SSE) instructions: ▪ Denormal input when the DAZ (Denormals Are Zeros) flag is off ▪ Underflow result when the FTZ (Flush To Zero) flag is off ▪ X87 instructions: ▪ NaN or denormal are loaded to a register or used as input from memory ▪ Division by 0 ▪ Underflow output Use IA32_PMC1 only.
12H	00H	MUL	Multiply operations executed	This event counts the number of multiply operations executed. This includes integer as well as floating point multiply operations. Use IA32_PMC1 only.
13H	00H	DIV	Divide operations executed	This event counts the number of divide operations executed. This includes integer divides, floating point divides and square-root operations executed. Use IA32_PMC1 only.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
14H	00H	CYCLES_DIV _BUSY	Cycles the divider busy	This event counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE. Use IA32_PMC0 only.
18H	00H	IDLE_DURING _DIV	Cycles the divider is busy and all other execution units are idle.	This event counts the number of cycles the divider is busy (with a divide or a square root operation) and no other execution unit or load operation is in progress. Load operations are assumed to hit the L1 data cache. This event considers only micro-ops dispatched after the divider started operating. Use IA32_PMC0 only.
19H	00H	DELAYED_ BYPASS.FP	Delayed bypass to FP operation	This event counts the number of times floating point operations use data immediately after the data was generated by a non-floating point execution unit. Such cases result in one penalty cycle due to data bypass between the units. Use IA32_PMC1 only.
19H	01H	DELAYED_ BYPASS.SIMD	Delayed bypass to SIMD operation	This event counts the number of times SIMD operations use data immediately after the data was generated by a non-SIMD execution unit. Such cases result in one penalty cycle due to data bypass between the units. Use IA32_PMC1 only.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
19H	02H	DELAYED_BYPASS.LOAD	Delayed bypass to load operation	This event counts the number of delayed bypass penalty cycles that a load operation incurred. When load operations use data immediately after the data was generated by an integer execution unit, they may (pending on certain dynamic internal conditions) incur one penalty cycle due to delayed data bypass between the units. Use IA32_PMC1 only.
21H	See Table 30-2	L2_ADS.(Core)	Cycles L2 address bus is in use	This event counts the number of cycles the L2 address bus is being used for accesses to the L2 cache or bus queue. It can count occurrences for this core or both cores.
23H	See Table 30-2	L2_DBUS_BUSY_RD.(Core)	Cycles the L2 transfers data to the core	This event counts the number of cycles during which the L2 data bus is busy transferring data from the L2 cache to the core. It counts for all L1 cache misses (data and instruction) that hit the L2 cache. This event can count occurrences for this core or both cores.
24H	Combined mask from Table 30-2 and Table 30-4	L2_LINES_IN.(Core, Prefetch)	L2 cache misses	This event counts the number of cache lines allocated in the L2 cache. Cache lines are allocated in the L2 cache as a result of requests from the L1 data and instruction caches and the L2 hardware prefetchers to cache lines that are missing in the L2 cache. This event can count occurrences for this core or both cores. It can also count demand requests and L2 hardware prefetch requests together or separately.
25H	See Table 30-2	L2_M_LINES_IN.(Core)	L2 cache line modifications	This event counts whenever a modified cache line is written back from the L1 data cache to the L2 cache. This event can count occurrences for this core or both cores.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
26H	See Table 30-2 and Table 30-4	L2_LINES_OUT.(Core, Prefetch)	L2 cache lines evicted	This event counts the number of L2 cache lines evicted. This event can count occurrences for this core or both cores. It can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.
27H	See Table 30-2 and Table 30-4	L2_M_LINES_OUT.(Core, Prefetch)	Modified lines evicted from the L2 cache	This event counts the number of L2 modified cache lines evicted. These lines are written back to memory unless they also exist in a modified-state in one of the L1 data caches. This event can count occurrences for this core or both cores. It can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.
28H	Combined mask from Table 30-2 and Table 30-5	L2_IFETCH.(Core, Cache Line State)	L2 cacheable instruction fetch requests	This event counts the number of instruction cache line requests from the IFU. It does not include fetch requests from uncacheable memory. It does not include ITLB miss accesses. This event can count occurrences for this core or both cores. It can also count accesses to cache lines at different MESI states.
29H	Combined mask from Table 30-2, Table 30-4, and Table 30-5	L2_LD.(Core, Prefetch, Cache Line State)	L2 cache reads	This event counts L2 cache read requests coming from the L1 data cache and L2 prefetchers. The event can count occurrences: <ul style="list-style-type: none"> ▪ for this core or both cores ▪ due to demand requests and L2 hardware prefetch requests together or separately ▪ of accesses to cache lines at different MESI states

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
2AH	See Table 30-2 and Table 30-5	L2_ST.(Core, Cache Line State)	L2 store requests	This event counts all store operations that miss the L1 data cache and request the data from the L2 cache. The event can count occurrences for this core or both cores. It can also count accesses to cache lines at different MESI states.
2BH	See Table 30-2 and Table 30-5	L2_LOCK.(Core, Cache Line State)	L2 locked accesses	This event counts all locked accesses to cache lines that miss the L1 data cache. The event can count occurrences for this core or both cores. It can also count accesses to cache lines at different MESI states.
2EH	See Table 30-2, Table 30-4, and Table 30-5	L2_RQSTS.(Core, Prefetch, Cache Line State)	L2 cache requests	This event counts all completed L2 cache requests. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, instruction fetches, and all L2 hardware prefetch requests. This event can count occurrences: <ul style="list-style-type: none"> ▪ for this core or both cores. ▪ due to demand requests and L2 hardware prefetch requests together, or separately ▪ of accesses to cache lines at different MESI states
2EH	41H	L2_RQSTS.SELF.DEMAND.I_STATE	L2 cache demand requests from this core that missed the L2	This event counts all completed L2 cache demand requests from this core that miss the L2 cache. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches. This is an architectural performance event.
2EH	4FH	L2_RQSTS.SELF.DEMAND.MESI	L2 cache demand requests from this core	This event counts all completed L2 cache demand requests from this core. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches. This is an architectural performance event.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
30H	See Table 30-2, Table 30-4, and Table 30-5	L2_REJECT_BUSQ.(Core, Prefetch, Cache Line State)	Rejected L2 cache requests	<p>This event indicates that a pending L2 cache request that requires a bus transaction is delayed from moving to the bus queue. Some of the reasons for this event are:</p> <ul style="list-style-type: none"> ▪ The bus queue is full. ▪ The bus queue already holds an entry for a cache line in the same set. <p>The number of events is greater or equal to the number of requests that were rejected.</p> <ul style="list-style-type: none"> ▪ for this core or both cores. ▪ due to demand requests and L2 hardware prefetch requests together, or separately. ▪ of accesses to cache lines at different MESI states.
32H	See Table 30-2	L2_NO_REQ.(Core)	Cycles no L2 cache requests are pending	<p>This event counts the number of cycles that no L2 cache requests were pending from a core. When using the BOTH_CORE modifier, the event counts only if none of the cores have a pending request. The event counts also when one core is halted and the other is not halted.</p> <p>The event can count occurrences for this core or both cores.</p>
3AH	00H	EIST_TRANS	Number of Enhanced Intel SpeedStep Technology (EIST) transitions	<p>This event counts the number of transitions that include a frequency change, either with or without voltage change. This includes Enhanced Intel SpeedStep Technology (EIST) and TM2 transitions.</p> <p>The event is incremented only while the counting core is in CO state. Since transitions to higher-numbered CxE states and TM2 transitions include a frequency change or voltage transition, the event is incremented accordingly.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
3BH	COH	THERMAL_TRIP	Number of thermal trips	<p>This event counts the number of thermal trips. A thermal trip occurs whenever the processor temperature exceeds the thermal trip threshold temperature.</p> <p>Following a thermal trip, the processor automatically reduces frequency and voltage. The processor checks the temperature every millisecond and returns to normal when the temperature falls below the thermal trip threshold temperature.</p>
3CH	00H	CPU_CLK_UNHALTED.CORE_P	Core cycles when core is not halted	<p>This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios.</p> <p>The core frequency may change due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason, this event may have a changing ratio in regard to time.</p> <p>When the core frequency is constant, this event can give approximate elapsed time while the core not in halt state.</p> <p>This is an architectural performance event.</p>
3CH	01H	CPU_CLK_UNHALTED.BUS	Bus cycles when core is not halted	<p>This event counts the number of bus cycles while the core is not in the halt state. This event can give a measurement of the elapsed time while the core was not in the halt state. The core enters the halt state when it is running the HLT instruction.</p> <p>The event also has a constant ratio with CPU_CLK_UNHALTED.REF event, which is the maximum bus to processor frequency ratio.</p> <p>Non-halted bus cycles are a component in many key event ratios.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
3CH	02H	CPU_CLK_UNHALTED.NO_OTHER	Bus cycles when core is active and the other is halted	<p>This event counts the number of bus cycles during which the core remains non-halted and the other core on the processor is halted.</p> <p>This event can be used to determine the amount of parallelism exploited by an application or a system. Divide this event count by the bus frequency to determine the amount of time that only one core was in use.</p>
40H	See Table 30-5	L1D_CACHE_LD. (Cache Line State)	L1 cacheable data reads	This event counts the number of data reads from cacheable memory. Locked reads are not counted.
41H	See Table 30-5	L1D_CACHE_ST. (Cache Line State)	L1 cacheable data writes	This event counts the number of data writes to cacheable memory. Locked writes are not counted.
42H	See Table 30-5	L1D_CACHE_LOCK. (Cache Line State)	L1 data cacheable locked reads	This event counts the number of locked data reads from cacheable memory.
42H	10H	L1D_CACHE_LOCK_DURATION	Duration of L1 data cacheable locked operation	<p>This event counts the number of cycles during which any cache line is locked by any locking instruction.</p> <p>Locking happens at retirement and therefore the event does not occur for instructions that are speculatively executed. Locking duration is shorter than locked instruction execution duration.</p>
43H	01H	L1D_ALL_REF	All references to the L1 data cache	<p>This event counts all references to the L1 data cache, including all loads and stores with any memory types.</p> <p>The event counts memory accesses only when they are actually performed. For example, a load blocked by unknown store address and later performed is only counted once.</p> <p>The event includes non-cacheable accesses, such as I/O accesses.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
43H	02H	L1D_ALL_CACHE_REF	L1 Data cacheable reads and writes	This event counts the number of data reads and writes from cacheable memory, including locked operations. This event is a sum of: <ul style="list-style-type: none"> ▪ L1D_CACHE_LD.MESI ▪ L1D_CACHE_ST.MESI ▪ L1D_CACHE_LOCK.MESI
45H	0FH	L1D_REPL	Cache lines allocated in the L1 data cache	This event counts the number of lines brought into the L1 data cache.
46H	00H	L1D_M_REPL	Modified cache lines allocated in the L1 data cache	This event counts the number of modified lines brought into the L1 data cache.
47H	00H	L1D_M_EVICT	Modified cache lines evicted from the L1 data cache	This event counts the number of modified lines evicted from the L1 data cache, whether due to replacement or by snoop HITM intervention.
48H	00H	L1D_PEND_MISS	Total number of outstanding L1 data cache misses at any cycle	This event counts the number of outstanding L1 data cache misses at any cycle. An L1 data cache miss is outstanding from the cycle on which the miss is determined until the first chunk of data is available. This event counts: <ul style="list-style-type: none"> ▪ all cacheable demand requests ▪ L1 data cache hardware prefetch requests ▪ requests to write through memory ▪ requests to write combine memory Uncacheable requests are not counted. The count of this event divided by the number of L1 data cache misses, L1D_REPL, is the average duration in core cycles of an L1 data cache miss.
49H	01H	L1D_SPLIT_LOADS	Cache line split loads from the L1 data cache	This event counts the number of load operations that span two cache lines. Such load operations are also called split loads. Split load operations are executed at retirement.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
49H	02H	L1D_SPLIT.STORES	Cache line split stores to the L1 data cache	This event counts the number of store operations that span two cache lines.
4BH	00H	SSE_PRE_MISS.NTA	Streaming SIMD Extensions (SSE) Prefetch NTA instructions missing all cache levels	This event counts the number of times the SSE instructions prefetchNTA were executed and missed all cache levels. Due to speculation an executed instruction might not retire. This instruction prefetches the data to the L1 data cache.
4BH	01H	SSE_PRE_MISS.L1	Streaming SIMD Extensions (SSE) PrefetchT0 instructions missing all cache levels	This event counts the number of times the SSE instructions prefetchT0 were executed and missed all cache levels. Due to speculation executed instruction might not retire. The prefetchT0 instruction prefetches data to the L2 cache and L1 data cache.
4BH	02H	SSE_PRE_MISS.L2	Streaming SIMD Extensions (SSE) PrefetchT1 and PrefetchT2 instructions missing all cache levels	This event counts the number of times the SSE instructions prefetchT1 and prefetchT2 were executed and missed all cache levels. Due to speculation, an executed instruction might not retire. The prefetchT1 and PrefetchNT2 instructions prefetch data to the L2 cache.
4CH	00H	LOAD_HIT_PRE	Load operations conflicting with a software prefetch to the same address	This event counts load operations sent to the L1 data cache while a previous Streaming SIMD Extensions (SSE) prefetch instruction to the same cache line has started prefetching but has not yet finished.
4EH	10H	L1D_PREFETCH.REQUESTS	L1 data cache prefetch requests	This event counts the number of times the L1 data cache requested to prefetch a data cache line. Requests can be rejected when the L2 cache is busy and resubmitted later or lost. All requests are counted, including those that are rejected.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
60H	See Table 30-2 and Table 30-3	BUS_REQUEST_OUTSTANDING. (Core and Bus Agents)	Outstanding cacheable data read bus requests duration	<p>This event counts the number of pending full cache line read transactions on the bus occurring in each cycle. A read transaction is pending from the cycle it is sent on the bus until the full cache line is received by the processor.</p> <p>The event counts only full-line cacheable read requests from either the L1 data cache or the L2 prefetchers. It does not count Read for Ownership transactions, instruction byte fetch transactions, or any other bus transaction.</p>
61H	See Table 30-3.	BUS_BNR_DRV. (Bus Agents)	Number of Bus Not Ready signals asserted	<p>This event counts the number of Bus Not Ready (BNR) signals that the processor asserts on the bus to suspend additional bus requests by other bus agents.</p> <p>A bus agent asserts the BNR signal when the number of data and snoop transactions is close to the maximum that the bus can handle. To obtain the number of bus cycles during which the BNR signal is asserted, multiply the event count by two.</p> <p>While this signal is asserted, new transactions cannot be submitted on the bus. As a result, transaction latency may have higher impact on program performance.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
62H	See Table 30-3	BUS_DRDY_CLOCKS.(Bus Agents)	Bus cycles when data is sent on the bus	This event counts the number of bus cycles during which the DRDY (Data Ready) signal is asserted on the bus. The DRDY signal is asserted when data is sent on the bus. With the 'THIS_AGENT' mask this event counts the number of bus cycles during which this agent (the processor) writes data on the bus back to memory or to other bus agents. This includes all explicit and implicit data writebacks, as well as partial writes. With the 'ALL_AGENTS' mask, this event counts the number of bus cycles during which any bus agent sends data on the bus. This includes all data reads and writes on the bus.
63H	See Table 30-2 and Table 30-3	BUS_LOCK_CLOCKS.(Core and Bus Agents)	Bus cycles when a LOCK signal asserted	This event counts the number of bus cycles, during which the LOCK signal is asserted on the bus. A LOCK signal is asserted when there is a locked memory access, due to: <ul style="list-style-type: none"> ▪ uncacheable memory ▪ locked operation that spans two cache lines ▪ page-walk from an uncacheable page table Bus locks have a very high performance penalty and it is highly recommended to avoid such accesses.
64H	See Table 30-2	BUS_DATA_RCV.(Core)	Bus cycles while processor receives data	This event counts the number of bus cycles during which the processor is busy receiving data.
65H	See Table 30-2 and Table 30-3	BUS_TRANS_BRD.(Core and Bus Agents)	Burst read bus transactions	This event counts the number of burst read transactions including: <ul style="list-style-type: none"> ▪ L1 data cache read misses (and L1 data cache hardware prefetches) ▪ L2 hardware prefetches by the DPL and L2 streamer ▪ IFU read misses of cacheable lines. It does not include RFO transactions.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
66H	See Table 30-2 and Table 30-3.	BUS_TRANS_RFO.(Core and Bus Agents)	RFO bus transactions	This event counts the number of Read For Ownership (RFO) bus transactions, due to store operations that miss the L1 data cache and the L2 cache. It also counts RFO bus transactions due to locked operations.
67H	See Table 30-2 and Table 30-3.	BUS_TRANS_WB.(Core and Bus Agents)	Explicit writeback bus transactions	This event counts all explicit writeback bus transactions due to dirty line evictions. It does not count implicit writebacks due to invalidation by a snoop request.
68H	See Table 30-2 and Table 30-3	BUS_TRANS_IFETCH.(Core and Bus Agents)	Instruction-fetch bus transactions	This event counts all instruction fetch full cache line bus transactions.
69H	See Table 30-2 and Table 30-3	BUS_TRANS_INVALID.(Core and Bus Agents)	Invalidate bus transactions	This event counts all invalidate transactions. Invalidate transactions are generated when: <ul style="list-style-type: none"> ▪ A store operation hits a shared line in the L2 cache. ▪ A full cache line write misses the L2 cache or hits a shared line in the L2 cache.
6AH	See Table 30-2 and Table 30-3	BUS_TRANS_PWR.(Core and Bus Agents)	Partial write bus transaction	This event counts partial write bus transactions.
6BH	See Table 30-2 and Table 30-3	BUS_TRANS_P.(Core and Bus Agents)	Partial bus transactions	This event counts all (read and write) partial bus transactions.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
6CH	See Table 30-2 and Table 30-3	BUS_TRANS_IO.(Core and Bus Agents)	IO bus transactions	This event counts the number of completed I/O bus transactions as a result of IN and OUT instructions. The count does not include memory mapped IO.
6DH	See Table 30-2 and Table 30-3	BUS_TRANS_DEF.(Core and Bus Agents)	Deferred bus transactions	This event counts the number of deferred transactions.
6EH	See Table 30-2 and Table 30-3	BUS_TRANS_BURST.(Core and Bus Agents)	Burst (full cache-line) bus transactions	This event counts burst (full cache line) transactions including: <ul style="list-style-type: none"> ▪ Burst reads ▪ RFOs ▪ Explicit writebacks ▪ Write combine lines
6FH	See Table 30-2 and Table 30-3	BUS_TRANS_MEM.(Core and Bus Agents)	Memory bus transactions	This event counts all memory bus transactions including: <ul style="list-style-type: none"> ▪ Burst transactions ▪ Partial reads and writes - invalidate transactions <p>The BUS_TRANS_MEM count is the sum of BUS_TRANS_BURST, BUS_TRANS_P and BUS_TRANS_IVAL.</p>
70H	See Table 30-2 and Table 30-3	BUS_TRANS_ANY.(Core and Bus Agents)	All bus transactions	This event counts all bus transactions. This includes: <ul style="list-style-type: none"> ▪ Memory transactions ▪ IO transactions (non memory-mapped) ▪ Deferred transaction completion ▪ Other less frequent transactions, such as interrupts

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
77H	See Table 30-2 and Table 30-6	EXT_SNOOP. (Bus Agents, Snoop Response)	External snoops	<p>This event counts the snoop responses to bus transactions. Responses can be counted separately by type and by bus agent.</p> <p>With the 'THIS_AGENT' mask, the event counts snoop responses from this processor to bus transactions sent by this processor. With the 'ALL_AGENTS' mask the event counts all snoop responses seen on the bus.</p>
78H	See Table 30-2 and Table 30-7	CMP_SNOOP.(Core, Snoop Type)	L1 data cache snooped by other core	<p>This event counts the number of times the L1 data cache is snooped for a cache line that is needed by the other core in the same processor. The cache line is either missing in the L1 instruction or data caches of the other core, or is available for reading only and the other core wishes to write the cache line.</p>
				<p>The snoop operation may change the cache line state. If the other core issued a read request that hit this core in E state, typically the state changes to S state in this core. If the other core issued a read for ownership request (due a write miss or hit to S state) that hits this core's cache line in E or S state, this typically results in invalidation of the cache line in this core. If the snoop hits a line in M state, the state is changed at a later opportunity.</p> <p>These snoops are performed through the L1 data cache store port. Therefore, frequent snoops may conflict with extensive stores to the L1 data cache, which may increase store latency and impact performance.</p>
7AH	See Table 30-3	BUS_HIT_DRV. (Bus Agents)	HIT signal asserted	<p>This event counts the number of bus cycles during which the processor drives the HIT# pin to signal HIT snoop response.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
7BH	See Table 30-3	BUS_HITM_DRV. (Bus Agents)	HITM signal asserted	This event counts the number of bus cycles during which the processor drives the HITM# pin to signal HITM snoop response.
7DH	See Table 30-2	BUSQ_EMPTY. (Core)	Bus queue empty	This event counts the number of cycles during which the core did not have any pending transactions in the bus queue. It also counts when the core is halted and the other core is not halted. This event can count occurrences for this core or both cores.
7EH	See Table 30-2 and Table 30-3	SNOOP_STALL_DRV. (Core and Bus Agents)	Bus stalled for snoops	This event counts the number of times that the bus snoop stall signal is asserted. To obtain the number of bus cycles during which snoops on the bus are prohibited, multiply the event count by two. During the snoop stall cycles, no new bus transactions requiring a snoop response can be initiated on the bus. A bus agent asserts a snoop stall signal if it cannot respond to a snoop request within three bus cycles.
7FH	See Table 30-2	BUS_IO_WAIT. (Core)	IO requests waiting in the bus queue	This event counts the number of core cycles during which IO requests wait in the bus queue. With the SELF modifier this event counts IO requests per core. With the BOTH_CORE modifier, this event increments by one for any cycle for which there is a request from either core.
80H	00H	L1_READS	Instruction fetches	This event counts all instruction fetches, including uncacheable fetches that bypass the Instruction Fetch Unit (IFU).
81H	00H	L1_MISSES	Instruction Fetch Unit misses	This event counts all instruction fetches that miss the Instruction Fetch Unit (IFU) or produce memory requests. This includes uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
82H	02H	ITLB.SMALL_MISS	ITLB small page misses	This event counts the number of instruction fetches from small pages that miss the ITLB.
82H	10H	ITLB.LARGE_MISS	ITLB large page misses	This event counts the number of instruction fetches from large pages that miss the ITLB.
82H	40H	ITLB.FLUSH	ITLB flushes	This event counts the number of ITLB flushes. This usually happens upon CR3 or CR0 writes, which are executed by the operating system during process switches.
82H	12H	ITLB.MISSES	ITLB misses	This event counts the number of instruction fetches from either small or large pages that miss the ITLB.
83H	02H	INST_QUEUE.FULL	Cycles during which the instruction queue is full	This event counts the number of cycles during which the instruction queue is full. In this situation, the core front-end stops fetching more instructions. This is an indication of very long stalls in the back-end pipeline stages.
86H	00H	CYCLES_L1I_MEM_STALLED	Cycles during which instruction fetches stalled	This event counts the number of cycles for which an instruction fetch stalls, including stalls due to any of the following reasons: <ul style="list-style-type: none"> ▪ instruction Fetch Unit cache misses ▪ instruction TLB misses ▪ instruction TLB faults
87H	00H	ILD_STALL	Instruction Length Decoder stall cycles due to a length changing prefix	This event counts the number of cycles during which the instruction length decoder uses the slow length decoder. Usually, instruction length decoding is done in one cycle. When the slow decoder is used, instruction decoding requires 6 cycles.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
				<p>The slow decoder is used in the following cases:</p> <ul style="list-style-type: none"> ▪ operand override prefix (66H) preceding an instruction with immediate data ▪ address override prefix (67H) preceding an instruction with a modr/m in real, big real, 16-bit protected or 32-bit protected modes <p>To avoid instruction length decoding stalls, generate code using imm8 or imm32 values instead of imm16 values. If you must use an imm16 value, store the value in a register using "mov reg, imm32" and use the register format of the instruction.</p>
88H	00H	BR_INST_EXEC	Branch instructions executed	<p>This event counts all executed branches (not necessarily retired). This includes only instructions and not micro-op branches.</p> <p>Frequent branching is not necessarily a major performance issue. However frequent branch mispredictions may be a problem.</p>
89H	00H	BR_MISSP_EXEC	Mispredicted branch instructions executed	<p>This event counts the number of mispredicted branch instructions that were executed.</p>
8AH	00H	BR_BAC_MISSP_EXEC	Branch instructions mispredicted at decoding	<p>This event counts the number of branch instructions that were mispredicted at decoding.</p>
8BH	00H	BR_CND_EXEC	Conditional branch instructions executed.	<p>This event counts the number of conditional branch instructions executed, but not necessarily retired.</p>
8CH	00H	BR_CND_MISSP_EXEC	Mispredicted conditional branch instructions executed	<p>This event counts the number of mispredicted conditional branch instructions that were executed.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
8DH	00H	BR_IND_EXEC	Indirect branch instructions executed	This event counts the number of indirect branch instructions that were executed.
8EH	00H	BR_IND_MISSP_EXEC	Mispredicted indirect branch instructions executed	This event counts the number of mispredicted indirect branch instructions that were executed.
8FH	00H	BR_RET_EXEC	RET instructions executed	This event counts the number of RET instructions that were executed.
90H	00H	BR_RET_MISSP_EXEC	Mispredicted RET instructions executed	This event counts the number of mispredicted RET instructions that were executed.
91H	00H	BR_RET_BAC_MISSP_EXEC	RET instructions executed mispredicted at decoding	This event counts the number of RET instructions that were executed and were mispredicted at decoding.
92H	00H	BR_CALL_EXEC	CALL instructions executed	This event counts the number of CALL instructions executed.
93H	00H	BR_CALL_MISSP_EXEC	Mispredicted CALL instructions executed	This event counts the number of mispredicted CALL instructions that were executed.
94H	00H	BR_IND_CALL_EXEC	Indirect CALL instructions executed	This event counts the number of indirect CALL instructions that were executed.
97H	00H	BR_TKN_BUBBLE_1	Branch predicted taken with bubble 1	<p>The events BR_TKN_BUBBLE_1 and BR_TKN_BUBBLE_2 together count the number of times a taken branch prediction incurred a one-cycle penalty. The penalty incurs when:</p> <ul style="list-style-type: none"> ▪ Too many taken branches are placed together. To avoid this, unroll loops and add a non-taken branch in the middle of the taken sequence. ▪ The branch target is unaligned. To avoid this, align the branch target.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
98H	00H	BR_TKN_BUBBLE_2	Branch predicted taken with bubble 2	The events BR_TKN_BUBBLE_1 and BR_TKN_BUBBLE_2 together count the number of times a taken branch prediction incurred a one-cycle penalty. The penalty incurs when: <ul style="list-style-type: none"> Too many taken branches are placed together. To avoid this, unroll loops and add a non-taken branch in the middle of the taken sequence. The branch target is unaligned. To avoid this, align the branch target.
A0H	00H	RS_UOPS_DISPATCHED	Micro-ops dispatched for execution	This event counts the number of micro-ops dispatched for execution. Up to six micro-ops can be dispatched in each cycle.
A1H	01H	RS_UOPS_DISPATCHED.PORT 0	Cycles micro-ops dispatched for execution on port 0	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Issue Ports are described in <i>Intel® 64 and IA-32 Architectures Optimization Reference Manual</i> . Use IA32_PMC0 only.
A1H	02H	RS_UOPS_DISPATCHED.PORT 1	Cycles micro-ops dispatched for execution on port 1	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.
A1H	04H	RS_UOPS_DISPATCHED.PORT 2	Cycles micro-ops dispatched for execution on port 2	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.
A1H	08H	RS_UOPS_DISPATCHED.PORT 3	Cycles micro-ops dispatched for execution on port 3	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
A1H	10H	RS_UOPS_DISPATCHED.PORT 4	Cycles micro-ops dispatched for execution on port 4	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.
A1H	20H	RS_UOPS_DISPATCHED.PORT 5	Cycles micro-ops dispatched for execution on port 5	This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.
AAH	01H	MACRO_INSTS_DECODED	Instructions decoded	This event counts the number of instructions decoded (but not necessarily executed or retired).
AAH	08H	MACRO_INSTS_CISC_DECODED	CISC Instructions decoded	This event counts the number of complex instructions decoded. Complex instructions usually have more than four micro-ops. Only one complex instruction can be decoded at a time.
ABH	01H	ESP.SYNCH	ESP register content synchronization	This event counts the number of times that the ESP register is explicitly used in the address expression of a load or store operation, after it is implicitly used, for example by a push or a pop instruction. ESP synch micro-op uses resources from the rename pipe-stage and up to retirement. The expected ratio of this event divided by the number of ESP implicit changes is 0,2. If the ratio is higher, consider rearranging your code to avoid ESP synchronization events.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
ABH	02H	ESP.ADDITIONS	ESP register automatic additions	This event counts the number of ESP additions performed automatically by the decoder. A high count of this event is good, since each automatic addition performed by the decoder saves a micro-op from the execution units. To maximize the number of ESP additions performed automatically by the decoder, choose instructions that implicitly use the ESP, such as PUSH, POP, CALL, and RET instructions whenever possible.
B0H	00H	SIMD_UOPS_EXEC	SIMD micro-ops executed (excluding stores)	This event counts all the SIMD micro-ops executed. It does not count MOVQ and MOVD stores from register to memory.
B1H	00H	SIMD_SAT_UOP_EXEC	SIMD saturated arithmetic micro-ops executed	This event counts the number of SIMD saturated arithmetic micro-ops executed.
B3H	01H	SIMD_UOP_TYPE_EXEC.MUL	SIMD packed multiply micro-ops executed	This event counts the number of SIMD packed multiply micro-ops executed.
B3H	02H	SIMD_UOP_TYPE_EXEC.SHIFT	SIMD packed shift micro-ops executed	This event counts the number of SIMD packed shift micro-ops executed.
B3H	04H	SIMD_UOP_TYPE_EXEC.PACK	SIMD pack micro-ops executed	This event counts the number of SIMD pack micro-ops executed.
B3H	08H	SIMD_UOP_TYPE_EXEC.UNPACK	SIMD unpack micro-ops executed	This event counts the number of SIMD unpack micro-ops executed.
B3H	10H	SIMD_UOP_TYPE_EXEC.LOGICAL	SIMD packed logical micro-ops executed	This event counts the number of SIMD packed logical micro-ops executed.
B3H	20H	SIMD_UOP_TYPE_EXEC.ARITHMETIC	SIMD packed arithmetic micro-ops executed	This event counts the number of SIMD packed arithmetic micro-ops executed.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
COH	00H	INST_RETIRED. ANY_P	Instructions retired	This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continue counting during hardware interrupts, traps, and inside interrupt handlers. INST_RETIRED.ANY_P is an architectural performance event.
COH	01H	INST_RETIRED. LOADS	Instructions retired, which contain a load	This event counts the number of instructions retired that contain a load operation.
COH	02H	INST_RETIRED. STORES	Instructions retired, which contain a store	This event counts the number of instructions retired that contain a store operation.
COH	04H	INST_RETIRED. OTHER	Instructions retired, with no load or store operation	This event counts the number of instructions retired that do not contain a load or a store operation.
C1H	01H	X87_OPS_ RETIRED.FXCH	FXCH instructions retired	This event counts the number of FXCH instructions retired. Modern compilers generate more efficient code and are less likely to use this instruction. If you obtain a high count for this event consider recompiling the code.
C1H	FEH	X87_OPS_ RETIRED.ANY	Retired floating-point computational operations (precise event)	This event counts the number of floating-point computational operations retired. It counts: <ul style="list-style-type: none"> ▪ floating point computational operations executed by the assist handler ▪ sub-operations of complex floating-point instructions like transcendental instructions

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
				<p>This event does not count:</p> <ul style="list-style-type: none"> ▪ floating-point computational operations that cause traps or assists. ▪ floating-point loads and stores. <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p>
C2H	01H	UOPS_RETIRED. LD_IND_BR	Fused load+op or load+indirect branch retired	<p>This event counts the number of retired micro-ops that fused a load with another operation. This includes:</p> <ul style="list-style-type: none"> ▪ Fusion of a load and an arithmetic operation, such as with the following instruction: <code>ADD EAX, [EBX]</code> where the content of the memory location specified by EBX register is loaded, added to EAX register, and the result is stored in EAX. ▪ Fusion of a load and a branch in an indirect branch operation, such as with the following instructions: <ul style="list-style-type: none"> ▪ <code>JMP [RDI+200]</code> ▪ <code>RET</code> ▪ Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code is using the processor resources effectively.
C2H	02H	UOPS_RETIRED. STD_STA	Fused store address + data retired	<p>This event counts the number of store address calculations that are fused with store data emission into one micro-op. Traditionally, each store operation required two micro-ops.</p> <p>This event counts fusion of retired micro-ops only. Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code is using the processor resources effectively.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
C2H	04H	UOPS_RETIREDD. MACRO_FUSION	Retired instruction pairs fused into one micro-op	This event counts the number of times CMP or TEST instructions were fused with a conditional branch instruction into one micro-op. It counts fusion by retired micro-ops only. Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code uses the processor resources more effectively.
C2H	07H	UOPS_RETIREDD. FUSED	Fused micro-ops retired	This event counts the total number of retired fused micro-ops. The counts include the following fusion types: <ul style="list-style-type: none"> ▪ Fusion of load operation with an arithmetic operation or with an indirect branch (counted by event UOPS_RETIREDD.LD_IND_BR) ▪ Fusion of store address and data (counted by event UOPS_RETIREDD.STD_STA) ▪ Fusion of CMP or TEST instruction with a conditional branch instruction (counted by event UOPS_RETIREDD.MACRO_FUSION) Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code is using the processor resources effectively.
C2H	08H	UOPS_RETIREDD. NON_FUSED	Non-fused micro-ops retired	This event counts the number of micro-ops retired that were not fused.
C2H	0FH	UOPS_RETIREDD. ANY	Micro-ops retired	This event counts the number of micro-ops retired. The processor decodes complex macro instructions into a sequence of simpler micro-ops. Most instructions are composed of one or two micro-ops.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
				Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists. In some cases micro-op sequences are fused or whole instructions are fused into one micro-op. See other UOPS_RETIRED events for differentiating retired fused and non-fused micro-ops.
C3H	01H	MACHINE_NUKES.SMC	Self-Modifying Code detected	This event counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel 64 and IA-32 processors.
C3H	04H	MACHINE_NUKES.MEM_ORDER	Execution pipeline restart due to memory ordering conflict or memory disambiguation misprediction	This event counts the number of times the pipeline is restarted due to either multi-threaded memory ordering conflicts or memory disambiguation misprediction. A multi-threaded memory ordering conflict occurs when a store, which is executed in another core, hits a load that is executed out of order in this core but not yet retired. As a result, the load needs to be restarted to satisfy the memory ordering model. See Chapter 8, "Multiple-Processor Management" in the <i>Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A</i> . To count memory disambiguation mispredictions, use the event MEMORY_DISAMBIGUATION.RESET.
C4H	00H	BR_INST_RETIRED.ANY	Retired branch instructions	This event counts the number of branch instructions retired. This is an architectural performance event.
C4H	01H	BR_INST_RETIRED.PRED_NOT_TAKEN	Retired branch instructions that were predicted not-taken	This event counts the number of branch instructions retired that were correctly predicted to be not-taken.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
C4H	02H	BR_INST_RETIRED. MISPRED_NOT_ TAKEN	Retired branch instructions that were mispredicted not-taken	This event counts the number of branch instructions retired that were mispredicted and not-taken.
C4H	04H	BR_INST_RETIRED. PRED_TAKEN	Retired branch instructions that were predicted taken	This event counts the number of branch instructions retired that were correctly predicted to be taken.
C4H	08H	BR_INST_RETIRED. MISPRED_TAKEN	Retired branch instructions that were mispredicted taken	This event counts the number of branch instructions retired that were mispredicted and taken.
C4H	0CH	BR_INST_RETIRED. TAKEN	Retired taken branch instructions	This event counts the number of branches retired that were taken.
C5H	00H	BR_INST_RETIRED. MISPRED	Retired mispredicted branch instructions. (precise event)	This event counts the number of retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor predicts that the branch would be taken, but it is not, or vice-versa. This is an architectural performance event.
C6H	01H	CYCLES_INT_ MASKED	Cycles during which interrupts are disabled	This event counts the number of cycles during which interrupts are disabled.
C6H	02H	CYCLES_INT_ PENDING_AND _MASKED	Cycles during which interrupts are pending and disabled	This event counts the number of cycles during which there are pending interrupts but interrupts are disabled.
C7H	01H	SIMD_INST_ RETIRED.PACKED_ SINGLE	Retired SSE packed-single instructions	This event counts the number of SSE packed-single instructions retired.
C7H	02H	SIMD_INST_ RETIRED.SCALAR_ SINGLE	Retired SSE scalar-single instructions	This event counts the number of SSE scalar-single instructions retired.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
C7H	04H	SIMD_INST_RETIRED.PACKED_DOUBLE	Retired SSE2 packed-double instructions	This event counts the number of SSE2 packed-double instructions retired.
C7H	08H	SIMD_INST_RETIRED.SCALAR_DOUBLE	Retired SSE2 scalar-double instructions	This event counts the number of SSE2 scalar-double instructions retired.
C7H	10H	SIMD_INST_RETIRED.VECTOR	Retired SSE2 vector integer instructions	This event counts the number of SSE2 vector integer instructions retired.
C7H	1FH	SIMD_INST_RETIRED.ANY	Retired Streaming SIMD instructions (precise event)	<p>This event counts the overall number of retired SIMD instructions that use XMM registers. To count each type of SIMD instruction separately, use the following events:</p> <ul style="list-style-type: none"> ▪ SIMD_INST_RETIRED.PACKED_SINGLE ▪ SIMD_INST_RETIRED.SCALAR_SINGLE ▪ SIMD_INST_RETIRED.PACKED_DOUBLE ▪ SIMD_INST_RETIRED.SCALAR_DOUBLE ▪ and SIMD_INST_RETIRED.VECTOR <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p>
C8H	00H	HW_INT_RCV	Hardware interrupts received	This event counts the number of hardware interrupts received by the processor.
C9H	00H	ITLB_MISS_RETIRED	Retired instructions that missed the ITLB	This event counts the number of retired instructions that missed the ITLB when they were fetched.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
CAH	01H	SIMD_COMP_INST_RETIREDPACKED_SINGLE	Retired computational SSE packed-single instructions	This event counts the number of computational SSE packed-single instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide). Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	02H	SIMD_COMP_INST_RETIREDSALAR_SINGLE	Retired computational SSE scalar-single instructions	This event counts the number of computational SSE scalar-single instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide). Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	04H	SIMD_COMP_INST_RETIREDPACKED_DOUBLE	Retired computational SSE2 packed-double instructions	This event counts the number of computational SSE2 packed-double instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide). Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	08H	SIMD_COMP_INST_RETIREDSALAR_DOUBLE	Retired computational SSE2 scalar-double instructions	This event counts the number of computational SSE2 scalar-double instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide). Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
CBH	01H	MEM_LOAD_RETIRED.L1D_MISS	Retired loads that miss the L1 data cache (precise event)	<p>This event counts the number of retired load operations that missed the L1 data cache. This includes loads from cache lines that are currently being fetched, due to a previous L1 data cache miss to the same cache line.</p> <p>This event counts loads from cacheable memory only. The event does not count loads by software prefetches.</p> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> <p>Use IA32_PMC0 only.</p>
CBH	02H	MEM_LOAD_RETIRED.L1D_LINE_MISS	L1 data cache line missed by retired loads (precise event)	<p>This event counts the number of load operations that miss the L1 data cache and send a request to the L2 cache to fetch the missing cache line. That is the missing cache line fetching has not yet started.</p> <p>The event count is equal to the number of cache lines fetched from the L2 cache by retired loads.</p> <p>This event counts loads from cacheable memory only. The event does not count loads by software prefetches.</p> <p>The event might not be counted if the load is blocked (see LOAD_BLOCK events).</p>
				<p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> <p>Use IA32_PMC0 only.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
CBH	04H	MEM_LOAD_RETIRED.L2_MISS	Retired loads that miss the L2 cache (precise event)	<p>This event counts the number of retired load operations that missed the L2 cache.</p> <p>This event counts loads from cacheable memory only. It does not count loads by software prefetches.</p> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> <p>Use IA32_PMC0 only.</p>
CBH	08H	MEM_LOAD_RETIRED.L2_LINE_MISS	L2 cache line missed by retired loads (precise event)	<p>This event counts the number of load operations that miss the L2 cache and result in a bus request to fetch the missing cache line. That is the missing cache line fetching has not yet started.</p> <p>This event count is equal to the number of cache lines fetched from memory by retired loads.</p> <p>This event counts loads from cacheable memory only. The event does not count loads by software prefetches.</p> <p>The event might not be counted if the load is blocked (see LOAD_BLOCK events).</p> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> <p>Use IA32_PMC0 only.</p>

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
CBH	10H	MEM_LOAD_RETIRED.DTLB_MISS	Retired loads that miss the DTLB (precise event)	<p>This event counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault.</p> <p>This event counts loads from cacheable memory only. The event does not count loads by software prefetches.</p> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> <p>Use IA32_PMC0 only.</p>
CCH	01H	FP_MMX_TRANS_TO_MMX	Transitions from Floating Point to MMX Instructions	This event counts the first MMX instructions following a floating-point instruction. Use this event to estimate the penalties for the transitions between floating-point and MMX states.
CCH	02H	FP_MMX_TRANS_TO_FP	Transitions from MMX Instructions to Floating Point Instructions	This event counts the first floating-point instructions following any MMX instruction. Use this event to estimate the penalties for the transitions between floating-point and MMX states.
CDH	00H	SIMD_ASSIST	SIMD assists invoked	This event counts the number of SIMD assists invoked. SIMD assists are invoked when an EMMS instruction is executed, changing the MMX state in the floating point stack.
CEH	00H	SIMD_INSTR_RETIRED	SIMD Instructions retired	This event counts the number of retired SIMD instructions that use MMX registers.
CFH	00H	SIMD_SAT_INSTR_RETIRED	Saturated arithmetic instructions retired	This event counts the number of saturated arithmetic SIMD instructions that retired.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
D2H	01H	RAT_STALLS. ROB_READ_PORT	ROB read port stalls cycles	This event counts the number of cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the out-of-order pipeline. Note that, at this stage in the pipeline, additional stalls may occur at the same cycle and prevent the stalled micro-ops from entering the pipe. In such a case, micro-ops retry entering the execution pipe in the next cycle and the ROB-read-port stall is counted again.
D2H	02H	RAT_STALLS. PARTIAL_CYCLES	Partial register stall cycles	This event counts the number of cycles instruction execution latency became longer than the defined latency because the instruction uses a register that was partially written by previous instructions.
D2H	04H	RAT_STALLS. FLAGS	Flag stall cycles	This event counts the number of cycles during which execution stalled due to several reasons, one of which is a partial flag register stall. A partial register stall may occur when two conditions are met: <ul style="list-style-type: none"> ▪ an instruction modifies some, but not all, of the flags in the flag register ▪ the next instruction, which depends on flags, depends on flags that were not modified by this instruction
D2H	08H	RAT_STALLS. FPSW	FPU status word stall	This event indicates that the FPU status word (FPSW) is written. To obtain the number of times the FPSW is written divide the event count by 2. The FPSW is written by instructions with long latency; a small count may indicate a high penalty.
D2H	0FH	RAT_STALLS. ANY	All RAT stall cycles	This event counts the number of stall cycles due to conditions described by: <ul style="list-style-type: none"> ▪ RAT_STALLS.ROB_READ_PORT ▪ RAT_STALLS.PARTIAL ▪ RAT_STALLS.FLAGS ▪ RAT_STALLS.FPSW.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
D4H	01H	SEG_RENAME_STALLS.ES	Segment rename stalls - ES	This event counts the number of stalls due to the lack of renaming resources for the ES segment register. If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front-end of the pipeline until the renamed segment retires.
D4H	02H	SEG_RENAME_STALLS.DS	Segment rename stalls - DS	This event counts the number of stalls due to the lack of renaming resources for the DS segment register. If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front-end of the pipeline until the renamed segment retires.
D4H	04H	SEG_RENAME_STALLS.FS	Segment rename stalls - FS	This event counts the number of stalls due to the lack of renaming resources for the FS segment register. If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front-end of the pipeline until the renamed segment retires.
D4H	08H	SEG_RENAME_STALLS.GS	Segment rename stalls - GS	This event counts the number of stalls due to the lack of renaming resources for the GS segment register. If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front-end of the pipeline until the renamed segment retires.
D4H	0FH	SEG_RENAME_STALLS.ANY	Any (ES/DS/FS/GS) segment rename stall	This event counts the number of stalls due to the lack of renaming resources for the ES, DS, FS, and GS segment registers. If a segment is renamed but not retired and a second update to the same segment occurs, a stall occurs in the front-end of the pipeline until the renamed segment retires.
D5H	01H	SEG_REG_RENAMES.ES	Segment renames - ES	This event counts the number of times the ES segment register is renamed.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
D5H	02H	SEG_REG_RENAMES.DS	Segment renames - DS	This event counts the number of times the DS segment register is renamed.
D5H	04H	SEG_REG_RENAMES.FS	Segment renames - FS	This event counts the number of times the FS segment register is renamed.
D5H	08H	SEG_REG_RENAMES.GS	Segment renames - GS	This event counts the number of times the GS segment register is renamed.
D5H	0FH	SEG_REG_RENAMES.ANY	Any (ES/DS/FS/GS) segment rename	This event counts the number of times any of the four segment registers (ES/DS/FS/GS) is renamed.
DCH	01H	RESOURCE_STALLS.ROB_FULL	Cycles during which the ROB full	This event counts the number of cycles when the number of instructions in the pipeline waiting for retirement reaches the limit the processor can handle. A high count for this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, and other instructions that depend on these cannot execute until the former instructions complete execution). In this situation new instructions can not enter the pipe and start execution.
DCH	02H	RESOURCE_STALLS.RS_FULL	Cycles during which the RS full	This event counts the number of cycles when the number of instructions in the pipeline waiting for execution reaches the limit the processor can handle. A high count of this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, and other instructions that depend on these cannot execute until the former instructions complete execution). In this situation new instructions can not enter the pipe and start execution.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
DCH	04	RESOURCE_STALLS.LD_ST	Cycles during which the pipeline has exceeded load or store limit or waiting to commit all stores	This event counts the number of cycles while resource-related stalls occur due to: <ul style="list-style-type: none"> ▪ The number of load instructions in the pipeline reached the limit the processor can handle. The stall ends when a loading instruction retires. ▪ The number of store instructions in the pipeline reached the limit the processor can handle. The stall ends when a storing instruction commits its data to the cache or memory. ▪ There is an instruction in the pipe that can be executed only when all previous stores complete and their data is committed in the caches or memory. For example, the SFENCE and MFENCE instructions require this behavior.
DCH	08H	RESOURCE_STALLS.FPCW	Cycles stalled due to FPU control word write	This event counts the number of cycles while execution was stalled due to writing the floating-point unit (FPU) control word.
DCH	10H	RESOURCE_STALLS.BR_MISS_CLEAR	Cycles stalled due to branch misprediction	This event counts the number of cycles after a branch misprediction is detected at execution until the branch and all older micro-ops retire. During this time new micro-ops cannot enter the out-of-order pipeline.
DCH	1FH	RESOURCE_STALLS.ANY	Resource related stalls	This event counts the number of cycles while resource-related stalls occurs for any conditions described by the following events: <ul style="list-style-type: none"> ▪ RESOURCE_STALLS.ROB_FULL ▪ RESOURCE_STALLS.RS_FULL ▪ RESOURCE_STALLS.LD_ST ▪ RESOURCE_STALLS.FPCW ▪ RESOURCE_STALLS.BR_MISS_CLEAR
EOH	00H	BR_INST_DECODED	Branch instructions decoded	This event counts the number of branch instructions decoded.

**Table A-10. Non-Architectural Performance Events
in Processors Based on Intel Core Microarchitecture (Contd.)**

Event Num	Umask Value	Event Name	Definition	Description and Comment
E4H	00H	BOGUS_BR	Bogus branches	This event counts the number of byte sequences that were mistakenly detected as taken branch instructions. This results in a BACLEAR event. This occurs mainly after task switches.
E6H	00H	BACLEARs	BACLEARs asserted	This event counts the number of times the front end is resteeded, mainly when the BPU cannot provide a correct prediction and this is corrected by other branch handling mechanisms at the front end. This can occur if the code has many branches such that they cannot be consumed by the BPU. Each BACLEAR asserted costs approximately 7 cycles of instruction fetch. The effect on total execution time depends on the surrounding code.
F0	00H	PREF_RQSTS_UP	Upward prefetches issued from DPL	This event counts the number of upward prefetches issued from the Data Prefetch Logic (DPL) to the L2 cache. A prefetch request issued to the L2 cache cannot be cancelled and the requested cache line is fetched to the L2 cache.
F8	00H	PREF_RQSTS_DN	Downward prefetches issued from DPL	This event counts the number of downward prefetches issued from the Data Prefetch Logic (DPL) to the L2 cache. A prefetch request issued to the L2 cache cannot be cancelled and the requested cache line is fetched to the L2 cache.

A.7 PERFORMANCE MONITORING EVENTS FOR INTEL® ATOM™ PROCESSORS

Processors based on the Intel Atom microarchitecture support the architectural and non-architectural performance-monitoring events listed in Table A-1 and Table A-10. In addition, they also support the following non-architectural performance-monitoring events listed in Table A-11.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
02H	81H	STORe_FORWA RDS.GOOD	Good store forwards	This event counts the number of times store data was forwarded directly to a load.
06H	00H	SEGMENT_REG_ LOADS.ANY	Number of segment register loads	This event counts the number of segment register load operations. Instructions that load new values into segment registers cause a penalty. This event indicates performance issues in 16-bit code. If this event occurs frequently, it may be useful to calculate the number of instructions retired per segment register load. If the resulting calculation is low (on average a small number of instructions are executed between segment register loads), then the code's segment register usage should be optimized. As a result of branch misprediction, this event is speculative and may include segment register loads that do not actually occur. However, most segment register loads are internally serialized and such speculative effects are minimized.
07H	01H	PREFETCH.PREF ETCHT0	Streaming SIMD Extensions (SSE) PrefetchT0 instructions executed.	This event counts the number of times the SSE instruction prefetchT0 is executed. This instruction prefetches the data to the L1 data cache and L2 cache.
07H	06H	PREFETCH.SW_ L2	Streaming SIMD Extensions (SSE) PrefetchT1 and PrefetchT2 instructions executed	This event counts the number of times the SSE instructions prefetchT1 and prefetchT2 are executed. These instructions prefetch the data to the L2 cache.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
07H	08H	PREFETCH.PREFETCHNTA	Streaming SIMD Extensions (SSE) Prefetch NTA instructions executed	This event counts the number of times the SSE instruction prefetchNTA is executed. This instruction prefetches the data to the L1 data cache.
08H	07H	DATA_TLB_MISSES.DTLB_MISS	Memory accesses that missed the DTLB	This event counts the number of Data Table Lookaside Buffer (DTLB) misses. The count includes misses detected as a result of speculative accesses. Typically a high count for this event indicates that the code accesses a large number of data pages.
08H	05H	DATA_TLB_MISSES.DTLB_MISS_LD	DTLB misses due to load operations	This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to load operations. This count includes misses detected as a result of speculative accesses.
08H	09H	DATA_TLB_MISSES.LO_DTLB_MISS_LD	LO_DTLB misses due to load operations	This event counts the number of LO_DTLB misses due to load operations. This count includes misses detected as a result of speculative accesses.
08H	06H	DATA_TLB_MISSES.DTLB_MISS_ST	DTLB misses due to store operations	This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to store operations. This count includes misses detected as a result of speculative accesses.
0CH	03H	PAGE_WALKS.WALKS	Number of page-walks executed	This event counts the number of page-walks executed due to either a DTLB or ITLB miss. The page walk duration, PAGE_WALKS.CYCLES, divided by number of page walks is the average duration of a page walk. This can hint to whether most of the page-walks are satisfied by the caches or cause an L2 cache miss. Edge trigger bit must be set.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
0CH	03H	PAGE_WALKS.CYCLES	Duration of page-walks in core cycles	This event counts the duration of page-walks in core cycles. The paging mode in use typically affects the duration of page walks. Page walk duration divided by number of page walks is the average duration of page-walks. This can hint at whether most of the page-walks are satisfied by the caches or cause an L2 cache miss. Edge trigger bit must be cleared.
10H	01H	X87_COMP_OPS_EXE.ANY.S	Floating point computational micro-ops executed	This event counts the number of x87 floating point computational micro-ops executed.
10H	81H	X87_COMP_OPS_EXE.ANY.AR	Floating point computational micro-ops retired	This event counts the number of x87 floating point computational micro-ops retired.
11H	01H	FP_ASSIST	Floating point assists	This event counts the number of floating point operations executed that required micro-code assist intervention. These assists are required in the following cases: X87 instructions: 1. NaN or denormal are loaded to a register or used as input from memory 2. Division by 0 3. Underflow output
11H	81H	FP_ASSIST.AR	Floating point assists	This event counts the number of floating point operations executed that required micro-code assist intervention. These assists are required in the following cases: X87 instructions: 1. NaN or denormal are loaded to a register or used as input from memory 2. Division by 0 3. Underflow output
12H	01H	MULS	Multiply operations executed	This event counts the number of multiply operations executed. This includes integer as well as floating point multiply operations.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
12H	81H	MUL.AR	Multiply operations retired	This event counts the number of multiply operations retired. This includes integer as well as floating point multiply operations.
13H	01H	DIV.S	Divide operations executed	This event counts the number of divide operations executed. This includes integer divides, floating point divides and square-root operations executed.
13H	81H	DIV.AR	Divide operations retired	This event counts the number of divide operations retired. This includes integer divides, floating point divides and square-root operations executed.
14H	01H	CYCLES_DIV_BUSY	Cycles the divider is busy	This event counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE.
21H	See Table 30-2	L2_ADS	Cycles L2 address bus is in use	This event counts the number of cycles the L2 address bus is being used for accesses to the L2 cache or bus queue. This event can count occurrences for this core or both cores.
22H	See Table 30-2	L2_DBUS_BUSY	Cycles the L2 cache data bus is busy	This event counts core cycles during which the L2 cache data bus is busy transferring data from the L2 cache to the core. It counts for all L1 cache misses (data and instruction) that hit the L2 cache. The count will increment by two for a full cache-line request.
24H	See Table 30-2 and Table 30-4	L2_LINES_IN	L2 cache misses	This event counts the number of cache lines allocated in the L2 cache. Cache lines are allocated in the L2 cache as a result of requests from the L1 data and instruction caches and the L2 hardware prefetchers to cache lines that are missing in the L2 cache. This event can count occurrences for this core or both cores. This event can also count demand requests and L2 hardware prefetch requests together or separately.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
25H	See Table 30-2	L2_M_LINES_IN	L2 cache line modifications	This event counts whenever a modified cache line is written back from the L1 data cache to the L2 cache. This event can count occurrences for this core or both cores.
26H	See Table 30-2 and Table 30-4	L2_LINES_OUT	L2 cache lines evicted	This event counts the number of L2 cache lines evicted. This event can count occurrences for this core or both cores. This event can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.
27H	See Table 30-2 and Table 30-4	L2_M_LINES_OUT	Modified lines evicted from the L2 cache	This event counts the number of L2 modified cache lines evicted. These lines are written back to memory unless they also exist in a shared-state in one of the L1 data caches. This event can count occurrences for this core or both cores. This event can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.
28H	See Table 30-2 and Table 30-5	L2_IFETCH	L2 cacheable instruction fetch requests	This event counts the number of instruction cache line requests from the ICache. It does not include fetch requests from uncacheable memory. It does not include ITLB miss accesses. This event can count occurrences for this core or both cores. This event can also count accesses to cache lines at different MESI states.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
29H	See Table 30-2, Table 30-4 and Table 30-5	L2_LD	L2 cache reads	<p>This event counts L2 cache read requests coming from the L1 data cache and L2 prefetchers.</p> <p>This event can count occurrences for this core or both cores. This event can count occurrences</p> <ul style="list-style-type: none"> - for this core or both cores. - due to demand requests and L2 hardware prefetch requests together or separately. - of accesses to cache lines at different MESI states.
2AH	See Table 30-2 and Table 30-5	L2_ST	L2 store requests	<p>This event counts all store operations that miss the L1 data cache and request the data from the L2 cache.</p> <p>This event can count occurrences for this core or both cores. This event can also count accesses to cache lines at different MESI states.</p>
2BH	See Table 30-2 and Table 30-5	L2_LOCK	L2 locked accesses	<p>This event counts all locked accesses to cache lines that miss the L1 data cache.</p> <p>This event can count occurrences for this core or both cores. This event can also count accesses to cache lines at different MESI states.</p>
2EH	See Table 30-2, Table 30-4 and Table 30-5	L2_RQSTS	L2 cache requests	<p>This event counts all completed L2 cache requests. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, instruction fetches, and all L2 hardware prefetch requests.</p> <p>This event can count occurrences</p> <ul style="list-style-type: none"> - for this core or both cores. - due to demand requests and L2 hardware prefetch requests together, or separately. - of accesses to cache lines at different MESI states.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
2EH	41H	L2_RQSTS.SELF.DEMAND.I_STAT E	L2 cache demand requests from this core that missed the L2	This event counts all completed L2 cache demand requests from this core that miss the L2 cache. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches. This is an architectural performance event.
2EH	4FH	L2_RQSTS.SELF.DEMAND.MESI	L2 cache demand requests from this core	This event counts all completed L2 cache demand requests from this core. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches. This is an architectural performance event.
30H	See Table 30-2, Table 30-4 and Table 30-5	L2_REJECT_BUS Q	Rejected L2 cache requests	This event indicates that a pending L2 cache request that requires a bus transaction is delayed from moving to the bus queue. Some of the reasons for this event are: <ul style="list-style-type: none"> - The bus queue is full. - The bus queue already holds an entry for a cache line in the same set. The number of events is greater or equal to the number of requests that were rejected. <ul style="list-style-type: none"> - for this core or both cores. - due to demand requests and L2 hardware prefetch requests together, or separately. - of accesses to cache lines at different MESI states.
32H	See Table 30-2	L2_NO_REQ	Cycles no L2 cache requests are pending	This event counts the number of cycles that no L2 cache requests are pending.
3AH	00H	EIST_TRANS	Number of Enhanced Intel SpeedStep(R) Technology (EIST) transitions	This event counts the number of Enhanced Intel SpeedStep(R) Technology (EIST) transitions that include a frequency change, either with or without VID change. This event is incremented only while the counting core is in CO state. Since the CxE states include an EIST transition, the event will be incremented accordingly.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
				EIST transitions are commonly initiated by OS, but can be initiated by HW internally. For example: CxE states are C-states (C1,C2,C3...) which not only place the CPU into a sleep state by turning off the clock and other components, but also lower the voltage (which reduces the leakage power consumption). The same is true for thermal throttling transition which uses EIST internally.
3BH	COH	THERMAL_TRIP	Number of thermal trips	This event counts the number of thermal trips. A thermal trip occurs whenever the processor temperature exceeds the thermal trip threshold temperature. Following a thermal trip, the processor automatically reduces frequency and voltage. The processor checks the temperature every millisecond, and returns to normal when the temperature falls below the thermal trip threshold temperature.
3CH	OOH	CPU_CLK_UNHALTED.CORE_P	Core cycles when core is not halted	<p>This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios.</p> <p>In mobile systems the core frequency may change from time to time. For this reason this event may have a changing ratio with regards to time. In systems with a constant core frequency, this event can give you a measurement of the elapsed time while the core was not in halt state by dividing the event count by the core frequency.</p> <ul style="list-style-type: none"> -This is an architectural performance event. - The event CPU_CLK_UNHALTED.CORE_P is counted by a programmable counter. - The event CPU_CLK_UNHALTED.CORE is counted by a designated fixed counter, leaving the two programmable counters available for other events.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
3CH	01H	CPU_CLK_UNHALTED.BUS	Bus cycles when core is not halted	<p>This event counts the number of bus cycles while the core is not in the halt state. This event can give you a measurement of the elapsed time while the core was not in the halt state, by dividing the event count by the bus frequency. The core enters the halt state when it is running the HLT instruction.</p> <p>The event also has a constant ratio with CPU_CLK_UNHALTED.REF event, which is the maximum bus to processor frequency ratio. Non-halted bus cycles are a component in many key event ratios.</p>
3CH	02H	CPU_CLK_UNHALTED.NO_OTHER	Bus cycles when core is active and the other is halted	<p>This event counts the number of bus cycles during which the core remains non-halted, and the other core on the processor is halted.</p> <p>This event can be used to determine the amount of parallelism exploited by an application or a system. Divide this event count by the bus frequency to determine the amount of time that only one core was in use.</p>
40H	21H	L1D_CACHE.LD	L1 Cacheable Data Reads	This event counts the number of data reads from cacheable memory.
40H	22H	L1D_CACHE.ST	L1 Cacheable Data Writes	This event counts the number of data writes to cacheable memory.
60H	See Table 30-2 and Table 30-3	BUS_REQUEST_OUTSTANDING	Outstanding cacheable data read bus requests duration	This event counts the number of pending full cache line read transactions on the bus occurring in each cycle. A read transaction is pending from the cycle it is sent on the bus until the full cache line is received by the processor. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
61H	See Table 30-3	BUS_BNR_DRV	Number of Bus Not Ready signals asserted	<p>This event counts the number of Bus Not Ready (BNR) signals that the processor asserts on the bus to suspend additional bus requests by other bus agents. A bus agent asserts the BNR signal when the number of data and snoop transactions is close to the maximum that the bus can handle.</p> <p>While this signal is asserted, new transactions cannot be submitted on the bus. As a result, transaction latency may have higher impact on program performance.</p> <p>NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.</p>
62H	See Table 30-3	BUS_DRDY_CLO CKS	Bus cycles when data is sent on the bus	<p>This event counts the number of bus cycles during which the DRDY (Data Ready) signal is asserted on the bus. The DRDY signal is asserted when data is sent on the bus.</p> <p>This event counts the number of bus cycles during which this agent (the processor) writes data on the bus back to memory or to other bus agents. This includes all explicit and implicit data writebacks, as well as partial writes.</p> <p>NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.</p>
63H	See Table 30-2 and Table 30-3	BUS_LOCK_CLO CKS	Bus cycles when a LOCK signal is asserted.	<p>This event counts the number of bus cycles, during which the LOCK signal is asserted on the bus. A LOCK signal is asserted when there is a locked memory access, due to:</p> <ul style="list-style-type: none"> - Uncacheable memory - Locked operation that spans two cache lines - Page-walk from an uncacheable page table. <p>Bus locks have a very high performance penalty and it is highly recommended to avoid such accesses. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.</p>

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
64H	See Table 30-2	BUS_DATA_RCV	Bus cycles while processor receives data	This event counts the number of cycles during which the processor is busy receiving data. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
65H	See Table 30-2 and Table 30-3	BUS_TRANS_BRD	Burst read bus transactions	This event counts the number of burst read transactions including: <ul style="list-style-type: none"> - L1 data cache read misses (and L1 data cache hardware prefetches) - L2 hardware prefetches by the DPL and L2 streamer - IFU read misses of cacheable lines. It does not include RFO transactions.
66H	See Table 30-2 and Table 30-3	BUS_TRANS_RFO	RFO bus transactions	This event counts the number of Read For Ownership (RFO) bus transactions, due to store operations that miss the L1 data cache and the L2 cache. This event also counts RFO bus transactions due to locked operations.
67H	See Table 30-2 and Table 30-3	BUS_TRANS_WB	Explicit writeback bus transactions	This event counts all explicit writeback bus transactions due to dirty line evictions. It does not count implicit writebacks due to invalidation by a snoop request.
68H	See Table 30-2 and Table 30-3	BUS_TRANS_IFETCH	Instruction-fetch bus transactions.	This event counts all instruction fetch full cache line bus transactions.
69H	See Table 30-2 and Table 30-3	BUS_TRANS_INVALID	Invalidate bus transactions	This event counts all invalidate transactions. Invalidate transactions are generated when: <ul style="list-style-type: none"> - A store operation hits a shared line in the L2 cache. - A full cache line write misses the L2 cache or hits a shared line in the L2 cache.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
6AH	See Table 30-2 and Table 30-3	BUS_TRANS_P WR	Partial write bus transaction.	This event counts partial write bus transactions.
6BH	See Table 30-2 and Table 30-3	BUS_TRANS_P	Partial bus transactions	This event counts all (read and write) partial bus transactions.
6CH	See Table 30-2 and Table 30-3	BUS_TRANS_IO	IO bus transactions	This event counts the number of completed I/O bus transactions as a result of IN and OUT instructions. The count does not include memory mapped IO.
6DH	See Table 30-2 and Table 30-3	BUS_TRANS_D EF	Deferred bus transactions	This event counts the number of deferred transactions.
6EH	See Table 30-2 and Table 30-3	BUS_TRANS_B URST	Burst (full cache-line) bus transactions.	This event counts burst (full cache line) transactions including: <ul style="list-style-type: none"> - Burst reads - RFOs - Explicit writebacks - Write combine lines
6FH	See Table 30-2 and Table 30-3	BUS_TRANS_M EM	Memory bus transactions	This event counts all memory bus transactions including: <ul style="list-style-type: none"> - burst transactions - partial reads and writes - invalidate transactions <p>The BUS_TRANS_MEM count is the sum of BUS_TRANS_BURST, BUS_TRANS_P and BUS_TRANS_INVALID.</p>

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
70H	See Table 30-2 and Table 30-3	BUS_TRANS_ANY	All bus transactions	This event counts all bus transactions. This includes: <ul style="list-style-type: none"> - Memory transactions - IO transactions (non memory-mapped) - Deferred transaction completion - Other less frequent transactions, such as interrupts
77H	See Table 30-2 and Table 30-5	EXT_SNOOP	External snoops	This event counts the snoop responses to bus transactions. Responses can be counted separately by type and by bus agent. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
7AH	See Table 30-3	BUS_HIT_DRV	HIT signal asserted	This event counts the number of bus cycles during which the processor drives the HIT# pin to signal HIT snoop response. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
7BH	See Table 30-3	BUS_HITM_DRV	HITM signal asserted	This event counts the number of bus cycles during which the processor drives the HITM# pin to signal HITM snoop response. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
7DH	See Table 30-2	BUSQ_EMPTY	Bus queue is empty	This event counts the number of cycles during which the core did not have any pending transactions in the bus queue. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.
7EH	See Table 30-2 and Table 30-3	SNOOP_STALL_DRV	Bus stalled for snoops	This event counts the number of times that the bus snoop stall signal is asserted. During the snoop stall cycles no new bus transactions requiring a snoop response can be initiated on the bus. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
7FH	See Table 30-2	BUS_IO_WAIT	IO requests waiting in the bus queue	This event counts the number of core cycles during which IO requests wait in the bus queue. This event counts IO requests from the core.
80H	03H	ICACHE.ACCESSES	Instruction fetches	This event counts all instruction fetches, including uncacheable fetches.
80H	02H	ICACHE.MISSES	Icache miss	This event counts all instruction fetches that miss the Instruction cache or produce memory requests. This includes uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.
82H	04H	ITLB.FLUSH	ITLB flushes	This event counts the number of ITLB flushes.
82H	02H	ITLB.MISSES	ITLB misses	This event counts the number of instruction fetches that miss the ITLB.
AAH	02H	MACRO_INSTS.CISC_DECODED	CISC macro instructions decoded	This event counts the number of complex instructions decoded, but not necessarily executed or retired. Only one complex instruction can be decoded at a time.
AAH	03H	MACRO_INSTS.ALL_DECODED	All Instructions decoded	This event counts the number of instructions decoded.
B0H	00H	SIMD_UOPS_EXEC.S	SIMD micro-ops executed (excluding stores)	This event counts all the SIMD micro-ops executed. This event does not count MOVQ and MOVD stores from register to memory.
B0H	80H	SIMD_UOPS_EXEC.AR	SIMD micro-ops retired (excluding stores)	This event counts the number of SIMD saturated arithmetic micro-ops executed.
B1H	00H	SIMD_SAT_UOP_EXEC.S	SIMD saturated arithmetic micro-ops executed	This event counts the number of SIMD saturated arithmetic micro-ops executed.
B1H	80H	SIMD_SAT_UOP_EXEC.AR	SIMD saturated arithmetic micro-ops retired	This event counts the number of SIMD saturated arithmetic micro-ops retired.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
B3H	01H	SIMD_UOP_TYP E_EXEC.MUL.S	SIMD packed multiply micro-ops executed	This event counts the number of SIMD packed multiply micro-ops executed.
B3H	81H	SIMD_UOP_TYP E_EXEC.MUL.AR	SIMD packed multiply micro-ops retired	This event counts the number of SIMD packed multiply micro-ops retired.
B3H	02H	SIMD_UOP_TYP E_EXEC.SHIFT.S	SIMD packed shift micro-ops executed	This event counts the number of SIMD packed shift micro-ops executed.
B3H	82H	SIMD_UOP_TYP E_EXEC.SHIFT.A R	SIMD packed shift micro-ops retired	This event counts the number of SIMD packed shift micro-ops retired.
B3H	04H	SIMD_UOP_TYP E_EXEC.PACK.S	SIMD pack micro-ops executed	This event counts the number of SIMD pack micro-ops executed.
B3H	84H	SIMD_UOP_TYP E_EXEC.PACK.A R	SIMD pack micro-ops retired	This event counts the number of SIMD pack micro-ops retired.
B3H	08H	SIMD_UOP_TYP E_EXEC.UNPAC K.S	SIMD unpack micro-ops executed	This event counts the number of SIMD unpack micro-ops executed.
B3H	88H	SIMD_UOP_TYP E_EXEC.UNPAC K.AR	SIMD unpack micro-ops retired	This event counts the number of SIMD unpack micro-ops retired.
B3H	10H	SIMD_UOP_TYP E_EXEC.LOGICA L.S	SIMD packed logical micro-ops executed	This event counts the number of SIMD packed logical micro-ops executed.
B3H	90H	SIMD_UOP_TYP E_EXEC.LOGICA L.AR	SIMD packed logical micro-ops retired	This event counts the number of SIMD packed logical micro-ops retired.
B3H	20H	SIMD_UOP_TYP E_EXEC.ARITHM ETIC.S	SIMD packed arithmetic micro-ops executed	This event counts the number of SIMD packed arithmetic micro-ops executed.
B3H	A0H	SIMD_UOP_TYP E_EXEC.ARITHM ETIC.AR	SIMD packed arithmetic micro-ops retired	This event counts the number of SIMD packed arithmetic micro-ops retired.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
C0H	00H	INST_RETIRED.ANY_P	Instructions retired (precise event).	This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers.
N/A	00H	INST_RETIRED.ANY	Instructions retired	This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers.
C2H	10H	UOPS_RETIRED.ANY	Micro-ops retired	This event counts the number of micro-ops retired. The processor decodes complex macro instructions into a sequence of simpler micro-ops. Most instructions are composed of one or two micro-ops. Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists. In some cases micro-op sequences are fused or whole instructions are fused into one micro-op. See other UOPS_RETIRED events for differentiating retired fused and non-fused micro-ops.
C3H	01H	MACHINE_CLEARS.SMC	Self-Modifying Code detected	This event counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel® architecture processors.
C4H	00H	BR_INST_RETIRED.ANY	Retired branch instructions	This event counts the number of branch instructions retired. This is an architectural performance event.
C4H	01H	BR_INST_RETIRED.PRED_NOT_TAKEN	Retired branch instructions that were predicted not-taken	This event counts the number of branch instructions retired that were correctly predicted to be not-taken.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
C4H	02H	BR_INST_RETIREDMISPRED_NOT_TAKEN	Retired branch instructions that were mispredicted not-taken	This event counts the number of branch instructions retired that were mispredicted and not-taken.
C4H	04H	BR_INST_RETIREDPRED_TAKEN	Retired branch instructions that were predicted taken	This event counts the number of branch instructions retired that were correctly predicted to be taken.
C4H	08H	BR_INST_RETIREDMISPRED_TAKEN	Retired branch instructions that were mispredicted taken	This event counts the number of branch instructions retired that were mispredicted and taken.
C4H	0AH	BR_INST_RETIREDMISPRED	Retired mispredicted branch instructions (precise event)	<p>This event counts the number of retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor predicts that the branch would be taken, but it is not, or vice-versa. Mispredicted branches degrade the performance because the processor starts executing instructions along a wrong path it predicts. When the misprediction is discovered, all the instructions executed in the wrong path must be discarded, and the processor must start again on the correct path.</p> <p>Using the Profile-Guided Optimization (PGO) features of the Intel® C++ compiler may help reduce branch mispredictions. See the compiler documentation for more information on this feature.</p>

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
				<p>To determine the branch misprediction ratio, divide the BR_INST_RETIREDMISPRED event count by the number of BR_INST_RETIRED.ANY event count. To determine the number of mispredicted branches per instruction, divide the number of mispredicted branches by the INST_RETIRED.ANY event count. To measure the impact of the branch mispredictions use the event RESOURCE_STALLS.BR_MISS_CLEAR.</p> <p>Tips</p> <ul style="list-style-type: none"> - See the optimization guide for tips on reducing branch mispredictions. - PGO's purpose is to have straight line code for the most frequent execution paths, reducing branches taken and increasing the "basic block" size, possibly also reducing the code footprint or working-set.
C4H	OCH	BR_INST_RETIRED.TAKEN	Retired taken branch instructions	This event counts the number of branches retired that were taken.
C4H	OFH	BR_INST_RETIRED.ANY1	Retired branch instructions	This event counts the number of branch instructions retired that were mispredicted. This event is a duplicate of BR_INST_RETIRED.MISPRED.
C5H	OOH	BR_INST_RETIRED.MISPRED	Retired mispredicted branch instructions (precise event).	This event counts the number of retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor predicts that the branch would be taken, but it is not, or vice-versa. Mispredicted branches degrade the performance because the processor starts executing instructions along a wrong path it predicts. When the misprediction is discovered, all the instructions executed in the wrong path must be discarded, and the processor must start again on the correct path.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
				<p>Using the Profile-Guided Optimization (PGO) features of the Intel® C++ compiler may help reduce branch mispredictions. See the compiler documentation for more information on this feature.</p> <p>To determine the branch misprediction ratio, divide the BR_INST_RETIRED.MISPRED event count by the number of BR_INST_RETIRED.ANY event count. C6H	01H	CYCLES_INT_MASKED.CYCLES_INT_MASKED	Cycles during which interrupts are disabled	This event counts the number of cycles during which interrupts are disabled.
C6H	02H	CYCLES_INT_MASKED.CYCLES_INT_PENDING_ASKED.CYCLES_INT_PENDING_ASKED	Cycles during which interrupts are pending and disabled	This event counts the number of cycles during which there are pending interrupts but interrupts are disabled.
C7H	01H	SIMD_INST_RETIRED.PACKED_SINGLE	Retired Streaming SIMD Extensions (SSE) packed-single instructions	This event counts the number of SSE packed-single instructions retired.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
C7H	02H	SIMD_INST_RETIRED.SCALAR_SINGLE	Retired Streaming SIMD Extensions (SSE) scalar-single instructions	This event counts the number of SSE scalar-single instructions retired.
C7H	04H	SIMD_INST_RETIRED.PACKED_DOUBLE	Retired Streaming SIMD Extensions 2 (SSE2) packed-double instructions	This event counts the number of SSE2 packed-double instructions retired.
C7H	08H	SIMD_INST_RETIRED.SCALAR_DOUBLE	Retired Streaming SIMD Extensions 2 (SSE2) scalar-double instructions.	This event counts the number of SSE2 scalar-double instructions retired.
C7H	10H	SIMD_INST_RETIRED.VECTOR	Retired Streaming SIMD Extensions 2 (SSE2) vector instructions.	This event counts the number of SSE2 vector instructions retired.
C7H	1FH	SIMD_INST_RETIRED.ANY	Retired Streaming SIMD instructions	This event counts the overall number of SIMD instructions retired. To count each type of SIMD instruction separately, use the following events: SIMD_INST_RETIRED.PACKED_SINGLE, SIMD_INST_RETIRED.SCALAR_SINGLE, SIMD_INST_RETIRED.PACKED_DOUBLE, SIMD_INST_RETIRED.SCALAR_DOUBLE, and SIMD_INST_RETIRED.VECTOR.
C8H	00H	HW_INT_RCV	Hardware interrupts received	This event counts the number of hardware interrupts received by the processor. This event will count twice for dual-pipe micro-ops.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
CAH	01H	SIMD_COMP_INST_RETIREDPACKED_SINGLE	Retired computational Streaming SIMD Extensions (SSE) packed-single instructions.	This event counts the number of computational SSE packed-single instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	02H	SIMD_COMP_INST_RETIREDSALAR_SINGLE	Retired computational Streaming SIMD Extensions (SSE) scalar-single instructions.	This event counts the number of computational SSE scalar-single instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	04H	SIMD_COMP_INST_RETIREDPACKED_DOUBLE	Retired computational Streaming SIMD Extensions 2 (SSE2) packed-double instructions.	This event counts the number of computational SSE2 packed-double instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CAH	08H	SIMD_COMP_INST_RETIREDSALAR_DOUBLE	Retired computational Streaming SIMD Extensions 2 (SSE2) scalar-double instructions	This event counts the number of computational SSE2 scalar-double instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.
CBH	01H	MEM_LOAD_RETIRED.L2_HIT	Retired loads that hit the L2 cache (precise event)	This event counts the number of retired load operations that missed the L1 data cache and hit the L2 cache.
CBH	02H	MEM_LOAD_RETIRED.L2_MISS	Retired loads that miss the L2 cache (precise event)	This event counts the number of retired load operations that missed the L2 cache.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
CBH	04H	MEM_LOAD_RETIRED.DTLB_MISSES	Retired loads that miss the DTLB (precise event)	This event counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault.
CDH	00H	SIMD_ASSIST	SIMD assists invoked	This event counts the number of SIMD assists invoked. SIMD assists are invoked when an EMMS instruction is executed after MMX™ technology code has changed the MMX state in the floating point stack. For example, these assists are required in the following cases: Streaming SIMD Extensions (SSE) instructions: 1. Denormal input when the DAZ (Denormals Are Zeros) flag is off 2. Underflow result when the FTZ (Flush To Zero) flag is off
CEH	00H	SIMD_INSTR_RETIRED	SIMD Instructions retired	This event counts the number of SIMD instructions that retired.
CFH	00H	SIMD_SAT_INSTR_RETIRED	Saturated arithmetic instructions retired	This event counts the number of saturated arithmetic SIMD instructions that retired.
EOH	01H	BR_INST_DECODED	Branch instructions decoded	This event counts the number of branch instructions decoded.

Table A-11. Non-Architectural Performance Events for Intel Atom Processors

Event Num.	Umask Value	Event Name	Definition	Description and Comment
E4H	01H	BOGUS_BR	Bogus branches	This event counts the number of byte sequences that were mistakenly detected as taken branch instructions. This results in a BACLEAR event and the BTB is flushed. This occurs mainly after task switches.
E6H	01H	BACLEAR.S.ANY	BACLEAR.S asserted	This event counts the number of times the front end is redirected for a branch prediction, mainly when an early branch prediction is corrected by other branch handling mechanisms in the front-end. This can occur if the code has many branches such that they cannot be consumed by the branch predictor. Each Baclear asserted costs approximately 7 cycles. The effect on total execution time depends on the surrounding code.

A.8 PERFORMANCE MONITORING EVENTS FOR INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Table A-12 lists non-architectural performance events for Intel Core Duo processors. If a non-architectural event requires qualification in core specificity, it is indicated in the comment column. Table A-12 also applies to Intel Core Solo processors; bits in the unit mask corresponding to core-specificity are reserved and should be 00B.

Table A-12. Non-Architectural Performance Events in Intel Core Solo and Intel Core Duo Processors

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
03H	LD_Blocks	00H	Load operations delayed due to store buffer blocks. The preceding store may be blocked due to unknown address, unknown data, or conflict due to partial overlap between the load and store.	
04H	SD_Drains	00H	Cycles while draining store buffers.	
05H	Misalign_Mem_Ref	00H	Misaligned data memory references (MOB splits of loads and stores).	
06H	Seg_Reg_Loads	00H	Segment register loads.	
07H	SSE_PrefNta_Ret	00H	SSE software prefetch instruction PREFETCHNTA retired.	
07H	SSE_PrefT1_Ret	01H	SSE software prefetch instruction PREFETCHT1 retired.	
07H	SSE_PrefT2_Ret	02H	SSE software prefetch instruction PREFETCHT2 retired.	
07H	SSE_NTStores_Ret	03H	SSE streaming store instruction retired.	
10H	FP_Comps_Op_Exe	00H	FP computational Instruction executed. FADD, FSUB, FCOM, FMULs, MUL, IMUL, FDIVs, DIV, IDIV, FPREMs, FSQRT are included; but exclude FADD or FMUL used in the middle of a transcendental instruction.	
11H	FP_Assist	00H	FP exceptions experienced microcode assists.	IA32_PMC1 only.

**Table A-12. Non-Architectural Performance Events
in Intel Core Solo and Intel Core Duo Processors (Contd.)**

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
12H	Mul	00H	Multiply operations (a speculative count, including FP and integer multiplies).	IA32_PMC1 only.
13H	Div	00H	Divide operations (a speculative count, including FP and integer divisions).	IA32_PMC1 only.
14H	Cycles_Div_Busy	00H	Cycles the divider is busy.	IA32_PMC0 only.
21H	L2_ADS	00H	L2 Address strobes.	Requires core-specificity
22H	Dbus_Busy	00H	Core cycle during which data bus was busy (increments by 4).	Requires core-specificity
23H	Dbus_Busy_Rd	00H	Cycles data bus is busy transferring data to a core (increments by 4).	Requires core-specificity
24H	L2_Lines_In	00H	L2 cache lines allocated.	Requires core-specificity and HW prefetch qualification
25H	L2_M_Lines_In	00H	L2 Modified-state cache lines allocated.	Requires core-specificity
26H	L2_Lines_Out	00H	L2 cache lines evicted.	Requires core-specificity and HW prefetch qualification
27H	L2_M_Lines_Out	00H	L2 Modified-state cache lines evicted.	Requires core-specificity and HW prefetch qualification
28H	L2_IFetch	Requires MESI qualification	L2 instruction fetches from instruction fetch unit (includes speculative fetches).	Requires core-specificity
29H	L2_LD	Requires MESI qualification	L2 cache reads.	Requires core-specificity
2AH	L2_ST	Requires MESI qualification	L2 cache writes (includes speculation).	Requires core-specificity

**Table A-12. Non-Architectural Performance Events
in Intel Core Solo and Intel Core Duo Processors (Contd.)**

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
2EH	L2_Rqsts	Requires MESI qualification	L2 cache reference requests.	Requires core-specificity, HW prefetch qualification
30H	L2_Reject_Cycles	Requires MESI qualification	Cycles L2 is busy and rejecting new requests.	
32H	L2_No_Request_Cycles	Requires MESI qualification	Cycles there is no request to access L2.	
3AH	EST_Trans_All	00H	Any Intel Enhanced SpeedStep(R) Technology transitions.	
3AH	EST_Trans_All	10H	Intel Enhanced SpeedStep Technology frequency transitions.	
3BH	Thermal_Trip	COH	Duration in a thermal trip based on the current core clock.	Use edge trigger to count occurrence
3CH	NonHlt_Ref_Cycles	01H	Non-halted bus cycles.	
3CH	Serial_Execution_Cycles	02H	Non-halted bus cycles of this core executing code while the other core is halted.	
40H	DCache_Cache_LD	Requires MESI qualification	L1 cacheable data read operations.	
41H	DCache_Cache_ST	Requires MESI qualification	L1 cacheable data write operations.	
42H	DCache_Cache_Lock	Requires MESI qualification	L1 cacheable lock read operations to invalid state.	
43H	Data_Mem_Ref	01H	L1 data read and writes of cacheable and non-cacheable types.	
44H	Data_Mem_Cache_Ref	02H	L1 data cacheable read and write operations.	
45H	DCache_Repl	0FH	L1 data cache line replacements.	
46H	DCache_M_Repl	00H	L1 data M-state cache line allocated.	

**Table A-12. Non-Architectural Performance Events
in Intel Core Solo and Intel Core Duo Processors (Contd.)**

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
47H	DCache_M_Evict	00H	L1 data M-state cache line evicted.	
48H	DCache_Pend_Miss	00H	Weighted cycles of L1 miss outstanding.	Use Cmask =1 to count duration.
49H	Dtlb_Miss	00H	Data references that missed TLB.	
4BH	SSE_PrefNta_Miss	00H	PREFETCHNTA missed all caches.	
4BH	SSE_PrefT1_Miss	01H	PREFETCHT1 missed all caches.	
4BH	SSE_PrefT2_Miss	02H	PREFETCHT2 missed all caches.	
4BH	SSE_NTStores_Miss	03H	SSE streaming store instruction missed all caches.	
4FH	L1_Pref_Req	00H	L1 prefetch requests due to DCU cache misses.	May overcount if request re-submitted
60H	Bus_Req_Outstanding	00; Requires core-specificity, and agent specificity	Weighted cycles of cacheable bus data read requests. This event counts full-line read request from DCU or HW prefetcher, but not RFO, write, instruction fetches, or others.	Use Cmask =1 to count duration. Use Umask bit 12 to include HWP or exclude HWP separately.
61H	Bus_BNR_Clocks	00H	External bus cycles while BNR asserted.	
62H	Bus_DRDY_Clocks	00H	External bus cycles while DRDY asserted.	Requires agent specificity
63H	Bus_Locks_Clocks	00H	External bus cycles while bus lock signal asserted.	Requires core specificity
64H	Bus_Data_Rcv	40H	Number of data chunks received by this processor.	
65H	Bus_Trans_Brd	See comment.	Burst read bus transactions (data or code).	Requires core specificity

**Table A-12. Non-Architectural Performance Events
in Intel Core Solo and Intel Core Duo Processors (Contd.)**

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
66H	Bus_Trans_RFO	See comment.	Completed read for ownership (RFO) transactions.	Requires agent specificity
68H	Bus_Trans_Ifetch	See comment.	Completed instruction fetch transactions.	Requires core specificity
69H	Bus_Trans_Inval	See comment.	Completed invalidate transactions.	Each transaction counts its address strobe Retried transaction may be counted more than once
6AH	Bus_Trans_Pwr	See comment.	Completed partial write transactions.	
6BH	Bus_Trans_P	See comment.	Completed partial transactions (include partial read + partial write + line write).	
6CH	Bus_Trans_IO	See comment.	Completed I/O transactions (read and write).	
6DH	Bus_Trans_Def	20H	Completed defer transactions.	Requires core specificity Retried transaction may be counted more than once
67H	Bus_Trans_WB	COH	Completed writeback transactions from DCU (does not include L2 writebacks).	Requires agent specificity Each
6EH	Bus_Trans_Burst	COH	Completed burst transactions (full line transactions include reads, write, RFO, and writebacks).	transaction counts its address strobe
6FH	Bus_Trans_Mem	COH	Completed memory transactions. This includes Bus_Trans_Burst + Bus_Trans_P+Bus_Trans_Inval.	Retried transaction may be counted more than once
70H	Bus_Trans_Any	COH	Any completed bus transactions.	
77H	Bus_Snoops	00H	Counts any snoop on the bus.	Requires MESI qualification Requires agent specificity
78H	DCU_Snoop_To_Share	01H	DCU snoops to share-state L1 cache line due to L1 misses.	Requires core specificity
7DH	Bus_Not_In_Use	00H	Number of cycles there is no transaction from the core.	Requires core specificity

**Table A-12. Non-Architectural Performance Events
in Intel Core Solo and Intel Core Duo Processors (Contd.)**

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
7EH	Bus_Snoop_Stall	00H	Number of bus cycles while bus snoop is stalled.	
80H	ICache_Reads	00H	Number of instruction fetches from ICache, streaming buffers (both cacheable and uncacheable fetches).	
81H	ICache_Misses	00H	Number of instruction fetch misses from ICache, streaming buffers.	
85H	ITLB_Misses	00H	Number of iTLB misses.	
86H	IFU_Mem_Stall	00H	Cycles IFU is stalled while waiting for data from memory.	
87H	ILD_Stall	00H	Number of instruction length decoder stalls (Counts number of LCP stalls).	
88H	Br_Inst_Exec	00H	Branch instruction executed (includes speculation).	
89H	Br_Misssp_Exec	00H	Branch instructions executed and mispredicted at execution (includes branches that do not have prediction or mispredicted).	
8AH	Br_BAC_Misssp_Exec	00H	Branch instructions executed that were mispredicted at front end.	
8BH	Br_Cnd_Exec	00H	Conditional branch instructions executed.	
8CH	Br_Cnd_Misssp_Exec	00H	Conditional branch instructions executed that were mispredicted.	
8DH	Br_Ind_Exec	00H	Indirect branch instructions executed.	
8EH	Br_Ind_Misssp_Exec	00H	Indirect branch instructions executed that were mispredicted.	
8FH	Br_Ret_Exec	00H	Return branch instructions executed.	
90H	Br_Ret_Misssp_Exec	00H	Return branch instructions executed that were mispredicted.	
91H	Br_Ret_BAC_Misssp_Exec	00H	Return branch instructions executed that were mispredicted at the front end.	

**Table A-12. Non-Architectural Performance Events
in Intel Core Solo and Intel Core Duo Processors (Contd.)**

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
92H	Br_Call_Exec	00H	Return call instructions executed.	
93H	Br_Call_Missp_Exec	00H	Return call instructions executed that were mispredicted.	
94H	Br_Ind_Call_Exec	00H	Indirect call branch instructions executed.	
A2H	Resource_Stall	00H	Cycles while there is a resource related stall (renaming, buffer entries) as seen by allocator.	
B0H	MMX_Instr_Exec	00H	Number of MMX instructions executed (does not include MOVQ and MOVD stores).	
B1H	SIMD_Int_Sat_Exec	00H	Number of SIMD Integer saturating instructions executed.	
B3H	SIMD_Int_Pmul_Exec	01H	Number of SIMD Integer packed multiply instructions executed.	
B3H	SIMD_Int_Psft_Exec	02H	Number of SIMD Integer packed shift instructions executed.	
B3H	SIMD_Int_Pck_Exec	04H	Number of SIMD Integer pack operations instruction executed.	
B3H	SIMD_Int_Upck_Exec	08H	Number of SIMD Integer unpack instructions executed.	
B3H	SIMD_Int_Plog_Exec	10H	Number of SIMD Integer packed logical instructions executed.	
B3H	SIMD_Int_Pari_Exec	20H	Number of SIMD Integer packed arithmetic instructions executed.	
C0H	Instr_Ret	00H	Number of instruction retired (Macro fused instruction count as 2).	
C1H	FP_Comp_Instr_Ret	00H	Number of FP compute instructions retired (X87 instruction or instruction that contain X87 operations).	Use IA32_PMC0 only.
C2H	Uops_Ret	00H	Number of micro-ops retired (include fused uops).	
C3H	SMC_Detected	00H	Number of times self-modifying code condition detected.	

**Table A-12. Non-Architectural Performance Events
in Intel Core Solo and Intel Core Duo Processors (Contd.)**

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
C4H	Br_Instr_Ret	00H	Number of branch instructions retired.	
C5H	Br_MisPred_Ret	00H	Number of mispredicted branch instructions retired.	
C6H	Cycles_Int_Masked	00H	Cycles while interrupt is disabled.	
C7H	Cycles_Int_Pedning_Masked	00H	Cycles while interrupt is disabled and interrupts are pending.	
C8H	HW_Int_Rx	00H	Number of hardware interrupts received.	
C9H	Br_Taken_Ret	00H	Number of taken branch instruction retired.	
CAH	Br_MisPred_Taken_Ret	00H	Number of taken and mispredicted branch instructions retired.	
CCH	MMX_FP_Trans	00H	Number of transitions from MMX to X87.	
CCH	FP_MMX_Trans	01H	Number of transitions from X87 to MMX.	
CDH	MMX_Assist	00H	Number of EMMS executed.	
CEH	MMX_Instr_Ret	00H	Number of MMX instruction retired.	
DOH	Instr_Decoded	00H	Number of instruction decoded.	
D7H	ESP_Uops	00H	Number of ESP folding instruction decoded.	
D8H	SIMD_FP_SP_Ret	00H	Number of SSE/SSE2 single precision instructions retired (packed and scalar).	
D8H	SIMD_FP_SP_S_Ret	01H	Number of SSE/SSE2 scalar single precision instructions retired.	
D8H	SIMD_FP_DP_P_Ret	02H	Number of SSE/SSE2 packed double precision instructions retired.	
D8H	SIMD_FP_DP_S_Ret	03H	Number of SSE/SSE2 scalar double precision instructions retired.	
D8H	SIMD_Int_128_Ret	04H	Number of SSE2 128 bit integer instructions retired.	

**Table A-12. Non-Architectural Performance Events
in Intel Core Solo and Intel Core Duo Processors (Contd.)**

Event Num.	Event Mask Mnemonic	Umask Value	Description	Comment
D9H	SIMD_FP_SP_P_Comp_Ret	00H	Number of SSE/SSE2 packed single precision compute instructions retired (does not include AND, OR, XOR).	
D9H	SIMD_FP_SP_S_Comp_Ret	01H	Number of SSE/SSE2 scalar single precision compute instructions retired (does not include AND, OR, XOR).	
D9H	SIMD_FP_DP_P_Comp_Ret	02H	Number of SSE/SSE2 packed double precision compute instructions retired (does not include AND, OR, XOR).	
D9H	SIMD_FP_DP_S_Comp_Ret	03H	Number of SSE/SSE2 scalar double precision compute instructions retired (does not include AND, OR, XOR).	
DAH	Fused_Uops_Ret	00H	All fused uops retired.	
DAH	Fused_Ld_Uops_Ret	01H	Fused load uops retired.	
DAH	Fused_St_Uops_Ret	02H	Fused store uops retired.	
DBH	Unfusion	00H	Number of unfusion events in the ROB (due to exception).	
E0H	Br_Instr_Decoded	00H	Branch instructions decoded.	
E2H	BTB_Misses	00H	Number of branches the BTB did not produce a prediction.	
E4H	Br_Bogus	00H	Number of bogus branches.	
E6H	BAClears	00H	Number of BAClears asserted.	
F0H	Pref_Rqsts_Up	00H	Number of hardware prefetch requests issued in forward streams.	
F8H	Pref_Rqsts_Dn	00H	Number of hardware prefetch requests issued in backward streams.	

A.9 PENTIUM 4 AND INTEL XEON PROCESSOR PERFORMANCE-MONITORING EVENTS

Tables A-13, A-14 and list performance-monitoring events that can be counted or sampled on processors based on Intel NetBurst® microarchitecture. Table A-13 lists the non-retirement events, and Table A-14 lists the at-retirement events. Tables A-16, A-17, and A-18 describes three sets of parameters that are available for three of the at-retirement counting events defined in Table A-14. Table A-19 shows which of the non-retirement and at retirement events are logical processor specific (TS) (see Section 30.10.4, "Performance Monitoring Events") and which are non-logical processor specific (TI).

Some of the Pentium 4 and Intel Xeon processor performance-monitoring events may be available only to specific models. The performance-monitoring events listed in Tables A-13 and A-14 apply to processors with CPUID signature that matches family encoding 15, model encoding 0, 1, 2 3, 4, or 6. Table applies to processors with a CPUID signature that matches family encoding 15, model encoding 3, 4 or 6.

The functionality of performance-monitoring events in Pentium 4 and Intel Xeon processors is also available when IA-32e mode is enabled.

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting

Event Name	Event Parameters	Parameter Value	Description
TC_deliver_mode			This event counts the duration (in clock cycles) of the operating modes of the trace cache and decode engine in the processor package. The mode is specified by one or more of the event mask bits.
	ESCR restrictions	MSR_TC_ESCR0 MSR_TC_ESCR1	
	Counter numbers per ESCR	ESCR0: 4, 5 ESCR1: 6, 7	
	ESCR Event Select	01H	ESCR[31:25]

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	ESCR Event Mask	Bit 0: DD 1: DB 2: DI 3: BD 4: BB 5: BI 6: ID 7: IB	ESCR[24:9] Both logical processors are in deliver mode. Logical processor 0 is in deliver mode and logical processor 1 is in build mode. Logical processor 0 is in deliver mode and logical processor 1 is either halted, under a machine clear condition or transitioning to a long microcode flow. Logical processor 0 is in build mode and logical processor 1 is in deliver mode. Both logical processors are in build mode. Logical processor 0 is in build mode and logical processor 1 is either halted, under a machine clear condition or transitioning to a long microcode flow. Logical processor 0 is either halted, under a machine clear condition or transitioning to a long microcode flow. Logical processor 1 is in deliver mode. Logical processor 0 is either halted, under a machine clear condition or transitioning to a long microcode flow. Logical processor 1 is in build mode.
	CCCR Select	01H	CCCR[15:13]

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	Event Specific Notes		If only one logical processor is available from a physical processor package, the event mask should be interpreted as logical processor 1 is halted. Event mask bit 2 was previously known as "DELIVER", bit 5 was previously known as "BUILD".
BPU_fetch_request			This event counts instruction fetch requests of specified request type by the Branch Prediction unit. Specify one or more mask bits to qualify the request type(s).
	ESCR restrictions	MSR_BPU_ESCR0 MSR_BPU_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	03H	ESCR[31:25]
	ESCR Event Mask	Bit 0: TCMISS	ESCR[24:9] Trace cache lookup miss
	CCCR Select	00H	CCCR[15:13]
ITLB_reference			This event counts translations using the Instruction Translation Look-aside Buffer (ITLB).
	ESCR restrictions	MSR_ITLB_ESCR0 MSR_ITLB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	18H	ESCR[31:25]

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	ESCR Event Mask	Bit 0: HIT 1: MISS 2: HIT_UC	ESCR[24:9] ITLB hit ITLB miss Uncacheable ITLB hit
	CCCR Select	03H	CCCR[15:13]
	Event Specific Notes		All page references regardless of the page size are looked up as actual 4-KByte pages. Use the page_walk_type event with the ITMISS mask for a more conservative count.
memory_cancel			This event counts the canceling of various type of request in the Data cache Address Control unit (DAC). Specify one or more mask bits to select the type of requests that are canceled.
	ESCR restrictions	MSR_DAC_ESCR0 MSR_DAC_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11	
	ESCR Event Select	02H	ESCR[31:25]
	ESCR Event Mask	Bit 2: ST_RB_FULL 3: 64K_CONF	ESCR[24:9] Replayed because no store request buffer is available Conflicts due to 64-KByte aliasing
	CCCR Select	05H	CCCR[15:13]
	Event Specific Notes		All_CACHE_MISS includes uncacheable memory in count.

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
memory_ complete			This event counts the completion of a load split, store split, uncacheable (UC) split, or UC load. Specify one or more mask bits to select the operations to be counted.
	ESCR restrictions	MSR_SAAT_ESCR0 MSR_SAAT_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11	
	ESCR Event Select	08H	ESCR[31:25]
	ESCR Event Mask	Bit 0: LSC 1: SSC	ESCR[24:9] Load split completed, excluding UC/WC loads Any split stores completed
	CCCR Select	02H	CCCR[15:13]
load_port_replay			This event counts replayed events at the load port. Specify one or more mask bits to select the cause of the replay.
	ESCR restrictions	MSR_SAAT_ESCR0 MSR_SAAT_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11	
	ESCR Event Select	04H	ESCR[31:25]
	ESCR Event Mask	Bit 1: SPLIT_LD	ESCR[24:9] Split load.
	CCCR Select	02H	CCCR[15:13]
	Event Specific Notes		Must use ESCR1 for at-retirement counting.

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
store_port_replay			This event counts replayed events at the store port. Specify one or more mask bits to select the cause of the replay.
	ESCR restrictions	MSR_SAAT_ESCR0 MSR_SAAT_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11	
	ESCR Event Select	05H	ESCR[31:25]
	ESCR Event Mask	Bit 1: SPLIT_ST	ESCR[24:9] Split store
	CCCR Select	02H	CCCR[15:13]
	Event Specific Notes		Must use ESCR1 for at-retirement counting.
MOB_load_replay			This event triggers if the memory order buffer (MOB) caused a load operation to be replayed. Specify one or more mask bits to select the cause of the replay.
	ESCR restrictions	MSR_MOB_ESCR0 MSR_MOB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	03H	ESCR[31:25]
	ESCR Event Mask	Bit 1: NO_STA 3: NO_STD	ESCR[24:9] Replayed because of unknown store address. Replayed because of unknown store data.

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
		4: PARTIAL_DATA 5: UNALGN_ADDR	Replayed because of partially overlapped data access between the load and store operations. Replayed because the lower 4 bits of the linear address do not match between the load and store operations.
	CCCR Select	02H	CCCR[15:13]
page_walk_type			This event counts various types of page walks that the page miss handler (PMH) performs.
	ESCR restrictions	MSR_PMH_ESCR0 MSR_PMH_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	01H	ESCR[31:25]
	ESCR Event Mask	Bit 0: DTMISS 1: ITMISS	ESCR[24:9] Page walk for a data TLB miss (either load or store). Page walk for an instruction TLB miss.
	CCCR Select	04H	CCCR[15:13]
BSQ_cache_reference			This event counts cache references (2nd level cache or 3rd level cache) as seen by the bus unit. Specify one or more mask bit to select an access according to the access type (read type includes both load and RFO, write type includes writebacks and evictions) and the access result (hit, misses).

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description

	ESCR Event Mask	8: RD_2ndL_MISS 9: RD_3rdL_MISS 10: WR_2ndL_MISS	Read 2nd level cache miss (includes load and RFO) Read 3rd level cache miss (includes load and RFO) A Writeback lookup from DAC misses the 2nd level cache (unlikely to happen)
	CCCR Select	07H	CCCR[15:13]
	Event Specific Notes		1: The implementation of this event in current Pentium 4 and Xeon processors treats either a load operation or a request for ownership (RFO) request as a "read" type operation.

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
			<p>2: Currently this event causes both over and undercounting by as much as a factor of two due to an erratum.</p> <p>3: It is possible for a transaction that is started as a prefetch to change the transaction's internal status, making it no longer a prefetch. or change the access result status (hit, miss) as seen by this event.</p>
IOQ_allocation			<p>This event counts the various types of transactions on the bus. A count is generated each time a transaction is allocated into the IOQ that matches the specified mask bits. An allocated entry can be a sector (64 bytes) or a chunks of 8 bytes.</p>
			<p>Requests are counted once per retry. The event mask bits constitute 4 bit fields. A transaction type is specified by interpreting the values of each bit field.</p> <p>Specify one or more event mask bits in a bit field to select the value of the bit field.</p> <p>Each field (bits 0-4 are one field) are independent of and can be ORed with the others. The request type field is further combined with bit 5 and 6 to form a binary expression. Bits 7 and 8 form a bit field to specify the memory type of the target address.</p>

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
			Bits 13 and 14 form a bit field to specify the source agent of the request. Bit 15 affects read operation only. The event is triggered by evaluating the logical expression: (((Request type) OR Bit 5 OR Bit 6) OR (Memory type)) AND (Source agent).
	ESCR restrictions	MSR_FSB_ESCR0, MSR_FSB_ESCR1

Event Name	Event Parameters	Parameter Value	Description
	Event Specific Notes		<p>1: Specified desired mask bits in ESCRO and ESCR1.</p> <p>2: See the ioq_allocation event for descriptions of the mask bits.</p> <p>3: Edge triggering should not be used when counting cycles.</p> <p>4: The mapping of interpreted bit field values to transaction types may differ across different processor model implementations of the Pentium 4 processor family. Applications that programs performance monitoring events should use the CPUID instruction to detect processor models when using this event. The logical expression that triggers this event as describe below:</p> <p>5a:For Pentium 4 and Xeon Processors starting with CPUID MODEL field encoding equal to 2 or greater, this event is triggered by evaluating the logical expression ((Request type) and (Bit 5 or Bit 6) and (Memory type) and (Source agent)).</p>

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
			<p>5b: For Pentium 4 and Xeon Processors starting with CPUID MODEL field encoding less than 2, this event is triggered by evaluating the logical expression $(((\text{Request type}) \text{ or Bit 5 or Bit 6}) \text{ or } (\text{Memory type})) \text{ and } (\text{Source agent})$. Event mask bits for memory type are ignored if either ALL_READ or ALL_WRITE is specified.</p> <p>5c: This event is known to ignore CPL in the current implementations of Pentium 4 and Xeon Processors Both user requests and OS requests are included in the count.</p> <p>6: An allocated entry can be a full line (64 bytes) or in individual chunks of 8 bytes.</p>
FSB_data_activity			This event increments once for each DRDY or DBSY event that occurs on the front side bus. The event allows selection of a specific DRDY or DBSY event.
	ESCR restrictions	MSR_FSB_ESCR0 MSR_FSB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	17H	ESCR[31:25]
	ESCR Event Mask	Bit 0: DRDY_DRV	ESCR[24:9] Count when this processor drives data onto the bus - includes writes and implicit writebacks.

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
		1: DRDY_OWN	<p>Asserted two processor clock cycles for partial writes and 4 processor clocks (usually in consecutive bus clocks) for full line writes.</p> <p>Count when this processor reads data from the bus - includes loads and some PIC transactions. Asserted two processor clock cycles for partial reads and 4 processor clocks (usually in consecutive bus clocks) for full line reads.</p> <p>Count DRDY events that we drive. Count DRDY events sampled that we own.</p>
		2: DRDY_OTHER	<p>Count when data is on the bus but not being sampled by the processor. It may or may not be being driven by this processor.</p> <p>Asserted two processor clock cycles for partial transactions and 4 processor clocks (usually in consecutive bus clocks) for full line transactions.</p>
		3: DBSY_DRV	<p>Count when this processor reserves the bus for use in the next bus cycle in order to drive data. Asserted for two processor clock cycles for full line writes and not at all for partial line writes.</p> <p>May be asserted multiple times (in consecutive bus clocks) if we stall the bus waiting for a cache lock to complete.</p>

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
		4:DBSY_OWN	Count when some agent reserves the bus for use in the next bus cycle to drive data that this processor will sample. Asserted for two processor clock cycles for full line writes and not at all for partial line writes. May be asserted multiple times (all one bus clock apart) if we stall the bus for some reason.
		5:DBSY_OTHER	Count when some agent reserves the bus for use in the next bus cycle to drive data that this processor will NOT sample. It may or may not be being driven by this processor. Asserted two processor clock cycles for partial transactions and 4 processor clocks (usually in consecutive bus clocks) for full line transactions.
	CCCR Select	06H	CCCR[15:13]
	Event Specific Notes		Specify edge trigger in the CCCR MSR to avoid double counting. DRDY_OWN and DRDY_OTHER are mutually exclusive; similarly for DBSY_OWN and DBSY_OTHER.
BSQ_allocation			This event counts allocations in the Bus Sequence Unit (BSQ) according to the specified mask bit encoding. The event mask bits consist of four sub-groups: <ul style="list-style-type: none"> ▪ request type, ▪ request length ▪ memory type ▪ and sub-group consisting mostly of independent bits (bits 5, 6, 7, 8, 9, and 10) Specify an encoding for each sub-group.

	ESCR Event Select	34H	ESCR[31:25]
	ESCR Event Mask	15: ALL	ESCR[24:9] Count assists for SSE/SSE2/SSE3 μ ops.
	CCCR Select	01H	CCCR[15:13]
	Event Specific Notes		1: Not all requests for assists are actually taken. This event is known to overcount in that it counts requests for assists from instructions on the non-retired path that do not incur a performance penalty. An assist is actually taken only for non-bogus μ ops. Any appreciable counts for this event are an indication that the DAZ or FTZ bit should be set and/or the source code should be changed to eliminate the condition.
			2: Two common situations for an SSE/SSE2/SSE3 operation needing an assist are: (1) when a denormal constant is used as an input and the Denormals-Are-Zero (DAZ) mode is not set, (2) when the input operand uses the underflowed result of a previous SSE/SSE2/SSE3 operation and neither the DAZ nor Flush-To-Zero (FTZ) modes are set.

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
			3: Enabling the DAZ mode prevents SSE/SSE2/SSE3 operations from needing assists in the first situation. Enabling the FTZ mode prevents SSE/SSE2/SSE3 operations from needing assists in the second situation.
packed_SP_uop			This event increments for each packed single-precision μ op, specified through the event mask for detection.

	Event Specific Notes		This event may overcount conditional branches if : <ul style="list-style-type: none"> ▪ Mispredictions cause the trace cache and delivery engine to build new traces. ▪ When the processor’s pipeline is being cleared.

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
resource_stall			This event monitors the occurrence or latency of stalls in the Allocator.
	ESCR restrictions	MSR_ALF_ESCR0 MSR_ALF_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	
	ESCR Event Select	01H	ESCR[30:25]
	Event Masks	Bit 5: SBFULL	ESCR[24:9] A Stall due to lack of store buffers.
	CCCR Select	01H	CCCR[15:13]
	Event Specific Notes		This event may not be supported in all models of the processor family.
WC_Buffer			This event counts Write Combining Buffer operations that are selected by the event mask.
	ESCR restrictions	MSR_DAC_ESCR0 MSR_DAC_ESCR1	
	Counter numbers per ESCR	ESCR0: 8, 9 ESCR1: 10, 11	
	ESCR Event Select	05H	ESCR[30:25]
	Event Masks	Bit 0: WCB_EVICTS	ESCR[24:9] WC Buffer evictions of all causes.
		1: WCB_FULL_EVICT	WC Buffer eviction: no WC buffer is available.
	CCCR Select	05H	CCCR[15:13]

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	Event Specific Notes		This event is useful for detecting the subset of 64K aliasing cases that are more costly (i.e. 64K aliasing cases involving stores) as long as there are no significant contributions due to write combining buffer full or hit-modified conditions.
b2b_cycles			This event can be configured to count the number back-to-back bus cycles using sub-event mask bits 1 through 6.
	ESCR restrictions	MSR_FSB_ESCR0 MSR_FSB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	016H	ESCR[30:25]
	Event Masks	Bit	ESCR[24:9]
	CCCR Select	03H	CCCR[15:13]
	Event Specific Notes		This event may not be supported in all models of the processor family.
bnr			This event can be configured to count bus not ready conditions using sub-event mask bits 0 through 2.
	ESCR restrictions	MSR_FSB_ESCR0 MSR_FSB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	08H	ESCR[30:25]
	Event Masks	Bit	ESCR[24:9]
	CCCR Select	03H	CCCR[15:13]
	Event Specific Notes		This event may not be supported in all models of the processor family.

Table A-13. Performance Monitoring Events Supported by Intel NetBurst Microarchitecture for Non-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
snoop			This event can be configured to count snoop hit modified bus traffic using sub-event mask bits 2, 6 and 7.
	ESCR restrictions	MSR_FSB_ESCR0 MSR_FSB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	06H	ESCR[30:25]
	Event Masks	Bit	ESCR[24:9]
	CCCR Select	03H	CCCR[15:13]
	Event Specific Notes		This event may not be supported in all models of the processor family.
Response			This event can be configured to count different types of responses using sub-event mask bits 1,2, 8, and 9.
	ESCR restrictions	MSR_FSB_ESCR0 MSR_FSB_ESCR1	
	Counter numbers per ESCR	ESCR0: 0, 1 ESCR1: 2, 3	
	ESCR Event Select	04H	ESCR[30:25]
	Event Masks	Bit	ESCR[24:9]
	CCCR Select	03H	CCCR[15:13]
	Event Specific Notes		This event may not be supported in all models of the processor family.

Table A-14. Performance Monitoring Events For Intel NetBurst Microarchitecture for At-Retirement Counting

Event Name	Event Parameters	Parameter Value	Description
front_end_event			This event counts the retirement of tagged μ ops, which are specified through the front-end tagging mechanism. The event mask specifies bogus or non-bogus μ ops.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	
	ESCR Event Select	08H	ESCR[31:25]
	ESCR Event Mask	Bit 0: NBOGUS 1: BOGUS	ESCR[24:9] The marked μ ops are not bogus. The marked μ ops are bogus.
	CCCR Select	05H	CCCR[15:13]
	Can Support PEBS	Yes	
	Require Additional MSRs for tagging	Selected ESCRs and/or MSR_TC_PRECISE_EVENT	See list of metrics supported by Front_end tagging in Table A-3
execution_event			This event counts the retirement of tagged μ ops, which are specified through the execution tagging mechanism. The event mask allows from one to four types of μ ops to be specified as either bogus or non-bogus μ ops to be tagged.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	
	ESCR Event Select	0CH	ESCR[31:25]

Table A-14. Performance Monitoring Events For Intel NetBurst Microarchitecture for At-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	ESCR Event Mask	Bit 0: NBOGUS0 1: NBOGUS1 2: NBOGUS2 3: NBOGUS3 4: BOGUS0 5: BOGUS1 6: BOGUS2 7: BOGUS3	ESCR[24:9] The marked μ ops are not bogus. The marked μ ops are not bogus. The marked μ ops are not bogus. The marked μ ops are not bogus. The marked μ ops are bogus. The marked μ ops are bogus. The marked μ ops are bogus. The marked μ ops are bogus.
	CCCR Select	05H	CCCR[15:13]
	Event Specific Notes		Each of the 4 slots to specify the bogus/non-bogus μ ops must be coordinated with the 4 TagValue bits in the ESCR (for example, NBOGUS0 must accompany a '1' in the lowest bit of the TagValue field in ESCR, NBOGUS1 must accompany a '1' in the next but lowest bit of the TagValue field).
	Can Support PEBS	Yes	
	Require Additional MSRs for tagging	An ESCR for an upstream event	See list of metrics supported by execution tagging in Table A-4.
replay_event			This event counts the retirement of tagged μ ops, which are specified through the replay tagging mechanism. The event mask specifies bogus or non-bogus μ ops.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	
	ESCR Event Select	09H	ESCR[31:25]

Table A-14. Performance Monitoring Events For Intel NetBurst Microarchitecture for At-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	ESCR Event Mask	Bit 0: NBOGUS 1: BOGUS	ESCR[24:9] The marked μ ops are not bogus. The marked μ ops are bogus.
	CCCR Select	05H	CCCR[15:13]
	Event Specific Notes		Supports counting tagged μ ops with additional MSRs.
	Can Support PEBS	Yes	
	Require Additional MSRs for tagging	IA32_PEBS_ENABLE MSR_PEBS_MATRIX_VERT Selected ESCR	See list of metrics supported by replay tagging in Table A-5.
instr_retired			This event counts instructions that are retired during a clock cycle. Mask bits specify bogus or non-bogus (and whether they are tagged using the front-end tagging mechanism).
	ESCR restrictions	MSR_CRU_ESCR0 MSR_CRU_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	
	ESCR Event Select	02H	ESCR[31:25]
	ESCR Event Mask	Bit 0: NBOGUSNTAG 1: NBOGUSTAG 2: BOGUSNTAG 3: BOGUSTAG	ESCR[24:9] Non-bogus instructions that are not tagged. Non-bogus instructions that are tagged. Bogus instructions that are not tagged. Bogus instructions that are tagged.
	CCCR Select	04H	CCCR[15:13]

**Table A-14. Performance Monitoring Events For Intel NetBurst
Microarchitecture for At-Retirement Counting (Contd.)**

Event Name	Event Parameters	Parameter Value	Description
	Event Specific Notes		<p>1: The event count may vary depending on the microarchitectural states of the processor when the event detection is enabled.</p> <p>2: The event may count more than once for some instructions with complex uop flows and were interrupted before retirement.</p>
	Can Support PEBS	No	
uops_retired			This event counts μ ops that are retired during a clock cycle. Mask bits specify bogus or non-bogus.
	ESCR restrictions	MSR_CRU_ESCR0 MSR_CRU_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	
	ESCR Event Select	01H	ESCR[31:25]
	ESCR Event Mask	Bit 0: NBOGUS 1: BOGUS	ESCR[24:9] The marked μ ops are not bogus. The marked μ ops are bogus.
	CCCR Select	04H	CCCR[15:13]
	Event Specific Notes		P6: EMON_UOPS_RETIRED
	Can Support PEBS	No	
uop_type			This event is used in conjunction with the front-end at-retirement mechanism to tag load and store μ ops.
	ESCR restrictions	MSR_RAT_ESCR0 MSR_RAT_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	

Table A-14. Performance Monitoring Events For Intel NetBurst Microarchitecture for At-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	ESCR Event Select	02H	ESCR[31:25]
	ESCR Event Mask	Bit 1: TAGLOADS 2: TAGSTORES	ESCR[24:9] The μ op is a load operation. The μ op is a store operation.
	CCCR Select	02H	CCCR[15:13]
	Event Specific Notes		Setting the TAGLOADS and TAGSTORES mask bits does not cause a counter to increment. They are only used to tag uops.
	Can Support PEBS	No	
branch_retired			This event counts the retirement of a branch. Specify one or more mask bits to select any combination of taken, not-taken, predicted and mispredicted.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	See Table 30-28 for the addresses of the ESCR MSRs
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	The counter numbers associated with each ESCR are provided. The performance counters and corresponding CCCRs can be obtained from Table 30-28.
	ESCR Event Select	06H	ESCR[31:25]
	ESCR Event Mask	Bit 0: MMNP 1: MMNM 2: MMTP 3: MMTM	ESCR[24:9] Branch not-taken predicted Branch not-taken mispredicted Branch taken predicted Branch taken mispredicted
	CCCR Select	05H	CCCR[15:13]
Event Specific Notes		P6: EMON_BR_INST_RETIRED	
Can Support PEBS	No		

**Table A-14. Performance Monitoring Events For Intel NetBurst
Microarchitecture for At-Retirement Counting (Contd.)**

Event Name	Event Parameters	Parameter Value	Description
mispred_branch_ retired			This event represents the retirement of mispredicted branch instructions.
	ESCR restrictions	MSR_CRU_ESCR0 MSR_CRU_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	
	ESCR Event Select	03H	ESCR[31:25]
	ESCR Event Mask	Bit 0: NBOGUS	ESCR[24:9] The retired instruction is not bogus.
	CCCR Select	04H	CCCR[15:13]
	Can Support PEBS	No	
x87_assist			This event counts the retirement of x87 instructions that required special handling. Specifies one or more event mask bits to select the type of assistance.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	
	ESCR Event Select	03H	ESCR[31:25]
	ESCR Event Mask	Bit 0: FPSU 1: FPSO 2: POAO 3: POAU 4: PREA	ESCR[24:9] Handle FP stack underflow Handle FP stack overflow Handle x87 output overflow Handle x87 output underflow Handle x87 input assist
	CCCR Select	05H	CCCR[15:13]
	Can Support PEBS	No	

Table A-14. Performance Monitoring Events For Intel NetBurst Microarchitecture for At-Retirement Counting (Contd.)

Event Name	Event Parameters	Parameter Value	Description
machine_clear			This event increments according to the mask bit specified while the entire pipeline of the machine is cleared. Specify one of the mask bit to select the cause.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	
	ESCR Event Select	02H	ESCR[31:25]
	ESCR Event Mask	Bit 0: CLEAR 2: MOCLEAR 6: SMCLEAR	ESCR[24:9] Counts for a portion of the many cycles while the machine is cleared for any cause. Use Edge triggering for this bit only to get a count of occurrence versus a duration. Increments each time the machine is cleared due to memory ordering issues. Increments each time the machine is cleared due to self-modifying code issues.
	CCCR Select	05H	CCCR[15:13]
	Can Support PEBS	No	

Table A-15. Intel NetBurst Microarchitecture Model-Specific Performance Monitoring Events (For Model Encoding 3, 4 or 6)

Event Name	Event Parameters	Parameter Value	Description
instr_completed			This event counts instructions that have completed and retired during a clock cycle. Mask bits specify whether the instruction is bogus or non-bogus and whether they are:
	ESCR restrictions	MSR_CRU_ESCR0 MSR_CRU_ESCR1	
	Counter numbers per ESCR	ESCR0: 12, 13, 16 ESCR1: 14, 15, 17	
	ESCR Event Select	07H	ESCR[31:25]
	ESCR Event Mask	Bit 0: NBOGUS 1: BOGUS	ESCR[24:9] Non-bogus instructions Bogus instructions
	CCCR Select	04H	CCCR[15:13]
	Event Specific Notes		This metric differs from instr_retired, since it counts instructions completed, rather than the number of times that instructions started.
	Can Support PEBS	No	

**Table A-16. List of Metrics Available for Front_end Tagging
(For Front_end Event Only)**

Front-end metric ¹	MSR_TC_PRECISE_EVENT MSR Bit field	Additional MSR	Event mask value for Front_end_event
memory_loads	None	Set TAGLOADS bit in ESCR corresponding to event Uop_Type.	NBOGUS
memory_stores	None	Set TAGSTORES bit in the ESCR corresponding to event Uop_Type.	NBOGUS

NOTES:

1. There may be some undercounting of front end events when there is an overflow or underflow of the floating point stack.

**Table A-17. List of Metrics Available for Execution Tagging
(For Execution Event Only)**

Execution metric	Upstream ESCR	TagValue in Upstream ESCR	Event mask value for execution_event
packed_SP_retired	Set ALL bit in event mask, TagUop bit in ESCR of packed_SP_uop.	1	NBOGUS0
packed_DP_retired	Set ALL bit in event mask, TagUop bit in ESCR of packed_DP_uop.	1	NBOGUS0
scalar_SP_retired	Set ALL bit in event mask, TagUop bit in ESCR of scalar_SP_uop.	1	NBOGUS0
scalar_DP_retired	Set ALL bit in event mask, TagUop bit in ESCR of scalar_DP_uop.	1	NBOGUS0
128_bit_MMX_retired	Set ALL bit in event mask, TagUop bit in ESCR of 128_bit_MMX_uop.	1	NBOGUS0

**Table A-17. List of Metrics Available for Execution Tagging
(For Execution Event Only) (Contd.)**

Execution metric	Upstream ESCR	TagValue in Upstream ESCR	Event mask value for execution_event
64_bit_MMX_retired	Set ALL bit in event mask, TagUop bit in ESCR of 64_bit_MMX_uop.	1	NBOGUSO
X87_FP_retired	Set ALL bit in event mask, TagUop bit in ESCR of x87_FP_uop.	1	NBOGUSO
X87_SIMD_memory_moves_retired	Set ALLP0, ALLP2 bits in event mask, TagUop bit in ESCR of X87_SIMD_moves_uop.	1	NBOGUSO

**Table A-18. List of Metrics Available for Replay Tagging
(For Replay Event Only)**

Replay metric ¹	IA32_PEBS_ENABLE Field to Set	MSR_PEBS_MATRIX_VERT Bit Field to Set	Additional MSR/Event	Event Mask Value for Replay_event
1stL_cache_load_miss_retired	Bit 0, Bit 24, Bit 25	Bit 0	None	NBOGUS
2ndL_cache_load_miss_retired ²	Bit 1, Bit 24, Bit 25	Bit 0	None	NBOGUS
DTLB_load_miss_retired	Bit 2, Bit 24, Bit 25	Bit 0	None	NBOGUS
DTLB_store_miss_retired	Bit 2, Bit 24, Bit 25	Bit 1	None	NBOGUS
DTLB_all_miss_retired	Bit 2, Bit 24, Bit 25	Bit 0, Bit 1	None	NBOGUS
Tagged_mispred_branch	Bit 15, Bit 16, Bit 24, Bit 25	Bit 4	None	NBOGUS
MOB_load_replay_retired ³	Bit 9, Bit 24, Bit 25	Bit 0	Select MOB_load_replay event and set PARTIAL_DATA and UNALGN_ADDR bit.	NBOGUS

**Table A-18. List of Metrics Available for Replay Tagging
(For Replay Event Only) (Contd.)**

Replay metric ¹	IA32_PEBS_ENABLE Field to Set	MSR_PEBS_MATRIX_VERT Bit Field to Set	Additional MSR/ Event	Event Mask Value for Replay_event
split_load_retired	Bit 10, Bit 24, Bit 25	Bit 0	Select load_port_replay event with the MSR_SAAT_ESCR1 MSR and set the SPLIT_LD mask bit.	NBOGUS
split_store_retired	Bit 10, Bit 24, Bit 25	Bit 1	Select store_port_replay event with the MSR_SAAT_ESCR0 MSR and set the SPLIT_ST mask bit.	NBOGUS

NOTES:

1. Certain kinds of μ ops cannot be tagged. These include I/O operations, UC and locked accesses, returns, and far transfers.
2. 2nd-level misses retired does not count all 2nd-level misses. It only includes those references that are found to be misses by the fast detection logic and not those that are later found to be misses.
3. While there are several causes for a MOB replay, the event counted with this event mask setting is the case where the data from a load that would otherwise be forwarded is not an aligned subset of the data from a preceding store.

A.10 PERFORMANCE MONITORING EVENTS FOR INTEL® PENTIUM® M PROCESSORS

The Pentium M processor's performance-monitoring events are based on monitoring events for the P6 family of processors. All of these performance events are model specific for the Pentium M processor and are not available in this form in other processors. Table A-20 lists the Performance-Monitoring events that were added in the Pentium M processor.

Table A-20. Performance Monitoring Events on Intel® Pentium® M Processors

Name	Hex Values	Descriptions
Power Management		
EMON_EST_TRANS	58H	Number of Enhanced Intel SpeedStep technology transitions: Mask = 00H - All transitions Mask = 02H - Only Frequency transitions
EMON_THERMAL_TRIP	59H	Duration/Occurrences in thermal trip; to count number of thermal trips: bit 22 in PerfEvtSel0/1 needs to be set to enable edge detect.
BPU		
BR_INST_EXEC	88H	Branch instructions that were executed (not necessarily retired).
BR_MISSP_EXEC	89H	Branch instructions executed that were mispredicted at execution.

Table A-20. Performance Monitoring Events on Intel® Pentium® M Processors (Contd.)

Name	Hex Values	Descriptions
BR_BAC_MISSP_EXEC	8AH	Branch instructions executed that were mispredicted at front end (BAC).
BR_CND_EXEC	8BH	Conditional branch instructions that were executed.
BR_CND_MISSP_EXEC	8CH	Conditional branch instructions executed that were mispredicted.
BR_IND_EXEC	8DH	Indirect branch instructions executed.
BR_IND_MISSP_EXEC	8EH	Indirect branch instructions executed that were mispredicted.
BR_RET_EXEC	8FH	Return branch instructions executed.
BR_RET_MISSP_EXEC	90H	Return branch instructions executed that were mispredicted at execution.
BR_RET_BAC_MISSP_EXEC	91H	Return branch instructions executed that were mispredicted at front end (BAC).
BR_CALL_EXEC	92H	CALL instruction executed.
BR_CALL_MISSP_EXEC	93H	CALL instruction executed and miss predicted.
BR_IND_CALL_EXEC	94H	Indirect CALL instructions executed.
Decoder		
EMON_SIMD_INSTR_RETIRED	CEH	Number of retired MMX instructions.
EMON_SYNCH_UOPS	D3H	Sync micro-ops
EMON_ESP_UOPS	D7H	Total number of micro-ops
EMON_FUSED_UOPS_RET	DAH	Number of retired fused micro-ops: Mask = 0 - Fused micro-ops Mask = 1 - Only load+Op micro-ops Mask = 2 - Only std+sta micro-ops
EMON_UNFUSION	DBH	Number of unfusion events in the ROB, happened on a FP exception to a fused μ op.

Table A-20. Performance Monitoring Events on Intel® Pentium® M Processors (Contd.)

Name	Hex Values	Descriptions
Prefetcher		
EMON_PREF_RQSTS_UP	F0H	Number of upward prefetches issued
EMON_PREF_RQSTS_DN	F8H	Number of downward prefetches issued

A number of P6 family processor performance monitoring events are modified for the Pentium M processor. Table A-21 lists the performance monitoring events that were changed in the Pentium M processor, and differ from performance monitoring events for the P6 family of processors.

Table A-21. Performance Monitoring Events Modified on Intel® Pentium® M Processors

Name	Hex Values	Descriptions
CPU_CLK_UNHALTED	79H	Number of cycles during which the processor is not halted, and not in a thermal trip.
EMON_SSE_SSE2_INST_RETIRE	D8H	Streaming SIMD Extensions Instructions Retired: Mask = 0 - SSE packed single and scalar single Mask = 1 - SSE scalar-single Mask = 2 - SSE2 packed-double Mask = 3 - SSE2 scalar-double
EMON_SSE_SSE2_COMP_INST_RETIRE	D9H	Computational SSE Instructions Retired: Mask = 0 - SSE packed single Mask = 1 - SSE Scalar-single Mask = 2 - SSE2 packed-double Mask = 3 - SSE2 scalar-double

Table A-21. Performance Monitoring Events Modified on Intel® Pentium® M Processors (Contd.)

Name	Hex Values	Descriptions	
L2_LD	29H	L2 data loads	Mask[0] = 1 - count I state lines
L2_LINES_IN	24H	L2 lines allocated	Mask[1] = 1 - count S state lines
L2_LINES_OUT	26H	L2 lines evicted	Mask[2] = 1 - count E state lines
L2_M_LINES_OUT	27H	Lw M-state lines evicted	Mask[3] = 1 - count M state lines Mask[5:4]: 00H - Excluding hardware-prefetched lines 01H - Hardware-prefetched lines only 02H/03H - All (HW-prefetched lines and non HW --Prefetched lines)

A.11 P6 FAMILY PROCESSOR PERFORMANCE-MONITORING EVENTS

Table A-22 lists the events that can be counted with the performance-monitoring counters and read with the RDPMC instruction for the P6 family processors. The unit column gives the microarchitecture or bus unit that produces the event; the event number column gives the hexadecimal number identifying the event; the mnemonic event name column gives the name of the event; the unit mask column gives the unit mask required (if any); the description column describes the event; and the comments column gives additional information about the event.

All of these performance events are model specific for the P6 family processors and are not available in this form in the Pentium 4 processors or the Pentium processors. Some events (such as those added in later generations of the P6 family processors) are only available in specific processors in the P6 family. All performance event encodings not listed in Table A-22 are reserved and their use will result in undefined counter results.

See the end of the table for notes related to certain entries in the table.

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
Data Cache Unit (DCU)	43H	DATA_MEM_REFS	00H	<p>All loads from any memory type. All stores to any memory type. Each part of a split is counted separately. The internal logic counts not only memory loads and stores, but also internal retries.</p> <p>80-bit floating-point accesses are double counted, since they are decomposed into a 16-bit exponent load and a 64-bit mantissa load. Memory accesses are only counted when they are actually performed (such as a load that gets squashed because a previous cache miss is outstanding to the same address, and which finally gets performed, is only counted once).</p> <p>Does not include I/O accesses, or other nonmemory accesses.</p>	
	45H	DCU_LINES_IN	00H	Total lines allocated in DCU.	
	46H	DCU_M_LINES_IN	00H	Number of M state lines allocated in DCU.	
	47H	DCU_M_LINES_OUT	00H	<p>Number of M state lines evicted from DCU.</p> <p>This includes evictions via snoop HITM, intervention or replacement.</p>	

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
	48H	DCU_MISS_OUTSTANDING	00H	Weighted number of cycles while a DCU miss is outstanding, incremented by the number of outstanding cache misses at any particular time. Cacheable read requests only are considered. Uncacheable requests are excluded. Read-for-ownerships are counted, as well as line fills, invalidates, and stores.	An access that also misses the L2 is short-changed by 2 cycles (i.e., if counts N cycles, should be N+2 cycles). Subsequent loads to the same cache line will not result in any additional counts. Count value not precise, but still useful.
Instruction Fetch Unit (IFU)	80H	IFU_IFETCH	00H	Number of instruction fetches, both cacheable and noncacheable, including UC fetches.	
	81H	IFU_IFETCH_MISS	00H	Number of instruction fetch misses All instruction fetches that do not hit the IFU (i.e., that produce memory requests). This includes UC accesses.	
	85H	ITLB_MISS	00H	Number of ITLB misses.	
	86H	IFU_MEM_STALL	00H	Number of cycles instruction fetch is stalled, for any reason. Includes IFU cache misses, ITLB misses, ITLB faults, and other minor stalls.	
	87H	ILD_STALL	00H	Number of cycles that the instruction length decoder is stalled.	

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
L2 Cache ¹	28H	L2_IFETCH	MESI OFH	<p>Number of L2 instruction fetches.</p> <p>This event indicates that a normal instruction fetch was received by the L2.</p> <p>The count includes only L2 cacheable instruction fetches; it does not include UC instruction fetches.</p> <p>It does not include ITLB miss accesses.</p>	
	29H	L2_LD	MESI OFH	<p>Number of L2 data loads.</p> <p>This event indicates that a normal, unlocked, load memory access was received by the L2.</p> <p>It includes only L2 cacheable memory accesses; it does not include I/O accesses, other nonmemory accesses, or memory accesses such as UC/WT memory accesses.</p> <p>It does include L2 cacheable TLB miss memory accesses.</p>	
	2AH	L2_ST	MESI OFH	<p>Number of L2 data stores.</p> <p>This event indicates that a normal, unlocked, store memory access was received by the L2.</p>	

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
				<p>it indicates that the DCU sent a read-for-ownership request to the L2. It also includes Invalid to Modified requests sent by the DCU to the L2.</p> <p>It includes only L2 cacheable memory accesses; it does not include I/O accesses, other nonmemory accesses, or memory accesses such as UC/WT memory accesses.</p> <p>It includes TLB miss memory accesses.</p>	
	24H	L2_LINES_IN	00H	Number of lines allocated in the L2.	
	26H	L2_LINES_OUT	00H	Number of lines removed from the L2 for any reason.	
	25H	L2_M_LINES_INM	00H	Number of modified lines allocated in the L2.	
	27H	L2_M_LINES_OUTM	00H	Number of modified lines removed from the L2 for any reason.	
	2EH	L2_RQSTS	MESI 0FH	Total number of L2 requests.	
	21H	L2_ADS	00H	Number of L2 address strobes.	
	22H	L2_DBUS_BUSY	00H	Number of cycles during which the L2 cache data bus was busy.	
	23H	L2_DBUS_BUSY_RD	00H	Number of cycles during which the data bus was busy transferring read data from L2 to the processor.	

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
External Bus Logic (EBL) ²	62H	BUS_DRDY_CLOCKS	00H (Self) 20H (Any)	Number of clocks during which DRDY# is asserted. Utilization of the external system data bus during data transfers.	Unit Mask = 00H counts bus clocks when the processor is driving DRDY#. Unit Mask = 20H counts in processor clocks when any agent is driving DRDY#.
	63H	BUS_LOCK_CLOCKS	00H (Self) 20H (Any)	Number of clocks during which LOCK# is asserted on the external system bus. ³	Always counts in processor clocks.
	60H	BUS_REQ_OUTSTANDING	00H (Self)	Number of bus requests outstanding. This counter is incremented by the number of cacheable read bus requests outstanding in any given cycle.	Counts only DCU full-line cacheable reads, not RFOs, writes, instruction fetches, or anything else. Counts "waiting for bus to complete" (last data chunk received).
	65H	BUS_TRAN_BRD	00H (Self) 20H (Any)	Number of burst read transactions.	
	66H	BUS_TRAN_RFO	00H (Self) 20H (Any)	Number of completed read for ownership transactions.	
	67H	BUS_TRANS_WB	00H (Self) 20H (Any)	Number of completed write back transactions.	

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
	68H	BUS_TRAN_IFETCH	00H (Self) 20H (Any)	Number of completed instruction fetch transactions.	
	69H	BUS_TRAN_INVALID	00H (Self) 20H (Any)	Number of completed invalidate transactions.	
	6AH	BUS_TRAN_PWR	00H (Self) 20H (Any)	Number of completed partial write transactions.	
	6BH	BUS_TRANS_P	00H (Self) 20H (Any)	Number of completed partial transactions.	
	6CH	BUS_TRANS_IO	00H (Self) 20H (Any)	Number of completed I/O transactions.	
	6DH	BUS_TRAN_DEF	00H (Self) 20H (Any)	Number of completed deferred transactions.	
	6EH	BUS_TRAN_BURST	00H (Self) 20H (Any)	Number of completed burst transactions.	
	70H	BUS_TRAN_ANY	00H (Self) 20H (Any)	Number of all completed bus transactions. Address bus utilization can be calculated knowing the minimum address bus occupancy. Includes special cycles, etc.	

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
	6FH	BUS_TRAN_MEM	00H (Self) 20H (Any)	Number of completed memory transactions.	
	64H	BUS_DATA_RCV	00H (Self)	Number of bus clock cycles during which this processor is receiving data.	
	61H	BUS_BNR_DRV	00H (Self)	Number of bus clock cycles during which this processor is driving the BNR# pin.	
	7AH	BUS_HIT_DRV	00H (Self)	Number of bus clock cycles during which this processor is driving the HIT# pin.	<p>Includes cycles due to snoop stalls.</p> <p>The event counts correctly, but BPM<i>i</i> (breakpoint monitor) pins function as follows based on the setting of the PC bits (bit 19 in the PerfEvtSel0 and PerfEvtSel1 registers):</p> <ul style="list-style-type: none"> If the core-clock-to-bus-clock ratio is 2:1 or 3:1, and a PC bit is set, the BPM<i>i</i> pins will be asserted for a single clock when the counters overflow.

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
					<ul style="list-style-type: none"> ▪ If the PC bit is clear, the processor toggles the BPM_i pins when the counter overflows. ▪ If the clock ratio is not 2:1 or 3:1, the BPM_i pins will not function for these performance-monitoring counter events.
	7BH	BUS_HITM_DRV	00H (Self)	Number of bus clock cycles during which this processor is driving the HITM# pin.	<p>Includes cycles due to snoop stalls.</p> <p>The event counts correctly, but BPM_i (breakpoint monitor) pins function as follows based on the setting of the PC bits (bit 19 in the PerfEvtSel0 and PerfEvtSel1 registers):</p> <ul style="list-style-type: none"> ▪ If the core-clock-to-bus-clock ratio is 2:1 or 3:1, and a PC bit is set, the BPM_i pins will be asserted for a single clock when the counters overflow.

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
					<ul style="list-style-type: none"> ▪ If the PC bit is clear, the processor toggles the BPM_i pins when the counter overflows. ▪ If the clock ratio is not 2:1 or 3:1, the BPM_i pins will not function for these performance-monitoring counter events.
	7EH	BUS_SNOOP_STALL	00H (Self)	Number of clock cycles during which the bus is snoop stalled.	
Floating-Point Unit	C1H	FLOPS	00H	<p>Number of computational floating-point operations retired.</p> <p>Excludes floating-point computational operations that cause traps or assists.</p> <p>Includes floating-point computational operations executed by the assist handler.</p> <p>Includes internal sub-operations for complex floating-point instructions like transcendentals.</p> <p>Excludes floating-point loads and stores.</p>	Counter 0 only.

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
	10H	FP_COMP_OPS_EXE	00H	<p>Number of computational floating-point operations executed.</p> <p>The number of FADD, FSUB, FCOM, FMULs, integer MULs and IMULs, FDIVs, FPREMs, FSQRTS, integer DIVs, and IDIVs.</p> <p>This number does not include the number of cycles, but the number of operations.</p> <p>This event does not distinguish an FADD used in the middle of a transcendental flow from a separate FADD instruction.</p>	Counter 0 only.
	11H	FP_ASSIST	00H	Number of floating-point exception cases handled by microcode.	Counter 1 only. This event includes counts due to speculative execution.
	12H	MUL	00H	<p>Number of multiplies.</p> <p>This count includes integer as well as FP multiplies and is speculative.</p>	Counter 1 only.
	13H	DIV	00H	<p>Number of divides.</p> <p>This count includes integer as well as FP divides and is speculative.</p>	Counter 1 only.

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
	14H	CYCLES_DIV_BUSY	00H	Number of cycles during which the divider is busy, and cannot accept new divides. This includes integer and FP divides, FPREM, FPSQRT, etc. and is speculative.	Counter 0 only.
Memory Ordering	03H	LD_BLOCKS	00H	Number of load operations delayed due to store buffer blocks. Includes counts caused by preceding stores whose addresses are unknown, preceding stores whose addresses are known but whose data is unknown, and preceding stores that conflicts with the load but which incompletely overlap the load.	
	04H	SB_DRAINS	00H	Number of store buffer drain cycles. Incremented every cycle the store buffer is draining. Draining is caused by serializing operations like CPUID, synchronizing operations like XCHG, interrupt acknowledgment, as well as other conditions (such as cache flushing).	

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
	05H	MISALIGN_MEM_REF	00H	<p>Number of misaligned data memory references.</p> <p>Incremented by 1 every cycle, during which either the processor's load or store pipeline dispatches a misaligned μop.</p> <p>Counting is performed if it is the first or second half, or if it is blocked, squashed, or missed.</p> <p>In this context, misaligned means crossing a 64-bit boundary.</p>	<p>MISALIGN_MEM_REF is only an approximation to the true number of misaligned memory references.</p> <p>The value returned is roughly proportional to the number of misaligned memory accesses (the size of the problem).</p>
	07H	EMON_KNI_PREF_DISPATCHED	00H 01H 02H 03H	<p>Number of Streaming SIMD extensions prefetch/weakly-ordered instructions dispatched (speculative prefetches are included in counting):</p> <p>0: prefetch NTA 1: prefetch T1 2: prefetch T2 3: weakly ordered stores</p>	Counters 0 and 1. Pentium III processor only.
	4BH	EMON_KNI_PREF_MISS	00H 01H 02H 03H	<p>Number of prefetch/weakly-ordered instructions that miss all caches:</p> <p>0: prefetch NTA 1: prefetch T1 2: prefetch T2 3: weakly ordered stores</p>	Counters 0 and 1. Pentium III processor only.

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
Instruction Decoding and Retirement	C0H	INST_RETIRED	00H	Number of instructions retired.	A hardware interrupt received during/after the last iteration of the REP STOS flow causes the counter to undercount by 1 instruction. An SMI received while executing a HLT instruction will cause the performance counter to not count the RSM instruction and undercount by 1.
	C2H	UOPS_RETIRED	00H	Number of μ ops retired.	
	D0H	INST_DECODED	00H	Number of instructions decoded.	
	D8H	EMON_KNI_INST_RETIRED	00H 01H	Number of Streaming SIMD extensions retired: 0: packed & scalar 1: scalar	Counters 0 and 1. Pentium III processor only.
	D9H	EMON_KNI_COMP_INST_RET	00H 01H	Number of Streaming SIMD extensions computation instructions retired: 0: packed and scalar 1: scalar	Counters 0 and 1. Pentium III processor only.

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
Interrupts	C8H	HW_INT_RX	00H	Number of hardware interrupts received.	
	C6H	CYCLES_INT_MASKED	00H	Number of processor cycles for which interrupts are disabled.	
	C7H	CYCLES_INT_PENDING_AND_MASKED	00H	Number of processor cycles for which interrupts are disabled and interrupts are pending.	
Branches	C4H	BR_INST_RETIRED	00H	Number of branch instructions retired.	
	C5H	BR_MISS_PRED_RETIRED	00H	Number of mispredicted branches retired.	
	C9H	BR_TAKEN_RETIRED	00H	Number of taken branches retired.	
	CAH	BR_MISS_PRED_TAKEN_RET	00H	Number of taken mispredictions branches retired.	
	E0H	BR_INST_DECODED	00H	Number of branch instructions decoded.	
	E2H	BTB_MISSES	00H	Number of branches for which the BTB did not produce a prediction.	
	E4H	BR_BOGUS	00H	Number of bogus branches.	
	E6H	BACLEARs	00H	Number of times BACLEAR is asserted. This is the number of times that a static branch prediction was made, in which the branch decoder decided to make a branch prediction because the BTB did not.	

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
Stalls	A2H	RESOURCE_STALLS	00H	<p>Incremented by 1 during every cycle for which there is a resource related stall.</p> <p>Includes register renaming buffer entries, memory buffer entries.</p> <p>Does not include stalls due to bus queue full, too many cache misses, etc.</p> <p>In addition to resource related stalls, this event counts some other events.</p> <p>Includes stalls arising during branch misprediction recovery, such as if retirement of the mispredicted branch is delayed and stalls arising while store buffer is draining from synchronizing operations.</p>	
	D2H	PARTIAL_RAT_STALLS	00H	<p>Number of cycles or events for partial stalls. This includes flag partial stalls.</p>	
Segment Register Loads	06H	SEGMENT_REG_LOADS	00H	<p>Number of segment register loads.</p>	
Clocks	79H	CPU_CLK_UNHALTED	00H	<p>Number of cycles during which the processor is not halted.</p>	

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
MMX Unit	B0H	MMX_INSTR_EXEC	00H	Number of MMX Instructions Executed.	Available in Intel Celeron, Pentium II and Pentium II Xeon processors only. Does not account for MOVQ and MOVD stores from register to memory.
	B1H	MMX_SAT_INSTR_EXEC	00H	Number of MMX Saturating Instructions Executed.	Available in Pentium II and Pentium III processors only.
	B2H	MMX_UOPS_EXEC	0FH	Number of MMX μ ops Executed.	Available in Pentium II and Pentium III processors only.
	B3H	MMX_INSTR_TYPE_EXEC	01H	MMX packed multiply instructions executed.	Available in Pentium II and Pentium III processors only.
			02H	MMX packed shift instructions executed.	
			04H	MMX pack operation instructions executed.	
			08H	MMX unpack operation instructions executed.	
			10H	MMX packed logical instructions executed.	
20H	MMX packed arithmetic instructions executed.				
CCH	FP_MMX_TRANS	00H	Transitions from MMX instruction to floating-point instructions.	Available in Pentium II and Pentium III processors only.	
		01H	Transitions from floating-point instructions to MMX instructions.		
CDH	MMX_ASSIST	00H	Number of MMX Assists (that is, the number of EMMS instructions executed).	Available in Pentium II and Pentium III processors only.	
CEH	MMX_INSTR_RET	00H	Number of MMX Instructions Retired.	Available in Pentium II processors only.	

Table A-22. Events That Can Be Counted with the P6 Family Performance-Monitoring Counters (Contd.)

Unit	Event Num.	Mnemonic Event Name	Unit Mask	Description	Comments
Segment Register Renaming	D4H	SEG_RENAME_STALLS		Number of Segment Register Renaming Stalls:	Available in Pentium II and Pentium III processors only.
			02H	Segment register ES	
			04H	Segment register DS	
			08H	Segment register FS	
			0FH	Segment register FS	
				Segment registers ES + DS + FS + GS	
	D5H	SEG_REG_RENAMES		Number of Segment Register Renames:	Available in Pentium II and Pentium III processors only.
			01H	Segment register ES	
			02H	Segment register DS	
			04H	Segment register FS	
			08H	Segment register FS	
			0FH	Segment registers ES + DS + FS + GS	
D6H	RET_SEG_RENAMES	00H	Number of segment register rename events retired.	Available in Pentium II and Pentium III processors only.	

NOTES:

1. Several L2 cache events, where noted, can be further qualified using the Unit Mask (UMSK) field in the PerfEvtSel0 and PerfEvtSel1 registers. The lower 4 bits of the Unit Mask field are used in conjunction with L2 events to indicate the cache state or cache states involved.

The P6 family processors identify cache states using the "MESI" protocol and consequently each bit in the Unit Mask field represents one of the four states: UMSK[3] = M (8H) state, UMSK[2] = E (4H) state, UMSK[1] = S (2H) state, and UMSK[0] = I (1H) state. UMSK[3:0] = MESI" (FH) should be used to collect data for all states; UMSK = 0H, for the applicable events, will result in nothing being counted.

2. All of the external bus logic (EBL) events, except where noted, can be further qualified using the Unit Mask (UMSK) field in the PerfEvtSel0 and PerfEvtSel1 registers.

Bit 5 of the UMSK field is used in conjunction with the EBL events to indicate whether the processor should count transactions that are self-generated (UMSK[5] = 0) or transactions that result from any processor on the bus (UMSK[5] = 1).

3. L2 cache locks, so it is possible to have a zero count.

A.12 PENTIUM PROCESSOR PERFORMANCE-MONITORING EVENTS

Table A-23 lists the events that can be counted with the performance-monitoring counters for the Pentium processor. The Event Number column gives the hexadecimal code that identifies the event and that is entered in the ES0 or ES1 (event select) fields of the CESR MSR. The Mnemonic Event Name column gives the name of the event, and the Description and Comments columns give detailed descriptions of the events. Most events can be counted with either counter 0 or counter 1; however, some events can only be counted with only counter 0 or only counter 1 (as noted).

NOTE

The events in the table that are shaded are implemented only in the Pentium processor with MMX technology.

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters

Event Num.	Mnemonic Event Name	Description	Comments
00H	DATA_READ	Number of memory data reads (internal data cache hit and miss combined).	Split cycle reads are counted individually. Data Memory Reads that are part of TLB miss processing are not included. These events may occur at a maximum of two per clock. I/O is not included.
01H	DATA_WRITE	Number of memory data writes (internal data cache hit and miss combined); I/O not included.	Split cycle writes are counted individually. These events may occur at a maximum of two per clock. I/O is not included.
0H2	DATA_TLB_MISS	Number of misses to the data cache translation look-aside buffer.	

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
03H	DATA_READ_MISS	Number of memory read accesses that miss the internal data cache whether or not the access is cacheable or noncacheable.	Additional reads to the same cache line after the first BRDY# of the burst line fill is returned but before the final (fourth) BRDY# has been returned, will not cause the counter to be incremented additional times. Data accesses that are part of TLB miss processing are not included. Accesses directed to I/O space are not included.
04H	DATA_WRITE_MISS	Number of memory write accesses that miss the internal data cache whether or not the access is cacheable or noncacheable.	Data accesses that are part of TLB miss processing are not included. Accesses directed to I/O space are not included.
05H	WRITE_HIT_TO_M-OR-E-STATE_LINES	Number of write hits to exclusive or modified lines in the data cache.	These are the writes that may be held up if EWBE# is inactive. These events may occur a maximum of two per clock.
06H	DATA_CACHE_LINES_WRITTEN_BACK	Number of dirty lines (all) that are written back, regardless of the cause.	Replacements and internal and external snoops can all cause writeback and are counted.
07H	EXTERNAL_SNOOPS	Number of accepted external snoops whether they hit in the code cache or data cache or neither.	Assertions of EADS# outside of the sampling interval are not counted, and no internal snoops are counted.
08H	EXTERNAL_DATA_CACHE_SNOOP_HITS	Number of external snoops to the data cache.	Snoop hits to a valid line in either the data cache, the data line fill buffer, or one of the write back buffers are all counted as hits.
09H	MEMORY_ACCESSES_IN_BOTH_PIPES	Number of data memory reads or writes that are paired in both pipes of the pipeline.	These accesses are not necessarily run in parallel due to cache misses, bank conflicts, etc.
0AH	BANK_CONFLICTS	Number of actual bank conflicts.	

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
0BH	MISALIGNED DATA MEMORY OR I/O REFERENCES	Number of memory or I/O reads or writes that are misaligned.	A 2- or 4-byte access is misaligned when it crosses a 4-byte boundary; an 8-byte access is misaligned when it crosses an 8-byte boundary. Ten byte accesses are treated as two separate accesses of 8 and 2 bytes each.
0CH	CODE READ	Number of instruction reads; whether the read is cacheable or noncacheable.	Individual 8-byte noncacheable instruction reads are counted.
0DH	CODE TLB MISS	Number of instruction reads that miss the code TLB whether the read is cacheable or noncacheable.	Individual 8-byte noncacheable instruction reads are counted.
0EH	CODE CACHE MISS	Number of instruction reads that miss the internal code cache; whether the read is cacheable or noncacheable.	Individual 8-byte noncacheable instruction reads are counted.
0FH	ANY SEGMENT REGISTER LOADED	Number of writes into any segment register in real or protected mode including the LDTR, GDTR, IDTR, and TR.	Segment loads are caused by explicit segment register load instructions, far control transfers, and task switches. Far control transfers and task switches causing a privilege level change will signal this event twice. Interrupts and exceptions may initiate a far control transfer.
10H	Reserved		
11H	Reserved		

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
12H	Branches	Number of taken and not taken branches, including: conditional branches, jumps, calls, returns, software interrupts, and interrupt returns.	Also counted as taken branches are serializing instructions, VERR and VERW instructions, some segment descriptor loads, hardware interrupts (including FLUSH#), and programmatic exceptions that invoke a trap or fault handler. The pipe is not necessarily flushed. The number of branches actually executed is measured, not the number of predicted branches.
13H	BTB_HITS	Number of BTB hits that occur.	Hits are counted only for those instructions that are actually executed.
14H	TAKEN_BRANCH_OR_BT_HIT	Number of taken branches or BTB hits that occur.	This event type is a logical OR of taken branches and BTB hits. It represents an event that may cause a hit in the BTB. Specifically, it is either a candidate for a space in the BTB or it is already in the BTB.
15H	PIPELINE FLUSHES	Number of pipeline flushes that occur Pipeline flushes are caused by BTB misses on taken branches, mispredictions, exceptions, interrupts, and some segment descriptor loads.	The counter will not be incremented for serializing instructions (serializing instructions cause the prefetch queue to be flushed but will not trigger the Pipeline Flushed event counter) and software interrupts (software interrupts do not flush the pipeline).

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
16H	INSTRUCTIONS_EXECUTED	Number of instructions executed (up to two per clock).	<p>Invocations of a fault handler are considered instructions. All hardware and software interrupts and exceptions will also cause the count to be incremented. Repeat prefixed string instructions will only increment this counter once despite the fact that the repeat loop executes the same instruction multiple times until the loop criteria is satisfied.</p> <p>This applies to all the Repeat string instruction prefixes (i.e., REP, REPE, REPZ, REPNE, and REPNZ). This counter will also only increment once per each HLT instruction executed regardless of how many cycles the processor remains in the HALT state.</p>
17H	INSTRUCTIONS_EXECUTED_V PIPE	<p>Number of instructions executed in the V_pipe.</p> <p>The event indicates the number of instructions that were paired.</p>	This event is the same as the 16H event except it only counts the number of instructions actually executed in the V-pipe.
18H	BUS_CYCLE_DURATION	<p>Number of clocks while a bus cycle is in progress.</p> <p>This event measures bus use.</p>	The count includes HLDA, AHOLD, and BOFF# clocks.
19H	WRITE_BUFFER_FULL_STALL_DURATION	Number of clocks while the pipeline is stalled due to full write buffers.	Full write buffers stall data memory read misses, data memory write misses, and data memory write hits to S-state lines. Stalls on I/O accesses are not included.
1AH	WAITING_FOR_DATA_MEMORY_READ_STALL_DURATION	Number of clocks while the pipeline is stalled while waiting for data memory reads.	Data TLB Miss processing is also included in the count. The pipeline stalls while a data memory read is in progress including attempts to read that are not bypassed while a line is being filled.

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
1BH	STALL ON WRITE TO AN E- OR M-STATE LINE	Number of stalls on writes to E- or M-state lines.	
1CH	LOCKED BUS CYCLE	Number of locked bus cycles that occur as the result of the LOCK prefix or LOCK instruction, page-table updates, and descriptor table updates.	Only the read portion of the locked read-modify-write is counted. Split locked cycles (SCYC active) count as two separate accesses. Cycles restarted due to BOFF# are not re-counted.
1DH	I/O READ OR WRITE CYCLE	Number of bus cycles directed to I/O space.	Misaligned I/O accesses will generate two bus cycles. Bus cycles restarted due to BOFF# are not re-counted.
1EH	NONCACHEABLE_MEMORY_READS	Number of noncacheable instruction or data memory read bus cycles. The count includes read cycles caused by TLB misses, but does not include read cycles to I/O space.	Cycles restarted due to BOFF# are not re-counted.
1FH	PIPELINE_AGI_STALLS	Number of address generation interlock (AGI) stalls. An AGI occurring in both the U- and V- pipelines in the same clock signals this event twice.	An AGI occurs when the instruction in the execute stage of either of U- or V-pipelines is writing to either the index or base address register of an instruction in the D2 (address generation) stage of either the U- or V- pipelines.
20H	Reserved		
21H	Reserved		

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
22H	FLOPS	Number of floating-point operations that occur.	<p>Number of floating-point adds, subtracts, multiplies, divides, remainders, and square roots are counted. The transcendental instructions consist of multiple adds and multiplies and will signal this event multiple times. Instructions generating the divide-by-zero, negative square root, special operand, or stack exceptions will not be counted.</p> <p>Instructions generating all other floating-point exceptions will be counted. The integer multiply instructions and other instructions which use the x87 FPU will be counted.</p>
23H	BREAKPOINT MATCH ON DR0 REGISTER	Number of matches on register DR0 breakpoint.	<p>The counters is incremented regardless if the breakpoints are enabled or not. However, if breakpoints are not enabled, code breakpoint matches will not be checked for instructions executed in the V-pipe and will not cause this counter to be incremented. (They are checked on instruction executed in the U-pipe only when breakpoints are not enabled.)</p> <p>These events correspond to the signals driven on the BP[3:0] pins. Refer to Chapter 16, "Debugging, Profiling Branches and Time-Stamp Counter" for more information.</p>
24H	BREAKPOINT MATCH ON DR1 REGISTER	Number of matches on register DR1 breakpoint.	See comment for 23H event.
25H	BREAKPOINT MATCH ON DR2 REGISTER	Number of matches on register DR2 breakpoint.	See comment for 23H event.

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
26H	BREAKPOINT MATCH ON DR3 REGISTER	Number of matches on register DR3 breakpoint.	See comment for 23H event.
27H	HARDWARE INTERRUPTS	Number of taken INTR and NMI interrupts.	
28H	DATA_READ_OR_WRITE	Number of memory data reads and/or writes (internal data cache hit and miss combined).	Split cycle reads and writes are counted individually. Data Memory Reads that are part of TLB miss processing are not included. These events may occur at a maximum of two per clock. I/O is not included.
29H	DATA_READ_MISS OR_WRITE MISS	Number of memory read and/or write accesses that miss the internal data cache, whether or not the access is cacheable or noncacheable.	Additional reads to the same cache line after the first BRDY# of the burst line fill is returned but before the final (fourth) BRDY# has been returned, will not cause the counter to be incremented additional times. Data accesses that are part of TLB miss processing are not included. Accesses directed to I/O space are not included.
2AH	BUS_OWNERSHIP_LATENCY (Counter 0)	The time from LRM bus ownership request to bus ownership granted (that is, the time from the earlier of a PBREQ (0), PHITM# or HITM# assertion to a PBGNT assertion)	The ratio of the 2AH events counted on counter 0 and counter 1 is the average stall time due to bus ownership conflict.
2AH	BUS_OWNERSHIP_TRANSFERS (Counter 1)	The number of bus ownership transfers (that is, the number of PBREQ (0) assertions)	The ratio of the 2AH events counted on counter 0 and counter 1 is the average stall time due to bus ownership conflict.
2BH	MMX_INSTRUCTIONS_EXECUTED_U-PIPE (Counter 0)	Number of MMX instructions executed in the U-pipe	

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
2BH	MMX_INSTRUCTIONS_EXECUTED_V-PIPE (Counter 1)	Number of MMX instructions executed in the V-pipe	
2CH	CACHE_M-STATE_LINE_SHARING (Counter 0)	Number of times a processor identified a hit to a modified line due to a memory access in the other processor (PHITM (0))	If the average memory latencies of the system are known, this event enables the user to count the Write Backs on PHITM(0) penalty and the Latency on Hit Modified(I) penalty.
2CH	CACHE_LINE_SHARING (Counter 1)	Number of shared data lines in the L1 cache (PHIT (0))	
2DH	EMMS_INSTRUCTIONS_EXECUTED (Counter 0)	Number of EMMS instructions executed	
2DH	TRANSITIONS_BETWEEN_MMX_AND_FP_INSTRUCTIONS (Counter 1)	Number of transitions between MMX and floating-point instructions or vice versa An even count indicates the processor is in MMX state. an odd count indicates it is in FP state.	This event counts the first floating-point instruction following an MMX instruction or first MMX instruction following a floating-point instruction. The count may be used to estimate the penalty in transitions between floating-point state and MMX state.
2EH	BUS_UTILIZATION_DUE_TO_PROCESSOR_ACTIVITY (Counter 0)	Number of clocks the bus is busy due to the processor's own activity (the bus activity that is caused by the processor)	
2EH	WRITES_TO_NONCACHEABLE_MEMORY (Counter 1)	Number of write accesses to noncacheable memory	The count includes write cycles caused by TLB misses and I/O write cycles. Cycles restarted due to BOFF# are not re-counted.

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
2FH	SATURATING_MMX_INSTRUCTIONS_EXECUTED (Counter 0)	Number of saturating MMX instructions executed, independently of whether they actually saturated.	
2FH	SATURATIONS_PERFORMED (Counter 1)	Number of MMX instructions that used saturating arithmetic when at least one of its results actually saturated	If an MMX instruction operating on 4 doublewords saturated in three out of the four results, the counter will be incremented by one only.
30H	NUMBER_OF_CYCLES_NOT_IN_HALT_STATE (Counter 0)	Number of cycles the processor is not idle due to HLT instruction	This event will enable the user to calculate "net CPI". Note that during the time that the processor is executing the HLT instruction, the Time-Stamp Counter is not disabled. Since this event is controlled by the Counter Controls CCO, CC1 it can be used to calculate the CPI at CPL=3, which the TSC cannot provide.
30H	DATA_CACHE_TLB_MISS_STALL_DURATION (Counter 1)	Number of clocks the pipeline is stalled due to a data cache translation look-aside buffer (TLB) miss	
31H	MMX_INSTRUCTION_DATA_READS (Counter 0)	Number of MMX instruction data reads	
31H	MMX_INSTRUCTION_DATA_READ_MISSES (Counter 1)	Number of MMX instruction data read misses	
32H	FLOATING_POINT_STALLS_DURATION (Counter 0)	Number of clocks while pipe is stalled due to a floating-point freeze	

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
32H	TAKEN_BRANCHES (Counter 1)	Number of taken branches	
33H	D1_STARVATION_ AND_FIFO_IS_EMPTY (Counter 0)	Number of times D1 stage cannot issue ANY instructions since the FIFO buffer is empty	The D1 stage can issue 0, 1, or 2 instructions per clock if those are available in an instructions FIFO buffer.
33H	D1_STARVATION_ AND_ONLY_ONE_INSTRUCTION_IN_FIFO (Counter 1)	Number of times the D1 stage issues a single instruction (since the FIFO buffer had just one instruction ready)	The D1 stage can issue 0, 1, or 2 instructions per clock if those are available in an instructions FIFO buffer. When combined with the previously defined events, Instruction Executed (16H) and Instruction Executed in the V-pipe (17H), this event enables the user to calculate the numbers of time pairing rules prevented issuing of two instructions.
34H	MMX_INSTRUCTION_DATA_WRITES (Counter 0)	Number of data writes caused by MMX instructions	
34H	MMX_INSTRUCTION_DATA_WRITE_MISSES (Counter 1)	Number of data write misses caused by MMX instructions	

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
35H	PIPELINE_FLUSHES_DUE_TO_WRONG_BRANCH_PREDICTIONS (Counter 0)	Number of pipeline flushes due to wrong branch predictions resolved in either the E-stage or the WB-stage	The count includes any pipeline flush due to a branch that the pipeline did not follow correctly. It includes cases where a branch was not in the BTB, cases where a branch was in the BTB but was mispredicted, and cases where a branch was correctly predicted but to the wrong address. Branches are resolved in either the Execute stage (E-stage) or the Writeback stage (WB-stage). In the later case, the misprediction penalty is larger by one clock. The difference between the 35H event count in counter 0 and counter 1 is the number of E-stage resolved branches.
35H	PIPELINE_FLUSHES_DUE_TO_WRONG_BRANCH_PREDICTIONS_RESOLVED_IN_WB-STAGE (Counter 1)	Number of pipeline flushes due to wrong branch predictions resolved in the WB-stage	See note for event 35H (Counter 0).
36H	MISALIGNED_DATA_MEMORY_REFERENCE_ON_MMX_INSTRUCTIONS (Counter 0)	Number of misaligned data memory references when executing MMX instructions	
36H	PIPELINE_ISTALL_FOR_MMX_INSTRUCTION_DATA_MEMORY_READS (Counter 1)	Number clocks during pipeline stalls caused by waits form MMX instruction data memory reads	T3:

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
37H	MISPREDICTED_OR_UNPREDICTED_RETURNS (Counter 1)	Number of returns predicted incorrectly or not predicted at all	The count is the difference between the total number of executed returns and the number of returns that were correctly predicted. Only RET instructions are counted (for example, IRET instructions are not counted).
37H	PREDICTED_RETURNS (Counter 1)	Number of predicted returns (whether they are predicted correctly and incorrectly)	Only RET instructions are counted (for example, IRET instructions are not counted).
38H	MMX_MULTIPLY_UNIT_INTERLOCK (Counter 0)	Number of clocks the pipe is stalled since the destination of previous MMX multiply instruction is not ready yet	The counter will not be incremented if there is another cause for a stall. For each occurrence of a multiply interlock, this event will be counted twice (if the stalled instruction comes on the next clock after the multiply) or by once (if the stalled instruction comes two clocks after the multiply).
38H	MOVD/MOVQ_STORE_STALL_DUE_TO_PREVIOUS_MMX_OPERATION (Counter 1)	Number of clocks a MOVD/MOVQ instruction store is stalled in D2 stage due to a previous MMX operation with a destination to be used in the store instruction.	
39H	RETURNS (Counter 0)	Number of returns executed.	Only RET instructions are counted; IRET instructions are not counted. Any exception taken on a RET instruction and any interrupt recognized by the processor on the instruction boundary prior to the execution of the RET instruction will also cause this counter to be incremented.
39H	Reserved		

Table A-23. Events That Can Be Counted with Pentium Processor Performance-Monitoring Counters (Contd.)

Event Num.	Mnemonic Event Name	Description	Comments
3AH	BTB_FALSE_ENTRIES (Counter 0)	Number of false entries in the Branch Target Buffer	False entries are causes for misprediction other than a wrong prediction.
3AH	BTB_MISS_PREDICTION_ON_NOT-TAKEN_BRANCH (Counter 1)	Number of times the BTB predicted a not-taken branch as taken	
3BH	FULL_WRITE_BUFFER_STALL_DURATION_WHILE_EXECUTING_MMX_INSTRUCTIONS (Counter 0)	Number of clocks while the pipeline is stalled due to full write buffers while executing MMX instructions	
3BH	STALL_ON_MMX_INSTRUCTION_WRITE_TO_E-OR_M-STATE_LINE (Counter 1)	Number of clocks during stalls on MMX instructions writing to E- or M-state lines	

PERFORMANCE-MONITORING EVENTS

APPENDIX B

MODEL-SPECIFIC REGISTERS (MSRS)

This appendix lists MSRs provided in Intel® Core™ 2 processor family, Intel® Atom™, Intel® Core™ Duo, Intel® Core™ Solo, Pentium® 4 and Intel® Xeon® processors, P6 family processors, and Pentium® processors in Tables B-13, B-18, and B-19, respectively. All MSRs listed can be read with the RDMSR and written with the WRMSR instructions.

Register addresses are given in both hexadecimal and decimal. The register name is the mnemonic register name and the bit description describes individual bits in registers.

Model specific registers and its bit-fields may be supported for a finite range of processor families/models. To distinguish between different processor family and/or models, software must use CPUID.01H leaf function to query the combination of DisplayFamily and DisplayModel to determine model-specific availability of MSRs (see CPUID instruction in Chapter 3, "Instruction Set Reference, A-M" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A*). Table B-1 lists the signature values of DisplayFamily and DisplayModel for various processor families or processor number series.

Table B-1. CPUID Signature Values of DisplayFamily_DisplayModel

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_2DH	Next Generation Intel Xeon processor
06_2FH	Intel Xeon processor E7 family
06_2AH	Intel Xeon processor E3 family; Second Generation Intel Core i7, i5, i3 Processors 2xxx Series
06_2EH	Intel Xeon processor 7500, 6500 series
06_25H, 06_2CH	Intel Xeon processors 3600, 5600 series, Intel Core i7, i5 and i3 Processors
06_1EH, 06_1FH	Intel Core i7 and i5 Processors
06_1AH	Intel Core i7 Processor, Intel Xeon Processor 3400, 3500, 5500 series
06_1DH	Intel Xeon Processor MP 7400 series
06_17H	Intel Xeon Processor 3100, 3300, 5200, 5400 series, Intel Core 2 Quad processors 8000, 9000 series
06_0FH	Intel Xeon Processor 3000, 3200, 5100, 5300, 7300 series, Intel Core 2 Quad processor 6000 series, Intel Core 2 Extreme 6000 series, Intel Core 2 Duo 4000, 5000, 6000, 7000 series processors, Intel Pentium dual-core processors

Table B-1. CPUID Signature (Contd.)Values of DisplayFamily_DisplayModel (Contd.)

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_0EH	Intel Core Duo, Intel Core Solo processors
06_0DH	Intel Pentium M processor
06_1CH	Intel Atom processor
0F_06H	Intel Xeon processor 7100, 5000 Series, Intel Xeon Processor MP, Intel Pentium 4, Pentium D processors
0F_03H, 0F_04H	Intel Xeon Processor, Intel Xeon Processor MP, Intel Pentium 4, Pentium D processors
06_09H	Intel Pentium M processor
0F_02H	Intel Xeon Processor, Intel Xeon Processor MP, Intel Pentium 4 processors
0F_0H, 0F_01H	Intel Xeon Processor, Intel Xeon Processor MP, Intel Pentium 4 processors
06_7H, 06_08H, 06_0AH, 06_0BH	Intel Pentium III Xeon Processor, Intel Pentium III Processor
06_03H, 06_05H	Intel Pentium II Xeon Processor, Intel Pentium II Processor
06_01H	Intel Pentium Pro Processor
05_01H, 05_02H, 05_04H	Intel Pentium Processor, Intel Pentium Processor with MMX Technology

B.1 ARCHITECTURAL MSRS

Many MSRs have carried over from one generation of IA-32 processors to the next and to Intel 64 processors. A subset of MSRs and associated bit fields, which do not change on future processor generations, are now considered architectural MSRs. For historical reasons (beginning with the Pentium 4 processor), these “architectural MSRs” were given the prefix “IA32_”. Table B-2 lists the architectural MSRs, their addresses, their current names, their names in previous IA-32 processors, and bit fields that are considered architectural. MSR addresses outside Table B-2 and certain bitfields in an MSR address that may overlap with architectural MSR addresses are model-specific. Code that accesses a machine specified MSR and that is executed on a processor that does not support that MSR will generate an exception.

Architectural MSR or individual bit fields in an architectural MSR may be introduced or transitioned at the granularity of certain processor family/model or the presence of certain CPUID feature flags. The right-most column of Table B-2 provides information on the introduction of each architectural MSR or its individual fields. This information is expressed either as signature values of “DF_DM” (see Table B-1) or via CPUID flags.

Certain bit field position may be related to the maximum physical address width, the value of which is expressed as "MAXPHYWID" in Table B-2. "MAXPHYWID" is reported by CPUID.8000_0008H leaf.

MSR address range between 40000000H - 400000FFH is marked as a specially reserved range. All existing and future processors will not implement any features using any MSR in this range.

Table B-2. IA-32 Architectural MSRs

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Introduced as Architectural MSR
Hex	Decimal			
0H	0	IA32_P5_MC_ADDR (P5_MC_ADDR)	See Appendix B.12, "MSRs in Pentium Processors."	Pentium Processor (05_01H)
1H	1	IA32_P5_MC_TYPE (P5_MC_TYPE)	See Appendix B.12, "MSRs in Pentium Processors."	DF_DM = 05_01H
6H	6	IA32_MONITOR_FILTER_SIZE	See Section 8.10.5, "Monitor/Mwait Address Range Determination."	0F_03H
10H	16	IA32_TIME_STAMP_COUNTER (TSC)	See Section 16.12, "Time-Stamp Counter."	05_01H
17H	23	IA32_PLATFORM_ID (MSR_PLATFORM_ID)	Platform ID. (RO) The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.	06_01H
		49:0	Reserved.	
		52:50	Platform Id. (RO) Contains information concerning the intended platform for the processor. 52 51 50 0 0 0 Processor Flag 0 0 0 1 Processor Flag 1 0 1 0 Processor Flag 2 0 1 1 Processor Flag 3 1 0 0 Processor Flag 4 1 0 1 Processor Flag 5 1 1 0 Processor Flag 6 1 1 1 Processor Flag 7	
		63:53	Reserved.	

Table B-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Introduced as Architectural MSR
Hex	Decimal			
1BH	27	IA32_APIC_BASE (APIC_BASE)		06_01H
		7:0	Reserved	
		8	BSP flag (R/W)	
		9	Reserved	
		10	Enable x2APIC mode	06_1AH
		11	APIC Global Enable (R/W)	
		(MAXPHYWID - 1):12	APIC Base (R/W)	
		63: MAXPHYWID	Reserved	
3AH	58	IA32_FEATURE_CONTROL	Control Features in Intel 64 Processor. (R/W)	If CPUID.01H: ECX[bit 5 or bit 6] = 1
		0	Lock bit (R/WO): (1 = locked). When set, locks this MSR from being written, writes to this bit will result in GP(0). Note: Once the Lock bit is set, the contents of this register cannot be modified. Therefore the lock bit must be set after configuring support for Intel Virtualization Technology and prior to transferring control to an option ROM or the OS. Hence, once the Lock bit is set, the entire IA32_FEATURE_CONTROL_MSR contents are preserved across RESET when PWRGOOD is not deasserted.	If CPUID.01H:ECX[bit 5 or bit 6] = 1

Table B-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Introduced as Architectural MSR
Hex	Decimal			
		1	Enable VMX inside SMX operation (R/WL): This bit enables a system executive to use VMX in conjunction with SMX to support Intel® Trusted Execution Technology. BIOS must set this bit only when the CPUID function 1 returns VMX feature flag and SMX feature flag set (ECX bits 5 and 6 respectively).	If CPUID.01H:ECX[bit 5 and bit 6] are set to 1
		2	Enable VMX outside SMX operation (R/WL): This bit enables VMX for system executive that do not require SMX.. BIOS must set this bit only when the CPUID function 1 returns VMX feature flag set (ECX bit 5).	If CPUID.01H:ECX[bit 5 or bit 6] = 1
		7:3	Reserved	
		14:8	SENTER Local Function Enables (R/WL): When set, each bit in the field represents an enable control for a corresponding SENTER function. This bit is supported only if CPUID.1:ECX.[bit 6] is set	If CPUID.01H:ECX[bit 6] = 1
		15	SENTER Global Enable (R/WL): This bit must be set to enable SENTER leaf functions. This bit is supported only if CPUID.1:ECX.[bit 6] is set	If CPUID.01H:ECX[bit 6] = 1
		63:16	Reserved

4000_0000H - 4000_00FFH		Reserved MSR Address Space	All existing and future processors will not implement MSR in this range	
C000_0080H		IA32_EFER	Extended Feature Enables.	If (CPUID.80000001. EDX.[bit 20] or CPUID.80000001. EDX.[bit29])
	0		SYSCALL Enable. (R/W) Enables SYSCALL/SYSRET instructions in 64-bit mode.	
	7:1		Reserved.	
	8		IA-32e Mode Enable. (R/W) Enables IA-32e mode operation.	
	9		Reserved.	
	10		IA-32e Mode Active. (R) Indicates IA-32e mode is active when set.	
	11		Execute Disable Bit Enable. (R)	
	63:12		Reserved	

Table B-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name and bit fields (Former MSR Name)	MSR/Bit Description	Introduced as Architectural MSR
Hex	Decimal			
C000_0081H		IA32_STAR	System Call Target Address. (R/W)	If CPUID.80000001.EDX.[bit 29] = 1
C000_0082H		IA32_LSTAR	IA-32e Mode System Call Target Address. (R/W)	If CPUID.80000001.EDX.[bit 29] = 1
C000_0084H		IA32_FMASK	System Call Flag Mask. (R/W)	If CPUID.80000001.EDX.[bit 29] = 1
C000_0100H		IA32_FS_BASE	Map of BASE Address of FS. (R/W)	If CPUID.80000001.EDX.[bit 29] = 1
C000_0101H		IA32_GS_BASE	Map of BASE Address of GS. (R/W)	If CPUID.80000001.EDX.[bit 29] = 1
C000_0102H		IA32_KERNEL_GS_BASE	Swap Target of BASE Address of GS. (R/W)	If CPUID.80000001.EDX.[bit 29] = 1
C000_0103H		IA32_TSC_AUX	Auxiliary TSC (RW)	If CPUID.80000001H: EDX[27] = 1
		31:0	AUX: Auxiliary signature of TSC	
		63:32	Reserved	

NOTES:

1. In processors based on Intel NetBurst® microarchitecture, MSR addresses 180H-197H are supported, software must treat them as model-specific. Starting with Intel Core Duo processors, MSR addresses 180H-185H, 188H-197H are reserved.
2. The *_ADDR MSRs may or may not be present; this depends on flag settings in IA32_MCI_STATUS. See Section 15.3.2.3 and Section 15.3.2.4 for more information.

B.2 MSRS IN THE INTEL® CORE™ 2 PROCESSOR FAMILY

Table B-3 lists model-specific registers (MSRs) for Intel Core 2 processor family and for Intel Xeon processors based on Intel Core microarchitecture, architectural MSR

addresses are also included in Table B-3. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_0FH, see Table B-1.

MSRs listed in Table B-2 and Table B-3 are also supported by processors based on the Enhanced Intel Core microarchitecture. Processors based on the Enhanced Intel Core microarchitecture have the CPUID signature DisplayFamily_DisplayModel of 06_17H.

The column “Shared/Unique” applies to multi-core processors based on Intel Core microarchitecture. “Unique” means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. “Shared” means the MSR or the bit field in an MSR address governs the operation of both processor cores.

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture

Register Address		Register Name	Shared/Unique	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Unique	See Appendix B.12, “MSRs in Pentium Processors.”
1H	1	IA32_P5_MC_TYPE	Unique	See Appendix B.12, “MSRs in Pentium Processors.”
6H	6	IA32_MONITOR_FILTER_SIZE	Unique	See Section 8.10.5, “Monitor/Mwait Address Range Determination.” and Table B-2
10H	16	IA32_TIME_STAMP_COUNTER	Unique	See Section 16.12, “Time-Stamp Counter.” and see Table B-2
17H	23	IA32_PLATFORM_ID	Shared	Platform ID. (R) See Table B-2.
17H	23	MSR_PLATFORM_ID	Shared	Model Specific Platform ID. (R)
		7:0		Reserved.
		12:8		Maximum Qualified Ratio. (R) The maximum allowed bus ratio.
		49:13		Reserved.
		52:50		See Table B-2.
		63:53		Reserved.
1BH	27	IA32_APIC_BASE	Unique	See Section 10.4.4, “Local APIC Status and Location.” and Table B-2
2AH	42	MSR_EBL_CR_POWERON	Shared	Processor Hard Power-On Configuration. (R/W) Enables and disables processor features; (R) indicates current processor configuration.

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		0		Reserved
		1		Data Error Checking Enable. (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		2		Response Error Checking Enable. (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		3		MCERR# Drive Enable. (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		4		Address Parity Enable. (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		5		Reserved
		6		Reserved
		7		BINIT# Driver Enable. (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		8		Output Tri-state Enabled. (R/O) 1 = Enabled; 0 = Disabled
		9		Execute BIST. (R/O) 1 = Enabled; 0 = Disabled
		10		MCERR# Observation Enabled. (R/O) 1 = Enabled; 0 = Disabled
		11		Intel TXT Capable Chipset. (R/O) 1 = Present; 0 = Not Present
		12		BINIT# Observation Enabled. (R/O) 1 = Enabled; 0 = Disabled
		13		Reserved

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		14		1 MByte Power on Reset Vector. (R/O) 1 = 1 MByte; 0 = 4 GBytes
		15		Reserved
		17:16		APIC Cluster ID. (R/O)
		18		N/2 Non-Integer Bus Ratio. (R/O) 0 = Integer ratio; 1 = Non-integer ratio
		19		Reserved.
		21: 20		Symmetric Arbitration ID. (R/O)
		26:22		Integer Bus Frequency Ratio. (R/O)
3AH	58	IA32_FEATURE_CONTROL	Unique	Control Features in Intel 64Processor. (R/w). see Table B-2
		3	Unique	SMRR Enable. (R/wL). When this bit is set and the lock bit is set makes the SMRR_PHYS_BASE and SMRR_PHYS_MASK registers read visible and writeable while in SMM.
40H	64	MSR_LASTBRANCH_0_FROM_IP	Unique	Last Branch Record 0 From IP. (R/w) One of four pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the source instruction for one of the last four branches, exceptions, or interrupts taken by the processor. See also: <ul style="list-style-type: none"> ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 16.10, “Last Branch, Interrupt, and Exception Recording (Pentium M Processors).”
41H	65	MSR_LASTBRANCH_1_FROM_IP	Unique	Last Branch Record 1 From IP. (R/w) See description of MSR_LASTBRANCH_0_FROM_IP.

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
42H	66	MSR_ LASTBRANCH_2_F ROM_IP	Unique	Last Branch Record 2 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
43H	67	MSR_ LASTBRANCH_3_F ROM_IP	Unique	Last Branch Record 3 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
60H	96	MSR_ LASTBRANCH_0_ TO_LIP	Unique	Last Branch Record 0 To IP. (R/W) One of four pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the destination instruction for one of the last four branches, exceptions, or interrupts taken by the processor.
61H	97	MSR_ LASTBRANCH_1_ TO_LIP	Unique	Last Branch Record 1 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
62H	98	MSR_ LASTBRANCH_2_ TO_LIP	Unique	Last Branch Record 2 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
63H	99	MSR_ LASTBRANCH_3_ TO_LIP	Unique	Last Branch Record 3 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
79H	121	IA32_BIOS_ UPDT_TRIG	Unique	BIOS Update Trigger Register. (W) see Table B-2
8BH	139	IA32_BIOS_ SIGN_ID	Unique	BIOS Update Signature ID. (RO) see Table B-2
AOH	160	MSR_SMRR_PHYS BASE	Unique	System Management Mode Base Address register. (WO in SMM) Model-specific implementation of SMRR-like interface, read visible and write only in SMM.
		11:0		Reserved
		31:12		PhysBase. SMRR physical Base Address.

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		63:32		Reserved
A1H	161	MSR_SMRR_PHYS MASK	Unique	System Management Mode Physical Address Mask register. (WO in SMM) Model-specific implementation of SMRR-like interface, read visible and write only in SMM..
		10:0		Reserved
		11		Valid. Physical address base and range mask are valid
		31:12		PhysMask. SMRR physical address range mask.
		63:32		Reserved
C1H	193	IA32_PMC0	Unique	Performance counter register. see Table B-2
C2H	194	IA32_PMC1	Unique	Performance counter register. see Table B-2
CDH	205	MSR_FSB_FREQ	Shared	Scaleable Bus Speed(R0). This field indicates the intended scaleable bus clock speed for processors based on Intel Core microarchitecture:
		2:0		<ul style="list-style-type: none"> ▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) ▪ 010B: 200 MHz (FSB 800) ▪ 000B: 267 MHz (FSB 1067) ▪ 100B: 333 MHz (FSB 1333) <p>133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B.</p> <p>166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.</p> <p>266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 000B.</p> <p>333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 100B.</p>

175H	373	IA32_SYSENTER_ESP	Unique	see Table B-2
176H	374	IA32_SYSENTER_EIP	Unique	see Table B-2
179H	377	IA32_MCG_CAP	Unique	see Table B-2
17AH	378	IA32_MCG_STATUS	Unique	
		0		RIPV. When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		1		EIPV. When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		MCIP. When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved.
186H	390	IA32_PERFEVTSELO	Unique	see Table B-2
187H	391	IA32_PERFEVTSEL1	Unique	see Table B-2
198H	408	IA32_PERF_STAT US	Shared	see Table B-2
198H	408	MSR_PERF_STATU S	Shared	
		15:0		Current Performance State Value.
		30:16		Reserved.
		31		XE Operation (R/O). If set, XE operation is enabled. Default is cleared.
		39:32		Reserved.
		44:40		Maximum Bus Ratio (R/O) Indicates maximum bus ratio configured for the processor.
		45		Reserved

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		46		Non-Integer Bus Ratio (R/O) Indicates non-integer bus ratio is enabled. Applies processors based on Enhanced Intel Core microarchitecture.
		63:47		Reserved.
199H	409	IA32_PERF_CTL	Unique	see Table B-2
19AH	410	IA32_CLOCK_MODULATION	Unique	Clock Modulation. (R/W) see Table B-2 IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.
19BH	411	IA32_THERM_INTERRUPT	Unique	Thermal Interrupt Control. (R/W) see Table B-2
19CH	412	IA32_THERM_STATUS	Unique	Thermal Monitor Status. (R/W) see Table B-2
19DH	413	MSR_THERM2_CTL	Unique	
		15:0		Reserved.
		16		TM_SELECT. (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 are enabled.
		63:16		Reserved.
1A0	416	IA32_MISC_ENABLE		Enable Misc. Processor Features. (R/W) Allows a variety of processor functions to be enabled and disabled.

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		0		Fast-Strings Enable. see Table B-2
		2:1		Reserved.
		3	Unique	Automatic Thermal Control Circuit Enable. (R/W) see Table B-2
		6:4		Reserved.
		7	Shared	Performance Monitoring Available. (R) see Table B-2
		8		Reserved.
		9		Hardware Prefetcher Disable. (R/W) When set, disables the hardware prefetcher operation on streams of data. When clear (default), enables the prefetch queue. Disabling of the hardware prefetcher may impact processor performance.
		10	Shared	FERR# Multiplexing Enable. (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor 0 = Indicates compatible FERR# signaling behavior This bit must be set to 1 to support XAPIC interrupt model usage.
		11	Shared	Branch Trace Storage Unavailable. (RO) see Table B-2
		12	Shared	Precise Event Based Sampling Unavailable. (RO) see Table B-2
		13	Shared	TM2 Enable. (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0.

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
				<p>When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state.</p> <p>The BIOS must enable this feature if the TM2 feature flag (CPUID.1:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location.</p> <p>The processor is operating out of specification if both this bit and the TM1 bit are set to 0.</p>
		15:14		Reserved.
		16	Shared	Enhanced Intel SpeedStep Technology Enable. (R/W) see Table B-2
		18	Shared	ENABLE MONITOR FSM. (R/W) see Table B-2
		19	Shared	<p>Adjacent Cache Line Prefetch Disable. (R/W)</p> <p>When set to 1, the processor fetches the cache line that contains data currently required by the processor. When set to 0, the processor fetches cache lines that comprise a cache line pair (128 bytes).</p> <p>Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing.</p> <p>BIOS may contain a setup option that controls the setting of this bit.</p>

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		20	Shared	<p>Enhanced Intel SpeedStep Technology Select Lock. (R/WO)</p> <p>When set, this bit causes the following bits to become read-only:</p> <ul style="list-style-type: none"> ▪ Enhanced Intel SpeedStep Technology Select Lock (this bit), ▪ Enhanced Intel SpeedStep Technology Enable bit. <p>The bit must be set before an Enhanced Intel SpeedStep Technology transition is requested. This bit is cleared on reset.</p>
		21		Reserved.
		22	Shared	Limit CPUID Maxval. (R/W) see Table B-2
		23	Shared	xTPR Message Disable. (R/W) see Table B-2
		33:24		Reserved.
		34	Unique	XD Bit Disable. (R/W) see Table B-2
		36:35		Reserved.
		37	Unique	<p>DCU Prefetcher Disable. (R/W)</p> <p>When set to 1, The DCU L1 data cache prefetcher is disabled. The default value after reset is 0. BIOS may write '1' to disable this feature.</p> <p>The DCU prefetcher is an L1 data cache prefetcher. When the DCU prefetcher detects multiple loads from the same line done within a time limit, the DCU prefetcher assumes the next line will be required. The next line is prefetched in to the L1 data cache from memory or L2.</p>

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		38	Shared	<p>IDA Disable. (R/W)</p> <p>When set to 1 on processors that support IDA, the Intel Dynamic Acceleration feature (IDA) is disabled and the IDA_Enable feature flag will be clear (CPUID.06H: EAX[1]=0).</p> <p>When set to a 0 on processors that support IDA, CPUID.06H: EAX[1] reports the processor's support of IDA is enabled.</p> <p>Note: the power-on default value is used by BIOS to detect hardware support of IDA. If power-on default value is 1, IDA is available in the processor. If power-on default value is 0, IDA is not available.</p>
		39	Unique	<p>IP Prefetcher Disable. (R/W)</p> <p>When set to 1, The IP prefetcher is disabled. The default value after reset is 0. BIOS may write '1' to disable this feature.</p> <p>The IP prefetcher is an L1 data cache prefetcher. The IP prefetcher looks for sequential load history to determine whether to prefetch the next expected data into the L1 cache from memory or L2.</p>
		63:40		Reserved.
1C9H	457	MSR_LASTBRANCH_TOS	Unique	<p>Last Branch Record Stack TOS. (R)</p> <p>Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).</p>
1D9H	473	IA32_DEBUGCTL	Unique	Debug Control. (R/W) see Table B-2
1DDH	477	MSR_LER_FROM_LIP	Unique	<p>Last Exception Record From Linear IP. (R)</p> <p>Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.</p>

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
1DEH	478	MSR_LER_TO_LIP	Unique	Last Exception Record To Linear IP. (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.
200H	512	IA32_MTRR_PHYS BASE0	Unique	see Table B-2
201H	513	IA32_MTRR_PHYS MASK0	Unique	see Table B-2
202H	514	IA32_MTRR_PHYS BASE1	Unique	see Table B-2
203H	515	IA32_MTRR_PHYS MASK1	Unique	see Table B-2
204H	516	IA32_MTRR_PHYS BASE2	Unique	see Table B-2
205H	517	IA32_MTRR_PHYS MASK2	Unique	see Table B-2
206H	518	IA32_MTRR_PHYS BASE3	Unique	see Table B-2
207H	519	IA32_MTRR_PHYS MASK3	Unique	see Table B-2
208H	520	IA32_MTRR_PHYS BASE4	Unique	see Table B-2
209H	521	IA32_MTRR_PHYS MASK4	Unique	see Table B-2
20AH	522	IA32_MTRR_PHYS BASE5	Unique	see Table B-2
20BH	523	IA32_MTRR_PHYS MASK5	Unique	see Table B-2
20CH	524	IA32_MTRR_PHYS BASE6	Unique	see Table B-2

38EH	910	IA32_PERF_GLOBAL_STAUS	Unique	see Table B-2. See Section 30.4.2, "Global Counter Control Facilities."
38EH	910	MSR_PERF_GLOBAL_STAUS	Unique	See Section 30.4.2, "Global Counter Control Facilities."
38FH	911	IA32_PERF_GLOBAL_CTRL	Unique	see Table B-2. See Section 30.4.2, "Global Counter Control Facilities."
38FH	911	MSR_PERF_GLOBAL_CTRL	Unique	See Section 30.4.2, "Global Counter Control Facilities."

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
390H	912	IA32_PERF_GLOBAL_OVF_CTRL	Unique	see Table B-2. See Section 30.4.2, "Global Counter Control Facilities."
390H	912	MSR_PERF_GLOBAL_OVF_CTRL	Unique	See Section 30.4.2, "Global Counter Control Facilities."
3F1H	1009	MSR_PEBS_ENABLE	Unique	see Table B-2. See Section 30.4.4, "Precise Event Based Sampling (PEBS)."
		0		Enable PEBS on IA32_PMC0. (R/W)
400H	1024	IA32_MCO_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MCO_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MCO_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
406H	1030	IA32_MC1_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
40AH	1034	IA32_MC2_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	MSR_MC4_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	MSR_MC4_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40EH	1038	MSR_MC4_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	MSR_MC3_CTL		See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	MSR_MC3_STATUS		See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
412H	1042	MSR_MC3_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	MSR_MC3_MISC	Unique	
414H	1044	MSR_MC5_CTL	Unique	
415H	1045	MSR_MC5_STATUS	Unique	

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description

416H	1046	MSR_MC5_ADDR	Unique	
417H	1047	MSR_MC5_MISC	Unique	
419H	1045	MSR_MC6_STATUS	Unique	Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E.
480H	1152	IA32_VMX_BASIC	Unique	Reporting Register of Basic VMX Capabilities. (R/O) see Table B-2. See Appendix G.1, "Basic VMX Information"
481H	1153	IA32_VMX_PINBASED_CTL	Unique	Capability Reporting Register of Pin-based VM-execution Controls. (R/O) see Table B-2. See Appendix G.3, "VM-Execution Controls"
482H	1154	IA32_VMX_PROCBASED_CTL	Unique	Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls"
483H	1155	IA32_VMX_EXIT_CTL	Unique	Capability Reporting Register of VM-exit Controls. (R/O) see Table B-2. See Appendix G.4, "VM-Exit Controls"
484H	1156	IA32_VMX_ENTRY_CTL	Unique	Capability Reporting Register of VM-entry Controls. (R/O) see Table B-2. See Appendix G.5, "VM-Entry Controls"
485H	1157	IA32_VMX_MISC	Unique	Reporting Register of Miscellaneous VMX Capabilities. (R/O) see Table B-2. See Appendix G.6, "Miscellaneous Data"
486H	1158	IA32_VMX_CR0_FIXED0	Unique	Capability Reporting Register of CR0 Bits Fixed to 0. (R/O) see Table B-2. See Appendix G.7, "VMX-Fixed Bits in CR0"
487H	1159	IA32_VMX_CR0_FIXED1	Unique	Capability Reporting Register of CR0 Bits Fixed to 1. (R/O) see Table B-2. See Appendix G.7, "VMX-Fixed Bits in CR0"

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
488H	1160	IA32_VMX_CR4_FI XED0	Unique	Capability Reporting Register of CR4 Bits Fixed to 0. (R/O) see Table B-2. See Appendix G.8, "VMX-Fixed Bits in CR4"
489H	1161	IA32_VMX_CR4_FI XED1	Unique	Capability Reporting Register of CR4 Bits Fixed to 1. (R/O) see Table B-2. See Appendix G.8, "VMX-Fixed Bits in CR4"
48AH	1162	IA32_VMX_ VMCS_ENUM	Unique	Capability Reporting Register of VMCS Field Enumeration. (R/O). see Table B-2. See Appendix G.9, "VMCS Enumeration"
48BH	1163	IA32_VMX_PROCB ASED_CTL2	Unique	Capability Reporting Register of Secondary Processor-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls"
600H	1536	IA32_DS_AREA	Unique	DS Save Area. (R/W). see Table B-2 See Section 30.9.4, "Debug Store (DS) Mechanism."
107C H		MSR_EMON_L3_C TR_CTL0	Unique	GBUSQ Event Control/Counter Register. (R/W). Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2
107C D		MSR_EMON_L3_C TR_CTL1	Unique	GBUSQ Event Control/Counter Register. (R/W). Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2
107C E		MSR_EMON_L3_C TR_CTL2	Unique	GSNPQ Event Control/Counter Register. (R/W). Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
107CF H		MSR_EMON_L3_C TR_CTL3	Unique	GSNPQ Event Control/Counter Register. (R/W). Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2
107D0 H		MSR_EMON_L3_C TR_CTL4	Unique	FSB Event Control/Counter Register. (R/W). Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2
107D1 H		MSR_EMON_L3_C TR_CTL5	Unique	FSB Event Control/Counter Register. (R/W). Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2
107D2 H		MSR_EMON_L3_C TR_CTL6	Unique	FSB Event Control/Counter Register. (R/W). Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2
107D3 H		MSR_EMON_L3_C TR_CTL7	Unique	FSB Event Control/Counter Register. (R/W). Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2
107D8 H		MSR_EMON_L3 _GL_CTL	Unique	L3/FSB Common Control Register. (R/W). Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 16.2.2
C000_ 0080H		IA32_EFER	Unique	Extended Feature Enables. see Table B-2
C000_ 0081H		IA32_STAR	Unique	System Call Target Address. (R/W). see Table B-2
C000_ 0082H		IA32_LSTAR	Unique	IA-32e Mode System Call Target Address. (R/W). see Table B-2
C000_ 0084H		IA32_FMASK	Unique	System Call Flag Mask. (R/W). see Table B-2

Table B-3. MSRs in Processors Based on Intel Core Microarchitecture (Contd.)

Hex	Dec			
C000_0100H		IA32_FS_BASE	Unique	Map of BASE Address of FS. (R/W). see Table B-2
C000_0101H		IA32_GS_BASE	Unique	Map of BASE Address of GS. (R/W). see Table B-2
C000_0102H		IA32_KERNEL_GS_BASE	Unique	Swap Target of BASE Address of GS. (R/W). see Table B-2

B.3 MSRS IN THE INTEL® ATOM™ PROCESSOR FAMILY

Table B-4 lists model-specific registers (MSRs) for Intel Atom processor family, architectural MSR addresses are also included in Table B-4. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_1CH, see Table B-1.

The column “Shared/Unique” applies to logical processors sharing the same core in processors based on the Intel Atom microarchitecture. “Unique” means each logical processor has a separate MSR, or a bit field in an MSR governs only a logical processor. “Shared” means the MSR or the bit field in an MSR address governs the operation of both logical processors in the same core.

Table B-4. MSRs in Intel Atom Processor Family

Register Address		Register Name	Shared/Unique	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Shared	See Appendix B.12, “MSRs in Pentium Processors.”
1H	1	IA32_P5_MC_TYPE	Shared	See Appendix B.12, “MSRs in Pentium Processors.”
6H	6	IA32_MONITOR_FILTER_SIZE	Unique	See Section 8.10.5, “Monitor/Mwait Address Range Determination.” and Table B-2
10H	16	IA32_TIME_STAMP_COUNTER	Shared	See Section 16.12, “Time-Stamp Counter.” and see Table B-2
17H	23	IA32_PLATFORM_ID	Shared	Platform ID. (R) See Table B-2.

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
17H	23	MSR_PLATFORM_ID	Shared	Model Specific Platform ID. (R)
		7:0		Reserved.
		12:8		Maximum Qualified Ratio. (R) The maximum allowed bus ratio.
		63:13		Reserved.
1BH	27	IA32_APIC_BASE	Unique	See Section 10.4.4, "Local APIC Status and Location." and Table B-2
2AH	42	MSR_EBL_CR_POWERON	Shared	Processor Hard Power-On Configuration. (R/W) Enables and disables processor features; (R) indicates current processor configuration.
		0		Reserved
		1		Data Error Checking Enable. (R/W) 1 = Enabled; 0 = Disabled Always 0.
		2		Response Error Checking Enable. (R/W) 1 = Enabled; 0 = Disabled Always 0.
		3		AERR# Drive Enable. (R/W) 1 = Enabled; 0 = Disabled Always 0.
		4		BERR# Enable for initiator bus requests. (R/W) 1 = Enabled; 0 = Disabled Always 0.
		5		Reserved
		6		Reserved
		7		BINIT# Driver Enable. (R/W) 1 = Enabled; 0 = Disabled Always 0.
		8		Reserved

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		9		Execute BIST. (R/O) 1 = Enabled; 0 = Disabled
		10		AERR# Observation Enabled. (R/O) 1 = Enabled; 0 = Disabled Always 0.
		11		Reserved
		12		BINIT# Observation Enabled. (R/O) 1 = Enabled; 0 = Disabled Always 0.
		13		Reserved
		14		1 MByte Power on Reset Vector. (R/O) 1 = 1 MByte; 0 = 4 GBytes
		15		Reserved
		17:16		APIC Cluster ID. (R/O) Always 00B.
		19: 18		Reserved.
		21: 20		Symmetric Arbitration ID. (R/O) Always 00B.
		26:22		Integer Bus Frequency Ratio. (R/O)
3AH	58	IA32_FEATURE_CONTROL	Unique	Control Features in Intel 64Processor. (R/W). see Table B-2
40H	64	MSR_LASTBRANCH_0_F ROM_IP	Unique	Last Branch Record 0 From IP. (R/W) One of eight pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the source instruction for one of the last eight branches, exceptions, or interrupts taken by the processor. See also: <ul style="list-style-type: none"> ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 16.10, “Last Branch, Interrupt, and Exception Recording (Pentium M Processors).”

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
41H	65	MSR_ LASTBRANCH_1_F ROM_IP	Unique	Last Branch Record 1 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
42H	66	MSR_ LASTBRANCH_2_F ROM_IP	Unique	Last Branch Record 2 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
43H	67	MSR_ LASTBRANCH_3_F ROM_IP	Unique	Last Branch Record 3 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
44H	68	MSR_ LASTBRANCH_4_F ROM_IP	Unique	Last Branch Record 4 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
45H	69	MSR_ LASTBRANCH_5_F ROM_IP	Unique	Last Branch Record 5 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
46H	70	MSR_ LASTBRANCH_6_F ROM_IP	Unique	Last Branch Record 6 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
47H	71	MSR_ LASTBRANCH_7_F ROM_IP	Unique	Last Branch Record 7 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
60H	96	MSR_ LASTBRANCH_0_ TO_LIP	Unique	Last Branch Record 0 To IP. (R/W) One of eight pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the destination instruction for one of the last eight branches, exceptions, or interrupts taken by the processor.
61H	97	MSR_ LASTBRANCH_1_ TO_LIP	Unique	Last Branch Record 1 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
62H	98	MSR_ LASTBRANCH_2_ TO_LIP	Unique	Last Branch Record 2 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
63H	99	MSR_LASTBRANCH_3_TO_LIP	Unique	Last Branch Record 3 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
64H	100	MSR_LASTBRANCH_4_TO_LIP	Unique	Last Branch Record 4 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
65H	101	MSR_LASTBRANCH_5_TO_LIP	Unique	Last Branch Record 5 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
66H	102	MSR_LASTBRANCH_6_TO_LIP	Unique	Last Branch Record 6 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
67H	103	MSR_LASTBRANCH_7_TO_LIP	Unique	Last Branch Record 7 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
79H	121	IA32_BIOS_UPDT_TRIG	Unique	BIOS Update Trigger Register. (W) see Table B-2
8BH	139	IA32_BIOS_SIGN_ID	Unique	BIOS Update Signature ID. (RO) see Table B-2
C1H	193	IA32_PMC0	Unique	Performance counter register. see Table B-2
C2H	194	IA32_PMC1	Unique	Performance counter register. see Table B-2
CDH	205	MSR_FSB_FREQ	Shared	Scaleable Bus Speed(RO). This field indicates the intended scaleable bus clock speed for processors based on Intel Atom microarchitecture:
		2:0		<ul style="list-style-type: none"> ▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) <p>133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B.</p> <p>166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.</p>

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

		63:3		Reserved
E7H	231	IA32_MPERF	Unique	Maximum Performance Frequency Clock Count. (RW) see Table B-2
E8H	232	IA32_APERF	Unique	Actual Performance Frequency Clock Count. (RW) see Table B-2
FEH	254	IA32_MTRRCAP	Shared	Memory Type Range Register. (R) see Table B-2
11EH	281	MSR_BBL_CR_CTL3	Shared	
		0		L2 Hardware Enabled. (RO) 1 = If the L2 is hardware-enabled 0 = Indicates if the L2 is hardware-disabled
		7:1		Reserved.
		8		L2 Enabled. (R/W) 1 = L2 cache has been initialized 0 = Disabled (default) Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9		Reserved.
		23		L2 Not Present. (RO) 0 = L2 Present 1 = L2 Not Present
		63:24		Reserved.
174H	372	IA32_SYSENTER_CS	Unique	see Table B-2
175H	373	IA32_SYSENTER_ESP	Unique	see Table B-2
176H	374	IA32_SYSENTER_EIP	Unique	see Table B-2
17AH	378	IA32_MCG_STATUS	Unique	

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		0		RIPV. When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted
		1		EIPV. When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		MCIP. When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved.
186H	390	IA32_PERFEVTSELO	Unique	see Table B-2
187H	391	IA32_PERFEVTSEL1	Unique	see Table B-2
198H	408	IA32_PERF_STAT US	Shared	see Table B-2
198H	408	MSR_PERF_STATU S	Shared	
		15:0		Current Performance State Value.
		39:16		Reserved.
		44:40		Maximum Bus Ratio (R/O) Indicates maximum bus ratio configured for the processor.
		63:45		Reserved.

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

30AH	778	IA32_FIXED_CTR1	Unique	Fixed-Function Performance Counter Register 1. (R/W) see Table B-2
30BH	779	IA32_FIXED_CTR2	Unique	Fixed-Function Performance Counter Register 2. (R/W) see Table B-2

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
345H	837	IA32_PERF_CAPABILITIES	Shared	see Table B-2. See Section 16.4.1, "IA32_DEBUGCTL MSR."
38DH	909	IA32_FIXED_CTRL_CTRL	Unique	Fixed-Function-Counter Control Register. (R/W) see Table B-2
38EH	910	IA32_PERF_GLOBAL_STAUS	Unique	see Table B-2. See Section 30.4.2, "Global Counter Control Facilities."
38FH	911	IA32_PERF_GLOBAL_CTRL	Unique	see Table B-2. See Section 30.4.2, "Global Counter Control Facilities."
390H	912	IA32_PERF_GLOBAL_OVF_CTRL	Unique	see Table B-2. See Section 30.4.2, "Global Counter Control Facilities."
3F1H	1009	MSR_PEBS_ENABLE	Unique	see Table B-2. See Section 30.4.4, "Precise Event Based Sampling (PEBS)."
		0		Enable PEBS on IA32_PMC0. (R/W)
400H	1024	IA32_MCO_CTL	Shared	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
401H	1025	IA32_MCO_STATUS	Shared	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."
402H	1026	IA32_MCO_ADDR	Shared	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	Shared	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Shared	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."
408H	1032	IA32_MC2_CTL	Shared	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Shared	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
40AH	1034	IA32_MC2_ADDR	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	MSR_MC3_CTL	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	MSR_MC3_STATUS	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40EH	1038	MSR_MC3_ADDR	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	MSR_MC4_CTL	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	MSR_MC4_STATUS	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
412H	1042	MSR_MC4_ADDR	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
480H	1152	IA32_VMX_BASIC	Unique	Reporting Register of Basic VMX Capabilities. (R/O) see Table B-2. See Appendix G.1, "Basic VMX Information"
481H	1153	IA32_VMX_PINBA SED_CTL	Unique	Capability Reporting Register of Pin-based VM-execution Controls. (R/O) see Table B-2. See Appendix G.3, "VM-Execution Controls"

Table B-4. MSRs in Intel Atom Processor Family (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
482H	1154	IA32_VMX_PROCBASED_CTL	Unique	Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls"
483H	1155	IA32_VMX_EXIT_CTL	Unique	Capability Reporting Register of VM-exit Controls. (R/O) see Table B-2. See Appendix G.4, "VM-Exit Controls"
484H	1156	IA32_VMX_ENTRY_CTL	Unique	Capability Reporting Register of VM-entry Controls. (R/O) see Table B-2. See Appendix G.5, "VM-Entry Controls"
485H	1157	IA32_VMX_MISC	Unique	Reporting Register of Miscellaneous VMX Capabilities. (R/O) see Table B-2. See Appendix G.6, "Miscellaneous Data"
486H	1158	IA32_VMX_CR0_FIXED0	Unique	Capability Reporting Register of CR0 Bits Fixed to 0. (R/O) see Table B-2. See Appendix G.7, "VMX-Fixed Bits in CR0"
487H	1159	IA32_VMX_CR0_FIXED1	Unique	Capability Reporting Register of CR0 Bits Fixed to 1. (R/O) see Table B-2. See Appendix G.7, "VMX-Fixed Bits in CR0"
488H	1160	IA32_VMX_CR4_FIXED0	Unique	Capability Reporting Register of CR4 Bits Fixed to 0. (R/O) see Table B-2. See Appendix G.8, "VMX-Fixed Bits in CR4"
489H	1161	IA32_VMX_CR4_FIXED1	Unique	Capability Reporting Register of CR4 Bits Fixed to 1. (R/O) see Table B-2. See Appendix G.8, "VMX-Fixed Bits in CR4"
48AH	1162	IA32_VMX_VMCS_ENUM	Unique	Capability Reporting Register of VMCS Field Enumeration. (R/O). see Table B-2. See Appendix G.9, "VMCS Enumeration"
48BH	1163	IA32_VMX_PROCBASED_CTL2	Unique	Capability Reporting Register of Secondary Processor-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls"

Hex	Dec			
600H	1536	IA32_DS_AREA	Unique	DS Save Area. (R/W). see Table B-2 See Section 30.9.4, "Debug Store (DS) Mechanism."
C000_0080H		IA32_EFER	Unique	Extended Feature Enables. see Table B-2
C000_0081H		IA32_STAR	Unique	System Call Target Address. (R/W). see Table B-2
C000_0082H		IA32_LSTAR	Unique	IA-32e Mode System Call Target Address. (R/W). see Table B-2
C000_0084H		IA32_FMASK	Unique	System Call Flag Mask. (R/W). see Table B-2
C000_0100H		IA32_FS_BASE	Unique	Map of BASE Address of FS. (R/W). see Table B-2
C000_0101H		IA32_GS_BASE	Unique	Map of BASE Address of GS. (R/W). see Table B-2
C000_0102H		IA32_KERNEL_GS_BASE	Unique	Swap Target of BASE Address of GS. (R/W). see Table B-2

B.4 MSRS IN THE INTEL® MICROARCHITECTURE CODE NAME NEHALEM

Table B-5 lists model-specific registers (MSRs) that are common for Intel® microarchitecture code name Nehalem. These include Intel Core i7 and i5 processor family. Architectural MSR addresses are also included in Table B-5. These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_1AH, 06_1EH, 06_1FH, 06_2EH, see Table B-1. Additional MSRs specific to 06_1AH, 06_1EH, 06_1FH are listed in Table B-6. Some MSRs listed in these tables are used by BIOS. More information about these MSR can be found at <http://biosbits.org>.

The column "Scope" represents the package/core/thread scope of individual bit field of an MSR. "Thread" means this bit field must be programmed on each logical processor independently. "Core" means the bit field must be programmed on each processor core independently, logical processors in the same core will be affected by change of this bit on the other logical processor in the same core. "Package" means the bit field must be programmed once for each physical package. Change of a bit filed with a package scope will affect all logical processors in that physical package.

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Thread	See Appendix B.12, "MSRs in Pentium Processors."
1H	1	IA32_P5_MC_TYPE	Thread	See Appendix B.12, "MSRs in Pentium Processors."
6H	6	IA32_MONITOR_FILTER_SIZE	Thread	See Section 8.10.5, "Monitor/Mwait Address Range Determination." and Table B-2
10H	16	IA32_TIME_STAMP_COUNTER	Thread	See Section 16.12, "Time-Stamp Counter." and see Table B-2
17H	23	IA32_PLATFORM_ID	Package	Platform ID. (R) See Table B-2.
17H	23	MSR_PLATFORM_ID	Package	Model Specific Platform ID. (R)
		49:0		Reserved.
		52:50		See Table B-2.
		63:53		Reserved.
1BH	27	IA32_APIC_BASE	Thread	See Section 10.4.4, "Local APIC Status and Location." and Table B-2
34H	52	MSR_SMI_COUNT	Thread	SMI Counter. (R/O).
		31:0		SMI Count. (R/O) Count SMIs
		63:32		Reserved.
3AH	58	IA32_FEATURE_CONTROL	Thread	Control Features in Intel 64 Processor. (R/W). see Table B-2
79H	121	IA32_BIOS_UPDT_TRIG	Core	BIOS Update Trigger Register. (W) see Table B-2
8BH	139	IA32_BIOS_SIGN_ID	Thread	BIOS Update Signature ID. (RO) see Table B-2
C1H	193	IA32_PMC0	Thread	Performance counter register. see Table B-2

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
C2H	194	IA32_PMC1	Thread	Performance counter register. see Table B-2
C3H	195	IA32_PMC2	Thread	Performance counter register. see Table B-2
C4H	196	IA32_PMC3	Thread	Performance counter register. see Table B-2
CEH	206	MSR_PLATFORM_INFO	Package	see http://biosbits.org .
		7:0		Reserved.
		15:8	Package	Maximum Non-Turbo Ratio. (R/O) The is the ratio of the frequency that invariant TSC runs at. The invariant TSC frequency can be computed by multiplying this ratio by 133.33 MHz.
		27:16		Reserved.
		28	Package	Programmable Ratio Limit for Turbo Mode. (R/O) When set to 1, indicates that Programmable Ratio Limits for Turbo mode is enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo mode is disabled.
		29	Package	Programmable TDC-TDP Limit for Turbo Mode. (R/O) When set to 1, indicates that TDC/TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDC and TDP Limits for Turbo mode are not programmable.
		39:30		Reserved.
		47:40	Package	Maximum Efficiency Ratio. (R/O) The is the minimum ratio (maximum efficiency) that the processor can operates, in units of 133.33MHz.
	63:48		Reserved.	

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Core	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org .
		2:0		Package C-State limit. (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0 (no package C-state support) 001b: C1 (Behavior is the same as 000b) 010b: C3 011b: C6 100b: C7 101b and 110b: Reserved 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.
		9:3		Reserved.
		10		I/O MWAIT Redirection Enable. (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions
		14:11		Reserved.
		15		CFG Lock. (R/WO) When set, lock bits 15:0 of this register until next reset
		23:16		Reserved.

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		24		Interrupt filtering enable. (R/W) When set, processor cores in a deep C-State will wake only when the event message is destined for that core. When 0, all processor cores in a deep C-State will wake for an event message
		25		C3 state auto demotion enable. (R/W) When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information
		26		C1 state auto demotion enable. (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information
		63:27		Reserved.
		E4H	228	MSR_PMG_IO_CAPTURE_BASE
		15:0		LVL_2 Base Address. (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software
		18:16		C-state Range. (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PMG_CST_CONFIG_CONTROL[bit10]: 000b - C3 is the max C-State to include 001b - C6 is the max C-State to include 010b - C7 is the max C-State to include
		63:19		Reserved.

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
E7H	231	IA32_MPERF	Thread	Maximum Performance Frequency Clock Count. (RW) see Table B-2
E8H	232	IA32_APERF	Thread	Actual Performance Frequency Clock Count. (RW) see Table B-2
FEH	254	IA32_MTRRCAP	Thread	see Table B-2
174H	372	IA32_SYSENTER_CS	Thread	see Table B-2
175H	373	IA32_SYSENTER_ESP	Thread	see Table B-2
176H	374	IA32_SYSENTER_EIP	Thread	see Table B-2
179H	377	IA32_MCG_CAP	Thread	see Table B-2
17AH	378	IA32_MCG_STATUS	Thread	
		0		RIPV. When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted
		1		EIPV. When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		MCIP. When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved.

40AH	1034	IA32_MC2_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40BH	1035	MSR_MC2_MISC	Core	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
40CH	1036	MSR_MC3_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	MSR_MC3_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40EH	1038	MSR_MC3_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
40FH	1039	MSR_MC3_MISC	Core	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
410H	1040	MSR_MC4_CTL	Core	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
411H	1041	MSR_MC4_STATUS	Core	See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."
412H	1042	MSR_MC4_ADDR	Core	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	MSR_MC4_MISC	Core	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
414H	1044	MSR_MC5_CTL	Core	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
415H	1045	MSR_MC5_STATUS	Core	See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."
416H	1046	MSR_MC5_ADDR	Core	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
417H	1047	MSR_MC5_MISC	Core	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
418H	1048	MSR_MC6_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
419H	1049	MSR_MC6_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E.
41AH	1050	MSR_MC6_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
41BH	1051	MSR_MC6_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
41CH	1052	MSR_MC7_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
41DH	1053	MSR_MC7_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E.
41EH	1054	MSR_MC7_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
41FH	1055	MSR_MC7_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
420H	1056	MSR_MC8_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
421H	1057	MSR_MC8_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E.

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
422H	1058	MSR_MC8_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
423H	1059	MSR_MC8_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
480H	1152	IA32_VMX_BASIC	Thread	Reporting Register of Basic VMX Capabilities. (R/O) see Table B-2. See Appendix G.1, "Basic VMX Information"
481H	1153	IA32_VMX_PINBASED_CTL	Thread	Capability Reporting Register of Pin-based VM-execution Controls. (R/O) see Table B-2. See Appendix G.3, "VM-Execution Controls"
482H	1154	IA32_VMX_PROCBASED_CTL	Thread	Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls"
483H	1155	IA32_VMX_EXIT_CTL	Thread	Capability Reporting Register of VM-exit Controls. (R/O) see Table B-2. See Appendix G.4, "VM-Exit Controls"
484H	1156	IA32_VMX_ENTRY_CTL	Thread	Capability Reporting Register of VM-entry Controls. (R/O) see Table B-2. See Appendix G.5, "VM-Entry Controls"
485H	1157	IA32_VMX_MISC	Thread	Reporting Register of Miscellaneous VMX Capabilities. (R/O) see Table B-2. See Appendix G.6, "Miscellaneous Data"
486H	1158	IA32_VMX_CR0_FIXED0	Thread	Capability Reporting Register of CR0 Bits Fixed to 0. (R/O) see Table B-2. See Appendix G.7, "VMX-Fixed Bits in CR0"
487H	1159	IA32_VMX_CR0_FIXED1	Thread	Capability Reporting Register of CR0 Bits Fixed to 1. (R/O) see Table B-2. See Appendix G.7, "VMX-Fixed Bits in CR0"
488H	1160	IA32_VMX_CR4_FIXED0	Thread	Capability Reporting Register of CR4 Bits Fixed to 0. (R/O) see Table B-2. See Appendix G.8, "VMX-Fixed Bits in CR4"
489H	1161	IA32_VMX_CR4_FIXED1	Thread	Capability Reporting Register of CR4 Bits Fixed to 1. (R/O) see Table B-2. See Appendix G.8, "VMX-Fixed Bits in CR4"

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
48AH	1162	IA32_VMX_VMCS_ENUM	Thread	Capability Reporting Register of VMCS Field Enumeration. (R/O). see Table B-2. See Appendix G.9, "VMCS Enumeration"
48BH	1163	IA32_VMX_PROCBASED_CTL2	Thread	Capability Reporting Register of Secondary Processor-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls"
600H	1536	IA32_DS_AREA	Thread	DS Save Area. (R/W). see Table B-2 See Section 30.9.4, "Debug Store (DS) Mechanism."
680H	1664	MSR_LASTBRANCH_0_FROM_IP	Thread	Last Branch Record 0 From IP. (R/W) One of sixteen pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the source instruction for one of the last sixteen branches, exceptions, or interrupts taken by the processor. See also: <ul style="list-style-type: none"> ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 16.6.1, "LBR Stack."
681H	1665	MSR_LASTBRANCH_1_FROM_IP	Thread	Last Branch Record 1 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
682H	1666	MSR_LASTBRANCH_2_FROM_IP	Thread	Last Branch Record 2 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
683H	1667	MSR_LASTBRANCH_3_FROM_IP	Thread	Last Branch Record 3 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
684H	1668	MSR_LASTBRANCH_4_FROM_IP	Thread	Last Branch Record 4 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
685H	1669	MSR_LASTBRANCH_5_FROM_IP	Thread	Last Branch Record 5 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
686H	1670	MSR_LASTBRANCH_6_FROM_IP	Thread	Last Branch Record 6 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
687H	1671	MSR_LASTBRANCH_7_FROM_IP	Thread	Last Branch Record 7 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
688H	1672	MSR_LASTBRANCH_8_FROM_IP	Thread	Last Branch Record 8 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
689H	1673	MSR_LASTBRANCH_9_FROM_IP	Thread	Last Branch Record 9 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68AH	1674	MSR_LASTBRANCH_10_FROM_IP	Thread	Last Branch Record 10 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68BH	1675	MSR_LASTBRANCH_11_FROM_IP	Thread	Last Branch Record 11 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68CH	1676	MSR_LASTBRANCH_12_FROM_IP	Thread	Last Branch Record 12 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68DH	1677	MSR_LASTBRANCH_13_FROM_IP	Thread	Last Branch Record 13 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68EH	1678	MSR_LASTBRANCH_14_FROM_IP	Thread	Last Branch Record 14 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68FH	1679	MSR_LASTBRANCH_15_FROM_IP	Thread	Last Branch Record 15 From IP. (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
6C0H	1728	MSR_LASTBRANCH_0_TO_LIP	Thread	Last Branch Record 0 To IP. (R/W) One of sixteen pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the destination instruction for one of the last sixteen branches, exceptions, or interrupts taken by the processor.
6C1H	1729	MSR_LASTBRANCH_1_TO_LIP	Thread	Last Branch Record 1 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
6C2H	1730	MSR_LASTBRANCH_2_TO_LIP	Thread	Last Branch Record 2 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
6C3H	1731	MSR_LASTBRANCH_3_TO_LIP	Thread	Last Branch Record 3 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
6C4H	1732	MSR_LASTBRANCH_4_TO_LIP	Thread	Last Branch Record 4 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
6C5H	1733	MSR_LASTBRANCH_5_TO_LIP	Thread	Last Branch Record 5 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
6C6H	1734	MSR_LASTBRANCH_6_TO_LIP	Thread	Last Branch Record 6 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
6C7H	1735	MSR_LASTBRANCH_7_TO_LIP	Thread	Last Branch Record 7 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
6C8H	1736	MSR_LASTBRANCH_8_TO_LIP	Thread	Last Branch Record 8 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.
6C9H	1737	MSR_LASTBRANCH_9_TO_LIP	Thread	Last Branch Record 9 To IP. (R/W) See description of MSR_LASTBRANCH_0_TO_LIP.

824H	2084	IA32_X2APIC_IRR 4	Thread	x2APIC Interrupt Request register bits [159:128] (R/O)
825H	2085	IA32_X2APIC_IRR 5	Thread	x2APIC Interrupt Request register bits [191:160] (R/O)
826H	2086	IA32_X2APIC_IRR 6	Thread	x2APIC Interrupt Request register bits [223:192] (R/O)
827H	2087	IA32_X2APIC_IRR 7	Thread	x2APIC Interrupt Request register bits [255:224] (R/O)
828H	2088	IA32_X2APIC_ESR	Thread	x2APIC Error Status register (R/W)
82FH	2095	IA32_X2APIC_LVT _CMCI	Thread	x2APIC LVT Corrected Machine Check Interrupt register (R/W)
830H	2096	IA32_X2APIC_ICR	Thread	x2APIC Interrupt Command register (R/W)
832H	2098	IA32_X2APIC_LVT _TIMER	Thread	x2APIC LVT Timer Interrupt register (R/W)
833H	2099	IA32_X2APIC_LVT _THERMAL	Thread	x2APIC LVT Thermal Sensor Interrupt register (R/W)
834H	2100	IA32_X2APIC_LVT _PMI	Thread	x2APIC LVT Performance Monitor register (R/W)
835H	2101	IA32_X2APIC_LVT _LINT0	Thread	x2APIC LVT LINT0 register (R/W)
836H	2102	IA32_X2APIC_LVT _LINT1	Thread	x2APIC LVT LINT1 register (R/W)
837H	2103	IA32_X2APIC_LVT _ERROR	Thread	x2APIC LVT Error register (R/W)
838H	2104	IA32_X2APIC_INIT _COUNT	Thread	x2APIC Initial Count register (R/W)
839H	2105	IA32_X2APIC_CUR _COUNT	Thread	x2APIC Current Count register (R/O)

Table B-5. MSRs in Processors Based on Intel Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
83EH	2110	IA32_X2APIC_DIV_CONF	Thread	x2APIC Divide Configuration register (R/W)
83FH	2111	IA32_X2APIC_SELF_IPI	Thread	x2APIC Self IPI register (W/O)
C000_0080H		IA32_EFER	Thread	Extended Feature Enables. see Table B-2
C000_0081H		IA32_STAR	Thread	System Call Target Address. (R/W). see Table B-2
C000_0082H		IA32_LSTAR	Thread	IA-32e Mode System Call Target Address. (R/W). see Table B-2
C000_0084H		IA32_FMASK	Thread	System Call Flag Mask. (R/W). see Table B-2
C000_0100H		IA32_FS_BASE	Thread	Map of BASE Address of FS. (R/W). see Table B-2
C000_0101H		IA32_GS_BASE	Thread	Map of BASE Address of GS. (R/W). see Table B-2
C000_0102H		IA32_KERNEL_GS_BASE	Thread	Swap Target of BASE Address of GS. (R/W). see Table B-2
C000_0103H		IA32_TSC_AUX	Thread	AUXILIARY TSC Signature. (R/W). see Table B-2 and Section 16.12.2, "IA32_TSC_AUX Register and RDTSCP Support."

B.4.1 Additional MSRs in the Intel® Xeon® Processor 5500 and 3400 Series

Intel Xeon Processor 5500 and 3400 series support additional model-specific registers listed in Table B-6. These MSRs also apply to Intel Core i7 and i5 processor family CPUID signature with DisplayFamily_DisplayModel of 06_1AH, 06_1EH and 06_1FH, see Table B-1.

Table B-6. Additional MSRs in Intel Xeon Processor 5500 and 3400 Series

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	Actual maximum turbo frequency is multiplied by 133.33MHz. (not available to model 06_2EH)
		7:0		Maximum Turbo Ratio Limit 1C. (R/O) maximum Turbo mode ratio limit with 1 core active.
		15:8		Maximum Turbo Ratio Limit 2C. (R/O) maximum Turbo mode ratio limit with 2cores active.
		23:16		Maximum Turbo Ratio Limit 3C. (R/O) maximum Turbo mode ratio limit with 3cores active.
		31:24		Maximum Turbo Ratio Limit 4C. (R/O) maximum Turbo mode ratio limit with 4 cores active.
		63:32		Reserved.

Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
295H	661	IA32_MC21_CTL2	Package	see Table B-2
394H	816	MSR_W_PMON_FI XED_CTR	Package	Uncore W-box perfmon fixed counter
395H	817	MSR_W_PMON_FI XED_CTR_CTL	Package	Uncore U-box perfmon fixed counter control MSR
424H	1060	MSR_MC9_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
425H	1061	MSR_MC9_ STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E.
426H	1062	MSR_MC9_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
427H	1063	MSR_MC9_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
428H	1064	MSR_MC10_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
429H	1065	MSR_MC10_ STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E.
42AH	1066	MSR_MC10_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
42BH	1067	MSR_MC10_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
42CH	1068	MSR_MC11_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
42DH	1069	MSR_MC11_ STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E.
42EH	1070	MSR_MC11_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
42FH	1071	MSR_MC11_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
430H	1072	MSR_MC12_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
431H	1073	MSR_MC12_ STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E.
432H	1074	MSR_MC12_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
433H	1075	MSR_MC12_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
434H	1076	MSR_MC13_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
435H	1077	MSR_MC13_ STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRs." and Appendix E.
436H	1078	MSR_MC13_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
437H	1079	MSR_MC13_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
438H	1080	MSR_MC14_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."

Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
439H	1081	MSR_MC14_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E.
43AH	1082	MSR_MC14_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
43BH	1083	MSR_MC14_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
43CH	1084	MSR_MC15_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
43DH	1085	MSR_MC15_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E.
43EH	1086	MSR_MC15_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
43FH	1087	MSR_MC15_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
440H	1088	MSR_MC16_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
441H	1089	MSR_MC16_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E.
442H	1090	MSR_MC16_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
443H	1091	MSR_MC16_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
444H	1092	MSR_MC17_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
445H	1093	MSR_MC17_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E.
446H	1094	MSR_MC17_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
447H	1095	MSR_MC17_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
448H	1096	MSR_MC18_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
449H	1097	MSR_MC18_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E.
44AH	1098	MSR_MC18_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
44BH	1099	MSR_MC18_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
44CH	1100	MSR_MC19_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
44DH	1101	MSR_MC19_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E.
44EH	1102	MSR_MC19_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
44FH	1103	MSR_MC19_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
450H	1104	MSR_MC20_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."

Table B-7. Additional MSRs in Intel Xeon Processor 7500 Series (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
451H	1105	MSR_MC20_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E.
452H	1106	MSR_MC20_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
453H	1107	MSR_MC20_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
454H	1108	MSR_MC21_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
455H	1109	MSR_MC21_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS." and Appendix E.
456H	1110	MSR_MC21_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
457H	1111	MSR_MC21_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
C00H	3072	MSR_U_PMON_GLOBAL_CTRL	Package	Uncore U-box perfmon global control MSR
C01H	3073	MSR_U_PMON_GLOBAL_STATUS	Package	Uncore U-box perfmon global status MSR
C02H	3074	MSR_U_PMON_GLOBAL_OVERFLOW_CTRL	Package	Uncore U-box perfmon global overflow control MSR
C10H	3088	MSR_U_PMON_EVENT_SELECT	Package	Uncore U-box perfmon event select MSR
C11H	3089	MSR_U_PMON_COUNTER	Package	Uncore U-box perfmon counter MSR
C20H	3104	MSR_B0_PMON_BOX0_CTRL	Package	Uncore B-box 0 perfmon local box control MSR
C21H	3105	MSR_B0_PMON_BOX0_STATUS	Package	Uncore B-box 0 perfmon local box status MSR
C22H	3106	MSR_B0_PMON_BOX0_OVERFLOW_CTRL	Package	Uncore B-box 0 perfmon local box overflow control MSR
C30H	3120	MSR_B0_PMON_EVENT_SELECT0	Package	Uncore B-box 0 perfmon event select MSR
C31H	3121	MSR_B0_PMON_COUNTER0	Package	Uncore B-box 0 perfmon counter MSR
C32H	3122	MSR_B0_PMON_EVENT_SELECT1	Package	Uncore B-box 0 perfmon event select MSR

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
E5DH	3677	MSR_M1_PMON_A DDR_MATCH	Package	Uncore M-box 1 perfmon local box address match MSR
E5EH	3678	MSR_M1_PMON_A DDR_MASK	Package	Uncore M-box 1 perfmon local box address mask MSR
3B5H	965	MSR_UNCORE_PM C5	Package	See Section 30.6.2.2, "Uncore Performance Event Configuration Facility."

B.5 MSRS IN THE INTEL XEON PROCESSOR 5600 SERIES (INTEL® MICROARCHITECTURE CODE NAME WESTMERE)

Intel Xeon processor 5600 series (Intel® microarchitecture code name Westmere) supports the MSR interfaces listed in Table B-5, Table B-6, plus additional MSR listed in Table B-8. These MSRs also apply to Intel Core i7, i5 and i3 processor family with CPUID signature DisplayFamily_DisplayModel of 06_25H and 06_2CH, see Table B-1.

Table B-8. Additional MSRs Supported by Intel Processors (Intel Microarchitecture Code Name Westmere)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
1A7H	423	MSR_OFFCORE_RS P_1	Thread	Offcore Response Event Select Register (R/W)
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	Maximum Ratio Limit of Turbo Mode. RO if MSR_PLATFORM_INFO.[28] = 0, RW if MSR_PLATFORM_INFO.[28] = 1
		7:0	Package	Maximum Ratio Limit for 1C. Maximum turbo ratio limit of 1 core active.
		15:8	Package	Maximum Ratio Limit for 2C. Maximum turbo ratio limit of 2 core active.
		23:16	Package	Maximum Ratio Limit for 3C. Maximum turbo ratio limit of 3 core active.

Table B-8. Additional MSRs Supported by Intel Processors (Contd.)(Intel Microarchitecture Code Name Westmere)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		31:24	Package	Maximum Ratio Limit for 4C. Maximum turbo ratio limit of 4 core active.
		39:32	Package	Maximum Ratio Limit for 5C. Maximum turbo ratio limit of 5 core active.
		47:40	Package	Maximum Ratio Limit for 6C. Maximum turbo ratio limit of 6 core active.
		63:48		Reserved.
1B0H	432	IA32_ENERGY_PE RF_BIAS	Package	see Table B-2

B.6 MSRS IN THE INTEL XEON PROCESSOR E7 FAMILY (INTEL® MICROARCHITECTURE CODE NAME WESTMERE)

Intel Xeon processor E7 family (Intel® microarchitecture code name Westmere) supports the MSR interfaces listed in Table B-5 (except MSR address 1ADH), Table B-6, plus additional MSR listed in Table B-9.

Table B-9. Additional MSRs Supported by Intel Xeon Processor E7 Family

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
1A7H	423	MSR_OFFCORE_RS P_1	Thread	Offcore Response Event Select Register (R/W)
1ADH	429	MSR_TURBO_RATI O_LIMIT	Package	Reserved. Attempt to read/write will cause #UD
1B0H	432	IA32_ENERGY_PE RF_BIAS	Package	see Table B-2

B.7 MSRS IN INTEL® PROCESSOR FAMILY (INTEL® MICROARCHITECTURE CODE NAME SANDY BRIDGE)

Table B-10 lists model-specific registers (MSRs) that are common to Intel® processor family based on Intel® microarchitecture (Sandy Bridge). All architectural MSRs listed in Table B-2 are supported. These processors have a CPUID signature with

DisplayFamily_DisplayModel of 06_2AH, 06_2DH, see Table B-1. Additional MSRs specific to 06_2AH are listed in Table B-11.

Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture Code Name Sandy Bridge

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Thread	See Appendix B.12, "MSRs in Pentium Processors."
1H	1	IA32_P5_MC_TYPE	Thread	See Appendix B.12, "MSRs in Pentium Processors."
6H	6	IA32_MONITOR_FILTER_SIZE	Thread	See Section 8.10.5, "Monitor/Mwait Address Range Determination." and Table B-2
10H	16	IA32_TIME_STAMP_COUNTER	Thread	See Section 16.12, "Time-Stamp Counter." and see Table B-2
17H	23	IA32_PLATFORM_ID	Package	Platform ID. (R) See Table B-2.
1BH	27	IA32_APIC_BASE	Thread	See Section 10.4.4, "Local APIC Status and Location." and Table B-2
34H	52	MSR_SMI_COUNT	Thread	SMI Counter. (R/O).
		31:0		SMI Count. (R/O) Count SMIs
		63:32		Reserved.
3AH	58	IA32_FEATURE_CONTROL	Thread	Control Features in Intel 64 Processor. (R/W). see Table B-2
79H	121	IA32_BIOS_UPDT_TRIG	Core	BIOS Update Trigger Register. (W) see Table B-2
8BH	139	IA32_BIOS_SIGN_ID	Thread	BIOS Update Signature ID. (RO) see Table B-2
C1H	193	IA32_PMC0	Thread	Performance counter register. see Table B-2
C2H	194	IA32_PMC1	Thread	Performance counter register. see Table B-2
C3H	195	IA32_PMC2	Thread	Performance counter register. see Table B-2
C4H	196	IA32_PMC3	Thread	Performance counter register. see Table B-2
C5H	197	IA32_PMC4	Core	Performance counter register. see Table B-2

Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture Code Name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
C6H	198	IA32_PMC5	Core	Performance counter register. see Table B-2
C7H	199	IA32_PMC6	Core	Performance counter register. see Table B-2
C8H	200	IA32_PMC7	Core	Performance counter register. see Table B-2
CEH	206	MSR_PLATFORM_INFO	Package	See http://biosbits.org .
		7:0		Reserved.
		15:8	Package	Maximum Non-Turbo Ratio. (R/O) The is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.
		27:16		Reserved.
		28	Package	Programmable Ratio Limit for Turbo Mode. (R/O) When set to 1, indicates that Programmable Ratio Limits for Turbo mode is enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo mode is disabled.
		29	Package	Programmable TDP Limit for Turbo Mode. (R/O) When set to 1, indicates that TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDP Limit for Turbo mode is not programmable.
		39:30		Reserved.
		47:40	Package	Maximum Efficiency Ratio. (R/O) The is the minimum ratio (maximum efficiency) that the processor can operates, in units of 100MHz.
		63:48		Reserved.
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Core	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org .

Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture Code Name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		2:0		<p>Package C-State limit. (R/W)</p> <p>Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit.</p> <p>The following C-state code name encodings are supported:</p> <p>000b: C0/C1 (no package C-state support)</p> <p>001b: C2</p> <p>010b: C6 no retention</p> <p>011b: C6 retention</p> <p>100b: C7</p> <p>101b: C7s</p> <p>111: No package C-state limit.</p> <p>Note: This field cannot be used to limit package C-state to C3.</p>
		9:3		Reserved.
		10		<p>I/O MWAIT Redirection Enable. (R/W)</p> <p>When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions</p>
		14:11		Reserved.
		15		<p>CFG Lock. (R/WO)</p> <p>When set, lock bits 15:0 of this register until next reset</p>
		24:16		Reserved.
		25		<p>C3 state auto demotion enable. (R/W)</p> <p>When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information</p>

Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture Code Name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		26		C1 state auto demotion enable. (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information
		27		Enable C3 undemotion (R/W) When set, enables undemotion from demoted C3
		28		Enable C1 undemotion (R/W) When set, enables undemotion from demoted C1
		63:29		Reserved.
E4H	228	MSR_PMG_IO_CAP TURE_BASE	Core	Power Management IO Redirection in C-state (R/W) See http://biosbits.org .
		15:0		LVL_2 Base Address. (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software
		18:16		C-state Range. (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PMG_CST_CONFIG_CONTROL[bit10]: 000b - C3 is the max C-State to include 001b - C6 is the max C-State to include 010b - C7 is the max C-State to include
		63:19		Reserved.
E7H	231	IA32_MPERF	Thread	Maximum Performance Frequency Clock Count. (RW) see Table B-2
E8H	232	IA32_APERF	Thread	Actual Performance Frequency Clock Count. (RW) see Table B-2

Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture Code Name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
FEH	254	IA32_MTRRCAP	Thread	see Table B-2
174H	372	IA32_SYSENTER_CS	Thread	see Table B-2
175H	373	IA32_SYSENTER_ESP	Thread	see Table B-2
176H	374	IA32_SYSENTER_EIP	Thread	see Table B-2
179H	377	IA32_MCG_CAP	Thread	see Table B-2
17AH	378	IA32_MCG_STATUS	Thread	
		0		RIPV. When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted
		1		EIPV. When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		MCIP. When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved.
186H	390	IA32_PERFEVTSELO	Thread	see Table B-2
187H	391	IA32_PERFEVTSEL1	Thread	see Table B-2

Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture Code Name Sandy Bridge (Contd.)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
188H	392	IA32_PERFEVTSEL2	Thread	see Table B-2
189H	393	IA32_PERFEVTSEL3	Thread	see Table B-2
18AH	394	IA32_PERFEVTSEL4	Core	see Table B-2; If CPUID.0AH:EAX[15:8] = 8
18BH	395	IA32_PERFEVTSEL5	Core	see Table B-2; If CPUID.0AH:EAX[15:8] = 8
18CH	396	IA32_PERFEVTSEL6	Core	see Table B-2; If CPUID.0AH:EAX[15:8] = 8
18DH	397	IA32_PERFEVTSEL7	Core	see Table B-2; If CPUID.0AH:EAX[15:8] = 8
198H	408	IA32_PERF_STAT US	Package	see Table B-2
		15:0		Current Performance State Value.
		63:16		Reserved.
198H	408	MSR_PERF_STATU S	Package	
		47:32		Core Voltage (R/O) P-state core voltage can be computed by MSR_PERF_STATUS[37:32] * (float) 1/(2 ¹³).
199H	409	IA32_PERF_CTL	Thread	see Table B-2
19AH	410	IA32_CLOCK_ MODULATION	Thread	Clock Modulation. (R/W) see Table B-2 IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.
		3:0		On demand Clock Modulation Duty Cycle (R/W). In 6.25% increment
		4		On demand Clock Modulation Enable (R/W).
		63:5		Reserved.

Table B-10. MSRs Supported by Intel Processors Based on Intel Microarchitecture Code Name Sandy Bridge (Contd.)

B.7.2 MSRs In Next Generation Intel® Xeon Processor Family (Intel® Microarchitecture Code Name Sandy Bridge)

Table B-12 lists selected model-specific registers (MSRs) that are specific to the next generation Intel® Xeon processor family (Intel® microarchitecture code name Sandy Bridge). These processors have a CPUID signature with DisplayFamily_DisplayModel of 06_2DH, see Table B-1.

Table B-12. Selected MSRs Supported by Next Generation Intel Xeon Processors (Intel Microarchitecture Code Name Sandy Bridge)

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
285H	645	IA32_MC5_CTL2	Package	see Table B-2
286H	646	IA32_MC6_CTL2	Package	see Table B-2
287H	647	IA32_MC7_CTL2	Package	see Table B-2

B.8 MSRS IN THE PENTIUM® 4 AND INTEL® XEON® PROCESSORS

Table B-13 lists MSRs (architectural and model-specific) that are defined across processor generations based on Intel NetBurst microarchitecture. The processor can be identified by its CPUID signatures of DisplayFamily encoding of 0FH, see Table B-1.

- MSRs with an "IA32_" prefix are designated as "architectural." This means that the functions of these MSRs and their addresses remain the same for succeeding families of IA-32 processors.
- MSRs with an "MSR_" prefix are model specific with respect to address functionalities. The column "Model Availability" lists the model encoding value(s) within the Pentium 4 and Intel Xeon processor family at the specified register address. The model encoding value of a processor can be queried using CPUID. See "CPUID—CPU Identification" in Chapter 3 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A*.

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
0H	0	IA32_P5_MC_ADDR	0, 1, 2, 3, 4, 6	Shared	See Appendix B.12, "MSRs in Pentium Processors."

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
1H	1	IA32_P5_MC_TYPE	0, 1, 2, 3, 4, 6	Shared	See Appendix B.12, "MSRs in Pentium Processors."
6H	6	IA32_MONITOR_FILTER_LINE_SIZE	3, 4, 6	Shared	See Section 8.10.5, "Monitor/Mwait Address Range Determination."
10H	16	IA32_TIME_STAMP_COUNTER	0, 1, 2, 3, 4, 6	Unique	Time Stamp Counter. see Table B-2
					On earlier processors, only the lower 32 bits are writable. On any write to the lower 32 bits, the upper 32 bits are cleared. For processor family 0FH, models 3 and 4: all 64 bits are writable.
17H	23	IA32_PLATFORM_ID	0, 1, 2, 3, 4, 6	Shared	Platform ID. (R). see Table B-2 The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.
1BH	27	IA32_APIC_BASE	0, 1, 2, 3, 4, 6	Unique	APIC Location and Status. (R/W) see Table B-2. See Section 10.4.4, "Local APIC Status and Location."
2AH	42	MSR_EBC_HARD_POWERON	0, 1, 2, 3, 4, 6	Shared	Processor Hard Power-On Configuration. (R/W) Enables and disables processor features; (R) indicates current processor configuration.
		0			Output Tri-state Enabled. (R) Indicates whether tri-state output is enabled (1) or disabled (0) as set by the strapping of SMI#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
		1			Execute BIST. (R) Indicates whether the execution of the BIST is enabled (1) or disabled (0) as set by the strapping of INIT#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		2			In Order Queue Depth. (R) Indicates whether the in order queue depth for the system bus is 1 (1) or up to 12 (0) as set by the strapping of A7#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		3			MCERR# Observation Disabled. (R) Indicates whether MCERR# observation is enabled (0) or disabled (1) as determined by the strapping of A9#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		4			BINIT# Observation Enabled. (R) Indicates whether BINIT# observation is enabled (0) or disabled (1) as determined by the strapping of A10#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
		6:5			APIC Cluster ID. (R) Contains the logical APIC cluster ID value as set by the strapping of A12# and A11#. The logical cluster ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.
		7			Bus Park Disable. (R) Indicates whether bus park is enabled (0) or disabled (1) as set by the strapping of A15#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		11:8			Reserved.
		13:12			Agent ID. (R) Contains the logical agent ID value as set by the strapping of BR[3:0]. The logical ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.
		63:14			Reserved.
2BH	43	MSR_EBC_SOFT_POWERON	0, 1, 2, 3, 4, 6	Shared	Processor Soft Power-On Configuration. (R/W) Enables and disables processor features.
		0			RCNT/SCNT On Request Encoding Enable. (R/W) Controls the driving of RCNT/SCNT on the request encoding. Set to enable (1); clear to disabled (0, default).

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
		1			Data Error Checking Disable. (R/W) Set to disable system data bus parity checking; clear to enable parity checking.
		2			Response Error Checking Disable. (R/W) Set to disable (default); clear to enable.
		3			Address/Request Error Checking Disable. (R/W) Set to disable (default); clear to enable.
		4			Initiator MCERR# Disable. (R/W) Set to disable MCERR# driving for initiator bus requests (default); clear to enable.
		5			Internal MCERR# Disable. (R/W) Set to disable MCERR# driving for initiator internal errors (default); clear to enable.
		6			BINIT# Driver Disable. (R/W) Set to disable BINIT# driver (default); clear to enable driver.
		63:7			Reserved.
2CH	44	MSR_EBC_FREQUENCY_ID	2,3,4,6	Shared	Processor Frequency Configuration. The bit field layout of this MSR varies according to the MODEL value in the CPUID version information. The following bit field layout applies to Pentium 4 and Xeon Processors with MODEL encoding equal or greater than 2. (R) The field Indicates the current processor frequency configuration.

		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
185H	389	MSR_MCG_RDI	0, 1, 2, 3, 4, 6	Unique	Machine Check EDI/RDI Save State. See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
186H	390	MSR_MCG_RBP	0, 1, 2, 3, 4, 6	Unique	Machine Check EBX/RBP Save State. See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
187H	391	MSR_MCG_RSP	0, 1, 2, 3, 4, 6	Unique	Machine Check ESP/RSP Save State. See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
188H	392	MSR_MCG_RFLAGS	0, 1, 2, 3, 4, 6	Unique	Machine Check EFLAGS/RFLAG Save State. See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
189H	393	MSR_MCG_RIP	0, 1, 2, 3, 4, 6	Unique	Machine Check EIP/RIP Save State. See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.
18AH	394	MSR_MCG_MISC	0, 1, 2, 3, 4, 6	Unique	Machine Check Miscellaneous. See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		0			DS. When set, the bit indicates that a page assist or page fault occurred during DS normal operation. The processors response is to shut down. The bit is used as an aid for debugging DS handling code. It is the responsibility of the user (BIOS or operating system) to clear this bit for normal operation.
		63:1			Reserved.

		63-0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
197H	407	MSR_MCG_R15	0, 1, 2, 3, 4, 6	Unique	Machine Check R15. See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63-0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
198H	408	IA32_PERF_STATUS	3, 4, 6	Unique	see Table B-2. See Section 14.1, "Enhanced Intel Speedstep [®] Technology."
199H	409	IA32_PERF_CTL	3, 4, 6	Unique	see Table B-2. See Section 14.1, "Enhanced Intel Speedstep [®] Technology."
19AH	410	IA32_CLOCK_MODULATION	0, 1, 2, 3, 4, 6	Unique	Thermal Monitor Control. (R/W) see Table B-2. See Section 14.5.3, "Software Controlled Clock Modulation."
19BH	411	IA32_THERM_INTERRUPT	0, 1, 2, 3, 4, 6	Unique	Thermal Interrupt Control. (R/W) See Section 14.5.2, "Thermal Monitor." and see Table B-2
19CH	412	IA32_THERM_STATUS	0, 1, 2, 3, 4, 6	Shared	Thermal Monitor Status. (R/W) See Section 14.5.2, "Thermal Monitor." and see Table B-2
19DH	413	MSR_THERM2_CTL			Thermal Monitor 2 Control.

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
			3,	Shared	For Family F, Model 3 processors: When read, specifies the value of the target TM2 transition last written. When set, it sets the next target value for TM2 transition.
			4, 6	Shared	For Family F, Model 4 and Model 6 processors: When read, specifies the value of the target TM2 transition last written. Writes may cause #GP exceptions.
1A0H	416	IA32_MISC_ENABLE	0, 1, 2, 3, 4, 6	Shared	Enable Miscellaneous Processor Features. (R/W)
		0			Fast-Strings Enable. see Table B-2
		1			Reserved.
		2			x87 FPU Fopcode Compatibility Mode Enable.
		3			Thermal Monitor 1 Enable. See Section 14.5.2, "Thermal Monitor." and see Table B-2.
		4			Split-Lock Disable. When set, the bit causes an #AC exception to be issued instead of a split-lock cycle. Operating systems that set this bit must align system structures to avoid split-lock scenarios. When the bit is clear (default), normal split-locks are issued to the bus. This debug feature is specific to the Pentium 4 processor.
5			Reserved.		

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
		6			<p>Third-Level Cache Disable. (R/W) When set, the third-level cache is disabled; when clear (default) the third-level cache is enabled. This flag is reserved for processors that do not have a third-level cache.</p> <p>Note that the bit controls only the third-level cache; and only if overall caching is enabled through the CD flag of control register CRO, the page-level cache controls, and/or the MTRRs.</p> <p>See Section 11.5.4, "Disabling and Enabling the L3 Cache."</p>
		7			<p>Performance Monitoring Available. (R). see Table B-2</p>
		8			<p>Suppress Lock Enable. When set, assertion of LOCK on the bus is suppressed during a Split Lock access. When clear (default), LOCK is not suppressed.</p>
		9			<p>Prefetch Queue Disable. When set, disables the prefetch queue. When clear (default), enables the prefetch queue.</p>
		10			<p>FERR# Interrupt Reporting Enable. (R/W) When set, interrupt reporting through the FERR# pin is enabled; when clear, this interrupt reporting function is disabled.</p>

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
					<p>When this flag is set and the processor is in the stop-clock state (STPCLK# is asserted), asserting the FERR# pin signals to the processor that an interrupt (such as, INIT#, BINIT#, INTR, NMI, SMI#, or RESET#) is pending and that the processor should return to normal operation to handle the interrupt.</p> <p>This flag does not affect the normal operation of the FERR# pin (to indicate an unmasked floating-point error) when the STPCLK# pin is not asserted.</p>
		11			<p>Branch Trace Storage Unavailable (BTS_UNAVAILABLE). (R). see Table B-2</p> <p>When set, the processor does not support branch trace storage (BTS); when clear, BTS is supported.</p>
		12			<p>PEBS_UNAVAILABLE: Precise Event Based Sampling Unavailable. (R). see Table B-2</p> <p>When set, the processor does not support precise event-based sampling (PEBS); when clear, PEBS is supported.</p>
		13	3		<p>TM2 Enable. (R/W)</p> <p>When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0.</p>

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
					When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state. If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.
		17:14			Reserved.
		18	3, 4, 6		ENABLE MONITOR FSM. (R/W) see Table B-2
		19			Adjacent Cache Line Prefetch Disable. (R/W) When set to 1, the processor fetches the cache line of the 128-byte sector containing currently required data. When set to 0, the processor fetches both cache lines in the sector.
					Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing. BIOS may contain a setup option that controls the setting of this bit.
		21:20			Reserved.
		22	3, 4, 6		Limit CPUID MAXVAL. (R/W) see Table B-2

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
					Setting this can cause unexpected behavior to software that depends on the availability of CPUID leaves greater than 3.
		23		Shared	xTPR Message Disable. (R/W) see Table B-2.
		24			L1 Data Cache Context Mode. (R/W) When set, the L1 data cache is placed in shared mode; when clear (default), the cache is placed in adaptive mode. This bit is only enabled for IA-32 processors that support Intel Hyper-Threading Technology. See Section 11.5.6, "L1 Data Cache Context Mode." When L1 is running in adaptive mode and CR3s are identical, data in L1 is shared across logical processors. Otherwise, L1 is not shared and cache use is competitive. If the Context ID feature flag (ECX[10]) is set to 0 after executing CPUID with EAX = 1, the ability to switch modes is not supported. BIOS must not alter the contents of IA32_MISC_ENABLE[24].
		33:25			Reserved.
		34		Unique	XD Bit Disable. (R/W) see Table B-2.
		63:35			Reserved.
1A1H	417	MSR_PLATFORM_BRV	3, 4, 6	Shared	Platform Feature Requirements. (R)
		17:0			Reserved.

3CAH	970	MSR_ALF_ESCR0	0, 1, 2, 3, 4, 6	Shared	See Section 30.9.1, "ESCR MSRs."
3CBH	971	MSR_ALF_ESCR1	0, 1, 2, 3, 4, 6	Shared	See Section 30.9.1, "ESCR MSRs."
3CCH	972	MSR_CRU_ESCR2	0, 1, 2, 3, 4, 6	Shared	See Section 30.9.1, "ESCR MSRs."
3CDH	973	MSR_CRU_ESCR3	0, 1, 2, 3, 4, 6	Shared	See Section 30.9.1, "ESCR MSRs."
3E0H	992	MSR_CRU_ESCR4	0, 1, 2, 3, 4, 6	Shared	See Section 30.9.1, "ESCR MSRs."
3E1H	993	MSR_CRU_ESCR5	0, 1, 2, 3, 4, 6	Shared	See Section 30.9.1, "ESCR MSRs."
3FOH	1008	MSR_TC_PRECISE_EVENT	0, 1, 2, 3, 4, 6	Shared	See Section 30.9.1, "ESCR MSRs."
3F1H	1009	MSR_PEBS_ENABLE	0, 1, 2, 3, 4, 6	Shared	Precise Event-Based Sampling (PEBS). (R/W) Controls the enabling of precise event sampling and replay tagging.
		12:0			See Table A-18.
		23:13			Reserved.
		24			UOP Tag. Enables replay tagging when set.
		25			ENABLE_PEBS_MY_THR. (R/W) Enables PEBS for the target logical processor when set; disables PEBS when clear (default). See Section 30.10.3, "IA32_PEBS_ENABLE MSR," for an explanation of the target logical processor. This bit is called ENABLE_PEBS in IA-32 processors that do not support Intel Hyper-Threading Technology.

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
		26			<p>ENABLE_PEBS_OTH_THR. (R/W) Enables PEBS for the target logical processor when set; disables PEBS when clear (default). See Section 30.10.3, "IA32_PEBS_ENABLE MSR," for an explanation of the target logical processor. This bit is reserved for IA-32 processors that do not support Intel Hyper-Threading Technology.</p>
		63:27			Reserved.
3F2H	1010	MSR_PEBS_MATRIX_VERT	0, 1, 2, 3, 4, 6	Shared	See Table A-18.
400H	1024	IA32_MCO_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MCO_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MCO_ADDR	0, 1, 2, 3, 4, 6	Shared	<p>See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.</p>
403H	1027	IA32_MCO_MISC	0, 1, 2, 3, 4, 6	Shared	<p>See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MCO_MISC MSR is either not implemented or does not contain additional information if the MISC_V flag in the IA32_MCO_STATUS register is clear.</p>

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
					When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
406H	1030	IA32_MC1_ADDR	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
407H	1031	IA32_MC1_MISC		Shared	See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC1_MISC MSR is either not implemented or does not contain additional information if the MISC_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
40AH	1034	IA32_MC2_ADDR			See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40BH	1035	IA32_MC2_MISC			See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC2_MISC MSR is either not implemented or does not contain additional information if the MISC_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	IA32_MC3_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC3_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40EH	1038	IA32_MC3_ADDR	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
40FH	1039	IA32_MC3_MISC	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC3_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	IA32_MC4_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC4_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
412H	1042	IA32_MC4_ADDR			See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRv flag in the IA32_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	IA32_MC4_MISC			See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC2_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC4_STATUS register is clear.

Hex	Dec				
					When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
480H	1152	IA32_VMX_BASIC	3, 4, 6	Unique	Reporting Register of Basic VMX Capabilities. (R/O). see Table B-2. See Appendix G.1, “Basic VMX Information”
481H	1153	IA32_VMX_PINBASED_CTL	3, 4, 6	Unique	Capability Reporting Register of Pin-based VM-execution Controls. (R/O). see Table B-2. See Appendix G.3, “VM-Execution Controls”
482H	1154	IA32_VMX_PROCBASED_CTL	3, 4, 6	Unique	Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O) See Appendix G.3, “VM-Execution Controls” and see Table B-2.
483H	1155	IA32_VMX_EXIT_CTL	3, 4, 6	Unique	Capability Reporting Register of VM-exit Controls. (R/O) See Appendix G.4, “VM-Exit Controls” and see Table B-2.
484H	1156	IA32_VMX_ENTRY_CTL	3, 4, 6	Unique	Capability Reporting Register of VM-entry Controls. (R/O) See Appendix G.5, “VM-Entry Controls” and see Table B-2.
485H	1157	IA32_VMX_MISC	3, 4, 6	Unique	Reporting Register of Miscellaneous VMX Capabilities. (R/O) See Appendix G.6, “Miscellaneous Data” and see Table B-2.
486H	1158	IA32_VMX_CRO_FIXED0	3, 4, 6	Unique	Capability Reporting Register of CRO Bits Fixed to 0. (R/O) See Appendix G.7, “VMX-Fixed Bits in CRO” and see Table B-2.

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
487H	1159	IA32_VMX_CR0_FIXED1	3, 4, 6	Unique	Capability Reporting Register of CR0 Bits Fixed to 1. (R/O) See Appendix G.7, "VMX-Fixed Bits in CR0" and see Table B-2.
488H	1160	IA32_VMX_CR4_FIXED0	3, 4, 6	Unique	Capability Reporting Register of CR4 Bits Fixed to 0. (R/O) See Appendix G.8, "VMX-Fixed Bits in CR4" and see Table B-2.
489H	1161	IA32_VMX_CR4_FIXED1	3, 4, 6	Unique	Capability Reporting Register of CR4 Bits Fixed to 1. (R/O) See Appendix G.8, "VMX-Fixed Bits in CR4" and see Table B-2.
48AH	1162	IA32_VMX_VMCS_ENUM	3, 4, 6	Unique	Capability Reporting Register of VMCS Field Enumeration. (R/O). See Appendix G.9, "VMCS Enumeration" and see Table B-2.
48BH	1163	IA32_VMX_PROCBASED_CTLDS2	3, 4, 6	Unique	Capability Reporting Register of Secondary Processor-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls" and see Table B-2.
600H	1536	IA32_DS_AREA	0, 1, 2, 3, 4, 6	Unique	DS Save Area. (R/W). see Table B-2. See Section 30.9.4, "Debug Store (DS) Mechanism."
680H	1664	MSR_LASTBRANCH_O_FROM_LIP	3, 4, 6	Unique	Last Branch Record 0. (R/W) One of 16 pairs of last branch record registers on the last branch record stack (680H-68FH). This part of the stack contains pointers to the source instruction for one of the last 16 branches, exceptions, or interrupts taken by the processor.

Table B-13. MSRs in the Pentium 4 and Intel Xeon Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique ¹	Bit Description
Hex	Dec				
					<p>The MSRs at 680H-68FH, 6C0H-6CfH are not available in processor releases before family 0FH, model 03H. These MSRs replace MSRs previously located at 1DBH-1DEH, which performed the same function for early releases.</p> <p>See Section 16.8, “Last Branch, Interrupt, and Exception Recording (Processors based on Intel NetBurst[®] Microarchitecture).”</p>
681H	1665	MSR_LASTBRANCH_1_FROM_LIP	3, 4, 6	Unique	Last Branch Record 1. See description of MSR_LASTBRANCH_0 at 680H.
682H	1666	MSR_LASTBRANCH_2_FROM_LIP	3, 4, 6	Unique	Last Branch Record 2. See description of MSR_LASTBRANCH_0 at 680H.

NOTES

1. For HT-enabled processors, there may be more than one logical processors per physical unit. If an MSR is Shared, this means that one MSR is shared between logical processors. If an MSR is unique, this means that each logical processor has its own MSR.

B.8.1 MSRs Unique to Intel Xeon Processor MP with L3 Cache

The MSRs listed in Table B-14 apply to Intel Xeon Processor MP with up to 8MB level three cache. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 3 or 4 (See CPUID instruction for more details.).

Table B-14. MSRs Unique to 64-bit Intel Xeon Processor MP with Up to an 8 MB L3 Cache

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique	Bit Description
107CCH		MSR_IFSB_BUSQ0	3, 4	Shared	IFSB BUSQ Event Control and Counter Register. (R/W) See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107CDH		MSR_IFSB_BUSQ1	3, 4	Shared	IFSB BUSQ Event Control and Counter Register. (R/W)
107CEH		MSR_IFSB_SNPQ0	3, 4	Shared	IFSB SNPQ Event Control and Counter Register. (R/W) See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."

Table B-14. MSRs Unique to 64-bit Intel Xeon Processor MP with Up to an 8 MB L3 Cache (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique	Bit Description
107CFH		MSR_IFSB_SNPQ1	3, 4	Shared	IFSB SNPQ Event Control and Counter Register. (R/W)
107D0H		MSR_EFSB_DRDY0	3, 4	Shared	EFSB DRDY Event Control and Counter Register. (R/W) See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache" for details.
107D1H		MSR_EFSB_DRDY1	3, 4	Shared	EFSB DRDY Event Control and Counter Register. (R/W)
107D2H		MSR_IFSB_CTL6	3, 4	Shared	IFSB Latency Event Control Register. (R/W) See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache" for details.
107D3H		MSR_IFSB_CNTR7	3, 4	Shared	IFSB Latency Event Counter Register. (R/W) See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."

The MSRs listed in Table B-15 apply to Intel Xeon Processor 7100 series. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 6 (See CPUID instruction for more details.). The performance monitoring MSRs listed in Table B-15 are shared between logical processors in the same core, but are replicated for each core.

Table B-15. MSRs Unique to Intel Xeon Processor 7100 Series

Register Address		Register Name Fields and Flags	Model Avail- ability	Shared/ Unique	Bit Description
107CCH		MSR_EMON_L3_CTR_C TL0	6	Shared	GBUSQ Event Control and Counter Register. (R/W) See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107CDH		MSR_EMON_L3_CTR_C TL1	6	Shared	GBUSQ Event Control and Counter Register. (R/W)
107CEH		MSR_EMON_L3_CTR_C TL2	6	Shared	GSNPQ Event Control and Counter Register. (R/W) See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107CFH		MSR_EMON_L3_CTR_C TL3	6	Shared	GSNPQ Event Control and Counter Register (R/W)
107D0H		MSR_EMON_L3_CTR_C TL4	6	Shared	FSB Event Control and Counter Register. (R/W) See Section 30.14, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache" for details.
107D1H		MSR_EMON_L3_CTR_C TL5	6	Shared	FSB Event Control and Counter Register. (R/W)
107D2H		MSR_EMON_L3_CTR_C TL6	6	Shared	FSB Event Control and Counter Register. (R/W)
107D3H		MSR_EMON_L3_CTR_C TL7	6	Shared	FSB Event Control and Counter Register. (R/W)

B.9 MSRS IN INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Model-specific registers (MSRs) for Intel Core Solo, Intel Core Duo processors, and Dual-core Intel Xeon processor LV are listed in Table B-16. The column “Shared/Unique” applies to Intel Core Duo processor. “Unique” means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. “Shared” means the MSR or the bit field in an MSR address governs the operation of both processor cores.

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV

Register Address		Register Name	Shared/Unique	Bit Description
Hex	Dec			
0H	0	P5_MC_ADDR	Unique	See Appendix B.12, “MSRs in Pentium Processors.” and see Table B-2
1H	1	P5_MC_TYPE	Unique	See Appendix B.12, “MSRs in Pentium Processors.” and see Table B-2
6H	6	IA32_MONITOR_FILTER_SIZE	Unique	See Section 8.10.5, “Monitor/Mwait Address Range Determination.” and see Table B-2
10H	16	IA32_TIME_STAMP_COUNTER	Unique	See Section 16.12, “Time-Stamp Counter.” and see Table B-2
17H	23	IA32_PLATFORM_ID	Shared	Platform ID. (R) see Table B-2 The operating system can use this MSR to determine “slot” information for the processor and the proper microcode update to load.
1BH	27	IA32_APIC_BASE	Unique	See Section 10.4.4, “Local APIC Status and Location.” and see Table B-2
2AH	42	MSR_EBL_CR_POWERON	Shared	Processor Hard Power-On Configuration. (R/W) Enables and disables processor features; (R) indicates current processor configuration.
		0		Reserved.
		1		Data Error Checking Enable. (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		2		Response Error Checking Enable. (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		3		MCERR# Drive Enable. (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		4		Address Parity Enable. (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		6: 5		Reserved
		7		BINIT# Driver Enable. (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		8		Output Tri-state Enabled. (R/O) 1 = Enabled; 0 = Disabled
		9		Execute BIST. (R/O) 1 = Enabled; 0 = Disabled
		10		MCERR# Observation Enabled. (R/O) 1 = Enabled; 0 = Disabled
		11		Reserved
		12		BINIT# Observation Enabled. (R/O) 1 = Enabled; 0 = Disabled
		13		Reserved
		14		1 MByte Power on Reset Vector. (R/O) 1 = 1 MByte; 0 = 4 GBytes
		15		Reserved
		17:16		APIC Cluster ID. (R/O)
		18		System Bus Frequency. (R/O) 0 = 100 MHz 1 = Reserved
		19		Reserved.
		21: 20		Symmetric Arbitration ID. (R/O)
		26:22		Clock Frequency Ratio. (R/O)

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
3AH	58	IA32_FEATURE_CONTROL	Unique	Control Features in IA-32 Processor. (R/W) see Table B-2
40H	64	MSR_LASTBRANCH_0	Unique	Last Branch Record 0. (R/W) One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the 'to' address. See also: <ul style="list-style-type: none"> ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 16.10, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."
41H	65	MSR_LASTBRANCH_1	Unique	Last Branch Record 1. (R/W) See description of MSR_LASTBRANCH_0.
42H	66	MSR_LASTBRANCH_2	Unique	Last Branch Record 2. (R/W) See description of MSR_LASTBRANCH_0.
43H	67	MSR_LASTBRANCH_3	Unique	Last Branch Record 3. (R/W) See description of MSR_LASTBRANCH_0.
44H	68	MSR_LASTBRANCH_4	Unique	Last Branch Record 4. (R/W) See description of MSR_LASTBRANCH_0.
45H	69	MSR_LASTBRANCH_5	Unique	Last Branch Record 5. (R/W) See description of MSR_LASTBRANCH_0.
46H	70	MSR_LASTBRANCH_6	Unique	Last Branch Record 6. (R/W) See description of MSR_LASTBRANCH_0.
47H	71	MSR_LASTBRANCH_7	Unique	Last Branch Record 7. (R/W) See description of MSR_LASTBRANCH_0.
79H	121	IA32_BIOS_UPDT_TRIG	Unique	BIOS Update Trigger Register (W). see Table B-2
8BH	139	IA32_BIOS_SIGN_ID	Unique	BIOS Update Signature ID (RO). see Table B-2
C1H	193	IA32_PMC0	Unique	Performance counter register. see Table B-2
C2H	194	IA32_PMC1	Unique	Performance counter register. see Table B-2

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
CDH	205	MSR_FSB_FREQ	Shared	Scaleable Bus Speed. (RO) This field indicates the scaleable bus clock speed:
		2:0		<ul style="list-style-type: none"> ▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) <p>133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 101B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B.</p>
		63:3		Reserved
E7H	231	IA32_MPERF	Unique	Maximum Performance Frequency Clock Count. (RW). see Table B-2
E8H	232	IA32_APERF	Unique	Actual Performance Frequency Clock Count. (RW). see Table B-2
FEH	254	IA32_MTRRCAP	Unique	see Table B-2
11EH	281	MSR_BBL_CR_CTL3	Shared	
		0		L2 Hardware Enabled. (RO) 1 = If the L2 is hardware-enabled 0 = Indicates if the L2 is hardware-disabled
		7:1		Reserved.
		8		L2 Enabled. (R/W) 1 = L2 cache has been initialized 0 = Disabled (default) Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9		Reserved.

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		23		L2 Not Present. (RO) 0 = L2 Present 1 = L2 Not Present
		63:24		Reserved.
174H	372	IA32_SYSENTER_CS	Unique	see Table B-2
175H	373	IA32_SYSENTER_ESP	Unique	see Table B-2
176H	374	IA32_SYSENTER_EIP	Unique	see Table B-2
179H	377	IA32_MCG_CAP	Unique	see Table B-2
17AH	378	IA32_MCG_STATUS	Unique	
		0		RIPV. When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted
		1		EIPV. When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		MCIP. When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		63:3		Reserved.
186H	390	IA32_PERFEVTSELO	Unique	see Table B-2
187H	391	IA32_PERFEVTSEL1	Unique	see Table B-2
198H	408	IA32_PERF_STAT US	Shared	see Table B-2
199H	409	IA32_PERF_CTL	Unique	see Table B-2
19AH	410	IA32_CLOCK_ MODULATION	Unique	Clock Modulation. (R/W) see Table B-2
19BH	411	IA32_THERM_ INTERRUPT	Unique	Thermal Interrupt Control. (R/W) see Table B-2 See Section 14.5.2, "Thermal Monitor."
19CH	412	IA32_THERM_ STATUS	Unique	Thermal Monitor Status. (R/W) see Table B-2. See Section 14.5.2, "Thermal Monitor".
19DH	413	MSR_THERM2_ CTL	Unique	
		15:0		Reserved.
		16		TM_SELECT. (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.
		63:16		Reserved.
1A0	416	IA32_MISC_ ENABLE		Enable Miscellaneous Processor Features. (R/W) Allows a variety of processor functions to be enabled and disabled.

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		2:0		Reserved.
		3	Unique	Automatic Thermal Control Circuit Enable. (R/W) see Table B-2
		6:4		Reserved
		7	Shared	Performance Monitoring Available. (R). see Table B-2
		9:8		Reserved
		10	Shared	FERR# Multiplexing Enable. (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor 0 = Indicates compatible FERR# signaling behavior This bit must be set to 1 to support XAPIC interrupt model usage.
		11	Shared	Branch Trace Storage Unavailable. (RO). see Table B-2
		12		Reserved.
		13	Shared	TM2 Enable. (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0.

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
				When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state. If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.
		15:14		Reserved
		16	Shared	Enhanced Intel SpeedStep Technology Enable. (R/W) 1 = Enhanced Intel SpeedStep Technology enabled
		18	Shared	ENABLE MONITOR FSM. (R/W) see Table B-2
		19		Reserved.
		22	Shared	Limit CPUID Maxval. (R/W) see Table B-2. Setting this bit may cause behavior in software that depends on the availability of CPUID leaves greater than 3.
		33:23		Reserved.
		34	Shared	XD Bit Disable. (R/W) see Table B-2
		63:35		Reserved.
1C9H	457	MSR_ LASTBRANCH_ TOS	Unique	Last Branch Record Stack TOS. (R) Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H)

2FFH	767	IA32_MTRR_DEF_TYPE	Unique	Default Memory Types. (R/W). see Table B-2. See Section 11.11.2.1, "IA32_MTRR_DEF_TYPE MSR."
400H	1024	IA32_MCO_CTL	Unique	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
401H	1025	IA32_MCO_STATUS	Unique	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."
402H	1026	IA32_MCO_ADDR	Unique	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	Unique	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Unique	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."
406H	1030	IA32_MC1_ADDR	Unique	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	Unique	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Unique	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR	Unique	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	MSR_MC4_CTL	Unique	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
40DH	1037	MSR_MC4_STATUS	Unique	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
40EH	1038	MSR_MC4_ADDR	Unique	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	MSR_MC3_CTL		See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
411H	1041	MSR_MC3_STATUS		See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."
412H	1042	MSR_MC3_ADDR	Unique	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	MSR_MC3_MISC	Unique	
414H	1044	MSR_MC5_CTL	Unique	
415H	1045	MSR_MC5_STATUS	Unique	
416H	1046	MSR_MC5_ADDR	Unique	
417H	1047	MSR_MC5_MISC	Unique	
480H	1152	IA32_VMX_BASIC	Unique	Reporting Register of Basic VMX Capabilities. (R/O). see Table B-2 See Appendix G.1, "Basic VMX Information" (If CPUID.01H:ECX.[bit 9])
481H	1153	IA32_VMX_PINBA SED_CTL	Unique	Capability Reporting Register of Pin-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls" (If CPUID.01H:ECX.[bit 9])

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
482H	1154	IA32_VMX_PROCBASED_CTL	Unique	Capability Reporting Register of Primary Processor-based VM-execution Controls. (R/O) See Appendix G.3, "VM-Execution Controls" (If CPUID.01H:ECX.[bit 9])
483H	1155	IA32_VMX_EXIT_CTL	Unique	Capability Reporting Register of VM-exit Controls. (R/O) See Appendix G.4, "VM-Exit Controls" (If CPUID.01H:ECX.[bit 9])
484H	1156	IA32_VMX_ENTRY_CTL	Unique	Capability Reporting Register of VM-entry Controls. (R/O) See Appendix G.5, "VM-Entry Controls" (If CPUID.01H:ECX.[bit 9])
485H	1157	IA32_VMX_MISC	Unique	Reporting Register of Miscellaneous VMX Capabilities. (R/O) See Appendix G.6, "Miscellaneous Data" (If CPUID.01H:ECX.[bit 9])
486H	1158	IA32_VMX_CR0_FIXED0	Unique	Capability Reporting Register of CR0 Bits Fixed to 0. (R/O) See Appendix G.7, "VMX-Fixed Bits in CR0" (If CPUID.01H:ECX.[bit 9])
487H	1159	IA32_VMX_CR0_FIXED1	Unique	Capability Reporting Register of CR0 Bits Fixed to 1. (R/O) See Appendix G.7, "VMX-Fixed Bits in CR0" (If CPUID.01H:ECX.[bit 9])
488H	1160	IA32_VMX_CR4_FIXED0	Unique	Capability Reporting Register of CR4 Bits Fixed to 0. (R/O) See Appendix G.8, "VMX-Fixed Bits in CR4" (If CPUID.01H:ECX.[bit 9])
489H	1161	IA32_VMX_CR4_FIXED1	Unique	Capability Reporting Register of CR4 Bits Fixed to 1. (R/O) See Appendix G.8, "VMX-Fixed Bits in CR4" (If CPUID.01H:ECX.[bit 9])

Table B-16. MSRs in Intel Core Solo, Intel Core Duo Processors, and Dual-Core Intel Xeon Processor LV (Contd.)

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
48AH	1162	IA32_VMX_VMCS_ENUM	Unique	Capability Reporting Register of VMCS Field Enumeration. (R/O). See Appendix G.9, “VMCS Enumeration” (If CPUID.01H:ECX.[bit 9])
48BH	1163	IA32_VMX_PROCBASED_CTLSS2	Unique	Capability Reporting Register of Secondary Processor-based VM-execution Controls. (R/O) See Appendix G.3, “VM-Execution Controls” (If CPUID.01H:ECX.[bit 9] and IA32_VMX_PROCBASED_CTLSS[bit 63])
600H	1536	IA32_DS_AREA	Unique	DS Save Area. (R/W) see Table B-2. See Section 30.9.4, “Debug Store (DS) Mechanism.”
		31:0		DS Buffer Management Area. Linear address of the first byte of the DS buffer management area.
		63:32		Reserved.
C000_0080H		IA32_EFER	Unique	see Table B-2
		10:0		Reserved.
		11		Execute Disable Bit Enable.
		63:12		Reserved

B.10 MSRS IN THE PENTIUM M PROCESSOR

Model-specific registers (MSRs) for the Pentium M processor are similar to those described in Section B.11 for P6 family processors. The following table describes new MSRs and MSRs whose behavior has changed on the Pentium M processor.

Table B-17. MSRs in Pentium M Processors

Register Address		Register Name	Bit Description
Hex	Dec		
0H	0	P5_MC_ADDR	See Appendix B.12, "MSRs in Pentium Processors."
1H	1	P5_MC_TYPE	See Appendix B.12, "MSRs in Pentium Processors."
10H	16	IA32_TIME_STAMP_COUNTER	See Section 16.12, "Time-Stamp Counter." and see Table B-2
17H	23	IA32_PLATFORM_ID	Platform ID. (R). see Table B-2 The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.
2AH	42	MSR_EBL_CR_POWERON	Processor Hard Power-On Configuration. (R/W) Enables and disables processor features. (R) Indicates current processor configuration.
		0	Reserved.
		1	Data Error Checking Enable. (R) 0 = Disabled Always 0 on the Pentium M processor.
		2	Response Error Checking Enable. (R) 0 = Disabled Always 0 on the Pentium M processor.
		3	MCERR# Drive Enable. (R) 0 = Disabled Always 0 on the Pentium M processor.
		4	Address Parity Enable. (R) 0 = Disabled Always 0 on the Pentium M processor.
		6:5	Reserved.
		7	BINIT# Driver Enable. (R) 1 = Enabled; 0 = Disabled Always 0 on the Pentium M processor.
		8	Output Tri-state Enabled. (R/O) 1 = Enabled; 0 = Disabled
		9	Execute BIST. (R/O) 1 = Enabled; 0 = Disabled

Table B-17. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		10	MCERR# Observation Enabled. (R/O) 1 = Enabled; 0 = Disabled Always 0 on the Pentium M processor.
		11	Reserved.
		12	BINIT# Observation Enabled. (R/O) 1 = Enabled; 0 = Disabled Always 0 on the Pentium M processor.
		13	Reserved
		14	1 MByte Power on Reset Vector. (R/O) 1 = 1 MByte; 0 = 4 GBytes Always 0 on the Pentium M processor.
		15	Reserved.
		17:16	APIC Cluster ID. (R/O) Always 00B on the Pentium M processor.
		18	System Bus Frequency. (R/O) 0 = 100 MHz 1 = Reserved Always 0 on the Pentium M processor.
		19	Reserved.
		21:20	Symmetric Arbitration ID. (R/O) Always 00B on the Pentium M processor.
		26:22	Clock Frequency Ratio (R/O)
40H	64	MSR_LASTBRANCH_0	Last Branch Record 0. (R/W) One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the to address. See also: <ul style="list-style-type: none"> ▪ Last Branch Record Stack TOS at 1C9H ▪ Section 16.10, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)"
41H	65	MSR_LASTBRANCH_1	Last Branch Record 1. (R/W) See description of MSR_LASTBRANCH_0.

Table B-17. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
42H	66	MSR_LASTBRANCH_2	Last Branch Record 2. (R/W) See description of MSR_LASTBRANCH_0.
43H	67	MSR_LASTBRANCH_3	Last Branch Record 3. (R/W) See description of MSR_LASTBRANCH_0.
44H	68	MSR_LASTBRANCH_4	Last Branch Record 4. (R/W) See description of MSR_LASTBRANCH_0.
45H	69	MSR_LASTBRANCH_5	Last Branch Record 5. (R/W) See description of MSR_LASTBRANCH_0.
46H	70	MSR_LASTBRANCH_6	Last Branch Record 6. (R/W) See description of MSR_LASTBRANCH_0.
47H	71	MSR_LASTBRANCH_7	Last Branch Record 7. (R/W) See description of MSR_LASTBRANCH_0.
119H	281	MSR_BBL_CR_CTL	
		63:0	Reserved.
11EH	281	MSR_BBL_CR_CTL3	
		0	L2 Hardware Enabled. (RO) 1 = If the L2 is hardware-enabled 0 = Indicates if the L2 is hardware-disabled
		4:1	Reserved.
		5	ECC Check Enable. (RO) This bit enables ECC checking on the cache data bus. ECC is always generated on write cycles. 0 = Disabled (default) 1 = Enabled For the Pentium M processor, ECC checking on the cache data bus is always enabled.
		7:6	Reserved.

Table B-17. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		8	L2 Enabled. (R/W) 1 = L2 cache has been initialized 0 = Disabled (default) Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9	Reserved.
		23	L2 Not Present. (RO) 0 = L2 Present 1 = L2 Not Present
		63:24	Reserved.
179H	377	IA32_MCG_CAP	
		7:0	Count. (RO) Indicates the number of hardware unit error reporting banks available in the processor
		8	IA32_MCG_CTL Present. (RO) 1 = Indicates that the processor implements the MSR_MCG_CTL register found at MSR 17BH. 0 = Not supported.
		63:9	Reserved.
17AH	378	IA32_MCG_STATUS	
		0	RIPV. When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted
		1	EIPV. When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.

Table B-17. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		2	MCIP. When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3	Reserved.
198H	408	IA32_PERF_STATUS	see Table B-2
199H	409	IA32_PERF_CTL	see Table B-2
19AH	410	IA32_CLOCK_MODULATION	Clock Modulation. (R/W). see Table B-2. See Section 14.5.3, "Software Controlled Clock Modulation."
19BH	411	IA32_THERM_INTERRUPT	Thermal Interrupt Control. (R/W). see Table B-2. See Section 14.5.2, "Thermal Monitor."
19CH	412	IA32_THERM_STATUS	Thermal Monitor Status. (R/W). see Table B-2 See Section 14.5.2, "Thermal Monitor."
19DH	413	MSR_THERM2_CTL	
		15:0	Reserved.
		16	TM_SELECT. (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.
		63:16	Reserved
1A0	416	IA32_MISC_ENABLE	Enable Miscellaneous Processor Features. (R/W) Allows a variety of processor functions to be enabled and disabled.
			2:0

Table B-17. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		3	<p>Automatic Thermal Control Circuit Enable. (R/W)</p> <p>1 = Setting this bit enables the thermal control circuit (TCC) portion of the Intel Thermal Monitor feature. This allows processor clocks to be automatically modulated based on the processor's thermal sensor operation.</p> <p>0 = Disabled (default).</p> <p>The automatic thermal control circuit enable bit determines if the thermal control circuit (TCC) will be activated when the processor's internal thermal sensor determines the processor is about to exceed its maximum operating temperature.</p> <p>When the TCC is activated and TM1 is enabled, the processors clocks will be forced to a 50% duty cycle. BIOS must enable this feature.</p> <p>The bit should not be confused with the on-demand thermal control circuit enable bit.</p>
		6:4	Reserved.
		7	<p>Performance Monitoring Available. (R)</p> <p>1 = Performance monitoring enabled</p> <p>0 = Performance monitoring disabled</p>
		9:8	Reserved.
		10	<p>FERR# Multiplexing Enable. (R/W)</p> <p>1 = FERR# asserted by the processor to indicate a pending break event within the processor</p> <p>0 = Indicates compatible FERR# signaling behavior</p> <p>This bit must be set to 1 to support XAPIC interrupt model usage.</p>
			<p>Branch Trace Storage Unavailable. (RO)</p> <p>1 = Processor doesn't support branch trace storage (BTS)</p> <p>0 = BTS is supported</p>

Table B-17. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		12	Precise Event Based Sampling Unavailable. (R0) 1 = Processor does not support precise event-based sampling (PEBS); 0 = PEBS is supported. The Pentium M processor does not support PEBS.
		15:13	Reserved.
		16	Enhanced Intel SpeedStep Technology Enable. (R/W) 1 = Enhanced Intel SpeedStep Technology enabled. On the Pentium M processor, this bit may be configured to be read-only.
		22:17	Reserved.
		23	xTPR Message Disable. (R/W) When set to 1, xTPR messages are disabled. xTPR messages are optional messages that allow the processor to inform the chipset of its priority. The default is processor specific.
		63:24	Reserved.
1C9H	457	MSR_LASTBRANCH_TOS	Last Branch Record Stack TOS. (R) Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See also: <ul style="list-style-type: none"> ▪ MSR_LASTBRANCH_0_FROM_IP (at 40H) ▪ Section 16.10, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)"
1D9H	473	MSR_DEBUGCTLB	Debug Control. (R/W) Controls how several debug features are used. Bit definitions are discussed in the referenced section. See Section 16.10, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."

Table B-17. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
1DDH	477	MSR_LER_TO_LIP	Last Exception Record To Linear IP. (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 16.10, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)" and Section 16.11.2, "Last Branch and Last Exception MSRs."
1DEH	478	MSR_LER_FROM_LIP	Last Exception Record From Linear IP. (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 16.10, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)" and Section 16.11.2, "Last Branch and Last Exception MSRs."
2FFH	767	IA32_MTRR_DEF_TYPE	Default Memory Types. (R/W) Sets the memory type for the regions of physical memory that are not mapped by the MTRRs. See Section 11.11.2.1, "IA32_MTRR_DEF_TYPE MSR."
400H	1024	IA32_MCO_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MCO_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
402H	1026	IA32_MCO_ADDR	See Section 14.3.2.3, "IA32_MCi_ADDR MSRs". The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."

Table B-17. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
406H	1030	IA32_MC1_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	See Chapter 15.3.2.2, "IA32_MCi_STATUS MSRs."
40AH	1034	IA32_MC2_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	MSR_MC4_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	MSR_MC4_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40EH	1038	MSR_MC4_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	MSR_MC3_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	MSR_MC3_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
412H	1042	MSR_MC3_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.

Table B-17. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
600H	1536	IA32_DS_AREA	DS Save Area. (R/W). see Table B-2 Points to the DS buffer management area, which is used to manage the BTS and PEBS buffers. See Section 30.9.4, "Debug Store (DS) Mechanism."
		31:0	DS Buffer Management Area. Linear address of the first byte of the DS buffer management area.
		63:32	Reserved.

B.11 MSRS IN THE P6 FAMILY PROCESSORS

The following MSRs are defined for the P6 family processors. The MSRs in this table that are shaded are available only in the Pentium II and Pentium III processors. Beginning with the Pentium 4 processor, some of the MSRs in this list have been designated as "architectural" and have had their names changed. See Table B-2 for a list of the architectural MSRs.

Table B-18. MSRs in the P6 Family Processors

Register Address		Register Name	Bit Description
Hex	Dec		
0H	0	P5_MC_ADDR	See Appendix B.12, "MSRs in Pentium Processors."
1H	1	P5_MC_TYPE	See Appendix B.12, "MSRs in Pentium Processors."
10H	16	TSC	See Section 16.12, "Time-Stamp Counter."
17H	23	IA32_PLATFORM_ID	Platform ID. (R) The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.
		49:0	Reserved.

Table B-18. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		52:50	Platform Id. (R) Contains information concerning the intended platform for the processor. 52 51 50 0 0 0 Processor Flag 0 0 0 1 Processor Flag 1 0 1 0 Processor Flag 2 0 1 1 Processor Flag 3 1 0 0 Processor Flag 4 1 0 1 Processor Flag 5 1 1 0 Processor Flag 6 1 1 1 Processor Flag 7
		56:53	L2 Cache Latency Read.
		59:57	Reserved.
		60	Clock Frequency Ratio Read.
		63:61	Reserved.
		1BH	27
		7:0	Reserved.
		8	Boot Strap Processor indicator Bit. 1 = BSP
		10:9	Reserved.
		11	APIC Global Enable Bit - Permanent till reset. 1 = Enabled 0 = Disabled
		31:12	APIC Base Address.
		63:32	Reserved.
2AH	42	EBL_CR_POWERON	Processor Hard Power-On Configuration. (R/W) Enables and disables processor features; (R) indicates current processor configuration.
		0	Reserved. ¹
		1	Data Error Checking Enable. (R/W) 1 = Enabled 0 = Disabled

Table B-18. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		2	Response Error Checking Enable FRCERR Observation Enable. (R/W) 1 = Enabled 0 = Disabled
		3	AERR# Drive Enable. (R/W) 1 = Enabled 0 = Disabled
		4	BERR# Enable for Initiator Bus Requests. (R/W) 1 = Enabled 0 = Disabled
		5	Reserved.
		6	BERR# Driver Enable for Initiator Internal Errors. (R/W) 1 = Enabled 0 = Disabled
		7	BINIT# Driver Enable. (R/W) 1 = Enabled 0 = Disabled
		8	Output Tri-state Enabled. (R) 1 = Enabled 0 = Disabled
		9	Execute BIST. (R) 1 = Enabled 0 = Disabled
		10	AERR# Observation Enabled. (R) 1 = Enabled 0 = Disabled
		11	Reserved.
		12	BINIT# Observation Enabled. (R) 1 = Enabled 0 = Disabled

Table B-18. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name	Bit Description
Hex	Dec		
		13	In Order Queue Depth. (R) 1 = 1 0 = 8
		14	1-MByte Power on Reset Vector. (R) 1 = 1MByte 0 = 4GBytes
		15	FRC Mode Enable. (R) 1 = Enabled 0 = Disabled
		17:16	APIC Cluster ID. (R)
		19:18	System Bus Frequency. (R) 00 = 66MHz 10 = 100Mhz 01 = 133MHz 11 = Reserved
		21: 20	Symmetric Arbitration ID. (R)
		25:22	Clock Frequency Ratio. (R)

413H	1043	MC3_MISC	Defined in MCA architecture but not implemented in the P6 family processors

NOTES

1. Bit 0 of this register has been redefined several times, and is no longer used in P6 family processors.
2. The processor number feature may be disabled by setting bit 21 of the BBL_CR_CTL MSR (model-specific register address 119h) to "1". Once set, bit 21 of the BBL_CR_CTL may not be cleared. This bit is write-once. The processor number feature will be disabled until the processor is reset.
3. The Pentium III processor will prevent FSB frequency overclocking with a new shutdown mechanism. If the FSB frequency selected is greater than the internal FSB frequency the processor will shutdown. If the FSB selected is less than the internal FSB frequency the BIOS may choose to use bit 11 to implement its own shutdown policy.

B.12 MSRS IN PENTIUM PROCESSORS

The following MSRs are defined for the Pentium processors. The P5_MC_ADDR, P5_MC_TYPE, and TSC MSRs (named IA32_P5_MC_ADDR, IA32_P5_MC_TYPE, and IA32_TIME_STAMP_COUNTER in the Pentium 4 processor) are architectural; that is, code that accesses these registers will run on Pentium 4 and P6 family processors without generating exceptions (see Section B.1, “Architectural MSRs”). The CESR, CTR0, and CTR1 MSRs are unique to Pentium processors; code that accesses these registers will generate exceptions on Pentium 4 and P6 family processors.

Table B-19. MSRs in the Pentium Processor

Register Address		Register Name	Bit Description
Hex	Dec		
0H	0	P5_MC_ADDR	See Section 15.10.2, “Pentium Processor Machine-Check Exception Handling.”
1H	1	P5_MC_TYPE	See Section 15.10.2, “Pentium Processor Machine-Check Exception Handling.”
10H	16	TSC	See Section 16.12, “Time-Stamp Counter.”
11H	17	CESR	See Section 30.17.1, “Control and Event Select Register (CESR).”
12H	18	CTR0	Section 30.17.3, “Events Counted.”
13H	19	CTR1	Section 30.17.3, “Events Counted.”

MODEL-SPECIFIC REGISTERS (MSRS)

APPENDIX C

MP INITIALIZATION FOR P6 FAMILY PROCESSORS

This appendix describes the MP initialization process for systems that use multiple P6 family processors. This process uses the MP initialization protocol that was introduced with the Pentium Pro processor (see Section 8.4, “Multiple-Processor (MP) Initialization”). For P6 family processors, this protocol is typically used to boot 2 or 4 processors that reside on single system bus; however, it can support from 2 to 15 processors in a multi-clustered system when the APIC busses are tied together. Larger systems are not supported.

C.1 OVERVIEW OF THE MP INITIALIZATION PROCESS FOR P6 FAMILY PROCESSORS

During the execution of the MP initialization protocol, one processor is selected as the bootstrap processor (BSP) and the remaining processors are designated as application processors (APs), see Section 8.4.1, “BSP and AP Processors.” Thereafter, the BSP manages the initialization of itself and the APs. This initialization includes executing BIOS initialization code and operating-system initialization code.

The MP protocol imposes the following requirements and restrictions on the system:

- An APIC clock (APICLK) must be provided.
- The MP protocol will be executed only after a power-up or RESET. If the MP protocol has been completed and a BSP has been chosen, subsequent INITs (either to a specific processor or system wide) do not cause the MP protocol to be repeated. Instead, each processor examines its BSP flag (in the APIC_BASE MSR) to determine whether it should execute the BIOS boot-strap code (if it is the BSP) or enter a wait-for-SIPI state (if it is an AP).
- All devices in the system that are capable of delivering interrupts to the processors must be inhibited from doing so for the duration of the MP initialization protocol. The time during which interrupts must be inhibited includes the window between when the BSP issues an INIT-SIPI-SIPI sequence to an AP and when the AP responds to the last SIPI in the sequence.

The following special-purpose interprocessor interrupts (IPIs) are used during the boot phase of the MP initialization protocol. These IPIs are broadcast on the APIC bus.

- **Boot IPI (BIPI)**—Initiates the arbitration mechanism that selects a BSP from the group of processors on the system bus and designates the remainder of the processors as APs. Each processor on the system bus broadcasts a BIPI to all the processors following a power-up or RESET.

- Final Boot IPI (FIPI)—Initiates the BIOS initialization procedure for the BSP. This IPI is broadcast to all the processors on the system bus, but only the BSP responds to it. The BSP responds by beginning execution of the BIOS initialization code at the reset vector.
- Startup IPI (SIPI)—Initiates the initialization procedure for an AP. The SIPI message contains a vector to the AP initialization code in the BIOS.

Table C-1 describes the various fields of the boot phase IPIs.

Table C-1. Boot Phase IPI Message Format

Type	Destination Field	Destination Shorthand	Trigger Mode	Level	Destination Mode	Delivery Mode	Vector (Hex)
BIPI	Not used	All including self	Edge	Deassert	Don't Care	Fixed (000)	40 to 4E*
FIPI	Not used	All including self	Edge	Deassert	Don't Care	Fixed (000)	10
SIPI	Used	All excluding self	Edge	Assert	Physical	StartUp (110)	00 to FF

NOTE:

* For all P6 family processors.

For BIPI messages, the lower 4 bits of the vector field contain the APIC ID of the processor issuing the message and the upper 4 bits contain the “generation ID” of the message. All P6 family processor will have a generation ID of 4H. BIPIs will therefore use vector values ranging from 40H to 4EH (4FH can not be used because FH is not a valid APIC ID).

C.2 MP INITIALIZATION PROTOCOL ALGORITHM

Following a power-up or RESET of a system, the P6 family processors in the system execute the MP initialization protocol algorithm to initialize each of the processors on the system bus. In the course of executing this algorithm, the following boot-up and initialization operations are carried out:

1. Each processor on the system bus is assigned a unique APIC ID, based on system topology (see Section 8.4.5, “Identifying Logical Processors in an MP System”). This ID is written into the local APIC ID register for each processor.
2. Each processor executes its internal BIST simultaneously with the other processors on the system bus. Upon completion of the BIST (at T0), each processor broadcasts a BIPI to “all including self” (see Figure 1).
3. APIC arbitration hardware causes all the APICs to respond to the BIPIs one at a time (at T1, T2, T3, and T4).
4. When the first BIPI is received (at time T1), each APIC compares the four least significant bits of the BIPI’s vector field with its APIC ID. If the vector and APIC ID match, the processor selects itself as the BSP by setting the BSP flag in its

IA32_APIC_BASE MSR. If the vector and APIC ID do not match, the processor selects itself as an AP by entering the “wait for SIPI” state. (Note that in Figure 1, the BIPI from processor 1 is the first BIPI to be handled, so processor 1 becomes the BSP.)

- The newly established BSP broadcasts an FIPI message to “all including self.” The FIPI is guaranteed to be handled only after the completion of the BIPIs that were issued by the non-BSP processors.

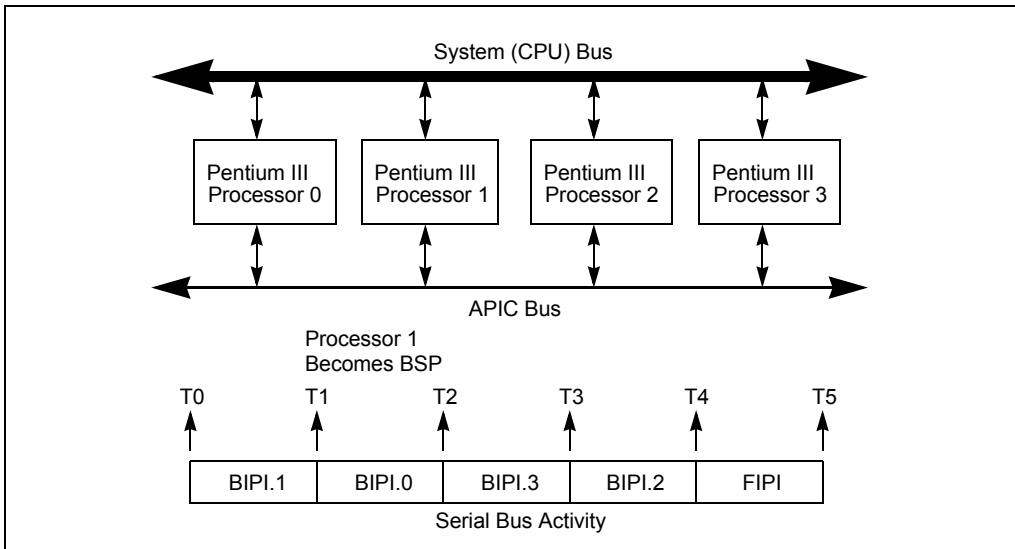

Figure C-1. MP System With Multiple Pentium III Processors

- After the BSP has been established, the outstanding BIPIs are received one at a time (at T2, T3, and T4) and ignored by all processors.
- When the FIPI is finally received (at T5), only the BSP responds to it. It responds by fetching and executing BIOS boot-strap code, beginning at the reset vector (physical address FFFF FFF0H).
- As part of the boot-strap code, the BSP creates an ACPI table and an MP table and adds its initial APIC ID to these tables as appropriate.
- At the end of the boot-strap procedure, the BSP broadcasts a SIPI message to all the APs in the system. Here, the SIPI message contains a vector to the BIOS AP initialization code (at 000V V000H, where VV is the vector contained in the SIPI message).
- All APs respond to the SIPI message by racing to a BIOS initialization semaphore. The first one to the semaphore begins executing the initialization code. (See MP init code for semaphore implementation details.) As part of the AP initialization procedure, the AP adds its APIC ID number to the ACPI and MP tables as appro-

priate. At the completion of the initialization procedure, the AP executes a CLI instruction (to clear the IF flag in the EFLAGS register) and halts itself.

11. When each of the APs has gained access to the semaphore and executed the AP initialization code and all written their APIC IDs into the appropriate places in the ACPI and MP tables, the BSP establishes a count for the number of processors connected to the system bus, completes executing the BIOS boot-strap code, and then begins executing operating-system boot-strap and start-up code.
12. While the BSP is executing operating-system boot-strap and start-up code, the APs remain in the halted state. In this state they will respond only to INITs, NMIs, and SMIs. They will also respond to snoops and to assertions of the STPCLK# pin.

See Section 8.4.4, "MP Initialization Example," for an annotated example the use of the MP protocol to boot IA-32 processors in an MP. This code should run on any IA-32 processor that used the MP protocol.

C.2.1 Error Detection and Handling During the MP Initialization Protocol

Errors may occur on the APIC bus during the MP initialization phase. These errors may be transient or permanent and can be caused by a variety of failure mechanisms (for example, broken traces, soft errors during bus usage, etc.). All serial bus related errors will result in an APIC checksum or acceptance error.

The MP initialization protocol makes the following assumptions regarding errors that occur during initialization:

- If errors are detected on the APIC bus during execution of the MP initialization protocol, the processors that detect the errors are shut down.
- The MP initialization protocol will be executed by processors even if they fail their BIST sequences.

APPENDIX D

PROGRAMMING THE LINT0 AND LINT1 INPUTS

The following procedure describes how to program the LINT0 and LINT1 local APIC pins on a processor after multiple processors have been booted and initialized (as described in Appendix C, “MP Initialization For P6 Family Processors,” and Appendix D, “Programming the LINT0 and LINT1 Inputs.” In this example, LINT0 is programmed to be the ExtINT pin and LINT1 is programmed to be the NMI pin.

D.1 CONSTANTS

The following constants are defined:

```
LVT1EQU 0FEE00350H
LVT2EQU 0FEE00360H
LVT3 EQU 0FEE00370H
SVR EQU 0FEE000F0H
```

D.2 LINT[0:1] PINS PROGRAMMING PROCEDURE

Use the following to program the LINT[1:0] pins:

1. Mask 8259 interrupts.
2. Enable APIC via SVR (spurious vector register) if not already enabled.

```
MOV ESI, SVR           ; address of SVR
MOV EAX, [ESI]
OR  EAX, APIC_ENABLED ; set bit 8 to enable (0 on reset)
MOV [ESI], EAX
```

3. Program LVT1 as an ExtINT which delivers the signal to the INTR signal of all processors cores listed in the destination as an interrupt that originated in an externally connected interrupt controller.

```
MOV ESI, LVT1
MOV EAX, [ESI]
AND EAX, 0FFFE58FFH; mask off bits 8-10, 12, 14 and 16
OR  EAX, 700H; Bit 16=0 for not masked, Bit 15=0 for edge
           ; triggered, Bit 13=0 for high active input
           ; polarity, Bits 8-10 are 111b for ExtINT
MOV [ESI], EAX; Write to LVT1
```

PROGRAMMING THE LINT0 AND LINT1 INPUTS

4. Program LVT2 as NMI, which delivers the signal on the NMI signal of all processor cores listed in the destination.

```
MOV ESI, LVT2
MOV EAX, [ESI]
AND EAX, 0FFFE58FFH; mask off bits 8-10 and 15
OR  EAX, 000000400H; Bit 16=0 for not masked, Bit 15=0 edge
    ; triggered, Bit 13=0 for high active input
    ; polarity, Bits 8-10 are 100b for NMI
MOV [ESI], EAX; Write to LVT2
    ;Unmask 8259 interrupts and allow NMI.
```

APPENDIX E

INTERPRETING MACHINE-CHECK ERROR CODES

Encoding of the model-specific and other information fields is different across processor families. The differences are documented in the following sections.

E.1 INCREMENTAL DECODING INFORMATION: PROCESSOR FAMILY 06H MACHINE ERROR CODES FOR MACHINE CHECK

Section E.1 provides information for interpreting additional model-specific fields for external bus errors relating to processor family 06H. The references to processor family 06H refers to only IA-32 processors with CPUID signatures listed in Table E-1.

Table E-1. CPUID DisplayFamily_DisplayModel Signatures for Processor Family 06H

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_0EH	Intel Core Duo, Intel Core Solo processors
06_0DH	Intel Pentium M processor
06_09H	Intel Pentium M processor
06_7H, 06_08H, 06_0AH, 06_0BH	Intel Pentium III Xeon Processor, Intel Pentium III Processor
06_03H, 06_05H	Intel Pentium II Xeon Processor, Intel Pentium II Processor
06_01H	Intel Pentium Pro Processor

These errors are reported in the IA32_MCi_STATUS MSRs. They are reported architecturally) as compound errors with a general form of *0000 1PPT RRRR IILL* in the MCA error code field. See Chapter 15 for information on the interpretation of compound error codes. Incremental decoding information is listed in Table E-2.

**Table E-2. Incremental Decoding Information: Processor Family 06H
Machine Error Codes For Machine Check**

Model specific errors	28	FRC error	1 if FRC error active
	29	BERR	1 if BERR is driven
	30	Internal BINIT	1 if BINIT driven for this processor
	31	Reserved	Reserved
Other information	32-34	Reserved	Reserved
	35	External BINIT	1 if BINIT is received from external bus.
	36	Response parity error	This bit is asserted in IA32_MCI_STATUS if this component has received a parity error on the RS[2:0]# pins for a response transaction. The RS signals are checked by the RSP# external pin.
	37	Bus BINIT	This bit is asserted in IA32_MCI_STATUS if this component has received a hard error response on a split transaction one access that has needed to be split across the 64-bit external bus interface into two accesses).
	38	Timeout BINIT	This bit is asserted in IA32_MCI_STATUS if this component has experienced a ROB time-out, which indicates that no micro-instruction has been retired for a predetermined period of time. A ROB time-out occurs when the 15-bit ROB time-out counter carries a 1 out of its high order bit. ² The timer is cleared when a micro-instruction retires, an exception is detected by the core processor, RESET is asserted, or when a ROB BINIT occurs.

**Table E-2. Incremental Decoding Information: Processor Family 06H
Machine Error Codes For Machine Check (Contd.)**

Type	Bit No.	Bit Function	Bit Description
			The ROB time-out counter is prescaled by the 8-bit PIC timer which is a divide by 128 of the bus clock the bus clock is 1:2, 1:3, 1:4 of the core clock). When a carry out of the 8-bit PIC timer occurs, the ROB counter counts up by one. While this bit is asserted, it cannot be overwritten by another error.
	39-41	Reserved	Reserved
	42	Hard error	This bit is asserted in IA32_MCI_STATUS if this component has initiated a bus transactions which has received a hard error response. While this bit is asserted, it cannot be overwritten.
	43	IERR	This bit is asserted in IA32_MCI_STATUS if this component has experienced a failure that causes the IERR pin to be asserted. While this bit is asserted, it cannot be overwritten.
	44	AERR	This bit is asserted in IA32_MCI_STATUS if this component has initiated 2 failing bus transactions which have failed due to Address Parity Errors AERR asserted). While this bit is asserted, it cannot be overwritten.
	45	UECC	The Uncorrectable ECC error bit is asserted in IA32_MCI_STATUS for uncorrected ECC errors. While this bit is asserted, the ECC syndrome field will not be overwritten.
	46	CECC	The correctable ECC error bit is asserted in IA32_MCI_STATUS for corrected ECC errors.
	47-54	ECC syndrome	The ECC syndrome field in IA32_MCI_STATUS contains the 8-bit ECC syndrome only if the error was a correctable/uncorrectable ECC error and there wasn't a previous valid ECC error syndrome logged in IA32_MCI_STATUS. A previous valid ECC error in IA32_MCI_STATUS is indicated by IA32_MCI_STATUS.bit45 uncorrectable error occurred) being asserted. After processing an ECC error, machine-check handling software should clear IA32_MCI_STATUS.bit45 so that future ECC error syndromes can be logged.

**Table E-2. Incremental Decoding Information: Processor Family 06H
Machine Error Codes For Machine Check (Contd.)**

Type	Bit No.	Bit Function	Bit Description
	55-56	Reserved	Reserved.
Status register validity indicators ¹	57-63		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.
2. For processors with a CPUID signature of 06_0EH, a ROB time-out occurs when the 23-bit ROB time-out counter carries a 1 out of its high order bit.

E.2 INCREMENTAL DECODING INFORMATION: INTEL CORE 2 PROCESSOR FAMILY MACHINE ERROR CODES FOR MACHINE CHECK

Table E-4 provides information for interpreting additional model-specific fields for external bus errors relating to processor based on Intel Core microarchitecture, which implements the P4 bus specification. Table E-3 lists the CPUID signatures for Intel 64 processors that are covered by Table E-4. These errors are reported in the IA32_MCi_STATUS MSRs. They are reported architecturally) as compound errors with a general form of *0000 1PPT RRRR IILL* in the MCA error code field. See Chapter 15 for information on the interpretation of compound error codes.

Table E-3. CPUID DisplayFamily_DisplayModel Signatures for Processors Based on Intel Core Microarchitecture

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_1DH	Intel Xeon Processor 7400 series.
06_17H	Intel Xeon Processor 5200, 5400 series, Intel Core 2 Quad processor Q9650.
06_0FH	Intel Xeon Processor 3000, 3200, 5100, 5300, 7300 series, Intel Core 2 Quad, Intel Core 2 Extreme, Intel Core 2 Duo processors, Intel Pentium dual-core processors

Table E-4. Incremental Bus Error Codes of Machine Check for Processors Based on Intel Core Microarchitecture

Type	Bit No.	Bit Function	Bit Description
MCA error codes ¹	0-15		
Model specific errors	16-18	Reserved	Reserved

NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

E.2.1 Model-Specific Machine Check Error Codes for Intel Xeon Processor 7400 Series

Intel Xeon processor 7400 series has machine check register banks that generally follows the description of Chapter 15 and Section E.2. Additional error codes specific to Intel Xeon processor 7400 series is describe in this section.

MC4_STATUS[63:0] is the main error logging for the processor’s L3 and front side bus errors for Intel Xeon processor 7400 series. It supports the L3 Errors, Bus and Interconnect Errors Compound Error Codes in the MCA Error Code Field.

E.2.1.1 Processor Machine Check Status Register Incremental MCA Error Code Definition

Intel Xeon processor 7400 series use compound MCA Error Codes for logging its Bus internal machine check errors, L3 Errors, and Bus/Interconnect Errors. It defines incremental Machine Check error types (IA32_MC6_STATUS[15:0]) beyond those defined in Chapter 15. Table E-5 lists these incremental MCA error code types that apply to IA32_MC6_STATUS. Error code details are specified in MC6_STATUS [31:16] (see Section E.2.2), the "Model Specific Error Code" field. The information in the "Other_Info" field (MC4_STATUS[56:32]) is common to the three processor error types and contains a correctable event count and specifies the MC6_MISC register format.

Table E-5. Incremental MCA Error Code Types for Intel Xeon Processor 7400

Processor MCA_Error_Code (MC6_STATUS[15:0])			
Type	Error Code	Binary Encoding	Meaning
C	Internal Error	0000 0100 0000 0000	Internal Error Type Code
B	Bus and Interconnect Error	0000 100x 0000 1111	Not used but this encoding is reserved for compatibility with other MCA implementations
		0000 101x 0000 1111	Not used but this encoding is reserved for compatibility with other MCA implementations
		0000 110x 0000 1111	Not used but this encoding is reserved for compatibility with other MCA implementations
		0000 1110 0000 1111	Bus and Interconnection Error Type Code
		0000 1111 0000 1111	Not used but this encoding is reserved for compatibility with other MCA implementations

The **Bold faced** binary encodings are the only encodings used by the processor for MC4_STATUS[15:0].

E.2.2 Intel Xeon Processor 7400 Model Specific Error Code Field

E.2.2.1 Processor Model Specific Error Code Field Type B: Bus and Interconnect Error

Note: The Model Specific Error Code field in MC6_STATUS (bits 31:16)

Table E-6. Type B Bus and Interconnect Error Codes

Bit Num	Sub-Field Name	Description
16	FSB Request Parity	Parity error detected during FSB request phase
19:17		Reserved
20	FSB Hard Fail Response	“Hard Failure” response received for a local transaction
21	FSB Response Parity	Parity error on FSB response field detected
22	FSB Data Parity	FSB data parity error on inbound data detected
31:23	---	Reserved

E.2.2.2 Processor Model Specific Error Code Field Type C: Cache Bus Controller Error

Table E-7. Type C Cache Bus Controller Error Codes

MC4_STATUS[31:16] (MSCE) Value	Error Description
0000_0000_0000_0001 0x0001	Inclusion Error from Core 0
0000_0000_0000_0010 0x0002	Inclusion Error from Core 1
0000_0000_0000_0011 0x0003	Write Exclusive Error from Core 0
0000_0000_0000_0100 0x0004	Write Exclusive Error from Core 1
0000_0000_0000_0101 0x0005	Inclusion Error from FSB
0000_0000_0000_0110 0x0006	SNP Stall Error from FSB
0000_0000_0000_0111 0x0007	Write Stall Error from FSB

Table E-7. Type C Cache Bus Controller Error Codes

MC4_STATUS[31:16] (MSCE) Value	Error Description
0000_0000_0000_1000 0x0008	FSB Arb Timeout Error
0000_0000_0000_1010 0x000A	Inclusion Error from Core 2
0000_0000_0000_1011 0x000B	Write Exclusive Error from Core 2
0000_0010_0000_0000 0x0200	Internal Timeout error
0000_0011_0000_0000 0x0300	Internal Timeout Error
0000_0100_0000_0000 0x0400	Intel® Cache Safe Technology Queue Full Error or Disabled-ways-in-a-set overflow
0000_0101_0000_0000 0x0500	Quiet cycle Timeout Error (correctable)
1100_0000_0000_0010 0xC002	Correctable ECC event on outgoing Core 0 data
1100_0000_0000_0100 0xC004	Correctable ECC event on outgoing Core 1 data
1100_0000_0000_1000 0xC008	Correctable ECC event on outgoing Core 2 data
1110_0000_0000_0010 0xE002	Uncorrectable ECC error on outgoing Core 0 data
1110_0000_0000_0100 0xE004	Uncorrectable ECC error on outgoing Core 1 data
1110_0000_0000_1000 0xE008	Uncorrectable ECC error on outgoing Core 2 data
— all other encodings —	Reserved

E.3 INCREMENTAL DECODING INFORMATION: PROCESSOR FAMILY WITH CPUID DISPLAYFAMILY_DISPLAYMODEL SIGNATURE 06_1AH, MACHINE ERROR CODES FOR MACHINE CHECK

Table E-8 through Table E-12 provide information for interpreting additional model-specific fields for memory controller errors relating to the processor family with CPUID DisplayFamily_DisplaySignature 06_1AH, which supports Intel QuickPath Interconnect links. Incremental MC error codes related to the Intel QPI links are reported in the register banks IA32_MC0 and IA32_MC1, incremental error codes for internal machine check is reported in the register bank IA32_MC7, and incremental error codes for the memory controller unit is reported in the register banks IA32_MC8.

E.3.1 Intel QPI Machine Check Errors

Table E-8. Intel QPI Machine Check Error Codes for IA32_MCO_STATUS and IA32_MC1_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA error codes ¹	0-15	MCACOD	Bus error format: 1PPTRRRRIILL
Model specific errors			
	16	Header Parity	If 1, QPI Header had bad parity
	17	Data Parity	If 1, QPI Data packet had bad parity
	18	Retries Exceeded	If 1, number of QPI retries was exceeded
	19	Received Poison	If 1, Received a data packet that was marked as poisoned by the sender
	21-20	Reserved	Reserved
	22	Unsupported Message	If 1, QPI received a message encoding it does not support
	23	Unsupported Credit	If 1, QPI credit type is not supported.
	24	Receive Flit Overrun	If 1, Sender sent too many QPI flits to the receiver.
	25	Received Failed Response	If 1, Indicates that sender sent a failed response to receiver.
	26	Receiver Clock Jitter	If 1, clock jitter detected in the internal QPI clocking
	56-27	Reserved	Reserved
Status register validity indicators ¹	57-63		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

Table E-9. Intel QPI Machine Check Error Codes for IA32_MCO_MISC and IA32_MC1_MISC

Type	Bit No.	Bit Function	Bit Description
Model specific errors ¹			
	7-0	QPI Opcode	Message class and opcode from the packet with the error
	13-8	RTId	QPI Request Transaction ID
	15-14	Reserved	Reserved
	18-16	RHNID	QPI Requestor/Home Node ID
	23-19	Reserved	Reserved
	24	IIB	QPI Interleave/Head Indication Bit

NOTES:

1. Which of these fields are valid depends on the error type.

E.3.2 Internal Machine Check Errors

Table E-10. Machine Check Error Codes for IA32_MC7_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA error codes ¹	0-15	MCACOD	
Model specific errors			
	23-16	Reserved	Reserved
	31-24	Reserved except for the following	00h - No Error 03h - Reset firmware did not complete 08h - Received an invalid CMPD 0Ah - Invalid Power Management Request 0Dh - Invalid S-state transition 11h - VID controller does not match POC controller selected 1Ah - MSID from POC does not match CPU MSID
	56-32	Reserved	Reserved
Status register validity indicators ¹	57-63		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, “Machine-Check Architecture,” for more information.

E.3.3 Memory Controller Errors

Table E-11. Incremental Memory Controller Error Codes of Machine Check for IA32_MC8_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA error codes ¹	0-15	MCACOD	Memory error format: 1MMMCCCC
Model specific errors			
	16	Read ECC error	If 1, ECC occurred on a read
	17	RAS ECC error	If 1, ECC occurred on a scrub
	18	Write parity error	If 1, bad parity on a write
	19	Redundancy loss	If 1, Error in half of redundant memory
	20	Reserved	Reserved
	21	Memory range error	If 1, Memory access out of range
	22	RTID out of range	If 1, Internal ID invalid
	23	Address parity error	If 1, bad address parity
	24	Byte enable parity error	If 1, bad enable parity
Other information	37-25	Reserved	Reserved
	52:38	CORE_ERR_CNT	Corrected error count
	56-53	Reserved	Reserved
Status register validity indicators ¹	57-63		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, “Machine-Check Architecture,” for more information.

Table E-12. Incremental Memory Controller Error Codes of Machine Check for IA32_MC8_MISC

Type	Bit No.	Bit Function	Bit Description
Model specific errors ¹			
	7-0	RTId	Transaction Tracker ID
	15-8	Reserved	Reserved
	17-16	DIMM	DIMM ID which got the error
	19-18	Channel	Channel ID which got the error
	31-20	Reserved	Reserved
	63-32	Syndrome	ECC Syndrome

NOTES:

1. Which of these fields are valid depends on the error type.

E.4 INCREMENTAL DECODING INFORMATION: PROCESSOR FAMILY WITH CPUID DISPLAYFAMILY_DISPLAYMODEL SIGNATURE 06_2DH, MACHINE ERROR CODES FOR MACHINE CHECK

Table E-8 through Table E-12 provide information for interpreting additional model-specific fields for memory controller errors relating to the processor family with CPUID DisplayFamily_DisplaySignature 06_2DH, which supports Intel QuickPath Interconnect links. Incremental MC error codes related to the Intel QPI links are reported in the register banks IA32_MC6 and IA32_MC7, incremental error codes for internal machine check error from PCU controller is reported in the register bank IA32_MC4, and incremental error codes for the memory controller unit is reported in the register banks IA32_MC8-IA32_MC11.

E.4.1 Internal Machine Check Errors

Table E-13. Machine Check Error Codes for IA32_MC4_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA error codes ¹	0-15	MCACOD	
Model specific errors	19:16	Reserved except for the following	0000b - No Error 0001b - Non_IMem_Sel 0010b - I_Parity_Error 0011b - Bad_OpCode 0100b - I_Stack_Underflow 0101b - I_Stack_Overflow 0110b - D_Stack_Underflow 0111b - D_Stack_Overflow 1000b - Non-DMem_Sel 1001b - D_Parity_Error
	23-20	Reserved	Reserved
	31-24	Reserved except for the following	00h - No Error 0Dh - MC_IMC_FORCE_SR_S3_TIMEOUT 0Eh - MC_CPD_UNCPD_ST_TIMEOUT 0Fh - MC_PKGS_SAFE_WP_TIMEOUT 43h - MC_PECI_MAILBOX QUIESCE_TIMEOUT 5Ch - MC_MORE_THAN_ONE_LT_AGENT 60h - MC_INVALID_PKGS_REQ_PCH 61h - MC_INVALID_PKGS_REQ_QPI 62h - MC_INVALID_PKGS_RES_QPI 63h - MC_INVALID_PKGC_RES_PCH 64h - MC_INVALID_PKG_STATE_CONFIG 70h - MC_WATCHDG_TIMEOUT_PKGC_SLAVE 71h - MC_WATCHDG_TIMEOUT_PKGC_MASTER 70h - MC_WATCHDG_TIMEOUT_PKGS_MASTER 7ah - MC_HA_FAILSTS_CHANGE_DETECTED 81h - MC_RECOVERABLE_DIE_THERMAL_TOO_HOT

Type	Bit No.	Bit Function	Bit Description
	56-32	Reserved	Reserved
Status register validity indicators ¹	57-63		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

E.4.2 Intel QPI Machine Check Errors

Table E-14. Intel QPI MC Error Codes for IA32_MC6_STATUS and IA32_MC7_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA error codes ¹	0-15	MCACOD	Bus error format: 1PPTRRRRILL
Model specific errors			
	56-16	Reserved	Reserved
Status register validity indicators ¹	57-63		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

E.4.3 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers are reported in the MSRs IA32_MC8_STATUS-IA32_MC11_STATUS. The supported error codes are follows the architectural MCACOD definition type 1MMMCCCC (see Chapter 15, "Machine-Check Architecture,").

E.5 INCREMENTAL DECODING INFORMATION: PROCESSOR FAMILY 0FH MACHINE ERROR CODES FOR MACHINE CHECK

Table E-15 provides information for interpreting additional family 0FH model-specific fields for external bus errors. These errors are reported in the IA32_MCi_STATUS MSRs. They are reported architecturally) as compound errors with a general form of 0000 1PPT RRRR IILL in the MCA error code field. See Chapter 15 for information on the interpretation of compound error codes.

**Table E-15. Incremental Decoding Information: Processor Family 0FH
Machine Error Codes For Machine Check**

Type	Bit No.	Bit Function	Bit Description
MCA error codes ¹	0-15		
Model-specific error codes	16	FSB address parity	Address parity error detected: 1 = Address parity error detected 0 = No address parity error
	17	Response hard fail	Hardware failure detected on response
	18	Response parity	Parity error detected on response
	19	PIC and FSB data parity	Data Parity detected on either PIC or FSB access
	20	Processor Signature = 00000F04H: Invalid PIC request All other processors: Reserved	Processor Signature = 00000F04H. Indicates error due to an invalid PIC request access was made to PIC space with W/B memory): 1 = Invalid PIC request error 0 = No Invalid PIC request error Reserved
	21	Pad state machine	The state machine that tracks P and N data-strobe relative timing has become unsynchronized or a glitch has been detected.
	22	Pad strobe glitch	Data strobe glitch
Type	Bit No.	Bit Function	Bit Description
	23	Pad address glitch	Address strobe glitch
Other Information	24-56	Reserved	Reserved
Status register validity indicators ¹	57-63		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, “Machine-Check Architecture,” for more information.

Table E-10 provides information on interpreting additional family 0FH, model specific fields for cache hierarchy errors. These errors are reported in one of the

IA32_MCi_STATUS MSRs. These errors are reported, architecturally, as compound errors with a general form of *0000 0001 RRRR TLL* in the MCA error code field. See Chapter 15 for how to interpret the compound error code.

E.5.1 Model-Specific Machine Check Error Codes for Intel Xeon Processor MP 7100 Series

Intel Xeon processor MP 7100 series has 5 register banks which contains information related to Machine Check Errors. MCI_STATUS[63:0] refers to all 5 register banks. MC0_STATUS[63:0] through MC3_STATUS[63:0] is the same as on previous generation of Intel Xeon processors within Family 0FH. MC4_STATUS[63:0] is the main error logging for the processor’s L3 and front side bus errors. It supports the L3 Errors, Bus and Interconnect Errors Compound Error Codes in the MCA Error Code Field.

Table E-16. MCI_STATUS Register Bit Definition

Bit Field Name	Bits	Description
MCA_Error_Code	15:0	Specifies the machine check architecture defined error code for the machine check error condition detected. The machine check architecture defined error codes are guaranteed to be the same for all Intel Architecture processors that implement the machine check architecture. See tables below
Model_Specific_Error_Code	31:16	Specifies the model specific error code that uniquely identifies the machine check error condition detected. The model specific error codes may differ among Intel Architecture processors for the same Machine Check Error condition. See tables below
Other_Info	56:32	The functions of the bits in this field are implementation specific and are not part of the machine check architecture. Software that is intended to be portable among Intel Architecture processors should not rely on the values in this field.
PCC	57	Processor Context Corrupt flag indicates that the state of the processor might have been corrupted by the error condition detected and that reliable restarting of the processor may not be possible. When clear, this flag indicates that the error did not affect the processor’s state. This bit will always be set for MC errors which are not corrected.
ADDRV	58	MC_ADDR register valid flag indicates that the MC_ADDR register contains the address where the error occurred. When clear, this flag indicates that the MC_ADDR register does not contain the address where the error occurred. The MC_ADDR register should not be read if the ADDRv bit is clear.

Table E-16. MCI_STATUS Register Bit Definition (Contd.)

Bit Field Name	Bits	Description
MISCV	59	MC_MISC register valid flag indicates that the MC_MISC register contains additional information regarding the error. When clear, this flag indicates that the MC_MISC register does not contain additional information regarding the error. MC_MISC should not be read if the MISCV bit is not set.
EN	60	Error enabled flag indicates that reporting of the machine check exception for this error was enabled by the associated flag bit of the MC_CTL register. Note that correctable errors do not have associated enable bits in the MC_CTL register so the EN bit should be clear when a correctable error is logged.
UC	61	Error uncorrected flag indicates that the processor did not correct the error condition. When clear, this flag indicates that the processor was able to correct the event condition.
OVER	62	Machine check overflow flag indicates that a machine check error occurred while the results of a previous error were still in the register bank (i.e., the VAL bit was already set in the MC_STATUS register). The processor sets the OVER flag and software is responsible for clearing it. Enabled errors are written over disabled errors, and uncorrected errors are written over corrected events. Uncorrected errors are not written over previous valid uncorrected errors.
VAL	63	MC_STATUS register valid flag indicates that the information within the MC_STATUS register is valid. When this flag is set, the processor follows the rules given for the OVER flag in the MC_STATUS register when overwriting previously valid entries. The processor sets the VAL flag and software is responsible for clearing it.

E.5.1.1 Processor Machine Check Status Register MCA Error Code Definition

Intel Xeon processor MP 7100 series use compound MCA Error Codes for logging its CBC internal machine check errors, L3 Errors, and Bus/Interconnect Errors. It defines additional Machine Check error types (IA32_MC4_STATUS[15:0]) beyond those defined in Chapter 15. Table E-17 lists these model-specific MCA error codes. Error code details are specified in MC4_STATUS [31:16] (see Section E.5.3), the "Model Specific Error Code" field. The information in the "Other_Info" field (MC4_STATUS[56:32]) is common to the three processor error types and contains a correctable event count and specifies the MC4_MISC register format.

Table E-17. Incremental MCA Error Code for Intel Xeon Processor MP 7100

Processor MCA_Error_Code (MC4_STATUS[15:0])			
Type	Error Code	Binary Encoding	Meaning
C	Internal Error	0000 0100 0000 0000	Internal Error Type Code
A	L3 Tag Error	0000 0001 0000 1011	L3 Tag Error Type Code
B	Bus and Interconnect Error	0000 100x 0000 1111	Not used but this encoding is reserved for compatibility with other MCA implementations
		0000 101x 0000 1111	Not used but this encoding is reserved for compatibility with other MCA implementations
		0000 110x 0000 1111	Not used but this encoding is reserved for compatibility with other MCA implementations
		0000 1110 0000 1111	Bus and Interconnection Error Type Code
		0000 1111 0000 1111	Not used but this encoding is reserved for compatibility with other MCA implementations

The **Bold faced** binary encodings are the only encodings used by the processor for MC4_STATUS[15:0].

E.5.2 Other_Info Field (all MCA Error Types)

The MC4_STATUS[56:32] field is common to the processor's three MCA error types (A, B & C):

Table E-18. Other Information Field Bit Definition

Bit Field Name	Bits	Description
39:32	8-bit Correctable Event Count	Holds a count of the number of correctable events since cold reset. This is a saturating counter; the counter begins at 1 (with the first error) and saturates at a count of 255.
41:40	MC4_MISC format type	The value in this field specifies the format of information in the MC4_MISC register. Currently, only two values are defined. Valid only when MISCV is asserted.
43:42	-	Reserved
51:44	ECC syndrome	ECC syndrome value for a correctable ECC event when the "Valid ECC syndrome" bit is asserted
52	Valid ECC syndrome	Set when correctable ECC event supplies the ECC syndrome
54:53	Threshold-Based Error Status	<p>00: No tracking - No hardware status tracking is provided for the structure reporting this event.</p> <p>01: Green - Status tracking is provided for the structure posting the event; the current status is green (below threshold).</p> <p>10: Yellow - Status tracking is provided for the structure posting the event; the current status is yellow (above threshold).</p> <p>11: Reserved for future use</p> <p>Valid only if Valid bit (bit 63) is set Undefined if the UC bit (bit 61) is set</p>
56:55	-	Reserved

E.5.3 Processor Model Specific Error Code Field

E.5.3.1 MCA Error Type A: L3 Error

Note: The Model Specific Error Code field in MC4_STATUS (bits 31:16)

Table E-19. Type A: L3 Error Codes

Bit Num	Sub-Field Name	Description	Legal Value(s)
18:16	L3 Error Code	Describes the L3 error encountered	000 - No error 001 - More than one way reporting a correctable event 010 - More than one way reporting an uncorrectable error 011 - More than one way reporting a tag hit 100 - No error 101 - One way reporting a correctable event 110 - One way reporting an uncorrectable error 111 - One or more ways reporting a correctable event while one or more ways are reporting an uncorrectable error
20:19	-	Reserved	00
31:21	-	Fixed pattern	0010_0000_000

E.5.3.2 Processor Model Specific Error Code Field Type B: Bus and Interconnect Error

Note: The Model Specific Error Code field in MC4_STATUS (bits 31:16)

Table E-20. Type B Bus and Interconnect Error Codes

Bit Num	Sub-Field Name	Description
16	FSB Request Parity	Parity error detected during FSB request phase
17	Core0 Addr Parity	Parity error detected on Core 0 request's address field
18	Core1 Addr Parity	Parity error detected on Core 1 request's address field
19		Reserved
20	FSB Response Parity	Parity error on FSB response field detected
21	FSB Data Parity	FSB data parity error on inbound data detected
22	Core0 Data Parity	Data parity error on data received from Core 0 detected
23	Core1 Data Parity	Data parity error on data received from Core 1 detected
24	IDS Parity	Detected an Enhanced Defer parity error (phase A or phase B)
25	FSB Inbound Data ECC	Data ECC event to error on inbound data (correctable or uncorrectable)
26	FSB Data Glitch	Pad logic detected a data strobe 'glitch' (or sequencing error)
27	FSB Address Glitch	Pad logic detected a request strobe 'glitch' (or sequencing error)
31:28	---	Reserved

Exactly one of the bits defined in the preceding table will be set for a Bus and Interconnect Error. The Data ECC can be correctable or uncorrectable (the MC4_STATUS.UC bit, of course, distinguishes between correctable and uncorrectable cases with the Other_Info field possibly providing the ECC Syndrome for correctable errors). All other errors for this processor MCA Error Type are uncorrectable.

**E.5.3.3 Processor Model Specific Error Code Field
Type C: Cache Bus Controller Error**

Table E-21. Type C Cache Bus Controller Error Codes

MC4_STATUS[31:16] (MSCE) Value	Error Description
0000_0000_0000_0001 0x0001	Inclusion Error from Core 0
0000_0000_0000_0010 0x0002	Inclusion Error from Core 1
0000_0000_0000_0011 0x0003	Write Exclusive Error from Core 0
0000_0000_0000_0100 0x0004	Write Exclusive Error from Core 1
0000_0000_0000_0101 0x0005	Inclusion Error from FSB
0000_0000_0000_0110 0x0006	SNP Stall Error from FSB
0000_0000_0000_0111 0x0007	Write Stall Error from FSB
0000_0000_0000_1000 0x0008	FSB Arb Timeout Error
0000_0000_0000_1001 0x0009	CBC OOD Queue Underflow/overflow
0000_0001_0000_0000 0x0100	Enhanced Intel SpeedStep Technology TM1-TM2 Error
0000_0010_0000_0000 0x0200	Internal Timeout error
0000_0011_0000_0000 0x0300	Internal Timeout Error
0000_0100_0000_0000 0x0400	Intel® Cache Safe Technology Queue Full Error or Disabled-ways-in-a-set overflow
1100_0000_0000_0001 0xC001	Correctable ECC event on outgoing FSB data
1100_0000_0000_0010 0xC002	Correctable ECC event on outgoing Core 0 data
1100_0000_0000_0100 0xC004	Correctable ECC event on outgoing Core 1 data
1110_0000_0000_0001 0xE001	Uncorrectable ECC error on outgoing FSB data
1110_0000_0000_0010 0xE002	Uncorrectable ECC error on outgoing Core 0 data
1110_0000_0000_0100 0xE004	Uncorrectable ECC error on outgoing Core 1 data
— all other encodings —	Reserved

All errors - except for the correctable ECC types - in this table are uncorrectable. The correctable ECC events may supply the ECC syndrome in the Other_Info field of the MC4_STATUS MSR..

Table E-22. Decoding Family OFH Machine Check Codes for Cache Hierarchy Errors

Type	Bit No.	Bit Function	Bit Description
MCA error codes ¹	0-15		
Model specific error codes	16-17	Tag Error Code	Contains the tag error code for this machine check error: 00 = No error detected 01 = Parity error on tag miss with a clean line 10 = Parity error/multiple tag match on tag hit 11 = Parity error/multiple tag match on tag miss
	18-19	Data Error Code	Contains the data error code for this machine check error: 00 = No error detected 01 = Single bit error 10 = Double bit error on a clean line 11 = Double bit error on a modified line
	20	L3 Error	This bit is set if the machine check error originated in the L3 it can be ignored for invalid PIC request errors): 1 = L3 error 0 = L2 error
	21	Invalid PIC Request	Indicates error due to invalid PIC request access was made to PIC space with WB memory): 1 = Invalid PIC request error 0 = No invalid PIC request error
	22-31	Reserved	Reserved
Other Information	32-39	8-bit Error Count	Holds a count of the number of errors since reset. The counter begins at 0 for the first error and saturates at a count of 255.
	40-56	Reserved	Reserved
Status register validity indicators ¹	57-63		

INTERPRETING MACHINE-CHECK ERROR CODES

NOTES:

1. These fields are architecturally defined. Refer to Chapter 15, "Machine-Check Architecture," for more information.

APPENDIX F

APIC BUS MESSAGE FORMATS

This appendix describes the message formats used when transmitting messages on the serial APIC bus. The information described here pertains only to the Pentium and P6 family processors.

F.1 BUS MESSAGE FORMATS

The local and I/O APICs transmit three types of messages on the serial APIC bus: EOI message, short message, and non-focused lowest priority message. The purpose of each type of message and its format are described below.

F.2 EOI MESSAGE

Local APICs send 14-cycle EOI messages to the I/O APIC to indicate that a level triggered interrupt has been accepted by the processor. This interrupt, in turn, is a result of software writing into the EOI register of the local APIC. Table F-1 shows the cycles in an EOI message.

Table F-1. EOI Message (14 Cycles)

Cycle	Bit1	Bit0	
1	1	1	11 = EOI
2	ArbID3	0	Arbitration ID bits 3 through 0
3	ArbID2	0	
4	ArbID1	0	
5	ArbID0	0	
6	V7	V6	Interrupt vector V7 - V0
7	V5	V4	
8	V3	V2	
9	V1	V0	
10	C	C	Checksum for cycles 6 - 9
11	0	0	
12	A	A	Status Cycle 0
13	A1	A1	Status Cycle 1
14	0	0	Idle

APIC BUS MESSAGE FORMATS

The checksum is computed for cycles 6 through 9. It is a cumulative sum of the 2-bit (Bit1:Bit0) logical data values. The carry out of all but the last addition is added to the sum. If any APIC computes a different checksum than the one appearing on the bus in cycle 10, it signals an error, driving 11 on the APIC bus during cycle 12. In this case, the APICs disregard the message. The sending APIC will receive an appropriate error indication (see Section 10.5.3, "Error Handling") and resend the message. The status cycles are defined in Table F-4.

F.2.1 Short Message

Short messages (21-cycles) are used for sending fixed, NMI, SMI, INIT, start-up, ExtINT and lowest-priority-with-focus interrupts. Table F-2 shows the cycles in a short message.

Table F-2. Short Message (21 Cycles)

Cycle	Bit1	Bit0	
1	0	1	0 1 = normal
2	ArbID3	0	Arbitration ID bits 3 through 0
3	ArbID2	0	
4	ArbID1	0	
5	ArbID0	0	
6	DM	M2	DM = Destination Mode
7	M1	M0	M2-M0 = Delivery mode
8	L	TM	L = Level, TM = Trigger Mode
9	V7	V6	V7-V0 = Interrupt Vector
10	V5	V4	
11	V3	V2	
12	V1	V0	
13	D7	D6	D7-D0 = Destination
14	D5	D4	
15	D3	D2	
16	D1	D0	
17	C	C	Checksum for cycles 6-16
18	0	0	
19	A	A	Status cycle 0
20	A1	A1	Status cycle 1
21	0	0	Idle

If the physical delivery mode is being used, then cycles 15 and 16 represent the APIC ID and cycles 13 and 14 are considered don't care by the receiver. If the logical delivery mode is being used, then cycles 13 through 16 are the 8-bit logical destination field.

For shorthands of "all-incl-self" and "all-excl-self," the physical delivery mode and an arbitration priority of 15 (D0:D3 = 1111) are used. The agent sending the message is the only one required to distinguish between the two cases. It does so using internal information.

When using lowest priority delivery with an existing focus processor, the focus processor identifies itself by driving 10 during cycle 19 and accepts the interrupt. This is an indication to other APICs to terminate arbitration. If the focus processor has not been found, the short message is extended on-the-fly to the non-focused lowest-priority message. Note that except for the EOI message, messages generating a checksum or an acceptance error (see Section 10.5.3, "Error Handling") terminate after cycle 21.

F.2.2 Non-focused Lowest Priority Message

These 34-cycle messages (see Table F-3) are used in the lowest priority delivery mode when a focus processor is not present. Cycles 1 through 20 are same as for the short message. If during the status cycle (cycle 19) the state of the (A:A) flags is 10B, a focus processor has been identified, and the short message format is used (see Table F-2). If the (A:A) flags are set to 00B, lowest priority arbitration is started and the 34-cycles of the non-focused lowest priority message are competed. For other combinations of status flags, refer to Section F.2.3, "APIC Bus Status Cycles."

Table F-3. Non-Focused Lowest Priority Message (34 Cycles)

Cycle	Bit0	Bit1	
1	0	1	0 1 = normal
2	ArbID3	0	Arbitration ID bits 3 through 0
3	ArbID2	0	
4	ArbID1	0	
5	ArbID0	0	
6	DM	M2	DM = Destination mode
7	M1	M0	M2-M0 = Delivery mode
8	L	TM	L = Level, TM = Trigger Mode
9	V7	V6	V7-V0 = Interrupt Vector
10	V5	V4	
11	V3	V2	
12	V1	V0	

Table F-3. Non-Focused Lowest Priority Message (34 Cycles) (Contd.)

Cycle	Bit0	Bit1	
13	D7	D6	D7-D0 = Destination
14	D5	D4	
15	D3	D2	
16	D1	D0	
17	C	C	Checksum for cycles 6-16
18	0	0	
19	A	A	Status cycle 0
20	A1	A1	Status cycle 1
21	P7	0	P7 - P0 = Inverted Processor Priority
22	P6	0	
23	P5	0	
24	P4	0	
25	P3	0	
26	P2	0	
27	P1	0	
28	P0	0	
29	ArbID3	0	Arbitration ID 3 -0
30	ArbID2	0	
31	ArbID1	0	
32	ArbID0	0	
33	A2	A2	Status Cycle
34	0	0	Idle

Cycles 21 through 28 are used to arbitrate for the lowest priority processor. The processors participating in the arbitration drive their inverted processor priority on the bus. Only the local APICs having free interrupt slots participate in the lowest priority arbitration. If no such APIC exists, the message will be rejected, requiring it to be tried at a later time.

Cycles 29 through 32 are also used for arbitration in case two or more processors have the same lowest priority. In the lowest priority delivery mode, all combinations of errors in cycle 33 (A2 A2) will set the "accept error" bit in the error status register (see Figure 10-9). Arbitration priority update is performed in cycle 20, and is not affected by errors detected in cycle 33. Only the local APIC that wins in the lowest

priority arbitration, drives cycle 33. An error in cycle 33 will force the sender to resend the message.

F.2.3 APIC Bus Status Cycles

Certain cycles within an APIC bus message are status cycles. During these cycles the status flags (A:A) and (A1:A1) are examined. Table F-4 shows how these status flags are interpreted, depending on the current delivery mode and existence of a focus processor.

Table F-4. APIC Bus Status Cycles Interpretation

Delivery Mode	A Status	A1 Status	A2 Status	Update ArbiD and Cycle#	Message Length	Retry
EOI	00: CS_OK	10: Accept	XX:	Yes, 13	14 Cycle	No
	00: CS_OK	11: Retry	XX:	Yes, 13	14 Cycle	Yes
	00: CS_OK	0X: Accept Error	XX:	No	14 Cycle	Yes
	11: CS_Error	XX:	XX:	No	14 Cycle	Yes
	10: Error	XX:	XX:	No	14 Cycle	Yes
	01: Error	XX:	XX:	No	14 Cycle	Yes
Fixed	00: CS_OK	10: Accept	XX:	Yes, 20	21 Cycle	No
	00: CS_OK	11: Retry	XX:	Yes, 20	21 Cycle	Yes
	00: CS_OK	0X: Accept Error	XX:	No	21 Cycle	Yes
	11: CS_Error	XX:	XX:	No	21 Cycle	Yes
	10: Error	XX:	XX:	No	21 Cycle	Yes
	01: Error	XX:	XX:	No	21 Cycle	Yes
NMI, SMI, INIT, ExtINT, Start-Up	00: CS_OK	10: Accept	XX:	Yes, 20	21 Cycle	No
	00: CS_OK	11: Retry	XX:	Yes, 20	21 Cycle	Yes
	00: CS_OK	0X: Accept Error	XX:	No	21 Cycle	Yes
	11: CS_Error	XX:	XX:	No	21 Cycle	Yes
	10: Error	XX:	XX:	No	21 Cycle	Yes
	01: Error	XX:	XX:	No	21 Cycle	Yes

Table F-4. APIC Bus Status Cycles Interpretation (Contd.)

Delivery Mode	A Status	A1 Status	A2 Status	Update ArbID and Cycle#	Message Length	Retry
Lowest	00: CS_OK, NoFocus	11: Do Lowest	10: Accept	Yes, 20	34 Cycle	No
	00: CS_OK, NoFocus	11: Do Lowest	11: Error	Yes, 20	34 Cycle	Yes
	00: CS_OK, NoFocus	11: Do Lowest	0X: Error	Yes, 20	34 Cycle	Yes
	00: CS_OK, NoFocus	10: End and Retry	XX:	Yes, 20	34 Cycle	Yes
	00: CS_OK, NoFocus	0X: Error	XX:	No	34 Cycle	Yes
	10: CS_OK, Focus	XX:	XX:	Yes, 20	34 Cycle	No
	11: CS_Error	XX:	XX:	No	21 Cycle	Yes
	01: Error	XX:	XX:	No	21 Cycle	Yes

APPENDIX G

VMX CAPABILITY REPORTING FACILITY

The ability of a processor to support VMX operation and related instructions is indicated by `CPUID.1:ECX.VMX[bit 5] = 1`. A value 1 in this bit indicates support for VMX features.

Support for specific features detailed in Chapter 21 and other VMX chapters is determined by reading values from a set of capability MSRs. These MSRs are indexed starting at MSR address 480H. VMX capability MSRs are read-only; an attempt to write them (with `WRMSR`) produces a general-protection exception (`#GP(0)`). They do not exist on processors that do not support VMX operation; an attempt to read them (with `RDMSR`) on such processors produces a general-protection exception (`#GP(0)`).

G.1 BASIC VMX INFORMATION

The `IA32_VMX_BASIC` MSR (index 480H) consists of the following fields:

- Bits 31:0 contain the 32-bit VMCS revision identifier used by the processor. Logical processors that use the same VMCS revision identifier use the same size for VMCS regions (see next item)
- Bits 44:32 report the number of bytes that software should allocate for the VMXON region and any VMCS region. It is a value greater than 0 and at most 4096 (bit 44 is set if and only if bits 43:32 are clear).
- Bit 48 indicates the width of the physical addresses that may be used for the VMXON region, each VMCS, and data structures referenced by pointers in a VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions). If the bit is 0, these addresses are limited to the processor's physical-address width.¹ If the bit is 1, these addresses are limited to 32 bits. This bit is always 0 for processors that support Intel 64 architecture.
- If bit 49 is read as 1, the logical processor supports the dual-monitor treatment of system-management interrupts and system-management mode. See Section 26.15 for details of this treatment.
- Bits 53:50 report the memory type that the logical processor uses to access the VMCS for `VMREAD` and `VMWRITE` and to access the VMCS, data structures referenced by pointers in the VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions), and the MSEG header during VM entries, VM exits, and in VMX non-root operation.²

1. On processors that support Intel 64 architecture, the pointer must not set bits beyond the processor's physical address width.

The first processors to support VMX operation use the write-back type. The values used are given in Table G-1.

Table G-1. Memory Types Used For VMCS Access

Value(s)	Field
0	Uncacheable (UC)
1-5	Not used
6	Write Back (WB)
7-15	Not used

If software needs to access these data structures (e.g., to modify the contents of the MSR bitmaps), it can configure the paging structures to map them into the linear-address space. If it does so, it should establish mappings that use the memory type reported in this MSR.¹

- If bit 54 is read as 1, the logical processor reports information in the VM-exit instruction-information field on VM exits due to execution of the INS and OUTS instructions. This reporting is done only if this bit is read as 1.
- Bit 55 is read as 1 if any VMX controls that default to 1 may be cleared to 0. See Appendix G.2 for details. It also reports support for the VMX capability MSRs IA32_VMX_TRUE_PINBASED_CTLS, IA32_VMX_TRUE_PROCBASED_CTLS, IA32_VMX_TRUE_EXIT_CTLS, and IA32_VMX_TRUE_ENTRY_CTLS. See Appendix G.3.1, Appendix G.3.2, Appendix G.4, and Appendix G.5 for details.
- The values of bits 47:45 and bits 63:56 are reserved and are read as 0.

G.2 RESERVED CONTROLS AND DEFAULT SETTINGS

As noted in Chapter 21, “Virtual-Machine Control Structures”, certain VMX controls are reserved and must be set to a specific value (0 or 1) determined by the processor. The specific value to which a reserved control must be set is its **default setting**.

2. If the MTRRs are disabled by clearing the E bit (bit 11) in the IA32_MTRR_DEF_TYPE MSR, the logical processor uses the UC memory type to access the indicated data structures, regardless of the value reported in bits 53:50 in the IA32_VMX_BASIC MSR. The processor will also use the UC memory type if the setting of CRO.CD on this logical processor (or another logical processor on the same physical processor) would cause it to do so for all memory accesses. The values of IA32_MTRR_DEF_TYPE.E and CRO.CD do not affect the value reported in IA32_VMX_BASIC[53:50].
1. Alternatively, software may map any of these regions or structures with the UC memory type. (This may be necessary for the MSEG header.) Doing so is discouraged unless necessary as it will cause the performance of software accesses to those structures to suffer. The processor will continue to use the memory type reported in the VMX capability MSR IA32_VMX_BASIC with the exceptions noted.

Software can discover the default setting of a reserved control by consulting the appropriate VMX capability MSR (see Appendix G.3 through Appendix G.5).

Future processors may define new functionality for one or more reserved controls. Such processors would allow each newly defined control to be set either to 0 or to 1. Software that does not desire a control's new functionality should set the control to its default setting. For that reason, it is useful for software to know the default settings of the reserved controls.

Default settings partition the various controls into the following classes:

- **Always-flexible.** These have never been reserved.
- **Default0.** These are (or have been) reserved with a default setting of 0.
- **Default1.** They are (or have been) reserved with a default setting of 1.

As noted in Appendix G.1, a logical processor uses bit 55 of the IA32_VMX_BASIC MSR to indicate whether any of the default1 controls may be 0:

- If bit 55 of the IA32_VMX_BASIC MSR is read as 0, all the default1 controls are reserved and must be 1. VM entry will fail if any of these controls are 1 (see Section 23.2.1).
- If bit 55 of the IA32_VMX_BASIC MSR is read as 1, not all the default1 controls are reserved, and some (but not necessarily all) may be 0. The CPU supports four (4) new VMX capability MSRs: IA32_VMX_TRUE_PINBASED_CTLs, IA32_VMX_TRUE_PROCBASED_CTLs, IA32_VMX_TRUE_EXIT_CTLs, and IA32_VMX_TRUE_ENTRY_CTLs. See Appendix G.3 through Appendix G.5 for details. (These MSRs are not supported if bit 55 of the IA32_VMX_BASIC MSR is read as 0.)

See Section 27.5.1 for recommended software algorithms for proper capability detection of the default1 controls.

G.3 VM-EXECUTION CONTROLS

There are separate capability MSRs for the pin-based VM-execution controls, the primary processor-based VM-execution controls, and the secondary processor-based VM-execution controls. These are described in Appendix G.3.1, Appendix G.3.2, and Appendix G.3.3, respectively.

G.3.1 Pin-Based VM-Execution Controls

The IA32_VMX_PINBASED_CTLs MSR (index 481H) reports on the allowed settings of **most** of the pin-based VM-execution controls (see Section 21.6.1):

- Bits 31:0 indicate the **allowed 0-settings** of these controls. VM entry allows control X (bit X of the pin-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the pin-based VM-execution controls in the default1 class (see Appendix G.2). These are bits 1, 2, and 4; the corresponding bits of the IA32_VMX_PINBASED_CTLMSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any pin-based VM-execution control in the default1 class is 0.
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PINBASED_CTLMSR (see below) reports which of the pin-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the **allowed 1-settings** of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PINBASED_CTLMSR (index 48DH) reports on the allowed settings of **all** of the pin-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the pin-based VM-execution controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32_VMX_PINBASED_CTLMSR. (The IA32_VMX_TRUE_PINBASED_CTLMSR is not supported.)
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32_VMX_TRUE_PINBASED_CTLMSR. Assuming that software knows that the default1 class of pin-based VM-execution controls contains bits 1, 2, and 4, there is no need for software to consult the IA32_VMX_PINBASED_CTLMSR.

G.3.2 Primary Processor-Based VM-Execution Controls

The IA32_VMX_PROCBASED_CTLMSR (index 482H) reports on the allowed settings of **most** of the primary processor-based VM-execution controls (see Section 21.6.2):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the primary processor-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the primary processor-based VM-execution controls in the default1 class (see Appendix G.2). These are bits 1, 4–6, 8, 13–16, and 26; the corresponding bits of the IA32_VMX_PROCBASED_CTLMSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any of the primary processor-based VM-execution controls in the default1 class is 0.
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PROCBASED_CTLMSR (see below) reports which of the primary processor-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PROCBASED_CTLMSR (index 48EH) reports on the allowed settings of **all** of the primary processor-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the primary processor-based VM-execution controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the primary processor-based VM-execution controls is contained in the IA32_VMX_PROCBASED_CTLMSR. (The IA32_VMX_TRUE_PROCBASED_CTLMSR is not supported.)
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the processor-based VM-execution controls is contained in the IA32_VMX_TRUE_PROCBASED_CTLMSR. Assuming that software knows that the default1 class of processor-based VM-execution controls contains bits 1, 4–6, 8, 13–16, and 26, there is no need for software to consult the IA32_VMX_PROCBASED_CTLMSR.

G.3.3 Secondary Processor-Based VM-Execution Controls

The IA32_VMX_PROCBASED_CTLMSR2 (index 48BH) reports on the allowed settings of the secondary processor-based VM-execution controls (see Section 21.6.2). VM entries perform the following checks:

- Bits 31:0 indicate the allowed 0-settings of these controls. These bits are always 0. This fact indicates that VM entry allows each bit of the secondary processor-based VM-execution controls to be 0.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X (bit X of the secondary processor-based VM-execution controls) to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X and the “activate secondary controls” primary processor-based VM-execution control are both 1.

The IA32_VMX_PROCBASED_CTLSS2 MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32_VMX_PROCBASED_CTLSS MSR is 1).

G.4 VM-EXIT CONTROLS

The IA32_VMX_EXIT_CTLSS MSR (index 483H) reports on the allowed settings of **most** of the VM-exit controls (see Section 21.7.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-exit controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the VM-exit controls in the default1 class (see Appendix G.2). These are bits 0–8, 10, 11, 13, 14, 16, and 17; the corresponding bits of the IA32_VMX_EXIT_CTLSS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any VM-exit control in the default1 class is 0.
 - If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_EXIT_CTLSS MSR (see below) reports which of the VM-exit controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_EXIT_CTLSS MSR (index 48FH) reports on the allowed settings of **all** of the VM-exit controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-exit controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the VM-exit controls is contained in the IA32_VMX_EXIT_CTLMS MSR. (The IA32_VMX_TRUE_EXIT_CTLMS MSR is not supported.)
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the VM-exit controls is contained in the IA32_VMX_TRUE_EXIT_CTLMS MSR. Assuming that software knows that the default1 class of VM-exit controls contains bits 0–8, 10, 11, 13, 14, 16, and 17, there is no need for software to consult the IA32_VMX_EXIT_CTLMS MSR.

G.5 VM-ENTRY CONTROLS

The IA32_VMX_ENTRY_CTLMS MSR (index 484H) reports on the allowed settings of **most** of the VM-entry controls (see Section 21.8.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-entry controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.
 Exceptions are made for the VM-entry controls in the default1 class (see Appendix G.2). These are bits 0–8 and 12; the corresponding bits of the IA32_VMX_ENTRY_CTLMS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:
 - If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any VM-entry control in the default1 class is 0.
 - If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_ENTRY_CTLMS MSR (see below) reports which of the VM-entry controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry fails if bit X is 1 in the VM-entry controls and bit 32+X is 0 in this MSR.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_ENTRY_CTLMS MSR (index 490H) reports on the allowed settings of **all** of the VM-entry controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-entry controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the VM-entry controls is contained in the

IA32_VMX_ENTRY_CTL5 MSR. (The IA32_VMX_TRUE_ENTRY_CTL5 MSR is not supported.)

- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the VM-entry controls is contained in the IA32_VMX_TRUE_ENTRY_CTL5 MSR. Assuming that software knows that the default1 class of VM-entry controls contains bits 0–8 and 12, there is no need for software to consult the IA32_VMX_ENTRY_CTL5 MSR.

G.6 MISCELLANEOUS DATA

The IA32_VMX_MISC MSR (index 485H) consists of the following fields:

- Bits 4:0 report a value X that specifies the relationship between the rate of the VMX-preemption timer and that of the timestamp counter (TSC). Specifically, the VMX-preemption timer (if it is active) counts down by 1 every time bit X in the TSC changes due to a TSC increment.
- If bit 5 is read as 1, VM exits store the value of IA32_EFER.LMA into the “IA-32e mode guest” VM-entry control; see Section 24.2 for more details. This bit is read as 1 on any logical processor that supports the 1-setting of the “unrestricted guest” VM-execution control.
- Bits 8:6 report, as a bitmap, the activity states supported by the implementation:
 - Bit 6 reports (if set) the support for activity state 1 (HLT).
 - Bit 7 reports (if set) the support for activity state 2 (shutdown).
 - Bit 8 reports (if set) the support for activity state 3 (wait-for-SIPI).

If an activity state is not supported, the implementation causes a VM entry to fail if it attempts to establish that activity state. All implementations support VM entry to activity state 0 (active).

- Bits 24:16 indicate the number of CR3-target values supported by the processor. This number is a value between 0 and 256, inclusive (bit 24 is set if and only if bits 23:16 are clear).
- Bits 27:25 is used to compute the recommended maximum number of MSRs that should appear in the VM-exit MSR-store list, the VM-exit MSR-load list, or the VM-entry MSR-load list. Specifically, if the value bits 27:25 of IA32_VMX_MISC is N, then $512 * (N + 1)$ is the recommended maximum number of MSRs to be included in each list. If the limit is exceeded, undefined processor behavior may result (including a machine check during the VMX transition).
- If bit 28 is read as 1, bit 2 of the IA32_SMM_MONITOR_CTL can be set to 1. VMXOFF unblocks SMIs unless IA32_SMM_MONITOR_CTL[bit 2] is 1 (see Section 26.14.4).
- Bits 63:32 report the 32-bit MSEG revision identifier used by the processor.
- Bits 15:9 and bits 31:29 are reserved and are read as 0.

G.7 VMX-FIXED BITS IN CR0

The IA32_VMX_CR0_FIXED0 MSR (index 486H) and IA32_VMX_CR0_FIXED1 MSR (index 487H) indicate how bits in CR0 may be set in VMX operation. They report on bits in CR0 that are allowed to be 0 and to be 1, respectively, in VMX operation. If bit X is 1 in IA32_VMX_CR0_FIXED0, then that bit of CR0 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in IA32_VMX_CR0_FIXED1, then that bit of CR0 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in IA32_VMX_CR0_FIXED0, then that bit is also 1 in IA32_VMX_CR0_FIXED1; if bit X is 0 in IA32_VMX_CR0_FIXED1, then that bit is also 0 in IA32_VMX_CR0_FIXED0. Thus, each bit in CR0 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in IA32_VMX_CR0_FIXED0 and 1 in IA32_VMX_CR0_FIXED1).

G.8 VMX-FIXED BITS IN CR4

The IA32_VMX_CR4_FIXED0 MSR (index 488H) and IA32_VMX_CR4_FIXED1 MSR (index 489H) indicate how bits in CR4 may be set in VMX operation. They report on bits in CR4 that are allowed to be 0 and 1, respectively, in VMX operation. If bit X is 1 in IA32_VMX_CR4_FIXED0, then that bit of CR4 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in IA32_VMX_CR4_FIXED1, then that bit of CR4 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in IA32_VMX_CR4_FIXED0, then that bit is also 1 in IA32_VMX_CR4_FIXED1; if bit X is 0 in IA32_VMX_CR4_FIXED1, then that bit is also 0 in IA32_VMX_CR4_FIXED0. Thus, each bit in CR4 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in IA32_VMX_CR4_FIXED0 and 1 in IA32_VMX_CR4_FIXED1).

G.9 VMCS ENUMERATION

The IA32_VMX_VMCS_ENUM MSR (index 48AH) provides information to assist software in enumerating fields in the VMCS.

As noted in Section 21.10.2, each field in the VMCS is associated with a 32-bit encoding which is structured as follows:

- Bits 31:15 are reserved (must be 0).
- Bits 14:13 indicate the field's width.
- Bit 12 is reserved (must be 0).
- Bits 11:10 indicate the field's type.
- Bits 9:1 is an index field that distinguishes different fields with the same width and type.
- Bit 0 indicates access type.

IA32_VMX_VMCS_ENUM indicates to software the highest index value used in the encoding of any field supported by the processor:

- Bits 9:1 contain the highest index value used for any VMCS encoding.
- Bit 0 and bits 63:10 are reserved and are read as 0.

G.10 VPID AND EPT CAPABILITIES

The IA32_VMX_EPT_VPID_CAP MSR (index 48CH) reports information about the capabilities of the logical processor with regard to virtual-processor identifiers (VPIDs, Section 25.1) and extended page tables (EPT, Section 25.2):

- If bit 0 is read as 1, the logical processor allows software to configure EPT paging-structure entries in which bits 2:0 have value 100b (indicating an execute-only translation).
- Bit 6 indicates support for a page-walk length of 4.
- If bit 8 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be uncacheable (UC); see Section 21.6.11.
- If bit 14 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be write-back (WB).
- If bit 16 is read as 1, the logical processor allows software to configure a EPT PDE to map a 2-Mbyte page (by setting bit 7 in the EPT PDE).
- If bit 17 is read as 1, the logical processor allows software to configure a EPT PDPTe to map a 1-Gbyte page (by setting bit 7 in the EPT PDPTe).
- Support for the INVEPT instruction (see Chapter 6 of the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A* and Section 25.3.3.1).
 - If bit 20 is read as 1, the INVEPT instruction is supported.
 - If bit 25 is read as 1, the single-context INVEPT type is supported.
 - If bit 26 is read as 1, the all-context INVEPT type is supported.
- Support for the INVVPID instruction (see Chapter 6 of the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A* and Section 25.3.3.1).
 - If bit 32 is read as 1, the INVVPID instruction is supported.
 - If bit 40 is read as 1, the individual-address INVVPID type is supported.
 - If bit 41 is read as 1, the single-context INVVPID type is supported.
 - If bit 42 is read as 1, the all-context INVVPID type is supported.
 - If bit 43 is read as 1, the single-context-retaining-globals INVVPID type is supported.
- Bits 5:1, bit 7, bits 13:9, bit 15, bits 19:17, bits 24:21, bits 31:27, bits 39:33, and bits 63:44 are reserved and are read as 0.

The IA32_VMX_EPT_VPID_CAP MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32_VMX_PROCBASED_CTLMSR is 1) and that support either the 1-setting of the

“enable EPT” VM-execution control (only if bit 33 of the IA32_VMX_PROCBASED_CTLX2 MSR is 1) or the 1-setting of the “enable VPID” VM-execution control (only if bit 37 of the IA32_VMX_PROCBASED_CTLX2 MSR is 1).

VMX CAPABILITY REPORTING FACILITY

APPENDIX H

FIELD ENCODING IN VMCS

Every component of the VMCS is encoded by a 32-bit field that can be used by VMREAD and VMWRITE. Section 21.10.2 describes the structure of the encoding space (the meanings of the bits in each 32-bit encoding).

This appendix enumerates all fields in the VMCS and their encodings. Fields are grouped by width (16-bit, 32-bit, etc.) and type (guest-state, host-state, etc.)

H.1 16-BIT FIELDS

A value of 0 in bits 14:13 of an encoding indicates a 16-bit field. Only guest-state areas and the host-state area contain 16-bit fields. As noted in Section 21.10.2, each 16-bit field allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

H.1.1 16-Bit Control Field

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. There is only one such 16-bit field as given in Table H-1.

Table H-1. Encoding for 16-Bit Control Fields (0000_00xx_xxxx_xxx0B)

Field Name	Index	Encoding
Virtual-processor identifier (VPID) ¹	000000000B	00000000H

NOTES:

1. This field exists only on processors that support the 1-setting of the “enable VPID” VM-execution control.

H.1.2 16-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table H-2 enumerates 16-bit guest-state fields.

Table H-2. Encodings for 16-Bit Guest-State Fields (0000_10xx_xxxx_xxx0B)

Field Name	Index	Encoding
Guest ES selector	000000000B	00000800H

Table H-2. Encodings for 16-Bit Guest-State Fields (0000_10xx_xxxx_xxx0B)

Field Name	Index	Encoding
Guest CS selector	000000001B	00000802H
Guest SS selector	000000010B	00000804H
Guest DS selector	000000011B	00000806H
Guest FS selector	000000100B	00000808H
Guest GS selector	000000101B	0000080AH
Guest LDTR selector	000000110B	0000080CH
Guest TR selector	000000111B	0000080EH

H.1.3 16-Bit Host-State Fields

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table H-3 enumerates the 16-bit host-state fields.

Table H-3. Encodings for 16-Bit Host-State Fields (0000_11xx_xxxx_xxx0B)

Field Name	Index	Encoding
Host ES selector	000000000B	00000C00H
Host CS selector	000000001B	00000C02H
Host SS selector	000000010B	00000C04H
Host DS selector	000000011B	00000C06H
Host FS selector	000000100B	00000C08H
Host GS selector	000000101B	00000C0AH
Host TR selector	000000110B	00000C0CH

H.2 64-BIT FIELDS

A value of 1 in bits 14:13 of an encoding indicates a 64-bit field. There are 64-bit fields only for controls and for guest state. As noted in Section 21.10.2, every 64-bit field has two encodings, which differ on bit 0, the access type. Thus, each such field has an even encoding for full access and an odd encoding for high access.

H.2.1 64-Bit Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table H-4 enumerates the 64-bit control fields.

Table H-4. Encodings for 64-Bit Control Fields (0010_00xx_xxxx_xxxAb)

Field Name	Index	Encoding
Address of I/O bitmap A (full)	00000000B	00002000H
Address of I/O bitmap A (high)	00000000B	00002001H
Address of I/O bitmap B (full)	00000001B	00002002H
Address of I/O bitmap B (high)	00000001B	00002003H
Address of MSR bitmaps (full) ¹	00000010B	00002004H
Address of MSR bitmaps (high) ¹	00000010B	00002005H
VM-exit MSR-store address (full)	00000011B	00002006H
VM-exit MSR-store address (high)	00000011B	00002007H
VM-exit MSR-load address (full)	00000100B	00002008H
VM-exit MSR-load address (high)	00000100B	00002009H

EPT pointer (EPTP; full) ⁴	000001101B	0000201AH
EPT pointer (EPTP; high) ⁴	000001101B	0000201BH

NOTES:

1. This field exists only on processors that support the 1-setting of the “use MSR bitmaps” VM-execution control.
2. This field exists only on processors that support either the 1-setting of the “use TPR shadow” VM-execution control.
3. This field exists only on processors that support the 1-setting of the “virtualize APIC accesses” VM-execution control.

4. This field exists only on processors that support the 1-setting of the “enable EPT” VM-execution control.

H.2.2 64-Bit Read-Only Data Field

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. There is only one such 64-bit field as given in Table H-5. (As with other 64-bit fields, this one has two encodings.)

Table H-5. Encodings for 64-Bit Read-Only Data Field (0010_01xx_xxxx_xxxAb)

Field Name	Index	Encoding
Guest-physical address (full) ¹	000000000B	00002400H
Guest-physical address (high) ¹	000000000B	00002401H

NOTES:

1. This field exists only on processors that support the 1-setting of the “enable EPT” VM-execution control.

H.2.3 64-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table H-6 enumerates the 64-bit guest-state fields.

Table H-6. Encodings for 64-Bit Guest-State Fields (0010_10xx_xxxx_xxxAb)

Field Name	Index	Encoding

Guest PDPTE3 (high) ⁴	000001000B	00002811H

NOTES:

1. This field exists only on processors that support either the 1-setting of the "load IA32_PAT" VM-entry control or that of the "save IA32_PAT" VM-exit control.
2. This field exists only on processors that support either the 1-setting of the "load IA32_EFER" VM-entry control or that of the "save IA32_EFER" VM-exit control.
3. This field exists only on processors that support the 1-setting of the "load IA32_PERF_GLOBAL_CTRL" VM-entry control.
4. This field exists only on processors that support the 1-setting of the "enable EPT" VM-execution control.

H.2.4 64-Bit Host-State Fields

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table H-7 enumerates the 64-bit control fields.

Table H-7. Encodings for 64-Bit Host-State Fields (0010_11xx_xxxx_xxxAb)

Field Name	Index	Encoding
Host IA32_PAT (full) ¹	000000000B	00002C00H
Host IA32_PAT (high) ¹	000000000B	00002C01H
Host IA32_EFER (full) ²	000000001B	00002C02H
Host IA32_EFER (high) ²	000000001B	00002C03H
Host IA32_PERF_GLOBAL_CTRL (full) ³	000000010B	00002C04H
Host IA32_PERF_GLOBAL_CTRL (high) ³	000000010B	00002C05H

NOTES:

1. This field exists only on processors that support the 1-setting of the "load IA32_PAT" VM-exit control.
2. This field exists only on processors that support the 1-setting of the "load IA32_EFER" VM-exit control.

3. This field exists only on processors that support the 1-setting of the “load IA32_PERF_GLOBAL_CTRL” VM-exit control.

H.3 32-BIT FIELDS

A value of 2 in bits 14:13 of an encoding indicates a 32-bit field. As noted in Section 21.10.2, each 32-bit field allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

H.3.1 32-Bit Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table H-8 enumerates the 32-bit control fields.

Table H-8. Encodings for 32-Bit Control Fields (0100_00xx_xxxx_xxx0B)

Field Name	Index	Encoding
Pin-based VM-execution controls	000000000B	00004000H
Primary processor-based VM-execution controls	000000001B	00004002H
Exception bitmap	000000010B	00004004H

PLE_Window ³	000010001b	00004022H

NOTES:

1. This field exists only on processors that support the 1-setting of the “use TPR shadow” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control.
3. This field exists only on processors that support the 1-setting of the “PAUSE-loop exiting” VM-execution control.

H.3.2 32-Bit Read-Only Data Fields

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. Table H-9 enumerates the 32-bit read-only data fields.

Table H-9. Encodings for 32-Bit Read-Only Data Fields (0100_01xx_xxxx_xxx0B)

Field Name	Index	Encoding
VM-instruction error	000000000B	00004400H
Exit reason	000000001B	00004402H
VM-exit interruption information	000000010B	00004404H
VM-exit interruption error code	000000011B	00004406H
IDT-vectoring information field	000000100B	00004408H
IDT-vectoring error code	000000101B	0000440AH
VM-exit instruction length	000000110B	0000440CH
VM-exit instruction information	000000111B	0000440EH

H.3.3 32-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table H-10 enumerates the 32-bit guest-state fields.

Table H-10. Encodings for 32-Bit Guest-State Fields (0100_10xx_xxxx_xxx0B)

Field Name	Index	Encoding
Guest ES limit	000000000B	00004800H
Guest CS limit	000000001B	00004802H
Guest SS limit	000000010B	00004804H

**Table H-10. Encodings for 32-Bit Guest-State Fields
(0100_10xx_xxxx_xxx0B) (Contd.)**

Field Name	Index	Encoding
Guest DS limit	000000011B	00004806H
Guest FS limit	000000100B	00004808H
Guest GS limit	000000101B	0000480AH
Guest LDTR limit	000000110B	0000480CH
Guest TR limit	000000111B	0000480EH
Guest GDTR limit	000001000B	00004810H
Guest IDTR limit	000001001B	00004812H
Guest ES access rights	000001010B	00004814H
Guest CS access rights	000001011B	00004816H
Guest SS access rights	000001100B	00004818H
Guest DS access rights	000001101B	0000481AH
Guest FS access rights	000001110B	0000481CH
Guest GS access rights	000001111B	0000481EH
Guest LDTR access rights	000010000B	00004820H
Guest TR access rights	000010001B	00004822H
Guest interruptibility state	000010010B	00004824H
Guest activity state	000010011B	00004826H
Guest SMBASE	000010100B	00004828H
Guest IA32_SYSENTER_CS	000010101B	0000482AH
VMX-preemption timer value ¹	000010111B	0000482EH

NOTES:

1. This field exists only on processors that support the 1-setting of the “activate VMX-preemption timer” VM-execution control.

The limit fields for GDTR and IDTR are defined to be 32 bits in width even though these fields are only 16-bits wide in the Intel 64 and IA-32 architectures. VM entry ensures that the high 16 bits of both these fields are cleared to 0.

H.3.4 32-Bit Host-State Field

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. There is only one such 32-bit field as given in Table H-11.

Table H-11. Encoding for 32-Bit Host-State Field (0100_11xx_xxxx_xxx0B)

Field Name	Index	Encoding
Host IA32_SYSENTER_CS	000000000B	00004C00H

H.4 NATURAL-WIDTH FIELDS

A value of 3 in bits 14:13 of an encoding indicates a natural-width field. As noted in Section 21.10.2, each of these fields allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

H.4.1 Natural-Width Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table H-12 enumerates the natural-width control fields.

Table H-12. Encodings for Natural-Width Control Fields (0110_00xx_xxxx_xxx0B)

Field Name	Index	Encoding
CR0 guest/host mask	000000000B	00006000H
CR4 guest/host mask	000000001B	00006002H
CR0 read shadow	000000010B	00006004H
CR4 read shadow	000000011B	00006006H
CR3-target value 0	000000100B	00006008H
CR3-target value 1	000000101B	0000600AH
CR3-target value 2	000000110B	0000600CH
CR3-target value 3 ¹	000000111B	0000600EH

NOTES:

1. If a future implementation supports more than 4 CR3-target values, they will be encoded consecutively following the 4 encodings given here.

H.4.2 Natural-Width Read-Only Data Fields

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. Table H-13 enumerates the natural-width read-only data fields.

**Table H-13. Encodings for Natural-Width Read-Only Data Fields
(0110_01xx_xxxx_xxx0B)**

Field Name	Index	Encoding
Exit qualification	000000000B	00006400H
I/O RCX	000000001B	00006402H

I/O RDI	000000011B	00006406H
I/O RIP	000000100B	00006408H
Guest-linear address	000000101B	0000640AH

H.4.3 Natural-Width Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table H-14 enumerates the natural-width guest-state fields.

**Table H-14. Encodings for Natural-Width Guest-State Fields
(0110_10xx_xxxx_xxx0B)**

Field Name	Index	Encoding
Guest CR0	000000000B	00006800H
Guest CR3	000000001B	00006802H
Guest CR4	000000010B	00006804H
Guest ES base	000000011B	00006806H
Guest CS base	000000100B	00006808H
Guest SS base	000000101B	0000680AH
Guest DS base	000000110B	0000680CH
Guest FS base	000000111B	0000680EH
Guest GS base	000001000B	00006810H
Guest LDTR base	000001001B	00006812H
Guest TR base	000001010B	00006814H
Guest GDTR base	000001011B	00006816H

Table H-14. Encodings for Natural-Width Guest-State Fields (0110_10xx_xxxx_xxx0B) (Contd.)

Field Name	Index	Encoding
Guest IDTR base	000001100B	00006818H
Guest DR7	000001101B	0000681AH
Guest RSP	000001110B	0000681CH
Guest RIP	000001111B	0000681EH
Guest RFLAGS	000010000B	00006820H
Guest pending debug exceptions	000010001B	00006822H
Guest IA32_SYSENTER_ESP	000010010B	00006824H
Guest IA32_SYSENTER_EIP	000010011B	00006826H

The base-address fields for ES, CS, SS, and DS in the guest-state area are defined to be natural-width (with 64 bits on processors supporting Intel 64 architecture) even though these fields are only 32-bits wide in the Intel 64 architecture. VM entry ensures that the high 32 bits of these fields are cleared to 0.

H.4.4 Natural-Width Host-State Fields

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table H-15 enumerates the natural-width host-state fields.

Table H-15. Encodings for Natural-Width Host-State Fields (0110_11xx_xxxx_xxx0B)

Field Name	Index	Encoding
Host RIP	000001011B	00006C16H

APPENDIX I

VMX BASIC EXIT REASONS

Every VM exit writes a 32-bit exit reason to the VMCS (see Section 21.9.1). Certain VM-entry failures also do this (see Section 23.7). The low 16 bits of the exit-reason field form the basic exit reason which provides basic information about the cause of the VM exit or VM-entry failure.

Table I-1 lists values for basic exit reasons and explains their meaning. Entries apply to VM exits, unless otherwise noted.

Table I-1. Basic Exit Reasons

Basic Exit Reason	Description
0	Exception or non-maskable interrupt (NMI). Either: 1: Guest software caused an exception and the bit in the exception bitmap associated with exception's vector was 1. 2: An NMI was delivered to the logical processor and the "NMI exiting" VM-execution control was 1. This case includes executions of BOUND that cause #BR, executions of INT3 (they cause #BP), executions of INTO that cause #OF, and executions of UD2 (they cause #UD).
1	External interrupt. An external interrupt arrived and the "external-interrupt exiting" VM-execution control was 1.
2	Triple fault. The logical processor encountered an exception while attempting to call the double-fault handler and that exception did not itself cause a VM exit due to the exception bitmap.
3	INIT signal. An INIT signal arrived
4	Start-up IPI (SIPI). A SIPI arrived while the logical processor was in the "wait-for-SIPI" state.
5	I/O system-management interrupt (SMI). An SMI arrived immediately after retirement of an I/O instruction and caused an SMM VM exit (see Section 26.15.2).
6	Other SMI. An SMI arrived and caused an SMM VM exit (see Section 26.15.2) but not immediately after retirement of an I/O instruction.
7	Interrupt window. At the beginning of an instruction, RFLAGS.IF was 1; events were not blocked by STI or by MOV SS; and the "interrupt-window exiting" VM-execution control was 1.
8	NMI window. At the beginning of an instruction, there was no virtual-NMI blocking; events were not blocked by MOV SS; and the "NMI-window exiting" VM-execution control was 1.
9	Task switch. Guest software attempted a task switch.
10	CPUID. Guest software attempted to execute CPUID.

Table I-1. Basic Exit Reasons (Contd.)

Basic Exit Reason	Description
11	GETSEC. Guest software attempted to execute GETSEC.
12	HLT. Guest software attempted to execute HLT and the “HLT exiting” VM-execution control was 1.
13	INVD. Guest software attempted to execute INVD.
14	INVLPG. Guest software attempted to execute INVLPG and the “INVLPG exiting” VM-execution control was 1.
15	RDPMC. Guest software attempted to execute RDPMC and the “RDPMC exiting” VM-execution control was 1.
16	RDTSC. Guest software attempted to execute RDTSC and the “RDTSC exiting” VM-execution control was 1.
17	RSM. Guest software attempted to execute RSM in SMM.
18	VMCALL. VMCALL was executed either by guest software (causing an ordinary VM exit) or by the executive monitor (causing an SMM VM exit; see Section 26.15.2).
19	VMCLEAR. Guest software attempted to execute VMCLEAR.
20	VMLAUNCH. Guest software attempted to execute VMLAUNCH.
21	VMPTRLD. Guest software attempted to execute VMPTRLD.
22	VMPTRST. Guest software attempted to execute VMPTRST.
23	VMREAD. Guest software attempted to execute VMREAD.
24	VMRESUME. Guest software attempted to execute VMRESUME.
25	VMWRITE. Guest software attempted to execute VMWRITE.
26	VMXOFF. Guest software attempted to execute VMXOFF.
27	VMXON. Guest software attempted to execute VMXON.
28	Control-register accesses. Guest software attempted to access CR0, CR3, CR4, or CR8 using CLTS, LMSW, or MOV CR and the VM-execution control fields indicate that a VM exit should occur (see Section 22.1 for details). This basic exit reason is not used for trap-like VM exits following executions of the MOV to CR8 instruction when the “use TPR shadow” VM-execution control is 1.
29	MOV DR. Guest software attempted a MOV to or from a debug register and the “MOV-DR exiting” VM-execution control was 1.
30	I/O instruction. Guest software attempted to execute an I/O instruction and either: 1: The “use I/O bitmaps” VM-execution control was 0 and the “unconditional I/O exiting” VM-execution control was 1. 2: The “use I/O bitmaps” VM-execution control was 1 and a bit in the I/O bitmap associated with one of the ports accessed by the I/O instruction was 1.

Table I-1. Basic Exit Reasons (Contd.)

Basic Exit Reason	Description
31	<p>RDMSR. Guest software attempted to execute RDMSR and either:</p> <ol style="list-style-type: none"> 1: The “use MSR bitmaps” VM-execution control was 0. 2: The value of RCX is neither in the range 00000000H - 00001FFFH nor in the range C0000000H - C0001FFFH. 3: The value of RCX was in the range 00000000H - 00001FFFH and the n^{th} bit in read bitmap for low MSRs is 1, where n was the value of RCX. 4: The value of RCX is in the range C0000000H - C0001FFFH and the n^{th} bit in read bitmap for high MSRs is 1, where n is the value of RCX & 00001FFFH.
32	<p>WRMSR. Guest software attempted to execute WRMSR and either:</p> <ol style="list-style-type: none"> 1: The “use MSR bitmaps” VM-execution control was 0. 2: The value of RCX is neither in the range 00000000H - 00001FFFH nor in the range C0000000H - C0001FFFH. 3: The value of RCX was in the range 00000000H - 00001FFFH and the n^{th} bit in write bitmap for low MSRs is 1, where n was the value of RCX. 4: The value of RCX is in the range C0000000H - C0001FFFH and the n^{th} bit in write bitmap for high MSRs is 1, where n is the value of RCX & 00001FFFH.
33	<p>VM-entry failure due to invalid guest state. A VM entry failed one of the checks identified in Section 23.3.1.</p>
34	<p>VM-entry failure due to MSR loading. A VM entry failed in an attempt to load MSRs. See Section 23.4.</p>
36	<p>MWAIT. Guest software attempted to execute MWAIT and the “MWAIT exiting” VM-execution control was 1.</p>
37	<p>Monitor trap flag. A VM entry occurred due to the 1-setting of the “monitor trap flag” VM-execution control and injection of an MTF VM exit as part of VM entry. See Section 22.7.2.</p>
39	<p>MONITOR. Guest software attempted to execute MONITOR and the “MONITOR exiting” VM-execution control was 1.</p>
40	<p>PAUSE. Either guest software attempted to execute PAUSE and the “PAUSE exiting” VM-execution control was 1 or the “PAUSE-loop exiting” VM-execution control was 1 and guest software executed a PAUSE loop with execution time exceeding PLE_Window (see Section 22.1.3).</p>
41	<p>VM-entry failure due to machine check. A machine check occurred during VM entry (see Section 23.8).</p>
43	<p>TPR below threshold. The logical processor determined that the value of the TPR shadow was below that of the TPR threshold VM-execution control field while the “use TPR shadow” VM-execution control was 1 in one of the following cases:</p> <ul style="list-style-type: none"> ▪ After guest software executed MOV to CR8 (see Section 22.1.3). ▪ As part of a TPR-shadow update (see Section 22.5.3.3). ▪ After VM entry with the 1-setting of the “virtualize APIC accesses” VM-execution control (see Section 23.6.7).

Table I-1. Basic Exit Reasons (Contd.)

Basic Exit Reason	Description
44	APIC access. Guest software attempted to access memory at a physical address on the APIC-access page and the “virtualize APIC accesses” VM-execution control was 1 (see Section 22.2).
46	Access to GDTR or IDTR. Guest software attempted to execute LGDT, LIDT, SGDT, or SIDT and the “descriptor-table exiting” VM-execution control was 1.
47	Access to LDTR or TR. Guest software attempted to execute LLDT, LTR, SLDT, or STR and the “descriptor-table exiting” VM-execution control was 1.
48	EPT violation. An attempt to access memory with a guest-physical address was disallowed by the configuration of the EPT paging structures.
49	EPT misconfiguration. An attempt to access memory with a guest-physical address encountered a misconfigured EPT paging-structure entry.
50	INVEPT. Guest software attempted to execute INVEPT.
51	RDTSMP. Guest software attempted to execute RDTSMP and the “enable RDTSMP” and “RDTSMP exiting” VM-execution controls were both 1.
52	VMX-preemption timer expired. The preemption timer counted down to zero.
53	INVVPID. Guest software attempted to execute INVVPID.
54	WBINVD. Guest software attempted to execute WBINVD and the “WBINVD exiting” VM-execution control was 1.
55	XSETBV. Guest software attempted to execute XSETBV.

remapping memory types, Vol.3-11-42

setting up memory ranges with MTRRs,
Vol.3-11-33

shared mode, L1 Data Cache, Vol.3-11-26

variable-range MTRRs, Vol.3-11-34, Vol.3-11-37

Cache Inclusiveness, Vol.2-3-201

Caches, Vol.3-2-10

cache hit, Vol.3-11-7

cache line, Vol.3-11-7

cache line fill, Vol.3-11-7

cache write hit, Vol.3-11-7

description of, Vol.3-11-1

effects of a locked operation on internal processor
caches, Vol.3-8-7

enabling, Vol.3-9-8

management, instructions, Vol.3-2-31,
Vol.3-11-25

Caches, invalidating (flushing), Vol.2-3-527,
Vol.2-4-500

cache, smart, Vol.1-2-6

Caching

cache control protocol, Vol.3-11-13

cache line, Vol.3-11-7

cache management instructions, Vol.3-11-25

cache mechanisms in IA-32 processors,
Vol.3-19-40

caching terminology, Vol.3-11-7

choosing a memory type, Vol.3-11-12

flushing TLBs, Vol.3-11-29

implicit caching, Vol.3-11-27

internal caches, Vol.3-11-1

L1 (level 1) cache, Vol.3-11-5

L2 (level 2) cache, Vol.3-11-5

L3 (level 3) cache, Vol.3-11-5

methods of caching available, Vol.3-11-8

MTRRs, description of, Vol.3-11-30

operating modes, Vol.3-11-17

overview of, Vol.3-11-1

self-modifying code, effect on, Vol.3-11-27,
Vol.3-19-41

snooping, Vol.3-11-8

store buffer, Vol.3-11-27

TLBs, Vol.3-11-6

UC (strong uncacheable) memory type, Vol.3-11-8

UC- (uncacheable) memory type, Vol.3-11-9

WB (write back) memory type, Vol.3-11-10

WC (write combining) memory type, Vol.3-11-9

WP (write protected) memory type, Vol.3-11-10

write-back caching, Vol.3-11-8

WT (write through) memory type, Vol.3-11-10

Call gate, Vol.1-6-9

Call gates

16-bit, interlevel return from, Vol.3-19-44

accessing a code segment through, Vol.3-5-22

description of, Vol.3-5-19

for 16-bit and 32-bit code modules, Vol.3-18-2

IA-32e mode, Vol.3-5-20

introduction to, Vol.3-2-5

mechanism, Vol.3-5-22

privilege level checking rules, Vol.3-5-23

COMBINED INDEX
