- **Shared Access** means that no other leaf function that requires an exclusive access to the same EPC page may be executed concurrently. Other leaf functions that require shared access may run concurrently. For example, EADD requires a shared access to the SECS page it accesses.
- **Concurrent Access** means that any other leaf function that requires any access to the same EPC page may be executed concurrently. For example, EGETKEY has no concurrency requirements for the KEYREQUEST page.

In addition to the base concurrency requirements, additional concurrency requirements are listed, which apply only to specific sets of leaf functions. For example, there are additional requirements that apply for EADD, EEXTEND and EINIT. EADD and EEXTEND can't execute concurrently on the same SECS page.

The tables also detail the leaf function's behavior when a conflict happens, i.e., a concurrency requirement is not met. In this case, the leaf function may return an SGX\_EPC\_PAGE\_CONFLICT error code in RAX, or it may cause an exception. In addition, the tables detail those conflicts where a VM Exit may be triggered, and list the Exit Qualification code that is provided in such cases.

## 40.2 INTEL® SGX INSTRUCTION REFERENCE

## ENCLS—Execute an Enclave System Function of Specified Leaf Number

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
NP 0F 01 CF ENCLS	NP	V/V	NA	This instruction is used to execute privileged Intel SGX leaf functions that are used for managing and debugging the enclaves.

### Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Implicit Register Operands
NP	NA	NA	NA	See Section 40.3

### Description

The ENCLS instruction invokes the specified privileged Intel SGX leaf function for managing and debugging enclaves. Software specifies the leaf function by setting the appropriate value in the register EAX as input. The registers RBX, RCX, and RDX have leaf-specific purpose, and may act as input, as output, or may be unused. In 64-bit mode, the instruction ignores upper 32 bits of the RAX register.

The ENCLS instruction produces an invalid-opcode exception (#UD) if CR0.PE = 0 or RFLAGS.VM = 1, or if it is executed in system-management mode (SMM). Additionally, any attempt to execute the instruction when CPL > 0 results in #UD. The instruction produces a general-protection exception (#GP) if CR0.PG = 0 or if an attempt is made to invoke an undefined leaf function.

In VMX non-root operation, execution of ENCLS may cause a VM exit if the “enable ENCLS exiting” VM-execution control is 1. In this case, execution of individual leaf functions of ENCLS is governed by the ENCLS-exiting bitmap field in the VMCS. Each bit in that field corresponds to the index of an ENCLS leaf function (as provided in EAX).

Software in VMX root operation can thus intercept the invocation of various ENCLS leaf functions in VMX non-root operation by setting the “enable ENCLS exiting” VM-execution control and setting the corresponding bits in the ENCLS-exiting bitmap.

Addresses and operands are 32 bits outside 64-bit mode (IA32\_EFER.LMA = 0 || CS.L = 0) and are 64 bits in 64-bit mode (IA32\_EFER.LMA = 1 || CS.L = 1). CS.D value has no impact on address calculation. The DS segment is used to create linear addresses.

Segment override prefixes and address-size override prefixes are ignored, and is the REX prefix in 64-bit mode.

### Operation

IF TSX\_ACTIVE

THEN GOTO TSX\_ABORT\_PROCESSING; FI;

IF CR0.PE = 0 or RFLAGS.VM = 1 or in SMM or CPUID.SGX\_LEAF.0:EAX.SE1 = 0

THEN #UD; FI;

IF (CPL > 0)

THEN #UD; FI;

IF in VMX non-root operation and the “enable ENCLS exiting” VM-execution control is 1

THEN

IF EAX < 63 and ENCLS\_exiting\_bitmap[EAX] = 1 or EAX > 62 and ENCLS\_exiting\_bitmap[63] = 1

THEN VM exit;

FI;

FI;

IF IA32\_FEATURE\_CONTROL.LOCK = 0 or IA32\_FEATURE\_CONTROL.SGX\_ENABLE = 0

THEN #GP(0); FI;

IF EAX is invalid leaf number)

THEN #GP(0); FI;

IF CR0.PG = 0  
THEN #GP(0); FI;

(\* DS must not be an expanded down segment \*)  
IF not in 64-bit mode and DS.Type is expand-down data  
THEN #GP(0); FI;

Jump to leaf specific flow

### Flags Affected

See individual leaf functions

### Protected Mode Exceptions

#UD                    If any of the LOCK/OSIZE/REP/VEX prefix is used.  
                         If current privilege level is not 0.  
                         If CPUID.(EAX=12H,ECX=0):EAX.SGX1 [bit 0] = 0.  
                         If logical processor is in SMM.

#GP(0)                If IA32\_FEATURE\_CONTROL.LOCK = 0.  
                         If IA32\_FEATURE\_CONTROL.SGX\_ENABLE = 0.  
                         If input value in EAX encodes an unsupported leaf.  
                         If data segment expand down.  
                         If CR0.PG=0.

### Real-Address Mode Exceptions

#UD                    ENCLS is not recognized in real mode.

### Virtual-8086 Mode Exceptions

#UD                    ENCLS is not recognized in virtual-8086 mode.

### Compatibility Mode Exceptions

Same exceptions as in protected mode.

### 64-Bit Mode Exceptions

#UD                    If any of the LOCK/OSIZE/REP/VEX prefix is used.  
                         If current privilege level is not 0.  
                         If CPUID.(EAX=12H,ECX=0):EAX.SGX1 [bit 0] = 0.  
                         If logical processor is in SMM.

#GP(0)                If IA32\_FEATURE\_CONTROL.LOCK = 0.  
                         If IA32\_FEATURE\_CONTROL.SGX\_ENABLE = 0.  
                         If input value in EAX encodes an unsupported leaf.

## ENCLU—Execute an Enclave User Function of Specified Leaf Number

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
NP 0F 01 D7 ENCLU	NP	V/V	NA	This instruction is used to execute non-privileged Intel SGX leaf functions.

### Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Implicit Register Operands
NP	NA	NA	NA	See Section 40.4

### Description

The ENCLU instruction invokes the specified non-privileged Intel SGX leaf functions. Software specifies the leaf function by setting the appropriate value in the register EAX as input. The registers RBX, RCX, and RDX have leaf-specific purpose, and may act as input, as output, or may be unused. In 64-bit mode, the instruction ignores upper 32 bits of the RAX register.

The ENCLU instruction produces an invalid-opcode exception (#UD) if CR0.PE = 0 or RFLAGS.VM = 1, or if it is executed in system-management mode (SMM). Additionally, any attempt to execute this instruction when CPL < 3 results in #UD. The instruction produces a general-protection exception (#GP) if either CR0.PG or CR0.NE is 0, or if an attempt is made to invoke an undefined leaf function. The ENCLU instruction produces a device not available exception (#NM) if CR0.TS = 1.

Addresses and operands are 32 bits outside 64-bit mode (IA32\_EFER.LMA = 0 or CS.L = 0) and are 64 bits in 64-bit mode (IA32\_EFER.LMA = 1 and CS.L = 1). CS.D value has no impact on address calculation. The DS segment is used to create linear addresses.

Segment override prefixes and address-size override prefixes are ignored, as is the REX prefix in 64-bit mode.

If input value in EAX encodes EGETKEY/EREPORT/EEXIT/EACCEPT/EACCEPTCOPY/EMODPE and ENCLAVE_MODE = 0. If CR0.NE = 0.
#NM	If CR0.TS = 1.

## ENCLV—Execute an Enclave VMM Function of Specified Leaf Number

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
NP OF 01 C0 ENCLV	NP	V/V	NA	This instruction is used to execute privileged SGX leaf functions that are reserved for VMM use. They are used for managing the enclaves.

### Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Implicit Register Operands
NP	NA	NA	NA	See Section 40.3

### Description

The ENCLV instruction invokes the virtualization SGX leaf functions for managing enclaves in a virtualized environment. Software specifies the leaf function by setting the appropriate value in the register EAX as input. The registers RBX, RCX, and RDX have leaf-specific purpose, and may act as input, as output, or may be unused. In non 64-bit mode, the instruction ignores upper 32 bits of the RAX register.

The ENCLV instruction produces an invalid-opcode exception (#UD) if CR0.PE = 0 or RFLAGS.VM = 1, if it is executed in system-management mode (SMM), or not in VMX operation. Additionally, any attempt to execute the instruction when CPL > 0 results in #UD. The instruction produces a general-protection exception (#GP) if CR0.PG = 0 or if an attempt is made to invoke an undefined leaf function.

Software in VMX root mode of operation can enable execution of the ENCLV instruction in VMX non-root mode by setting enable ENCLV execution control in the VMCS. If enable ENCLV execution control in the VMCS is clear, execution of the ENCLV instruction in VMX non-root mode results in #UD.

When execution of ENCLV instruction in VMX non-root mode is enabled, software in VMX root operation can intercept the invocation of various ENCLS leaf functions in VMX non-root operation by setting the corresponding bits in the ENCLV-exiting bitmap.

Addresses and operands are 32 bits in 32-bit mode (IA32\_EFER.LMA == 0 || CS.L == 0) and are 64 bits in 64-bit mode (IA32\_EFER.LMA == 1 && CS.L == 1). CS.D value has no impact on address calculation.

Segment override prefixes and address-size override prefixes are ignored, as is the REX prefix in 64-bit mode.

### Operation

```

IF TSX_ACTIVE
    THEN GOTO TSX_ABORT_PROCESSING; FI;

IF CR0.PE = 0 or RFLAGS.VM = 1 or in SMM or CPUID.SGX_LEAF.0:EAX.OSS = 0
    THEN #UD; FI;

## 40.3 INTEL® SGX SYSTEM LEAF FUNCTION REFERENCE

Leaf functions available with the ENCLS instruction mnemonic are covered in this section. In general, each instruction leaf requires EAX to specify the leaf function index and/or additional implicit registers specifying leaf-specific input parameters. An instruction operand encoding table provides details of each implicit register usage and associated input/output semantics.

In many cases, an input parameter specifies an effective address associated with a memory object inside or outside the EPC, the memory addressing semantics of these memory objects are also summarized in a separate table.

## EADD—Add a Page to an Uninitialized Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 01H ENCLS[EADD]	IR	V/V	SGX1	This leaf function adds a page to an uninitialized enclave.

### Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EADD (In)	Address of a PAGEINFO (In)	Address of the destination EPC page (In)

### Description

This leaf function copies a source page from non-enclave memory into the EPC, associates the EPC page with an SECS page residing in the EPC, and stores the linear address and security attributes in EPCM. As part of the association, the enclave offset and the security attributes are measured and extended into the SECS.MRENCLAVE. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a PAGEINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of EADD leaf function.

### EADD Memory Parameter Semantics

PAGEINFO	PAGEINFO.SECS	PAGEINFO.SRCPGE	PAGEINFO.SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read/Write access permitted by Enclave	Read access permitted by Non Enclave	Read access permitted by Non Enclave	Write access permitted by Enclave

The instruction faults if any of the following:

### EADD Faulting Conditions

The operands are not properly aligned.	Unsupported security attributes are set.
Refers to an invalid SECS.	Reference is made to an SECS that is locked by another thread.
The EPC page is locked by another thread.	RCX does not contain an effective address of an EPC page.
The EPC page is already valid.	If security attributes specifies a TCS and the source page specifies unsupported TCS values or fields.
The SECS has been initialized.	The specified enclave offset is outside of the enclave address space.

### Concurrency Restrictions

**Table 40-8. Base Concurrency Restrictions of EADD**

Leaf	Parameter	Base Concurrency Restrictions

## EAUG—Add a Page to an Initialized Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 0DH ENCLS[EAUG]	IR	V/V	SGX2	This leaf function adds a page to an initialized enclave.

### Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EAUG (In)	Address of a SECFINFO (In)	Address of the destination EPC page (In)

### Description

This leaf function zeroes a page of EPC memory, associates the EPC page with an SECS page residing in the EPC, and stores the linear address and security attributes in the EPCM. As part of the association, the security attributes are configured to prevent access to the EPC page until a corresponding invocation of the EACCEPT leaf or EACCEPT-COPY leaf confirms the addition of the new page into the enclave. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a PAGEINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EAUG leaf function.

### EAUG Memory Parameter Semantics

PAGEINFO	PAGEINFO.SECS	PAGEINFO.SRCPGE	PAGEINFO.SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read/Write access permitted by Enclave	Must be zero	Read access permitted by Non Enclave	Write access permitted by Enclave

The instruction faults if any of the following:

### EAUG Faulting Conditions

The operands are not properly aligned.	Unsupported security attributes are set.
Refers to an invalid SECS.	Reference is made to an SECS that is locked by another thread.
The EPC page is locked by another thread.	RCX does not contain an effective address of an EPC page.
The EPC page is already valid.	The specified enclave offset is outside of the enclave address space.
The SECS has been initialized.

## EBLOCK—Mark a page in EPC as Blocked

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 09H ENCLS[EBLOCK]	IR	V/V	SGX1	This leaf function marks a page in the EPC as blocked.

### Instruction Operand Encoding

Op/En	EAX		RCX
IR	EBLOCK (In)	Return error code (Out)	Effective address of the EPC page (In)

### Description

This leaf function causes an EPC page to be marked as BLOCKED. This instruction can only be executed when current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create linear address. Segment override is not supported.

An error code is returned in RAX.

The table below provides additional information on the memory parameter of EBLOCK leaf function.

### EBLOCK Memory Parameter Semantics

EPCPAGE
Read/Write access permitted by Enclave

The error codes are:

**Table 40-12. EBLOCK Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	EBLOCK successful.
SGX_BLKSTATE	Page already blocked. This value is used to indicate to a VMM that the page was already in BLOCKED state as a result of EBLOCK and thus will need to be restored to this state when it is eventually reloaded (using ELDB).
SGX_ENTRYEPOCH_LOCKED	SECS locked for Entry Epoch update. This value indicates that an ETRACK is currently executing on the SECS. The EBLOCK should be reattempted.
SGX_NOTBLOCKABLE	Page type is not one which can be blocked.
SGX_PG_INVLD	Page is not valid and cannot be blocked.
SGX_EPC_PAGE_CONFLICT	Page is being written by EADD, EAUG, ECREATE, ELDU/B, EMODT, or EWB.

### Concurrency Restrictions

#GP(0)	If a memory operand is non-canonical form. If a memory operand is not properly aligned. If the specified EPC resource is in use.
#PF(error code)	If a page fault occurs in accessing memory operands. If a memory operand is not an EPC page.

## ECREATE—Create an SECS page in the Enclave Page Cache

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 00H ENCLS[ECREATE]	IR	V/V	SGX1	This leaf function begins an enclave build by creating an SECS page in EPC.

### Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	ECREATE (In)	Address of a PAGEINFO (In)	Address of the destination SECS page (In)

#### Description

ENCLS[ECREATE] is the first instruction executed in the enclave build process. ECREATE copies an SECS structure outside the EPC into an SECS page inside the EPC. The internal structure of SECS is not accessible to software.

ECREATE will set up fields in the protected SECS and mark the page as valid inside the EPC. ECREATE initializes or checks unused fields.

Software sets the following fields in the source structure: SECS:BASEADDR, SECS:SIZE in bytes, ATTRIBUTES, CONFIGID and CONFIGSVN. SECS:BASEADDR must be naturally aligned on an SECS.SIZE boundary. SECS.SIZE must be at least 2 pages (8192).

The source operand RBX contains an effective address of a PAGEINFO structure. PAGEINFO contains an effective address of a source SECS and an effective address of an SECINFO. The SECS field in PAGEINFO is not used.

The RCX register is the effective address of the destination SECS. It is an address of an empty slot in the EPC. The SECS structure must be page aligned. SECINFO flags must specify the page as an SECS page.

### ECREATE Memory Parameter Semantics

PAGEINFO	PAGEINFO.SRCPGE	PAGEINFO.SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read access permitted by Non Enclave	Read access permitted by Non Enclave	Write access permitted by Enclave

ECREATE will fault if the SECS target page is in use; already valid; outside the EPC. It will also fault if addresses are not aligned; unused PAGEINFO fields are not zero.

If the amount of space needed to store the SSA frame is greater than the amount specified in SECS.SSAFRAME-SIZE, a #GP(0) results. The amount of space needed for an SSA frame is computed based on DS:TMP\_SECS.ATTRIBUTES.XFRM size. Details of computing the size can be found Section 41.7.

#### Concurrency Restrictions

## EDBGRD—Read From a Debug Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 04H ENCLS[EDBGRD]	IR	V/V	SGX1	This leaf function reads a dword/quadword from a debug enclave.

### Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EDBGRD (In)	Data read from a debug enclave (Out)	Address of source memory in the EPC (In)

### Description

This leaf function copies a quadword/doubleword from an EPC page belonging to a debug enclave into the RBX register. Eight bytes are read in 64-bit mode, four bytes are read in non-64-bit modes. The size of data read cannot be overridden.

The effective address of the source location inside the EPC is provided in the register RCX.

### EDBGRD Memory Parameter Semantics

EPCQW
Read access permitted by Enclave

The error codes are:

**Table 40-17. EDBGRD Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	EDBGRD successful.
SGX_PAGE_NOT_DEBUGGABLE	The EPC page cannot be accessed because it is in the PENDING or MODIFIED state.

The instruction faults if any of the following:

### EDBGRD Faulting Conditions

RCX points into a page that is an SECS.	RCX does not resolve to a naturally aligned linear address.
RCX points to a page that does not belong to an enclave that is in debug mode.	RCX points to a location inside a TCS that is beyond the architectural size of the TCS (SGX_TCS_LIMIT).
An operand causing any segment violation.	May page fault.
CPL > 0.	

This instruction ignores the EPCM RWX attributes on the enclave page. Consequently, violation of EPCM RWX attributes via EDBGRD does not result in a #GP.

Concurrency Restrictions

## EDBGWR—Write to a Debug Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 05H ENCLS[EDBGWR]	IR	V/V	SGX1	This leaf function writes a dword/quadword to a debug enclave.

### Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EDBGWR (In)	Data to be written to a debug enclave (In)	Address of Target memory in the EPC (In)

### Description

This leaf function copies the content in EBX/RBX to an EPC page belonging to a debug enclave. Eight bytes are written in 64-bit mode, four bytes are written in non-64-bit modes. The size of data cannot be overridden.

The effective address of the source location inside the EPC is provided in the register RCX.

### EDBGWR Memory Parameter Semantics

EPCQW
Write access permitted by Enclave

The instruction faults if any of the following:

### EDBGWR Faulting Conditions

RCX points into a page that is an SECS.	RCX does not resolve to a naturally aligned linear address.
RCX points to a page that does not belong to an enclave that is in debug mode.	RCX points to a location inside a TCS that is not the FLAGS word.
An operand causing any segment violation.	May page fault.
CPL > 0.	

The error codes are:

**Table 40-20. EDBGWR Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	EDBGWR successful.
SGX_PAGE_NOT_DEBUGGABLE	The EPC page cannot be accessed because it is in the PENDING or MODIFIED state.

This instruction ignores the EPCM RWX attributes on the enclave page. Consequently, violation of EPCM RWX attributes via EDBGWR does not result in a #GP.

## EEXTEND—Extend Uninitialized Enclave Measurement by 256 Bytes

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 06H ENCLS[EEXTEND]	IR	V/V	SGX1	This leaf function measures 256 bytes of an uninitialized enclave page.

### Instruction Operand Encoding

Op/En	EAX	EBX	RCX
IR	EEXTEND (In)	Effective address of the SECS of the data chunk (In)	Effective address of a 256-byte chunk in the EPC (In)

### Description

This leaf function updates the MRENCLAVE measurement register of an SECS with the measurement of an EXTEND string comprising of “EEXTEND” || ENCLAVEOFFSET || PADDING || 256 bytes of the enclave page. This instruction can only be executed when current privilege level is 0 and the enclave is uninitialized.

RBX contains the effective address of the SECS of the region to be measured. The address must be the same as the one used to add the page into the enclave.

RCX contains the effective address of the 256 byte region of an EPC page to be measured. The DS segment is used to create linear addresses. Segment override is not supported.

### EEXTEND Memory Parameter Semantics

EPC[RCX]
Read access by Enclave

The instruction faults if any of the following:

### EEXTEND Faulting Conditions

RBX points to an address not 4KBytes aligned.	RBX does not resolve to an SECS.
RBX does not point to an SECS page.	RBX does not point to the SECS page of the data chunk.
RCX points to an address not 256B aligned.	RCX points to an unused page or a SECS.
RCX does not resolve in an EPC page.	If SECS is locked.
If the SECS is already initialized.	May page fault.

### EINIT—Initialize an Enclave for Execution

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 02H ENCLS[EINIT]	IR	V/V	SGX1	This leaf function initializes the enclave and makes it ready to execute enclave code.

#### Instruction Operand Encoding

Op/En	EAX		RBX	RCX	RDX
IR	EINIT (In)	Error code (Out)	Address of SIGSTRUCT (In)	Address of SECS (In)	Address of EINITTOKEN (In)

#### Description

This leaf function is the final instruction executed in the enclave build process. After EINIT, the MRENCLAVE measurement is complete, and the enclave is ready to start user code execution using the EENTER instruction.

EINIT takes the effective address of a SIGSTRUCT and EINITTOKEN. The SIGSTRUCT describes the enclave including MRENCLAVE, ATTRIBUTES, ISVSVN, a 3072 bit RSA key, and a signature using the included key. SIGSTRUCT must be populated with two values, q1 and q2. These are calculated using the formulas shown below:

$$q1 = \text{floor}(\text{Signature}^2 / \text{Modulus});$$

$$q2 = \text{floor}((\text{Signature}^3 - q1 * \text{Signature} * \text{Modulus}) / \text{Modulus});$$

The EINITTOKEN contains the MRENCLAVE, MRSIGNER, and ATTRIBUTES. These values must match the corresponding values in the SECS. If the EINITTOKEN was created with a debug launch key, the enclave must be in debug mode as well.

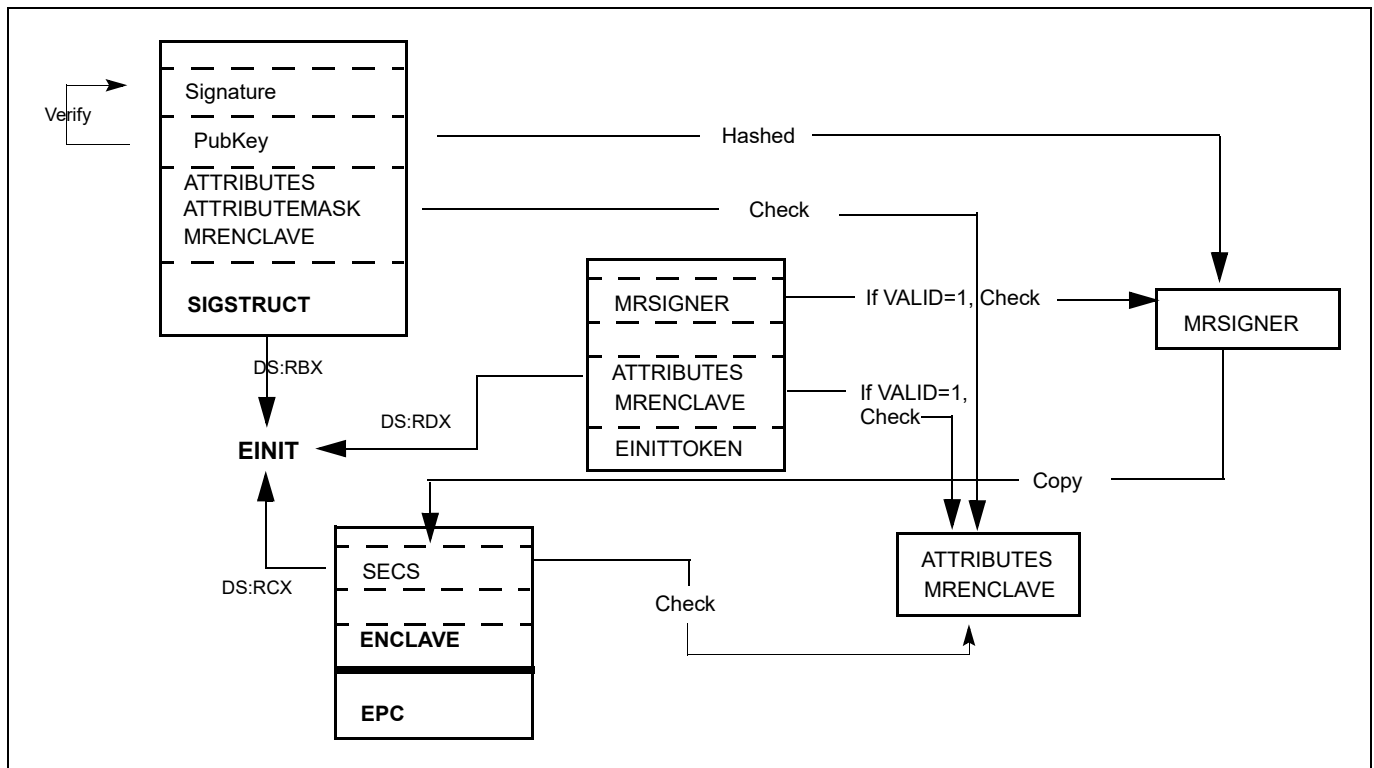

Figure 40-1. Relationships Between SECS, SIGSTRUCT and EINITTOKEN

**EINIT Memory Parameter Semantics**

SIGSTRUCT	SECS	EINITOKEN
Access by non-Enclave	Read/Write access by Enclave	Access by non-Enclave

EINIT performs the following steps, which can be seen in Figure 40-1:

Validates that SIGSTRUCT is signed using the enclosed public key.

Checks that the completed computation of SECS.MRENCLAVE equals SIGSTRUCT.HASHENCLAVE.

Checks that no reserved bits are set to 1 in SIGSTRUCT.ATTRIBUTES and no reserved bits in SIGSTRUCT.ATTRIBUTESMASK are set to 0.

Checks that no controlled ATTRIBUTES bits are set in SIGSTRUCT.ATTRIBUTES unless the SHA256 digest of SIGSTRUCT.MODULUS equals IA32\_SGX\_LEPUBKEYHASH.

Checks that SIGSTRUCT.ATTRIBUTES equals the result of logically and-ing SIGSTRUCT.ATTRIBUTESMASK with SECS.ATTRIBUTES.

If EINITOKEN.VALID is 0, checks that the SHA256 digest of SIGSTRUCT.MODULUS equals IA32\_SGX\_LEPUBKEYHASH.

If EINITOKEN.VALID is 1, checks the validity of EINITOKEN.

If EINITOKEN.VALID is 1, checks that EINITOKEN.MRENCLAVE equals SECS.MRENCLAVE.

If EINITOKEN.VALID is 1 and EINITOKEN.ATTRIBUTES.DEBUG is 1, SECS.ATTRIBUTES.DEBUG must be 1.

Commits SECS.MRENCLAVE, and sets SECS.MRSIGNER, SECS.ISVSVN, and SECS.ISVPRODID based on SIGSTRUCT.

Update the SECS as Initialized.

Periodically, EINIT polls for certain asynchronous events. If such an event is detected, it completes with failure code (ZF=1 and RAX = SGX\_UNMASKED\_EVENT), and RIP is incremented to point to the next instruction. These events includes external interrupts, non-maskable interrupts, system-management interrupts, machine checks, INIT signals, and the VMX-preemption timer. EINIT does not fail if the pending event is inhibited (e.g., external interrupts could be inhibited due to blocking by MOV SS blocking or by STI).

The following bits in RFLAGS are cleared: CF, PF, AF, OF, and SF. When the instruction completes with an error, RFLAGS.ZF is set to 1, and the corresponding error bit is set in RAX. If no error occurs, RFLAGS.ZF is cleared and RAX is set to 0.

The error codes are:

**Table 40-25. EINIT Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	EINIT successful.
SGX_INVALID_SIG_STRUCT	If SIGSTRUCT contained an invalid value.
SGX_INVALID_ATTRIBUTE	If SIGSTRUCT contains an unauthorized attributes mask.
SGX_INVALID_MEASUREMENT	If SIGSTRUCT contains an incorrect measurement. If EINITOKEN contains an incorrect measurement.
SGX_INVALID_SIGNATURE	If signature does not validate with enclosed public key.
SGX_INVALID_LICENSE	If license is invalid.
SGX_INVALID_CPUSVN	If license SVN is unsupported.
SGX_UNMASKED_EVENT	If an unmasked event is received before the instruction completes its operation.

## Concurrency Restrictions

Table 40-26. Base Concurrency Restrictions of EINIT

Leaf	Parameter	Base Concurrency Restrictions		
		Access	On Conflict	SGX_CONFLICT VM Exit Qualification
EINIT	SECS [DS:RCX]	Shared	#GP	

Table 40-27. Additional Concurrency Restrictions of ENIT

Leaf	Parameter	Additional Concurrency Restrictions					
		vs. EACCEPT, EACCEPTCOPY, EMODPE, EMODPR, EMODT		vs. EADD, EEXTEND, EINIT		vs. ETRACK, ETRACKC	
		Access	On Conflict	Access	On Conflict	Access	On Conflict
EINIT	SECS [DS:RCX]	Concurrent		Exclusive	#GP	Concurrent	

## Operation

## Temp Variables in EINIT Operational Flow

Name	Type	Size	Description
TMP_SIG	SIGSTRUCT	1808Bytes	Temp space for SIGSTRUCT.
TMP_TOKEN	EINITTOKEN	304Bytes	Temp space for EINITTOKEN.
TMP_MRENCLAVE		32Bytes	Temp space for calculating MRENCLAVE.
TMP_MRSIGNER		32Bytes	Temp space for calculating MRSIGNER.
CONTROLLED_ATTRIBUTES	ATTRIBUTES	16Bytes	Constant mask of all ATTRIBUTE bits that can only be set for authorized enclaves.
TMP_KEYDEPENDENCIES	Buffer	224Bytes	Temp space for key derivation.
TMP_EINITTOKENKEY		16Bytes	Temp space for the derived EINITTOKEN Key.
TMP_SIG_PADDING	PKCS Padding Buffer	352Bytes	The value of the top 352 bytes from the computation of Signature <sup>3</sup> modulo MRSIGNER.

### ELDB/ELDU/ELDBC/ELBUC—Load an EPC Page and Mark its State

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 07H ENCLS[ELDB]	IR	V/V	SGX1	This leaf function loads, verifies an EPC page and marks the page as blocked.
EAX = 08H ENCLS[ELDU]	IR	V/V	SGX1	This leaf function loads, verifies an EPC page and marks the page as unblocked.
EAX = 12H ENCLS[ELDBC]	IR	V/V	EAX[5]	This leaf function behaves like ELDB but with improved conflict handling for oversubscription.
EAX = 13H ENCLS[ELBUC]	IR	V/V	EAX[5]	This leaf function behaves like ELDU but with improved conflict handling for oversubscription.

#### Instruction Operand Encoding

Op/En	EAX		RBX	RCX	RDX
IR	ELDB/ELDU (In)	Return error code (Out)	Address of the PAGEINFO (In)	Address of the EPC page (In)	Address of the version- array slot (In)

#### Description

This leaf function copies a page from regular main memory to the EPC. As part of the copying process, the page is cryptographically authenticated and decrypted. This instruction can only be executed when current privilege level is 0.

The ELDB leaf function sets the BLOCK bit in the EPCM entry for the destination page in the EPC after copying. The ELDU leaf function clears the BLOCK bit in the EPCM entry for the destination page in the EPC after copying.

RBX contains the effective address of a PAGEINFO structure; RCX contains the effective address of the destination EPC page; RDX holds the effective address of the version array slot that holds the version of the page.

The ELDBC/ELBUC leafs are very similar to ELDB and ELDU. They provide an error code on the concurrency conflict for any of the pages which need to acquire a lock. These include the destination, SECS, and VA slot.

The table below provides additional information on the memory parameter of ELDB/ELDU leaf functions.

#### ELDB/ELDU/ELDBC/ELBUC Memory Parameter Semantics

PAGEINFO	PAGEINFO.SRCPGE	PAGEINFO.PCMD	PAGEINFO.SECS	EPCPAGE	Version-Array Slot
Non-enclave read access	Non-enclave read access	Non-enclave read access	Enclave read/write access	Read/Write access permitted by Enclave	Read/Write access permitted by Enclave

The error codes are:

**Table 40-28. ELDB/ELDU/ELDBC/ELBUC Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	ELDB/ELDU successful.
SGX_MAC_COMPARE_FAIL	If the MAC check fails.

## Concurrency Restrictions

Table 40-29. Base Concurrency Restrictions of ELDB/ELDU/ELDBC/ELBUC

Leaf	Parameter	Base Concurrency Restrictions

## EMODPR—Restrict the Permissions of an EPC Page

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 0EH ENCLS[EMODPR]	IR	V/V	SGX2	This leaf function restricts the access rights associated with a EPC page in an initialized enclave.

### Instruction Operand Encoding

Op/En	EAX		RBX	RCX
IR	EMODPR (In)	Return Error Code (Out)	Address of a SECINFO (In)	Address of the destination EPC page (In)

### Description

This leaf function restricts the access rights associated with an EPC page in an initialized enclave. THE RWX bits of the SECINFO parameter are treated as a permissions mask; supplying a value that does not restrict the page permissions will have no effect. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EMODPR leaf function.

### EMODPR Memory Parameter Semantics

SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read/Write access permitted by Enclave

The instruction faults if any of the following:

### EMODPR Faulting Conditions

The operands are not properly aligned.	If unsupported security attributes are set.
The Enclave is not initialized.	SECS is locked by another thread.
The EPC page is locked by another thread.	RCX does not contain an effective address of an EPC page in the running enclave.
The EPC page is not valid.	

The error codes are:

**Table 40-31. EMODPR Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	EMODPR successful.
SGX_PAGE_NOT_MODIFIABLE	The EPC page cannot be modified because it is in the PENDING or MODIFIED state.
SGX_EPC_PAGE_CONFLICT	Page is being written by EADD, EAUG, ECREATE, ELDU/B, EMODT, or EWB.

### Concurrency Restrictions

#PF(error code)	If a page fault occurs in accessing memory operands. If a memory operand is not an EPC page.

## EMODT—Change the Type of an EPC Page

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 0FH ENCLS[EMODT]	IR	V/V	SGX2	This leaf function changes the type of an existing EPC page.

### Instruction Operand Encoding

Op/En	EAX		RBX	RCX
IR	EMODT (In)	Return Error Code (Out)	Address of a SECINFO (In)	Address of the destination EPC page (In)

### Description

This leaf function modifies the type of an EPC page. The security attributes are configured to prevent access to the EPC page at its new type until a corresponding invocation of the EACCEPT leaf confirms the modification. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EMODT leaf function.

### EMODT Memory Parameter Semantics

SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read/Write access permitted by Enclave

The instruction faults if any of the following:

### EMODT Faulting Conditions

The operands are not properly aligned.	If unsupported security attributes are set.
The Enclave is not initialized.	SECS is locked by another thread.
The EPC page is locked by another thread.	RCX does not contain an effective address of an EPC page in the running enclave.
The EPC page is not valid.	

The error codes are:

**Table 40-34. EMODT Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	EMODT successful.
SGX_PAGE_NOT_MODIFIABLE	The EPC page cannot be modified because it is in the PENDING or MODIFIED state.
SGX_EPC_PAGE_CONFLICT	Page is being written by EADD, EAUG, ECREATE, ELDU/B, EMODPR, or EWB.

### Concurrency Restrictions

## ERDINFO—Read Type and Status Information About an EPC Page

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 10H ENCLS[ERDINFO]	IR	V/V	EAX[6]	This leaf function returns type and status information about an EPC page.

### Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	ERDINFO (In)	Address of a RDINFO structure (In)	Address of the destination EPC page (In)

### Description

This instruction reads type and status information about an EPC page and returns it in a RDINFO structure. The STATUS field of the structure describes the status of the page and determines the validity of the remaining fields. The FLAGS field returns the EPCM permissions of the page; the page type; and the BLOCKED, PENDING, MODIFIED, and PR status of the page. For enclave pages, the ENCLAVECONTEXT field of the structure returns the value of SECS.ENCLAVECONTEXT. For non-enclave pages (e.g., VA) ENCLAVECONTEXT returns 0.

For invalid or non-EPC pages, the instruction returns an information code indicating the page's status, in addition to populating the STATUS field.

ERDINFO returns an error code if the destination EPC page is being modified by a concurrent SGX instruction.

RBX contains the effective address of a RDINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of ERDINFO leaf function.

### ERDINFO Memory Parameter Semantics

RDINFO	EPCPAGE
Read/Write access permitted by Non Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

### ERDINFO Faulting Conditions

A memory operand effective address is outside the DS segment limit (32b mode).	A memory operand is not properly aligned.
DS segment is unusable (32b mode).	A page fault occurs in accessing memory operands.
A memory address is in a non-canonical form (64b mode).	

The error codes are:

**Table 40-39. ERDINFO Return Value in RAX**

Error Code	Value	Description
No Error	0	ERDINFO successful.
SGX_EPC_PAGE_CONFLICT		Failure due to concurrent operation of another SGX instruction.
SGX_PG_INVLD		Target page is not a valid EPC page.
SGX_PG_NONEPC		Page is not an EPC page.

## EREMOVE—Remove a page from the EPC

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 03H ENCLS[EREMOVE]	IR	V/V	SGX1	This leaf function removes a page from the EPC.

### Instruction Operand Encoding

Op/En	EAX	RCX
IR	EREMOVE (In)	Effective address of the EPC page (In)

### Description

This leaf function causes an EPC page to be un-associated with its SECS and be marked as unused. This instruction leaf can only be executed when the current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create linear address. Segment override is not supported.

The instruction fails if the operand is not properly aligned or does not refer to an EPC page or the page is in use by another thread, or other threads are running in the enclave to which the page belongs. In addition the instruction fails if the operand refers to an SECS with associations.

### EREMOVE Memory Parameter Semantics

EPCPAGE
Write access permitted by Enclave

The instruction faults if any of the following:

### EREMOVE Faulting Conditions

The memory operand is not properly aligned.	The memory operand does not resolve in an EPC page.
Refers to an invalid SECS.	Refers to an EPC page that is locked by another thread.
Another Intel SGX instruction is accessing the EPC page.	RCX does not contain an effective address of an EPC page.
the EPC page refers to an SECS with associations.	

The error codes are:

**Table 40-42. EREMOVE Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	EREMOVE successful.
SGX_CHILD_PRESENT	If the SECS still have enclave pages loaded into EPC.
SGX_ENCLAVE_ACT	If there are still logical processors executing inside the enclave.

## Concurrency Restrictions

If a memory operand is not an EPC page.

**64-Bit Mode Exceptions**

- #GP(0) If a memory operand is non-canonical form.  
If a memory operand is not properly aligned.  
If the specified EPC resource is in use.
- #PF(error code) If a page fault occurs in accessing memory operands.  
If a memory operand is not an EPC page.

## ETRACKC—Activates EBLOCK Checks

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 11H ENCLS[ETRACKC]	IR	V/V	EAX[6]	This leaf function activates EBLOCK checks.

### Instruction Operand Encoding

Op/En	EAX		RCX	
IR	ETRACK (In)	Return error code (Out)	Address of the destination EPC page (In, EA)	Address of the SECS page (In, EA)

### Description

The ETRACKC instruction is thread safe variant of ETRACK leaf and can be executed concurrently with other CPU threads operating on the same SECS.

This leaf function provides the mechanism for hardware to track that software has completed the required TLB address clears successfully. The instruction can only be executed when the current privilege level is 0.

The content of RCX is an effective address of an EPC page.

The table below provides additional information on the memory parameter of ETRACK leaf function.

### ETRACKC Memory Parameter Semantics

EPCPAGE
Read/Write access permitted by Enclave

The error codes are:

**Table 40-48. ETRACKC Return Value in RAX**

Error Code	Value	Description
No Error	0	ETRACKC successful.
SGX_EPC_PAGE_CONFLICT	7	Failure due to concurrent operation of another SGX instruction.
SGX_PG_INVLD	6	Target page is not a VALID EPC page.
SGX_PREV_TRK_INCMPL	17	All processors did not complete the previous tracking sequence.
SGX_TRACK_NOT_REQUIRED	27	Target page type does not require tracking.

### Concurrency Restrictions

                          If DS segment is unusable.
- #PF(error code)    If the memory operand is not properly aligned.  
                          If the memory operand expected to be in EPC does not resolve to an EPC page.  
                          If a page fault occurs in access memory operand.

**64-Bit Mode Exceptions**

- #GP(0)                If a memory address is in a non-canonical form.  
                          If a memory operand is not properly aligned.
- #PF(error code)    If the memory operand expected to be in EPC does not resolve to an EPC page.  
                          If a page fault occurs in access memory operand.

## EWB—Invalidate an EPC Page and Write out to Main Memory

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 0BH ENCLS[EWB]	IR	V/V	SGX1	This leaf function invalidates an EPC page and writes it out to main memory.

### Instruction Operand Encoding

Op/En	EAX		RBX	RCX	RDX
IR	EWB (In)	Error code (Out)	Address of an PAGEINFO (In)	Address of the EPC page (In)	Address of a VA slot (In)

### Description

This leaf function copies a page from the EPC to regular main memory. As part of the copying process, the page is cryptographically protected. This instruction can only be executed when current privilege level is 0.

The table below provides additional information on the memory parameter of EPA leaf function.

### EWB Memory Parameter Semantics

PAGEINFO	PAGEINFO.SRCPGE	PAGEINFO.PCMD	EPCPAGE	VASLOT
Non-EPC R/W access	Non-EPC R/W access	Non-EPC R/W access	EPC R/W access	EPC R/W access

The error codes are:

**Table 40-51. EWB Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	EWB successful.
SGX_PAGE_NOT_BLOCKED	If page is not marked as blocked.
SGX_NOT_TRACKED	If EWB is racing with ETRACK instruction.
SGX_VA_SLOT_OCCUPIED	Version array slot contained valid entry.
SGX_CHILD_PRESENT	Child page present while attempting to page out enclave.

## 40.4 INTEL® SGX USER LEAF FUNCTION REFERENCE

Leaf functions available with the ENCLU instruction mnemonic are covered in this section. In general, each instruction leaf requires EAX to specify the leaf function index and/or additional registers specifying leaf-specific input parameters. An instruction operand encoding table provides details of the implicitly-encoded register usage and associated input/output semantics.

In many cases, an input parameter specifies an effective address associated with a memory object inside or outside the EPC, the memory addressing semantics of these memory objects are also summarized in a separate table.

## EACCEPT—Accept Changes to an EPC Page

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 05H ENCLU[EACCEPT]	IR	V/V	SGX2	This leaf function accepts changes made by system software to an EPC page in the running enclave.

### Instruction Operand Encoding

Op/En	EAX		RBX	RCX
IR	EACCEPT (In)	Return Error Code (Out)	Address of a SECINFO (In)	Address of the destination EPC page (In)

### Description

This leaf function accepts changes to a page in the running enclave by verifying that the security attributes specified in the SECINFO match the security attributes of the page in the EPCM. This instruction leaf can only be executed when inside the enclave.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EACCEPT leaf function.

### EACCEPT Memory Parameter Semantics

SECINFO	EPCPAGE (Destination)
Read access permitted by Non Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

### EACCEPT Faulting Conditions

The operands are not properly aligned.	RBX does not contain an effective address in an EPC page in the running enclave.
The EPC page is locked by another thread.	RCX does not contain an effective address of an EPC page in the running enclave.
The EPC page is not valid.	Page type is PT_REG and MODIFIED bit is 0.
SECINFO contains an invalid request.	Page type is PT_TCS or PT_TRIM and PENDING bit is 0 and MODIFIED bit is 1.
If security attributes of the SECINFO page make the page inaccessible.	

The error codes are:

**Table 40-54. EACCEPT Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	EACCEPT successful.
SGX_PAGE_ATTRIBUTES_MISMATCH	The attributes of the target EPC page do not match the expected values.
SGX_NOT_TRACKED	The OS did not complete an ETRACK on the target page.

Concurrency Restrictions

### Flags Affected

Sets ZF if page cannot be accepted, otherwise cleared. Clears CF, PF, AF, OF, SF

### Protected Mode Exceptions

#GP(0)	If a memory operand effective address is outside the DS segment limit. If a memory operand is not properly aligned. If a memory operand is locked.
#PF(error code)	If a page fault occurs in accessing memory operands. If a memory operand is not an EPC page. If EPC page has incorrect page type or security attributes.

### 64-Bit Mode Exceptions

#GP(0)	If a memory operand is non-canonical form. If a memory operand is not properly aligned. If a memory operand is locked.
#PF(error code)	If a page fault occurs in accessing memory operands. If a memory operand is not an EPC page. If EPC page has incorrect page type or security attributes.

## EACCEPTCOPY—Initialize a Pending Page

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 07H ENCLU[EACCEPTCOPY]	IR	V/V	SGX2	This leaf function initializes a dynamically allocated EPC page from another page in the EPC.

### Instruction Operand Encoding

Op/En	EAX		RBX	RCX	RDX
IR	EACCEPTCOPY (In)	Return Error Code (Out)	Address of a SECINFO (In)	Address of the destination EPC page (In)	Address of the source EPC page (In)

### Description

This leaf function copies the contents of an existing EPC page into an uninitialized EPC page (created by EAUG). After initialization, the instruction may also modify the access rights associated with the destination EPC page. This instruction leaf can only be executed when inside the enclave.

RBX contains the effective address of a SECINFO structure while RCX and RDX each contain the effective address of an EPC page. The table below provides additional information on the memory parameter of the EACCEPTCOPY leaf function.

### EACCEPTCOPY Memory Parameter Semantics

SECINFO	EPCPAGE (Destination)	EPCPAGE (Source)
Read access permitted by Non Enclave	Read/Write access permitted by Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

### EACCEPTCOPY Faulting Conditions

The operands are not properly aligned.	If security attributes of the SECINFO page make the page inaccessible.
The EPC page is locked by another thread.	If security attributes of the source EPC page make the page inaccessible.
The EPC page is not valid.	RBX does not contain an effective address in an EPC page in the running enclave.
SECINFO contains an invalid request.	RCX/RDX does not contain an effective address of an EPC page in the running enclave.

The error codes are:

**Table 40-57. EACCEPTCOPY Return Value in RAX**

Error Code (see Table 40-4)	Description
No Error	EACCEPTCOPY successful.
SGX_PAGE_ATTRIBUTES_MISMATCH	The attributes of the target EPC page do not match the expected values.

## EENTER—Enters an Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 02H ENCLU[EENTER]	IR	V/V	SGX1	This leaf function is used to enter an enclave.

### Instruction Operand Encoding

Op/En	EAX		RBX	RCX	
IR	EENTER (In)	Content of RBX.CSSA (Out)	Address of a TCS (In)	Address of AEP (In)	Address of IP following EENTER (Out)

### Description

The ENCLU[EENTER] instruction transfers execution to an enclave. At the end of the instruction, the logical processor is executing in enclave mode at the RIP computed as EnclaveBase + TCS.OENTRY. If the target address is not within the CS segment (32-bit) or is not canonical (64-bit), a #GP(0) results.

### EENTER Memory Parameter Semantics

TCS
Enclave access

EENTER is a serializing instruction. The instruction faults if any of the following occurs:

Address in RBX is not properly aligned.	Any TCS.FLAGS's must-be-zero bit is not zero.
TCS pointed to by RBX is not valid or available or locked.	Current 32/64 mode does not match the enclave mode in SECS.ATTRIBUTES.MODE64.
The SECS is in use.	Either of TCS-specified FS and GS segment is not a subsets of the current DS segment.
Any one of DS, ES, CS, SS is not zero.	If XSAVE available, CR4.OSXSAVE = 0, but SECS.ATTRIBUTES.XFRM ≠ 3.
CR4.OSFXSR ≠ 1.	If CR4.OSXSAVE = 1, SECS.ATTRIBUTES.XFRM is not a subset of XCR0.

The following operations are performed by EENTER:

- RSP and RBP are saved in the current SSA frame on EENTER and are automatically restored on EEXIT or interrupt.
- The AEP contained in RCX is stored into the TCS for use by AEXs. FS and GS (including hidden portions) are saved and new values are constructed using TCS.OFSBASE/GSBASE (32 and 64-bit mode) and TCS.OFSLIMIT/GSLIMIT (32-bit mode only). The resulting segments must be a subset of the DS segment.
- If CR4.OSXSAVE == 1, XCR0 is saved and replaced by SECS.ATTRIBUTES.XFRM. The effect of RFLAGS.TF depends on whether the enclave entry is opt-in or opt-out (see Section 42.1.2):
  - On opt-out entry, TF is saved and cleared (it is restored on EEXIT or AEX). Any attempt to set TF via a POPF instruction while inside the enclave clears TF (see Section 42.2.5).
  - On opt-in entry, a single-step debug exception is pending on the instruction boundary immediately after EENTER (see Section 42.2.2).
- All code breakpoints that do not overlap with ELRANGE are also suppressed. If the entry is an opt-out entry, all code and data breakpoints that overlap with the ELRANGE are suppressed.
- On opt-out entry, a number of performance monitoring counters and behaviors are modified or suppressed (see Section 42.2.3):

- All performance monitoring activity on the current thread is suppressed except for incrementing and firing of FIXED\_CTR1 and FIXED\_CTR2.
- PEBS is suppressed.
- AnyThread counting on other threads is demoted to MyThread mode and IA32\_PERF\_GLOBAL\_STATUS[60] on that thread is set
- If the opt-out entry on a hardware thread results in suppression of any performance monitoring, then the processor sets IA32\_PERF\_GLOBAL\_STATUS[60] and IA32\_PERF\_GLOBAL\_STATUS[63].

- #GP(0)
  - If DS:RBX is not page aligned.
  - If the enclave is not initialized.
  - If the thread is not in the INACTIVE state.
  - If CS, DS, ES or SS bases are not all zero.
  - If executed in enclave mode.
  - If part or all of the FS or GS segment specified by TCS is outside the DS segment or not properly aligned.
  - If the target address is not canonical.
  - If CR4.OSFXSR = 0.
  - If CR4.OSXSAVE = 0 and SECS.ATTRIBUTES.XFRM ≠ 3.
  - If CR4.OSXSAVE = 1 and SECS.ATTRIBUTES.XFRM is not a subset of XCR0.
- #PF(error code)
  - If a page fault occurs in accessing memory operands.
  - If DS:RBX does not point to a valid TCS.
  - If one or more pages of the current SSA frame are not readable/writable, or do not resolve to a valid PT\_REG EPC page.

## EEXIT—Exits an Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 04H ENCLU[EEXIT]	IR	V/V	SGX1	This leaf function is used to exit an enclave.

### Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EEXIT (In)	Target address outside the enclave (In)	Address of the current AEP (In)

### Description

The ENCLU[EEXIT] instruction exits the currently executing enclave and branches to the location specified in RBX. RCX receives the current AEP. If RBX is not within the CS (32-bit mode) or is not canonical (64-bit mode) a #GP(0) results.

### EEXIT Memory Parameter Semantics

Target Address
Non-Enclave read and execute access

If RBX specifies an address that is inside the enclave, the instruction will complete normally. The fetch of the next instruction will occur in non-enclave mode, but will attempt to fetch from inside the enclave. This fetch returns a fixed data pattern.

If secrets are contained in any registers, it is responsibility of enclave software to clear those registers.

If XCR0 was modified on enclave entry, it is restored to the value it had at the time of the most recent EENTER or ERESUME.

If the enclave is opt-out, RFLAGS.TF is loaded from the value previously saved on EENTER.

Code and data breakpoints are unsuppressed.

Performance monitoring counters are unsuppressed.

## EGETKEY—Retrieves a Cryptographic Key

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 01H ENCLU[EGETKEY]	IR	V/V	SGX1	This leaf function retrieves a cryptographic key.

### Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EGETKEY (In)	Address to a KEYREQUEST (In)	Address of the OUTPUTDATA (In)

### Description

The ENCLU[EGETKEY] instruction returns a 128-bit secret key from the processor specific key hierarchy. The register RBX contains the effective address of a KEYREQUEST structure, which the instruction interprets to determine the key being requested. The Requesting Keys section below provides a description of the keys that can be requested. The RCX register contains the effective address where the key will be returned. Both the addresses in RBX & RCX should be locations inside the enclave.

EGETKEY derives keys using a processor unique value to create a specific key based on a number of possible inputs. This instruction leaf can only be executed inside an enclave.

### EGETKEY Memory Parameter Semantics

KEYREQUEST	OUTPUTDATA
Enclave read access	Enclave write access

After validating the operands, the instruction determines which key is to be produced and performs the following actions:

- The instruction assembles the derivation data for the key based on the Table 40-64.
- Computes derived key using the derivation data and package specific value.
- Outputs the calculated key to the address in RCX.

The instruction fails with #GP(0) if the operands are not properly aligned. Successful completion of the instruction will clear RFLAGS.{ZF, CF, AF, OF, SF, PF}. The instruction returns an error code if the user tries to request a key based on an invalid CPUSVN or ISVSVN (when the user request is accepted, see the table below), requests a key for which it has not been granted the attribute to request, or requests a key that is not supported by the hardware. These checks may be performed in any order. Thus, an indication by error number of one cause (for example, invalid attribute) does not imply that there are not also other errors. Different processors may thus give different error numbers for the same Enclave. The correctness of software should not rely on the order resulting from the checks documented in this section. In such cases the ZF flag is set and the corresponding error bit (SGX\_INVALID\_SVN, SGX\_INVALID\_ATTRIBUTE, SGX\_INVALID\_KEYNAME) is set in RAX and the data at the address specified by RCX is unmodified.

### Requesting Keys

The KEYREQUEST structure (see Section 37.17.1) identifies the key to be provided. The Keyrequest.KeyName field identifies which type of key is requested.

### Deriving Keys

Key derivation is based on a combination of the enclave specific values (see Table 40-64) and a processor key. Depending on the key being requested a field may either be included by definition or the value may be included from the KeyRequest. A “yes” in Table 40-64 indicates the value for the field is included from its default location, identified in the source row, and a “request” indicates the values for the field is included from its corresponding KeyRequest field.

**Table 40-64. Key Derivation**

	Key Name	Attributes	Owner Epoch	CPU SVN	ISV SVN	ISV PROPID	ISVEXT PROPID	ISVFAM ILYID	MRENCLAVE	MRSIGNER	CONFIG ID	CONFIGS VN	RAND
Source	Key Dependent Constant	Y← SECS.ATTRIBUTES and SECS.MISCSELECT;	CR_SGX OWNER EPOCH	Y← CPUSVN Register;	R← Req.ISV SVN;	SECS. ISVID	SECS.IS VEXTPROPID	SECS.IS VFAMIL YID	SECS. MRENCLAVE	SECS. MRSIGNER	SECS.CO NFIGID	SECS.CO NFIGSVN	Req. KEYID
		R←AttribMask & SECS.ATTRIBUTES and SECS.MISCSELECT;		R← Req.CPU SVN;									
EINITTOKEN	Yes	Request	Yes	Request	Request	Yes	No	No	No	Yes	No	No	Request
Report	Yes	Yes	Yes	Yes	No	No	No	No	Yes	No	Yes	Yes	Request
Seal	Yes	Request	Yes	Request	Request	Request	Request	Request	Request	Request	Request	Request	Request
Provisioning	Yes	Request	No	Request	Request	Yes	No	No	No	Yes	No	No	Yes
Provisioning Seal	Yes	Request	No	Request	Request	Request	Request	Request	No	Yes	Request	Request	Yes

Keys that permit the specification of a CPU or ISV's code's, or enclave configuration's SVNs have additional requirements. The caller may not request a key for an SVN beyond the current CPU, ISV or enclave configuration's SVN, respectively.

Several keys are access controlled. Access to the Provisioning Key and Provisioning Seal key requires the enclave's ATTRIBUTES.PROVISIONKEY be set. The EINITTOKEN Key requires ATTRIBUTES.EINITTOKEN\_KEY be set and SECS.MRSIGNER equal IA32\_SGXLEPUBKEYHASH.

Some keys are derived based on a hardcoded PKCS padding constant (352 byte string):

HARDCODED\_PKCS1\_5\_PADDING[15:0] ← 0100H;

HARDCODED\_PKCS1\_5\_PADDING[2655:16] ← SignExtend330Byte(-1); // 330 bytes of 0FFH

HARDCODED\_PKCS1\_5\_PADDING[2815:2656] ← 2004000501020403650148866009060D30313000H;

The error codes are:

**Table 40-65. EGETKEY Return Value in RAX**

Error Code (see Table 40-4)	Value	Description
No Error	0	EGETKEY successful.
SGX_INVALID_ATTRIBUTE		The KEYREQUEST contains a KEYNAME for which the enclave is not authorized.
SGX_INVALID_CPUSVN		If KEYREQUEST.CPUSVN is an unsupported platforms CPUSVN value.
SGX_INVALID_ISVSVN		If KEYREQUEST software SVN (ISVSVN or CONFIGSVN) is greater than the enclave's corresponding SVN.
SGX_INVALID_KEYNAME		If KEYREQUEST.KEYNAME is an unsupported value.

### Flags Affected

ZF is cleared if successful, otherwise ZF is set. CF, PF, AF, OF, SF are cleared.

### Protected Mode Exceptions

#GP(0)	If a memory operand effective address is outside the current enclave. If an effective address is not properly aligned. If an effective address is outside the DS segment limit. If KEYREQUEST format is invalid.
#PF(error code)	If a page fault occurs in accessing memory.

### 64-Bit Mode Exceptions

#GP(0)	If a memory operand effective address is outside the current enclave. If an effective address is not properly aligned. If an effective address is not canonical. If KEYREQUEST format is invalid.
#PF(error code)	If a page fault occurs in accessing memory operands.

## EMODPE—Extend an EPC Page Permissions

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 06H ENCLU[EMODPE]	IR	V/V	SGX2	This leaf function extends the access rights of an existing EPC page.

### Instruction Operand Encoding

Op/En	EAX	RBX	RCX
IR	EMODPE (In)	Address of a SECINFO (In)	Address of the destination EPC page (In)

### Description

This leaf function extends the access rights associated with an existing EPC page in the running enclave. THE RWX bits of the SECINFO parameter are treated as a permissions mask; supplying a value that does not extend the page permissions will have no effect. This instruction leaf can only be executed when inside the enclave.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EMODPE leaf function.

### EMODPE Memory Parameter Semantics

SECINFO	EPCPAGE
Read access permitted by Non Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

### EMODPE Faulting Conditions

The operands are not properly aligned.	If security attributes of the SECINFO page make the page inaccessible.
The EPC page is locked by another thread.	RBX does not contain an effective address in an EPC page in the running enclave.
The EPC page is not valid.	RCX does not contain an effective address of an EPC page in the running enclave.
SECINFO contains an invalid request.	

### Concurrency Restrictions

## EREPORT—Create a Cryptographic Report of the Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 00H ENCLU[EREPORT]	IR	V/V	SGX1	This leaf function creates a cryptographic report of the enclave.

### Instruction Operand Encoding

Op/En	EAX	RBX	RCX	RDX
IR	EREPORT (In)	Address of TARGETINFO (In)	Address of REPORTDATA (In)	Address where the REPORT is written to in an OUTPUTDATA (In)

### Description

This leaf function creates a cryptographic REPORT that describes the contents of the enclave. This instruction leaf can only be executed when inside the enclave. The cryptographic report can be used by other enclaves to determine that the enclave is running on the same platform.

RBX contains the effective address of the MRENCLAVE value of the enclave that will authenticate the REPORT output, using the REPORT key delivered by EGETKEY command for that enclave. RCX contains the effective address of a 64-byte REPORTDATA structure, which allows the caller of the instruction to associate data with the enclave from which the instruction is called. RDX contains the address where the REPORT will be output by the instruction.

### EREPORT Memory Parameter Semantics

TARGETINFO	REPORTDATA	OUTPUTDATA
Read access by Enclave	Read access by Enclave	Read/Write access by Enclave

This instruction leaf perform the following:

1. Validate the 3 operands (RBX, RCX, RDX) are inside the enclave.
2. Compute a report key for the target enclave, as indicated by the value located in RBX(TARGETINFO).
3. Assemble the enclave SECS data to complete the REPORT structure (including the data provided using the RCX (REPORTDATA) operand).
4. Computes a cryptographic hash over REPORT structure.
5. Add the computed hash to the REPORT structure.
6. Output the completed REPORT structure to the address in RDX (OUTPUTDATA).

The instruction fails if the operands are not properly aligned.

CR\_REPORT\_KEYID, used to provide key wearout protection, is populated with a statistically unique value on boot of the platform by a trusted entity within the SGX TCB.

The instruction faults if any of the following:

### EREPORT Faulting Conditions

An effective address not properly aligned.	An memory address does not resolve in an EPC page.
If accessing an invalid EPC page.	If the EPC page is blocked.
May page fault.	

## Concurrency Restrictions

Table 40-70. Base Concurrency Restrictions of EREPORT

### Protected Mode Exceptions

#GP(0)	If the address in RCS is outside the DS segment limit. If a memory operand is not properly aligned. If a memory operand is not in the current enclave.
#PF(error code)	If a page fault occurs in accessing memory operands.

### 64-Bit Mode Exceptions

#GP(0)	If RCX is non-canonical form. If a memory operand is not properly aligned. If a memory operand is not in the current enclave.
#PF(error code)	If a page fault occurs in accessing memory operands.

## ERESUME—Re-Enters an Enclave

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 03H ENCLU[ERESUME]	IR	V/V	SGX1	This leaf function is used to re-enter an enclave after an interrupt.

### Instruction Operand Encoding

Op/En	RAX	RBX	RCX
IR	ERESUME (In)	Address of a TCS (In)	Address of AEP (In)

### Description

The ENCLU[ERESUME] instruction resumes execution of an enclave that was interrupted due to an exception or interrupt, using the machine state previously stored in the SSA.

### ERESUME Memory Parameter Semantics

TCS
Enclave read/write access

The instruction faults if any of the following:

Address in RBX is not properly aligned.	Any TCS.FLAGS's must-be-zero bit is not zero.
TCS pointed to by RBX is not valid or available or locked.	Current 32/64 mode does not match the enclave mode in SECS.ATTRIBUTES.MODE64.
The SECS is in use by another enclave.	Either of TCS-specified FS and GS segment is not a subset of the current DS segment.
Any one of DS, ES, CS, SS is not zero.	If XSAVE available, CR4.OSXSAVE = 0, but SECS.ATTRIBUTES.XFRM ≠ 3.
CR4.OSFXSR ≠ 1.	If CR4.OSXSAVE = 1, SECS.ATTRIBUTES.XFRM is not a subset of XCR0.
Offsets 520-535 of the XSAVE area not 0.	The bit vector stored at offset 512 of the XSAVE area must be a subset of SECS.ATTRIBUTES.XFRM.
The SSA frame is not valid or in use.	

The following operations are performed by ERESUME:

- RSP and RBP are saved in the current SSA frame on EENTER and are automatically restored on EEXIT or an asynchronous exit due to any Interrupt event.
- The AEP contained in RCX is stored into the TCS for use by AEXs. FS and GS (including hidden portions) are saved and new values are constructed using TCS.OFSBASE/GSBASE (32 and 64-bit mode) and TCS.OFSLIMIT/GSLIMIT (32-bit mode only). The resulting segments must be a subset of the DS segment.
- If CR4.OSXSAVE == 1, XCR0 is saved and replaced by SECS.ATTRIBUTES.XFRM. The effect of RFLAGS.TF depends on whether the enclave entry is opt-in or opt-out (see Section 42.1.2):
  - On opt-out entry, TF is saved and cleared (it is restored on EEXIT or AEX). Any attempt to set TF via a POPF instruction while inside the enclave clears TF (see Section 42.2.5).
  - On opt-in entry, a single-step debug exception is pended on the instruction boundary immediately after EENTER (see Section 42.2.3).
- All code breakpoints that do not overlap with ELRANGE are also suppressed. If the entry is an opt-out entry, all code and data breakpoints that overlap with the ELRANGE are suppressed.

- On opt-out entry, a number of performance monitoring counters and behaviors are modified or suppressed (see Section 42.2.3):
  - All performance monitoring activity on the current thread is suppressed except for incrementing and firing of FIXED\_CTR1 and FIXED\_CTR2.
  - PEBS is suppressed.
  - AnyThread counting on other threads is demoted to MyThread mode and IA32\_PERF\_GLOBAL\_STATUS[60] on that thread is set.
  - If the opt-out entry on a hardware thread results in suppression of any performance monitoring, then the processor sets IA32\_PERF\_GLOBAL\_STATUS[60] and IA32\_PERF\_GLOBAL\_STATUS[63].

## Concurrency Restrictions

**Table 40-72. Base Concurrency Restrictions of ERESUME**

## 40.5 INTEL® SGX VIRTUALIZATION LEAF FUNCTION REFERENCE

Leaf functions available with the ENCLV instruction mnemonic are covered in this section. In general, each instruction leaf requires EAX to specify the leaf function index and/or additional implicit registers specifying leaf-specific input parameters. An instruction operand encoding table provides details of each implicit register usage and associated input/output semantics.

In many cases, an input parameter specifies an effective address associated with a memory object inside or outside the EPC, the memory addressing semantics of these memory objects are also summarized in a separate table.

**EDECVIRTCHILD—Decrement VIRTCHILDCNT in SECS**

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 00H ENCLV[EDECVIRTCHILD]	IR	V/V	EAX[5]	This leaf function decrements the SECS VIRTCHILDCNT field.

**Instruction Operand Encoding**

Op/En	EAX	RBX	RCX
IR	EDECVIRTCHILD (In)	Address of an enclave page (In)	Address of an SECS page (In)

**Description**

This instruction decrements the SECS VIRTCHILDCNT field. This instruction can only be executed when current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create linear address. Segment override is not supported.

**EDECVIRTCHILD Memory Parameter Semantics**

EPCPAGE	SECS
Read/Write access permitted by Non Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

**EDECVIRTCHILD Faulting Conditions**

A memory operand effective address is outside the DS segment limit (32b mode).	A page fault occurs in accessing memory operands.
DS segment is unusable (32b mode).	RBX does not refer to an enclave page (REG, TCS, TRIM, SECS).
A memory address is in a non-canonical form (64b mode).	RCX does not refer to an SECS page.
A memory operand is not properly aligned.	RBX does not refer to an enclave page associated with SECS referenced in RCX.

**Concurrency Restrictions****Table 40-74. Base Concurrency Restrictions of EDECVIRTCHILD**

Leaf	Parameter	Base Concurrency Restrictions		
		Access	On Conflict	SGX_CONFLICT VM Exit Qualification
EDECVIRTCHILD	Target [DS:RBX]	Shared	SGX_EPC_PAGE_CONFLICT	
	SECS [DS:RCX]	Concurrent		

**Table 40-75. Additional Concurrency Restrictions of EDECVIRTUALCHILD**

Leaf	Parameter	Additional Concurrency Restrictions					
		vs. EACCEPT, EACCEPTCOPY, EMODPE, EMODPR, EMODT		vs. EADD, EEXTEND, EINIT		vs. ETRACK, ETRACKC	
		Access	On Conflict	Access	On Conflict	Access	On Conflict
EDECVIRTUALCHILD	Target [DS:RBX]	Concurrent		Concurrent		Concurrent	
	SECS [DS:RCX]	Concurrent		Concurrent		Concurrent	

**Operation**

**Temp Variables in EDECVIRTUALCHILD Operational Flow**

Name	Type	Size (bits)	Description
TMP_SECS	Physical Address	64	Physical address of the SECS of the page being modified.
TMP_VIRTUALCHILDCNT	Integer	64	Number of virtual child pages.

**EDECVIRTUALCHILD Return Value in RAX**

Error	Value	Description
No Error	0	EDECVIRTUALCHILD Successful.
SGX_EPC_PAGE_CONFLICT		Failure due to concurrent operation of another SGX instruction.
SGX_INVALID_COUNTER		Attempt to decrement counter that is already zero.

### Flags Affected

ZF is set if EDECVIRTCHILD fails due to concurrent operation with another SGX instruction, or if there is a VIRTCHILDCNT underflow. Otherwise cleared.

### Protected Mode Exceptions

#GP(0)	If a memory operand effective address is outside the DS segment limit. If DS segment is unusable. If a memory operand is not properly aligned. RBX does not refer to an enclave page associated with SECS referenced in RCX.
#PF(error code)	If a page fault occurs in accessing memory operands. If RBX does not refer to an enclave page (REG, TCS, TRIM, SECS). If RCX does not refer to an SECS page.

**64-Bit Mode Exceptions**

- #GP(0)            If a memory address is in a non-canonical form.  
                  If a memory operand is not properly aligned.  
                  RBX does not refer to an enclave page associated with SECS referenced in RCX.
- #PF(error code)    If a page fault occurs in accessing memory operands.  
                  If RBX does not refer to an enclave page (REG, TCS, TRIM, SECS).  
                  If RCX does not refer to an SECS page.

**EINCVIRTCHILD—Increment VIRTCHILDCNT in SECS**

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 01H ENCLV[EINCVIRTCHILD]	IR	V/V	EAX[5]	This leaf function increments the SECS VIRTCHILDCNT field.

**Instruction Operand Encoding**

Op/En	EAX	RBX	RCX
IR	EINCVIRTCHILD (In)	Address of an enclave page (In)	Address of an SECS page (In)

**Description**

This instruction increments the SECS VIRTCHILDCNT field. This instruction can only be executed when the current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create a linear address. Segment override is not supported.

**EINCVIRTCHILD Memory Parameter Semantics**

EPCPAGE	SECS
Read/Write access permitted by Non Enclave	Read access permitted by Enclave

The instruction faults if any of the following:

**EINCVIRTCHILD Faulting Conditions**

A memory operand effective address is outside the DS segment limit (32b mode).	A page fault occurs in accessing memory operands.
DS segment is unusable (32b mode).	RBX does not refer to an enclave page (REG, TCS, TRIM, SECS).
A memory address is in a non-canonical form (64b mode).	RCX does not refer to an SECS page.
A memory operand is not properly aligned.	RBX does not refer to an enclave page associated with SECS referenced in RCX.

                  If RCX does not refer to an SECS page.

## ESETCONTEXT—Set the ENCLAVECONTEXT Field in SECS

Opcode/ Instruction	Op/En	64/32 bit Mode Support	CPUID Feature Flag	Description
EAX = 02H ENCLV[ESETCONTEXT]	IR	V/V	EAX[5]	This leaf function sets the ENCLAVECONTEXT field in SECS.

### Instruction Operand Encoding

Op/En	EAX	RCX	RDX
IR	ESETCONTEXT (In)	Address of the destination EPC page (In, EA)	Context Value (In, EA)

### Description

The ESETCONTEXT leaf overwrites the ENCLAVECONTEXT field in the SECS. ECREATE and ELD of an SECS set the ENCLAVECONTEXT field in the SECS to the address of the SECS (for access later in ERDINFO). The ESETCONTEXT instruction allows a VMM to overwrite the default context value if necessary, for example, if the VMM is emulating ECREATE or ELD on behalf of the guest.

The content of RCX is an effective address of the SECS page to be updated, RDX contains the address pointing to the value to be stored in the SECS. The DS segment is used to create linear address. Segment override is not supported.

The instruction fails if:

- The operand is not properly aligned.
- RCX does not refer to an SECS page.

### ESETCONTEXT Memory Parameter Semantics

EPCPAGE	CONTEXT
Read access permitted by Enclave	Read/Write access permitted by Non Enclave

The instruction faults if any of the following:

### ESETCONTEXT Faulting Conditions

A memory operand effective address is outside the DS segment limit (32b mode).	A memory operand is not properly aligned.
DS segment is unusable (32b mode).	A page fault occurs in accessing memory operands.
A memory address is in a non-canonical form (64b mode).

#PF(error code)	If a page fault occurs in accessing memory operands.

# CHAPTER 41

## INTEL® SGX INTERACTIONS WITH IA32 AND INTEL® 64 ARCHITECTURE

---

Intel® SGX provides Intel® Architecture with a collection of enclave instructions for creating protected execution environments on processors supporting IA32 and Intel® 64 architectures. These Intel SGX instructions are designed to work with legacy software and the various IA32 and Intel 64 modes of operation.

### 41.1 INTEL® SGX AVAILABILITY IN VARIOUS PROCESSOR MODES

The Intel SGX extensions (see Table 36-1) are available only when the processor is executing in protected mode of operation. Additionally, the extensions are not available in System Management Mode (SMM) of operation or in Virtual 8086 (VM86) mode of operation. Finally, all leaf functions of ENCLU and ENCLS require CR0.PG enabled.

The exact details of exceptions resulting from illegal modes and their priority are listed in the reference pages of ENCLS and ENCLU.

### 41.2 IA32\_FEATURE\_CONTROL

IA32\_FEATURE\_CONTROL MSR provides two new bits related to two aspects of Intel SGX: using the instruction extensions and launch control configuration.

#### 41.2.1 Availability of Intel SGX

IA32\_FEATURE\_CONTROL[bit 18] allows BIOS to control the availability of Intel SGX extensions. For Intel SGX extensions to be available on a logical processor, bit 18 in the IA32\_FEATURE\_CONTROL MSR on that logical processor must be set, and IA32\_FEATURE\_CONTROL MSR on that logical processor must be locked (bit 0 must be set). See Section 36.7.1 for additional details. OS is expected to examine the value of bit 18 prior to enabling Intel SGX on the thread, as the settings of bit 18 is not reflected by CPUID.

#### 41.2.2 Intel SGX Launch Control Configuration

The IA32\_SGXLEPUBKEYHASHn MSRs used to configure authorized launch enclaves' MRSIGNER digest value. They are present on logical processors that support the collection of SGX1 leaf functions (i.e. CPUID.(EAX=12H, ECX=00H):EAX[0] = 1) and that CPUID.(EAX=07H, ECX=00H):ECX[30] = 1. IA32\_FEATURE\_CONTROL[bit 17] allows to BIOS to enable write access to these MSRs. If IA32\_FEATURE\_CONTROL.LE\_WR (bit 17) is set to 1 and IA32\_FEATURE\_CONTROL is locked on that logical processor, IA32\_SGXLEPUBKEYHASH MSRs on that logical processor are writeable. If this bit 17 is not set or IA32\_FEATURE\_CONTROL is not locked, IA32\_SGXLEPUBKEYHASH MSRs are read only. See Section 38.1.4 for additional details.

### 41.3 INTERACTIONS WITH SEGMENTATION

#### 41.3.1 Scope of Interaction

Intel SGX extensions are available only when the processor is executing in a protected mode operation (see Section 41.1 for Intel SGX availability in various processor modes). Enclaves abide by all the segmentation policies set up by the OS, but they can be more restrictive than the OS.

Intel SGX interacts with segmentation at two levels:

- The Intel SGX instruction (see the enclave instruction in Table 36-1).

- While executing inside an enclave (legacy instructions and enclave instructions permitted inside an enclave).

### 41.3.2 Interactions of Intel® SGX Instructions with Segment, Operand, and Addressing Prefixes

All the memory operands used by the Intel SGX instructions are interpreted as offsets within the data segment (DS). The segment-override prefix on Intel SGX instructions is ignored.

Operand size is fixed for each enclave instruction. The operand-size prefix is reserved, and results in a #UD exception if used.

All address sizes are determined by the operating mode of the processor. The address-size prefix is ignored. This implies that while operating in 64-bit mode of operation, the address size is always 64 bits, and while operating in 32-bit mode of operation, the address size is always 32 bits. Additionally, when operating in 16-bit addressing, memory operands used by enclave instructions use 32 bit addressing; the value of CS.D is ignored.

### 41.3.3 Interaction of Intel® SGX Instructions with Segmentation

All leaf functions of ENCLU and ENCLS instructions require that the DS segment be usable, and be an expand-up segment. Failing this check results in generation of a #GP(0) exception.

The Intel SGX leaf functions used for entering the enclave (ENCLU[EENTER] and ENCLU[ERESUME]) operate as follows:

- All usable segment registers except for FS and GS have a zero base.
- The contents of the FS/GS segment registers (including the hidden portion) is saved in the processor.
- New FS and GS values compatible with enclave security are loaded from the TCS
- The linear ranges and access rights available under the newly-loaded FS and GS must abide to OS policies by ensuring they are subsets of the linear-address range and access rights available for the DS segment.
- The CS segment mode (64-bit, compatible, or 32 bit modes) must be consistent with the segment mode for which the enclave was created, as indicated by the SECS.ATTRIBUTES.MODE64 bit, and that the CPL of the logical processor is 3

An exit from the enclave either via ENCLU[EEXIT] or via an AEX restores the saved values of FS/GS segment registers.

### 41.3.4 Interactions of Enclave Execution with Segmentation

During the course of execution, enclave code abides by all segmentation policies as dictated by IA32 and Intel 64 Architectures, and generates appropriate exceptions on violations.

Additionally, any attempt by software executing inside an enclave to modify the processor's segmentation state (e.g. via MOV seg register, POP seg register, LDS, far jump, etc; excluding WRFSBASE/WRGSBASE) results in the generation of a #UD. See Section 38.6.1 for more information.

Upon enclave entry via the EENTER leaf function, FS is loaded from the (TCS.OFSBASE + SECS.BASEADDR) and TCS.FSLIMIT fields and GS is loaded from the (TCS.OGSBASE + SECS.BASEADDR) and TCS.GSLIMIT fields.

Execution of WRFSBASE and WRGSBASE from inside a 64-bit enclave is allowed. The processor will save the new values into the current SSA frame on an asynchronous exit (AEX) and restore them back on enclave entry via ENCLU[ERESUME] instruction.

## 41.4 INTERACTIONS WITH PAGING

Intel SGX instructions are available only when the processor is executing in a protected mode of operation. Additionally, all Intel SGX leaf functions except for EDBGD and EDBGW are available only if paging is enabled. Any attempt to execute these leaf functions with paging disabled results in an invalid-opcode exception (#UD). As with

segmentation, enclaves abide by all the paging policies set up by the OS, but they can be more restrictive than the OS.

All the memory operands passed into Intel SGX instructions are interpreted as offsets within the DS segment, and the linear addresses generated by combining these offsets with DS segment register are subject to paging-based access control if paging is enabled at the time of the execution of the leaf function.

Since the ENCLU[EENTER] and ENCLU[ERESUME] can only be executed when paging is enabled, and since paging cannot be disabled by software running inside an enclave (recall that enclaves always run with CPL = 3), enclave execution is always subject to paging-based access control. The Intel SGX access control itself is implemented as an extension to the existing paging modes. See Section 37.5 for details.

Execution of Intel SGX instructions may set accessed and dirty flags on accesses to EPC pages that do not fault even if the instruction later causes a fault for some other reason.

## 41.5 INTERACTIONS WITH VMX

Intel SGX functionality (including SGX1 and SGX2) can be made available to software running in either VMX root operation or VMX non-root operation, as long as the processor is using a legal mode of operation (see Section 41.1).

A VMM has the flexibility to configure a VMCS to permit a guest to use any subset of the ENCLS leaf functions. Availability of the ENCLU leaf functions in VMX non-root operation has the same requirement as ENCLU leaf functions outside of a virtualized environment.

Details of the VMCS control to allow VMM to configure support of Intel SGX in VMX non-root operation is described in Section 41.5.1

### 41.5.1 VMM Controls to Configure Guest Support of Intel® SGX

Intel SGX capabilities are primarily exposed to the software via the CPUID instruction. VMMs can virtualize CPUID instruction to expose/hide this capability to/from guests.

Some of Intel SGX resources are exposed/controlled via model-specific registers (see Section 36.7). VMMs can virtualize these MSRs for the guests using the MSR bitmaps referenced by pointers in the VMCS.

The VMM can partition the Enclave Page Cache, and assign various partitions to (a subset of) its guests via the usual memory-virtualization techniques such as paging or the extended page table mechanism (EPT).

The VMM can set the “enable ENCLS exiting” VM-execution controls to cause a VM exit when the ENCLS instruction is executed in VMX non-root operation. If the “enable ENCLS exiting” control is 0, all of the ENCLS leaf functions are permitted in VMX non-root operation. If the “enable ENCLS exiting” control is 1, execution of ENCLS leaf functions in VMX non-root operation is governed by consulting the bits in a new 64-bit VM-execution control field called the ENCLS-exiting bitmap (Each bit in the bitmap corresponds to an ENCLS leaf function with an EAX value that is identical to the bit’s position). When bits in the “ENCLS-exiting bitmap” are set, attempts to execute the corresponding ENCLS leaf functions in VMX non-root operation causes VM exits. The checking for these VM exits occurs immediately after checking that CPL = 0.

### 41.5.2 Interactions with the Extended Page Table Mechanism (EPT)

Intel SGX instructions are fully compatible with the extended page-table mechanism (EPT; see Section 28.2).

All the memory operands passed into Intel SGX instructions are interpreted as offsets within the DS segment, and the linear addresses generated by combining these offsets with DS segment register are subject to paging and EPT. As with paging, enclaves abide by all the policies set up by the VMM.

The Intel SGX access control itself is implemented as an extension to paging and EPT, and may be more restrictive. See Section 41.4 for details of this extension.

An execution of an Intel SGX instruction may set accessed and dirty flags for EPT (when enabled; see Section 28.2.4) on accesses to EPC pages that do not fault or cause VM exits even if the instruction later causes a fault or VM exit for some other reason.

### 41.5.3 Interactions with APIC Virtualization

This section applies to Intel SGX in VMX non-root operation when the “virtualize APIC accesses” VM-execution control is 1.

A memory access by an enclave instruction that implicitly uses a cached physical address is never checked for overlap with the APIC-access page. Such accesses never cause APIC-access VM exits and are never redirected to the virtual-APIC page. Implicit memory accesses can only be made to the SECS, the TCS, or the SSA of an enclave (see Section 37.5.3.2).

An explicit Enclave Access (a linear memory access which is either from within an enclave into its ELRANGE, or an access by an Intel SGX instruction that is expected to be in the EPC) that overlaps with the APIC-access page causes a #PF exception (APIC page is expected to be outside of EPC).

Non-Enclave accesses made either by an Intel SGX instruction or by a logical processor inside an enclave to an address that without SGX would have caused redirection to the virtual-APIC page instead cause an APIC-access VM exit.

Other than implicit accesses made by Intel SGX instructions, guest-physical and physical accesses are not considered “enclave accesses”; consequently, such accesses result in undefined behavior if these accesses eventually reach EPC. This applies to any non-enclave physical accesses.

While a logical processor is executing inside an enclave, an attempt to execute an instruction outside of ELRANGE results in a #GP(0), even if the linear address would translate to a physical address that overlaps the APIC-access page.

### 41.5.4 Interactions with VT and SGX concurrency

In some cases, a VMM is required to handle conflicts between its own operation and a guest operation on EPC pages that are present in both guest and VMM address space. These conflict would otherwise cause the guest to experience an unexpected behavior (vs. running directly on the h/w). These conflict cases are:

- ETRACK/ETRAKCK failure due to Entry Epoch Object Lock conflict or reference tracking check failure.
- EPC Page Resource conflict.

A new exit reason is defined for all those cases: SGX\_CONFLICT (value 71). The VMCS exit qualification field details the specific case as follows:

**Table 41-1. SGX Conflict Exit Qualification**

Bits	Size (bits)	Name	Description
15:0	16	Code	Exit qualification code. The following values are defined: 0: TRACKING_RESOURCE_CONFLICT 1: TRACKING_REFERENCE_CONFLICT 2: EPC_PAGE_CONFLICT_EXCEPTION 3: EPC_PAGE_CONFLICT_ERROR Other: Reserved
31:16	16	Error	Error code. Applicable only if the exit qualification code is EPC_PAGE_CONFLICT_ERROR; contains the error code that would be returned in RAX if the instruction was executed on bare metal platform or if the ENABLE_EPC_VIRTUALIZATION_EXTENSIONS bit in the secondary processor control field is not set. In other cases this field is reserved as 0.
63:32	32	Reserved	Always 0.

This SGX\_CONFLICT exiting behavior is controlled by a VM execution control called ENABLE\_EPC\_VIRTUALIZATION\_EXTENSIONS (bit 29 of the secondary processor control field).

Details for various SGX\_CONFLICT VMEXIT cases are provided in the following sections.

### 41.5.5 Virtual Child Tracking

SGX oversubscription support adds the ability to associate virtual children with each enclave using the ENCLV[EINCVIRTCHILD] and ENCLV[EDECVIRTCHILD] instructions. The VMM enables checking of the virtual child count by EREMOVE and EWB in guests with a new VM execution control called ENABLE\_EPC\_VIRTUALIZATION\_EXTENSIONS.

When in VMX non-root operation and the ENABLE\_EPC\_VIRTUALIZATION\_EXTENSIONS control enabled, the following instructions change their behavior:

- EWB and EREMOVE return the SGX\_CHILD\_PRESENT error code if any virtual or physical children are associated with the enclave.
- ERDINFO set STATUS.CHILDPRESENT if any virtual or physical children are associated with the enclave.

### 41.5.6 Handling EPCM Entry Lock Conflicts

When performing paging within a VMM, it is possible for a contention on the EPC page to happen in the following case:

- The VMM performs an ELDB/ELDU/ELDBC/ELDUC of an enclave page, and the guest attempts to perform some SGX instruction (e.g., EREMOVE) where the same SECS parent page is required.

A similar conflict may occur if the VMM uses EINCVIRTCHILD or EDECVIRTCHILD pointing to an SECS page. In all other cases where a SGX instruction executed by the VMM the applicable EPC page should not be mapped to the guest, thus no resource conflict occurs.

This conflicting situation can cause the guest's instruction to fail and cause guest instability. To help the VMM manage such conflicts, the SGX VMM paging extensions introduce a new VM-Exit that will be triggered whenever the guest encounters a resource conflict.

The exit reason is SGX\_CONFLICT. The exit qualification field is used to distinguish the two kinds of resource conflicts:

- A value of EPCM\_RESOURCE\_CONFLICT\_EXCEPTION (2) in the exit qualification code field indicates that a resource conflict occurred that would result in a #GP. In that case, the exit qualification error field is set to zero.
- A value of EPC\_PAGE\_CONFLICT\_ERROR (3) in the exit qualification code field indicates that a resource conflict occurred that would result in an error code being return in RAX. In that case, the exit qualification error field is set to SGX\_EPC\_PAGE\_CONFLICT.

The Guest Linear Address and Guest Physical Address fields are set to the guest linear and guest physical addresses respectively of the EPC page on which the conflict occurred. The VMM may determine which instruction induced the exit by reading RAX. The exit also populates the VM-exit instruction length field.

The VMM can determine whether the conflict may be due to its own operation, e.g., by setting a per-enclave busy indicator before executing ELD\*, and clearing it afterwards. In that case, the VMM can handle an SGX Conflict (EPCM\_PAGE\_CONFLICT\_\*) exit by resuming guest execution at the same instruction, allowing the guest to re-execute the instruction. The VMM may also take steps to throttle its own paging thread to reduce contention with the guest.

If the VMM determines that the conflict is not due to its own operation, it may inject a #GP (in case of EPC\_PAGE\_CONFLICT\_EXCEPTION), or emulate an error code as the guest instruction would return (in case of EPC\_PAGE\_CONFLICT\_ERROR) by setting ZF and copying the error value provided in the exit qualification to guest RAX.

To gracefully handle resource contention on the VMM side, the VMM should use the new ELDBC and ELDUC instructions. These are similar to ELDB and ELDU respectively, except that on EPC resource contention they return an SGX\_EPC\_PAGE\_CONFLICT error instead of issuing a #GP. In case of an error, the VMM can retry the instruction, possibly throttling the guest to assure progress.

When using EDECVIRTCHILD and EINCVIRTCHILD, the VMM should preferably point to the enclave child page, not to the SECS page, avoiding resource conflict on the SECS. If the VMM chooses to point to the SECS page, it should handle conflicts in the same way as handling the ELD\* case.

## 41.5.7 Context Tracking

The ENCLAVECONTEXT field in the SECS is available for use by the VMM to track context information associated with that enclave, such as the GPA of the SECS in the context of the appropriate guest. This field is initialized by the successful execution of ECREATE and ELD of an SECS page. The value stored in the ENCLAVECONTEXT field will be the translation of the target page address produced by paging (GPA in VMMs that have EPTs turned on). VMMs may override this default value by calling the ENCLV[ESETCONTEXT] instruction, which allows the VMM to store an arbitrary 64-bit value in the ENCLAVECONTEXT field. The VMM may later access the ENCLAVECONTEXT field by calling ENCLS[ERDINFO] on any member page of the enclave, including the SECS.

For nested virtualization cases, the lowest level VMM can make SGX oversubscription instructions higher level guest VMMs. In that case the lower level VMM can simply inject #GP to higher level VMMs when attempting to execute these instructions.

However, if VMMs expose SGX oversubscription instructions to higher level VMMs, then VMMs have to use ENCLV[ESETCONTEXT] instruction to properly manage the ENCLAVECONTEXT field of SECS during paging operations. That may involve emulating ECREATE, ELD, ESETCONTEXT and ERDINFO instructions apart from managing ENCLAVECONTEXT values.

## 41.6 INTEL® SGX INTERACTIONS WITH ARCHITECTURALLY-VISIBLE EVENTS

All architecturally visible vectored events (IA32 exceptions, interrupts, SMI, NMI, INIT, VM exit) can be detected while inside an enclave and will cause an asynchronous enclave exit if they are not blocked. Additionally, INT3, and the SignalTXTMsg[SENDER] (i.e. GETSEC[SENDER]'s rendezvous event message) events also cause asynchronous enclave exits. Note that SignalTXTMsg[SEXIT] (i.e. GETSEC[SEXIT]'s teardown message) does not cause an AEX.

On an AEX, information about the event causing the AEX is stored in the SSA (see Section 39.4 for details of AEX). The information stored in the SSA only describes the first event that triggered the AEX. If parsing/delivery of the first event results in detection of further events (e.g. VM exit, double fault, etc.), then the event information in the SSA is not updated to reflect these subsequently detected events.

## 41.7 INTERACTIONS WITH THE PROCESSOR EXTENDED STATE AND MISCELLANEOUS STATE

### 41.7.1 Requirements and Architecture Overview

Processor extended states are the ISA features that are enabled by the settings of CR4.OSXSAVE and the XCR0 register. Processor extended states are normally saved/restored by software via XSAVE/XRSTOR instructions. Details of discovery of processor extended states and management of these states are described in CHAPTER 13 of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*.

Additionally, the following requirements apply to Intel SGX:

- On an AEX, the Intel SGX architecture must protect the processor extended state and miscellaneous state by saving them in the enclave's state-save area (SSA), and clear the secrets from the processor extended state that is used by an enclave.
- Intel SGX architecture must verify that the SSA frame size is large enough to contain all the processor extended states and miscellaneous state used by the enclave.
- Intel SGX architecture must ensure that enclaves can only use processor extended state that is enabled by system software in XCR0.
- Enclave software should be able to discover only those processor extended state and miscellaneous state for which such protection is enabled.
- The processor extended states that are enabled inside the enclave must be approved by the enclave developer:
  - Certain processor extended state (e.g., Memory Protection Extensions, see Chapter 17, "Intel® MPX" of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1*) modify the behavior of the

legacy ISA software. If such features are enabled for enclaves that do not understand those features, then such a configuration could lead to a compromise of the enclave's security.

- The processor extended states that are enabled inside the enclave must form an integral part of the enclave's identity. This requirement has two implications:
  - Service providers may decide to assign different trust level to the same enclave depending on the ISA features the enclave is using.

To meet these requirements, the Intel SGX architecture defines a sub-field called X-Feature Request Mask (XFRM) in the ATTRIBUTES field of the SECS. On enclave creation (ENCLS[ECREATE] leaf function), the required SSA frame size is calculated by the processor from the list of enabled extended and miscellaneous states and verified against the actual SSA frame size defined by SECS.SSAFRAMESIZE.

On enclave entry, after verifying that XFRM is only enabling features that are already enabled in XCR0, the value in the XCR0 is saved internally by the processor, and is replaced by the XFRM. On enclave exit, the original value of XCR0 is restored. Consequently, while inside the enclave, the processor extended states enabled in XFRM are in enabled state, and those that are disabled in XFRM are in disabled state.

The entire ATTRIBUTES field, including the XFRM subfield is integral part of enclave's identity (i.e., its value is included in reports generated by ENCLU[EREPORT], and select bits from this field can be included in key-derivation for keys obtained via the ENCLU[EGETKEY] leaf function).

Enclave developers can create their enclave to work with certain features and fallback to another code path in case those features aren't available (e.g. optimize for AVX and fallback to SSE). For this purpose Intel SGX provides the following fields in SIGSTRUCT: ATTRIBUTES, ATTRIBUTESMASK, MISCSELECT, and MISCMASK. EINIT ensures that the final SECS.ATTRIBUTES and SECS.MISCSELECT comply with the enclave developer's requirements as follows:

SIGSTRUCT.ATTRIBUTES & SIGSTRUCT.ATTRIBUTESMASK = SECS.ATTRIBUTES & SIGSTRUCT.ATTRIBUTESMASK

SIGSTRUCT.MISCSELECT & SIGSTRUCT.MISCMASK = SECS.MISCSELECT & SIGSTRUCT.MISCMASK.

On an asynchronous enclave exit, the processor extended states enabled by XFRM are saved in the current SSA frame, and overwritten by synthetic state (see Section 39.3 for the definition of the synthetic state). When the interrupted enclave is resumed via the ENCLU[ERESUME] leaf function, the saved state for processor extended states enabled by XFRM is restored.

## 41.7.2 Relevant Fields in Various Data Structures

### 41.7.2.1 SECS.ATTRIBUTES.XFRM

The ATTRIBUTES field of the SECS data structure (see Section 37.7) contains a sub-field called XSAVE-Feature Request Mask (XFRM). Software populates this field at the time of enclave creation according to the features that are enabled by the operating system and approved by the enclave developer.

Intel SGX architecture guarantees that during enclave execution, the processor extended state configuration of the processor is identical to what is required by the XFRM sub-field. All the processor extended states enabled in XFRM are saved on AEX from the enclave and restored on ERESUME.

The XFRM sub-field has the same layout as XCR0, and has consistency requirements that are similar to those for XCR0. Specifically, the consistency requirements on XFRM values depend on the processor implementation and the set of features enabled in CR4.

Legal values for SECS.ATTRIBUTES.XFRM conform to these requirements:

- XFRM[1:0] must be set to 0x3.
- If the processor does not support XSAVE, or if the system software has not enabled XSAVE, then XFRM[63:2] must be zero.
- If the processor does support XSAVE, XFRM must contain a value that would be legal if loaded into XCR0.

The various consistency requirements are enforced at different times in the enclave's life cycle, and the exact enforcement mechanisms are elaborated in Section 41.7.3 through Section 41.7.6.

On processors not supporting XSAVE, software should initialize XFRM to 0x3. On processors supporting XSAVE, software should initialize XFRM to be a subset of XCR0 that would be present at the time of enclave execution.

Because bits 0 and 1 of XFRM must always be set, the use of Intel SGX requires that SSE be enabled (CR4.OSFXSR = 1).

### 41.7.2.2 SECS.SSAFRAMESIZE

The SSAFRAMESIZE field in the SECS data structure specifies the number of pages which software allocated<sup>1</sup> for each SSA frame, including both the GPRSGX area, MISC area, the XSAVE area (x87 and XMM states are stored in the latter area), and optionally padding between the MISC and XSAVE area. The GPRSGX area must hold all the general-purpose registers and additional Intel SGX specific information. The MISC area must hold the Miscellaneous state as specified by SECS.MISCSELECT, the XSAVE area holds the set of processor extended states specified by SECS.ATTRIBUTES.XFRM (see Section 37.9 for the layout of SSA and Section 41.7.3 for ECREATE's consistency checks). The SSA is always in non-compacted format.

If the processor does not support XSAVE, the XSAVE area will always be 576 bytes; a copy of XFRM (which will be set to 0x3) is saved at offset 512 on an AEX.

If the processor does support XSAVE, the length of the XSAVE area depends on SECS.ATTRIBUTES.XFRM. The length would be equal to what CPUID.(EAX=0DH, ECX= 0):EBX would return if XCR0 were set to XFRM. The following pseudo code illustrates how software can calculate this length using XFRM as the input parameter without modifying XCR0:

```
offset = 576;
size_last_x = 0;
For x=2 to 63
  IF (XFRM[x] != 0) Then
    tmp_offset = CPUID.(EAX=0DH, ECX= x):EBX[31:0];
    IF (tmp_offset >= offset + size_last_x) Then
      offset = tmp_offset;
      size_last_x = CPUID.(EAX=0DH, ECX= x):EAX[31:0];
    FI;
  FI;
EndFor
return (offset + size_last_x); (* compute_xsave_size(XFRM), see "ECREATE—Create an SECS page in the Enclave Page Cache"*)
```

Where the non-zero bits in XFRM are a subset of non-zero bit fields in XCR0.

The size of the MISC region depends on the setting of SECS.MISCSELECT and can be calculated using the layout information described in Section 37.9.2

### 41.7.2.3 XSAVE Area in SSA

The XSAVE area of an SSA frame begins at offset 0 of the frame.

### 41.7.2.4 MISC Area in SSA

The MISC area of an SSA frame is positioned immediately before the GPRSGX region.

### 41.7.2.5 SIGSTRUCT Fields

Intel SGX provides the flexibility for an enclave developer to choose the enclave's code path according to the features that are enabled on the platform (e.g. optimize for AVX and fallback to SSE). See Section 41.7.1 for details.

---

1. It is the responsibility of the enclave to actually allocate this memory.

SIGSTRUCT includes the following fields:

SIGSTRUCT.ATTRIBUTES, SIGSTRUCT.ATTRIBUTEMASK, SIGSTRUCT.MISCSELECT, SIGSTRUCT.MISCMASK.

#### 41.7.2.6 REPORT.ATTRIBUTES.XFRM and REPORT.MISCSELECT

The processor extended states and miscellaneous states that are enabled inside the enclave form an integral part of the enclave's identity and are therefore included in the enclave's report, as provided by the ENCLU[EREPORT] leaf function. The REPORT structure includes the enclave's XFRM and MISCSELECT configurations.

#### 41.7.2.7 KEYREQUEST

An enclave developer can specify which bits out of XFRM and MISCSELECT ENCLU[EGETKEY] should include in the derivation of the sealing key by specifying ATTRIBUTEMASK and MISCMASK in the KEYREQUEST structure.

### 41.7.3 Processor Extended States and ENCLS[ECREATE]

The ECREATE leaf function of the ENCLS instruction enforces a number of consistency checks described earlier. The execution of ENCLS[ECREATE] leaf function results in a #GP(0) in any of the following cases:

- SECS.ATTRIBUTES.XFRM[1:0] is not 3.
- The processor does not support XSAVE and any of the following is true:
  - SECS.ATTRIBUTES.XFRM[63:2] is not 0.
  - SECS.SSAFRAMESIZE is 0.
- The processor supports XSAVE and any of the following is true:
  - XSETBV would fault on an attempt to load XFRM into XCR0.
  - XFRM[63]=1.
  - The SSAFRAME is too small to hold required, enabled states (see Section 41.7.2.2).

### 41.7.4 Processor Extended States and ENCLU[EENTER]

#### 41.7.4.1 Fault Checking

The EENTER leaf function of the ENCLU instruction enforces a number of consistency requirements described earlier. The execution of the ENCLU[EENTER] leaf function results in a #GP(0) in any of the following cases:

- If CR4.OSFXSR=0.
- If The processor supports XSAVE and either of the following is true:
  - CR4.OSXSAVE=0 and SECS.ATTRIBUTES.XFRM is not 3.
  - (SECS.ATTRIBUTES.XFRM & XCR0) != SECS.ATTRIBUTES.XFRM

#### 41.7.4.2 State Loading

If ENCLU[EENTER] is successful, the current value of XCR0 is saved internally by the processor and replaced by SECS.ATTRIBUTES.XFRM.

## 41.7.5 Processor Extended States and AEX

### 41.7.5.1 State Saving

On an AEX, processor extended states are saved into the XSAVE area of the SSA frame in a compatible format with XSAVE that was executed with  $EDX:EAX = SECS.ATTRIBUTES.XFRM$ , with the memory operand being the XSAVE area, and (for 64-bit enclaves) as if  $REX.W=1$ . The  $XSTATE\_BV$  part of the XSAVE header is saved with 0 for every bit that is 0 in XFRM. Other bits may be saved as 0 if the state saved is initialized.

Note that enclave entry ensures that if  $CR4.OSXSAVE$  is set to 0, then  $SECS.ATTRIBUTES.XFRM$  is set to 3. It should also be noted that it is not possible to enter an enclave with FXSAVE disabled.

### 41.7.5.2 State Synthesis

After saving the extended state, the processor restores XCR0 to the value it held at the time of the most recent enclave entry.

The state of features corresponding to bits set in XFRM is synthesized. In general, these states are initialized. Details of state synthesis on AEX are documented in Section 39.3.1.

## 41.7.6 Processor Extended States and ENCLU[ERESUME]

### 41.7.6.1 Fault Checking

The ERESUME leaf function of the ENCLU instruction enforces a number of consistency requirements described earlier. Specifically, the ENCLU[ERESUME] leaf function results in a #GP(0) in any of the following cases:

- $CR4.OSFXSR=0$ .
- The processor supports XSAVE and either of the following is true:
  - $CR4.OSXSAVE=0$  and  $SECS.ATTRIBUTES.XFRM$  is not 3.
  - $(SECS.ATTRIBUTES.XFRM \& XCR0) \neq SECS.ATTRIBUTES.XFRM$ .

A successful execution of ENCLU[ERESUME] loads state from the XSAVE area of the SSA frame in a fashion similar to that used by the XRSTOR instruction. Data in the XSAVE area that would cause the XRSTOR instruction to fault will cause the ENCLU[ERESUME] leaf function to fault. Examples include, but are not restricted to the following:

- A bit is set in the  $XSTATE\_BV$  field and clear in XFRM.
- The required bytes in the header are not clear.
- Loading data would set a reserved bit in MXCSR.

Any of these conditions will cause ERESUME to fault, even if  $CR4.OSXSAVE=0$ .

### 41.7.6.2 State Loading

If ENCLU[ERESUME] is successful, the current value of XCR0 is saved internally by the processor and replaced by  $SECS.ATTRIBUTES.XFRM$ .

State is loaded from the XSAVE area of the SSA frame as if the XRSTOR instruction were executed with  $XCR0=XFRM$ ,  $EDX:EAX = XFRM$ , with the memory operand being the XSAVE area, and (for 64-bit enclaves) as if  $REX.W=1$ .

ENCLU[ERESUME] ensures that a subsequent execution of XSAVEOPT inside the enclave will operate properly (e.g., by marking all state as modified).

## 41.7.7 Processor Extended States and ENCLU[EEXIT]

The ENCLU[EEXIT] leaf function does not perform any X-feature specific consistency checks, nor performs any state synthesis. It is the responsibility of enclave software to clear any sensitive data from the registers before

executing EEXIT. However, successful execution of the ENCLU[EEXIT] leaf function restores XCR0 to the value it held at the time of the most recent enclave entry.

### 41.7.8 Processor Extended States and ENCLU[EREPORT]

The ENCLU[EREPORT] leaf function creates the MAC-protected REPORT structure that reports on the enclave's identity. ENCLU[EREPORT] includes in the report the values of SECS.ATTRIBUTES.XFRM and SECS.MISCSELECT.

### 41.7.9 Processor Extended States and ENCLU[EGETKEY]

The ENCLU[EGETKEY] leaf function returns a cryptographic key based on the information provided by the KEYREQUEST structure. Intel SGX provides the means for isolation between different operating conditions by allowing an enclave developer to select which bits out of XFRM and MISCSELECT need to be included in the derivation of the keys.

## 41.8 INTERACTIONS WITH SMM

### 41.8.1 Availability of Intel® SGX instructions in SMM

Enclave instructions are not available in SMM, and any attempt to execute ENCLS or ENCLU instructions inside SMM results in an invalid-opcode exception (#UD).

### 41.8.2 SMI while Inside an Enclave

If the logical processor executing inside an enclave receives an SMI, the logical processor exits the enclave asynchronously. The response to an SMI received while executing inside an enclave depends on whether the dual-monitor treatment is enabled. For detailed discussion of transfer to SMM, see Chapter 34, "System Management Mode" of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C*.

If the logical processor executing inside an enclave receives an SMI when dual-monitor treatment is not enabled, the logical processor exits the enclave asynchronously, and transfers the control to the SMM handler. In addition to saving the synthetic architectural state to the SMRAM State Save Map (SSM), the logical processor also sets the "Enclave Interruption" bit in the SMRAM SSM (bit position 1 in SMRAM field at offset 7EE0H).

If the logical processor executing inside an enclave receives an SMI when dual-monitor treatment is enabled, the logical processor exits the enclave asynchronously, and transfers the control to the SMM monitor via SMM VM exit. The SMM VM exit sets the "Enclave Interruption" bit in the Exit Reason (see Table 41-2) and in the Guest Interruptibility State field (see Table 41-3) of the SMM VMCS.

### 41.8.3 SMRAM Synthetic State of AEX Triggered by SMI

All processor registers saved in the SMRAM have the same synthetic values listed in Section 39.3. Additional SMRAM fields that are treated specially on SMI are:

**Table 41-2. SMRAM Synthetic States on Asynchronous Enclave Exit**

Position	Field	Value	Writable
SMRAM Offset 07EE0H.Bit 1	ENCLAVE_INTERRUPTION	Set to 1 if exit occurred in enclave mode	No

## 41.9 INTERACTIONS OF INIT, SIPI, AND WAIT-FOR-SIPI WITH INTEL® SGX

INIT received inside an enclave, while the logical processor is not in VMX operation, causes the logical processor to exit the enclave asynchronously. After the AEX, the processor's architectural state is initialized to "Power-on" state (Table 9.1 in *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*). If the logical processor is BSP, then it proceeds to execute the BIOS initialization code. If the logical processor is an AP, it enters wait-for-SIPI state.

INIT received inside an enclave, while the logical processor (LP) is in VMX root operation, follows regular Intel Architecture behavior and is blocked.

INIT received inside an enclave, while the logical processor is in VMX non-root operation, causes an AEX. Subsequent to the AEX, the INIT causes a VM exit with the Enclave Interruption bit in the exit-reason field in the VMCS.

A processor cannot be inside an enclave in the wait-for-SIPI state. Consequently, a SIPI received while inside an enclave is lost.

Intel SGX does not change the behavior of the processor in the wait-for-SIPI state.

The SGX-related processor states after INIT-SIPI-SIPI is as follows:

- EPC Settings: Unchanged
- EPCM: Unchanged
- CPUID.LEAF\_12H.\*: Unchanged
- ENCLAVE\_MODE: 0 (LP exits enclave asynchronously)
- MEE state: Unchanged

Software should be aware that following INIT-SIPI-SIPI, the EPC might contain valid pages and should take appropriate measures such as initialize the EPC with the EREMOVE leaf function.

## 41.10 INTERACTIONS WITH DMA

DMA is not allowed to access any Processor Reserved Memory.

## 41.11 INTERACTIONS WITH TXT

### 41.11.1 Enclaves Created Prior to Execution of GETSEC

Enclaves which have been created before the GETSEC[SENDER] leaf function are available for execution after the successful completion of GETSEC[SENDER] and the corresponding SINIT ACM. Actions that a TXT Launched Environment performs in preparation to execute code in the Launched Environment, also applies to enclave code that would run after GETSEC[SENDER].

### 41.11.2 Interaction of GETSEC with Intel® SGX

All leaf functions of the GETSEC instruction are illegal inside an enclave, and results in an invalid-opcode exception (#UD).

Responding Logical Processors (RLP) which are executing inside an enclave at the time a GETSEC[SENDER] event occurs perform an AEX from the enclave and then enter the Wait-for-SIPI state.

RLP executing inside an enclave at the time of GETSEC[SEXIT], behave as defined for GETSEC[SEXIT]-that is, the RLPs pause during execution of SEXIT and resume after the completion of SEXIT.

The execution of a TXT launch does not affect Intel SGX configuration or security parameters.

### 41.11.3 Interactions with Authenticated Code Modules (ACMs)

Intel SGX only allows launching ACMs with an Intel SGX SVN that is at the same level or higher than the expected Intel SGX SVN. The expected Intel SGX SVN is specified by BIOS and locked down by the processor on the first successful execution of an Intel SGX instruction that doesn't return an error code. Intel SGX provides interfaces for system software to discover whether a non-faulting Intel SGX instruction has been executed, and evaluate the suitability of the Intel SGX SVN value of any ACM that is expected to be launched by the OS or the VMM.

These interfaces are provided through a read-only MSR called the IA32\_SGX\_SVN\_STATUS MSR (MSR address 500h). The IA32\_SGX\_SVN\_STATUS MSR has the format shown in Table 41-3.

**Table 41-3. Layout of the IA32\_SGX\_SVN\_STATUS MSR**

Bit Position	Name	ACM Module ID	Value
0	Lock	N.A.	<ul style="list-style-type: none"> <li>▪ If 1, indicates that a non-faulting Intel SGX instruction has been executed, consequently, launching a properly signed ACM but with Intel SGX SVN value less than the BIOS specified Intel SGX SVN threshold would lead to an TXT shutdown.</li> <li>▪ If 0, indicates that the processor will allow a properly signed ACM to launch irrespective of the Intel SGX SVN value of the ACM.</li> </ul>
15:1	RSVD	N.A.	0
23:16	SGX_SVN_SINIT	SINIT ACM	<ul style="list-style-type: none"> <li>▪ If CPUID.01H:ECX.SMX = 1, this field reflects the expected threshold of Intel SGX SVN for the SINIT ACM.</li> <li>▪ If CPUID.01H:ECX.SMX = 0, this field is reserved (0).</li> </ul>
63:24	RSVD	N.A.	0

OS/VMM that wishes to launch an architectural ACM such as SINIT is expected to read the IA32\_SGX\_SVN\_STATUS MSR to determine whether the ACM can be launched or a new ACM is needed:

- If either the Intel SGX SVN of the ACM is greater than the value reported by IA32\_SGX\_SVN\_STATUS, or the lock bit in the IA32\_SGX\_SVN\_STATUS is not set, then the OS/VMM can safely launch the ACM.
- If the Intel SGX SVN value reported in the corresponding component of the IA32\_SGX\_SVN\_STATUS is greater than the Intel SGX SVN value in the ACM's header, and if bit 0 of IA32\_SGX\_SVN\_STATUS is 1, then the OS/VMM should not launch that version of the ACM. It should obtain an updated version of the ACM either from the BIOS or from an external resource.

However, OSVs/VMMs are strongly advised to update their version of the ACM any time they detect that the Intel SGX SVN of the ACM carried by the OS/VMM is lower than that reported by IA32\_SGX\_SVN\_STATUS MSR, irrespective of the setting of the lock bit.

## 41.12 INTERACTIONS WITH CACHING OF LINEAR-ADDRESS TRANSLATIONS

Entering and exiting an enclave causes the logical processor to flush all the global linear-address context as well as the linear-address context associated with the current VPID and PCID. The MONITOR FSM is also cleared.

## 41.13 INTERACTIONS WITH INTEL® TRANSACTIONAL SYNCHRONIZATION EXTENSIONS (INTEL® TSX)

1. ENCLU or ENCLS instructions inside an HLE region will cause the flow to be aborted and restarted non-speculatively. ENCLU or ENCLS instructions inside an RTM region will cause the flow to be aborted and transfer control to the fallback handler.
2. If XBEGIN is executed inside an enclave, the processor does NOT check whether the address of the fallback handler is within the enclave.
3. If an RTM transaction is executing inside an enclave and there is an attempt to fetch an instruction outside the enclave, the transaction is aborted and control is transferred to the fallback handler. No #GP is delivered.

4. If an RTM transaction is executing inside an enclave and there is a data access to an address within the enclave that denied due to EPCM content (e.g., to a page belonging to a different enclave), the transaction is aborted and control is transferred to the fallback handler. No #GP is delivered.

5. If an RTM transaction executing inside an enclave aborts and the address of the fallback handler is outside the enclave, a #GP is delivered after the abort (EIP reported is that of the fallback handler).

### 41.13.1 HLE and RTM Debug

RTM debug will be suppressed on opt-out enclave entry. After opt-out entry, the logical processor will behave as if IA32\_DEBUG\_CTL[15]=0. Any #DB detected inside an RTM transaction region will just cause an abort with no exception delivered.

After opt-in entry, if either DR7[11] = 0 OR IA32\_DEBUGCTL[15] = 0, any #DB or #BP detected inside an RTM transaction region will just cause an abort with no exception delivered.

After opt-in entry, if DR7[11] = 1 AND IA32\_DEBUGCTL[15] = 1, any #DB or #BP detected inside an RTM transaction will

- terminate speculative execution,
- set RIP to the address of the XBEGIN instruction, and
- be delivered as #DB (implying an Intel SGX AEX; any #BP is converted to #DB).
- DR6[16] will be cleared, indicating RTM debug (if the #DB causes a VM exit, DR6 is not modified but bit 16 of the pending debug exceptions field in the VMCS will be set).

## 41.14 INTEL® SGX INTERACTIONS WITH S STATES

Whenever an Intel SGX enabled processor enters S3-S5 state, enclaves are destroyed. This is due to the EPC being destroyed when power down occurs. It is the application runtime's responsibility to re-instantiate an enclave after a power transition for which the enclaves were destroyed.

## 41.15 INTEL® SGX INTERACTIONS WITH MACHINE CHECK ARCHITECTURE (MCA)

### 41.15.1 Interactions with MCA Events

All architecturally visible machine check events (#MC and CMCI) that are detected while inside an enclave cause an asynchronous enclave exit.

Any machine check exception (#MC) that occurs after Intel SGX is first enables causes Intel SGX to be disabled, (CPUID.SGX\_Leaf.0:EAX[SGX1] == 0). It cannot be enabled until after the next reset.

### 41.15.2 Machine Check Enables (IA32\_MCi\_CTL)

All supported IA32\_MCi\_CTL bits for all the machine check banks must be set for Intel SGX to be available (CPUID.SGX\_Leaf.0:EAX[SGX1] == 1). Any act of clearing bits from '1' to '0' in any of the IA32\_MCi\_CTL register may disable Intel SGX (set CPUID.SGX\_Leaf.0:EAX[SGX1] to 0) until the next reset.

### 41.15.3 CR4.MCE

CR4.MCE can be set or cleared with no interactions with Intel SGX.

## 41.16 INTEL® SGX INTERACTIONS WITH PROTECTED MODE VIRTUAL INTERRUPTS

ENCLS[EENTER] modifies neither EFLAGS.VIP nor EFLAGS.VIF.

ENCLS[ERESUME] loads EFLAGS in a manner similar to that of an execution of IRET with CPL = 3. This means that ERESUME modifies neither EFLAGS.VIP nor EFLAGS.VIF regardless of the value of the EFLAGS image in the SSA frame.

AEX saves EFLAGS.VIP and EFLAGS.VIF unmodified into the EFLAGS image in the SSA frame. AEX modifies neither EFLAGS.VIP nor EFLAGS.VIF after saving EFLAGS.

If CR4.PVI = 1, CPL = 3, EFLAGS.VM = 0, IOPL < 3, EFLAGS.VIP = 1, and EFLAGS.VIF = 0, execution of STI causes a #GP fault. In this case, STI modifies neither EFLAGS.IF nor EFLAGS.VIF. This behavior applies without change within an enclave (where CPL is always 3). Note that, if IOPL = 3, STI always sets EFLAGS.IF without fault; CR4.PVI, EFLAGS.VIP, and EFLAGS.VIF are neither consulted nor modified in this case.

## 41.17 INTEL SGX INTERACTION WITH PROTECTION KEYS

SGX interactions with PKRU are as follows:

- CPUID.(EAX=12H, ECX=1):ECX.PKRU indicates whether SECS.ATTRIBUTES.XFRM.PKRU can be set. If SECS.ATTRIBUTES.XFRM.PKRU is set, then PKRU is saved and cleared as part of AEX and is restored as part of ERESUME. If CR4.PKE is set, an enclave can execute RDPKRU and WRKRU independent of whether SECS.ATTRIBUTES.XFRM.PKRU is set.

SGX interactions with domain permission checks are as follows:

- 1) If CR4.PKE is not set, then legacy and SGX permission checks are not effected.
- 2) If CR4.PKE is set, then domain permission checks are applied to all non-enclave access and enclave accesses to user pages in addition to legacy and SGX permission checks at a higher priority than SGX permission checks.
- 3) Implicit accesses aren't subject to domain permission checks.

## CHAPTER 42

# ENCLAVE CODE DEBUG AND PROFILING

---

Intel® SGX is architected to provide protection for production enclaves and permit enclave code developers to use an SGX-aware debugger to effectively debug a non-production enclave (debug enclave). Intel SGX also allows a non-SGX-aware debugger to debug non-enclave portions of the application without getting confused by enclave instructions.

## 42.1 CONFIGURATION AND CONTROLS

### 42.1.1 Debug Enclave vs. Production Enclave

The SECS of each enclave provides a bit, SECS.ATTRIBUTES.DEBUG, indicating whether the enclave is a debug enclave (if set) or a production enclave (if 0). If this bit is set, software outside the enclave can use EDBGWR/EDBGWR to access the EPC memory of the enclave. The value of DEBUG is not included in the measurement of the enclave and therefore doesn't require an alternate SIGSTRUCT to be generated to debug the enclave.

The ATTRIBUTES field in the SECS is reported in the enclave's attestation, and is included in the key derivation. Enclave secrets that were protected by the enclave using Intel SGX keys when it ran as a production enclave will not be accessible by the debug enclave. A debugger needs to be aware that special debug content might be required for a debug enclave to run in a meaningful way.

EPC memory belonging to a debug enclave can be accessed via the EDBGWR/EDBGWR leaf functions (see Section 40.4), while that belonging to a non-debug enclave cannot be accessed by these leaf functions.

### 42.1.2 Tool-Chain Opt-in

The TCS.FLAGS.DBGOPTIN bit controls interactions of certain debug and profiling features with enclaves, including code/data breakpoints, TF, RF, monitor trap flag, BTF, LBRs, BTM, BTS, Intel Processor Trace, and performance monitoring. This bit is forced to zero when EPC pages are added via EADD. A debugger can set this bit via EDBGWR to the TCS of a debug enclave.

An enclave entry through a TCS with the TCS.FLAGS.DBGOPTIN set to 0 is called an **opt-out** entry. Conversely, an enclave entry through a TCS with TCS.FLAGS.DBGOPTIN set to 1 is called an **opt-in** entry.

## 42.2 SINGLE STEP DEBUG

### 42.2.1 Single Stepping ENCLS Instruction Leafs

If the RFLAGS.TF bit is set at the beginning of ENCLS, then a single-step debug exception is pending as a trap-class exception on the instruction boundary immediately after the ENCLS instruction. Additionally, if the instruction is executed in VMX non-root operation and the "monitor trap flag" VM-execution control is 1, an MTF VM exit is pending on the instruction boundary immediately after the instruction if the instruction does not fault.

### 42.2.2 Single Stepping ENCLU Instruction Leafs

The interactions of the unprivileged Intel SGX instruction ENCLU are leaf dependent.

An enclave entry via EENTER/ERESUME leaf functions of the ENCLU, in certain cases, may mask the RFLAGS.TF bit, and mask the setting of the "monitor trap flag" VM-execution control. In such situations, an exit from the enclave, either via the EEXIT leaf function or via an AEX unmask the RFLAGS.TF bit and the "monitor trap flag" VM-execu-

tion control. The details of this masking/unmasking and the pending of single stepping events across EENTER/ERESUME/EEXIT/AEX are covered in detail in Section 42.2.3.

If the EFLAGS.TF bit is set at the beginning of EREPORT or EGETKEY leafs, and if the EFLAGS.TF is not masked by the preceding enclave entry, then a single-step debug exception is pending on the instruction boundary immediately after the ENCLU instruction. Additionally, if the instruction is executed in VMX non-root operation and the “monitor trap flag” VM-execution control is 1, and if the monitor trap flag is not masked by the preceding enclave entry, then an MTF VM exit is pending on the instruction boundary immediately after the instruction.

If the instruction under consideration results in a fault, then the control flow goes to the fault handler, and no single-step debug exception is asserted. In such a situation, if the instruction is executed in VMX non-root operation and the “monitor trap flag” VM-execution control is 1, an MTF VM exit is pending after the delivery of the fault (or any nested exception). No MTF VM exit occurs if another VM exit occurs before reaching that boundary on which an MTF VM exit would be pending.

### 42.2.3 Single-Stepping Enclave Entry with Opt-out Entry

#### 42.2.3.1 Single Stepping without AEX

Figure 42-1 shows the most common case for single-stepping after an opt-out entry.

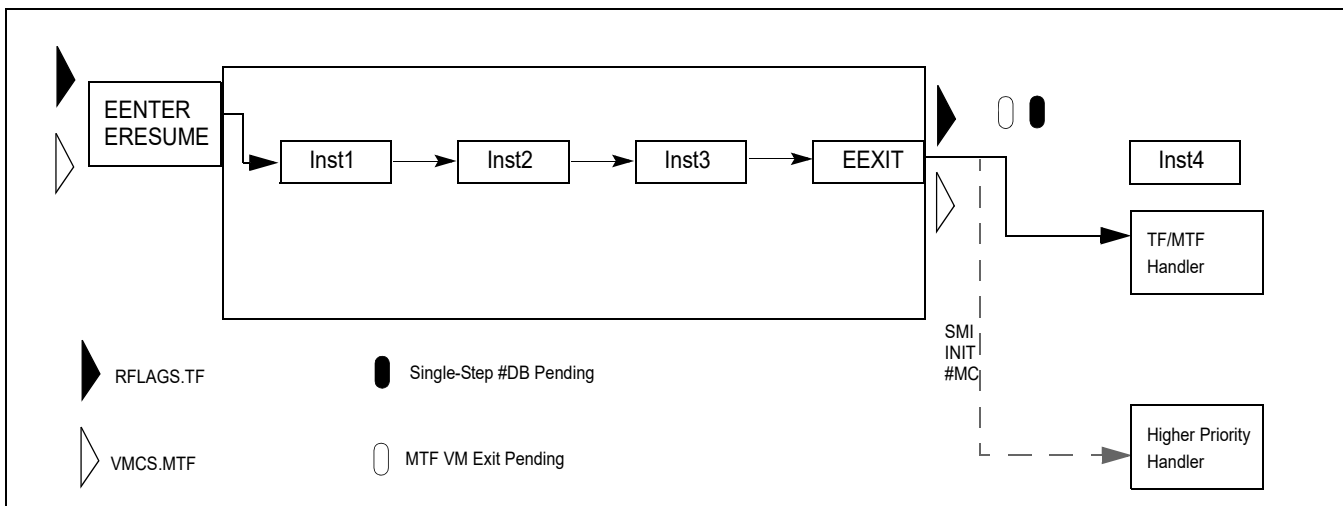

Figure 42-1. Single Stepping with Opt-out Entry - No AEX

In this scenario, if the RFLAGS.TF bit is set at the time of the enclave entry, then a single step debug exception is pending on the instruction boundary after EEXIT. Additionally, if the enclave is executing in VMX non-root operation and the “monitor trap flag” VM-execution control is 1, an MTF VM exit is pending on the instruction boundary after EEXIT.

The value of the RFLAGS.TF bit at the end of EEXIT is the same as the value of RFLAGS.TF at the time of the enclave entry.

#### 42.2.3.2 Single Step Preempted by AEX Due to Non-SMI Event

Figure 42-2 shows the interaction of single stepping with AEX due to a non-SMI event after an opt-out entry.

**Figure 42-2. Single Stepping with Opt-out Entry -AEX Due to Non-SMI Event Before Single-Step Boundary**

In this scenario, if the enclave is executing in VMX non-root operation and the “monitor trap flag” VM-execution control is 1, an MTF VM exit is pending on the instruction boundary after the AEX. No MTF VM exit occurs if another VM exit happens before reaching that instruction boundary.

The value of the **RFLAGS.TF** bit at the end of AEX is the same as the value of **RFLAGS.TF** at the time of the enclave entry.

#### 42.2.4 RFLAGS.TF Treatment on AEX

The value of **EFLAGS.TF** at the end of AEX from an opt-out enclave is same as the value of **EFLAGS.TF** at the time of the enclave entry. The value of **EFLAGS.TF** at the end of AEX from an opt-in enclave is unmodified. The **EFLAGS.TF** saved in GPR portion of the SSA on an AEX is 0. For more detail see **EENTER** and **ERESUME** in Chapter 5.

#### 42.2.5 Restriction on Setting of TF after an Opt-Out Entry

Enclave entered through an opt-out entry is not allowed to set **EFLAGS.TF**. The **POPF** instruction forces **RFLAGS.TF** to 0 if the enclave was entered through opt-out entry.

#### 42.2.6 Trampoline Code Considerations

Any AEX from the enclave which results in the **RFLAGS.TF = 1** on the reporting stack will result in a single-step #DB after the first instruction of the trampoline code if the trampoline is entered using the **IRET** instruction.

### 42.3 CODE AND DATA BREAKPOINTS

#### 42.3.1 Breakpoint Suppression

Following an opt-out entry:

- Instruction breakpoints are suppressed during execution in an enclave.
- Data breakpoints are not triggered on accesses to the address range defined by **ELRANGE**.
- Data breakpoints are triggered on accesses to addresses outside the **ELRANGE**

Following an opt-in entry instruction and data breakpoints are not suppressed.

The processor does not report any matches on debug breakpoints that are suppressed on enclave entry. However, the processor does not clear any bits in DR6 that were already set at the time of the enclave entry.

### 42.3.2 Reporting of Instruction Breakpoint on Next Instruction on a Debug Trap

A debug exception caused by the single-step execution mode or when a data breakpoint condition was met causes the processor to perform an AEX. Following such an AEX, the processor reports in the debug status register (DR6) matches of the new instruction pointer (the AEP address) in a breakpoint address register setup to detect instruction execution.

### 42.3.3 RF Treatment on AEX

RF flag value saved in SSA is the same as what would have been pushed on stack if the exception or event causing the AEX occurred when executing outside an enclave (see Section 17.3.1.1). Following an AEX, the RF flag is 0 in the synthetic state.

### 42.3.4 Breakpoint Matching in Intel® SGX Instruction Flows

Implicit accesses made by Intel SGX instructions to EPC regions do not trigger data breakpoints. Explicit accesses made by ENCLS[ECREATE], ENCLS[EADD], ENCLS[EEXTEND], ENCLS[EINIT], ENCLS[EREMOVE], ENCLS[ETRACK], ENCLS[EBLOCK], ENCLS[EPA], ENCLS[EWB], ENCLS[ELD], ENCLS[EDBGGRD], ENCLS[EDBGWR], ENCLU[EENTER], and ENCLU[ERESUME] to the EPC operands do not trigger data breakpoints.

Explicit accesses made by the Intel SGX instructions (ENCLU[EGETKEY] and ENCLU[EREPORT]) executed by an enclave following an opt-in entry, trigger data breakpoints on accesses to their EPC operands. All Intel SGX instructions trigger data breakpoints on accesses to their non-EPC operands.

## 42.4 INT3 CONSIDERATION

### 42.4.1 Behavior of INT3 Inside an Enclave

Inside an enclave, INT3 delivers a fault-class exception and thus does not require the CPL to be less than DPL in the IDT gate 3. Following opt-out entry, the instruction delivers #UD. Following opt-in entry, INT3 delivers #BP.

The RIP saved in the SSA on AEX is that of the INT3 instruction. The RIP saved on the stack ( or in the TSS or VMCS) is that of the AEP.

If execution of INT3 in an enclave causes a VM exit, the event type in the VM-exit interruption information field indicates a hardware exception (type 3; not a software exception with type 6) and the VM-exit instruction length field is saved as zero.

### 42.4.2 Debugger Considerations

The INT3 is fault-like inside an enclave and the RIP saved in the SSA on AEX is that of the INT3 instruction. Consequently, the debugger must not decrement SSA.RIP for #BP coming from an enclave to re-execute the instruction at the RIP of the INT3 instruction on a subsequent enclave entry.

### 42.4.3 VMM Considerations

As described above, INT3 executed by enclave delivers #BP with "interruption type" of 3. A VMM that re-injects #BP into the guest can obtain the VM entry interruption information from appropriate VMCS fields (as recommended in *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C*).

VMMs that create the VM-entry interruption information based on the interruption vector should use event type of 3 (instead of 6) when they detect a VM exit incident to enclave mode that is due to an event with vector 3.

## 42.5 BRANCH TRACING

### 42.5.1 BTF Treatment

When software enables single-stepping on branches then:

- Following an opt-in entry using EENTER the processor generates a single step debug exception.
- Following an EEXIT the processor generates a single-step debug exception

Enclave entry using ERESUME (opt-in or opt-out) and an AEX from the enclave do not cause generation of the single-step debug exception.

### 42.5.2 LBR Treatment

#### 42.5.2.1 LBR Stack on Opt-in Entry

Following an opt-in entry into an enclave, last branch recording facilities if enabled continued to store branch records in the LBR stack MSRs as follows:

- On enclave entry using EENTER/ERESUME, the processor push the address of EENTER/ERESUME instruction into MSR\_LASTBRANCH\_n\_FROM\_IP, and the destination address of the EENTER/ERESUME into MSR\_LASTBRANCH\_n\_TO\_IP.
- On EEXIT, the processor pushes the address of EEXIT instruction into MSR\_LASTBRANCH\_n\_FROM\_IP, and the address of EEXIT destination into MSR\_LASTBRANCH\_n\_TO\_IP.
- On AEX, the processor pushes RIP saved in the SSA into MSR\_LASTBRANCH\_n\_FROM\_IP, and the address of AEP into MSR\_LASTBRANCH\_n\_TO\_IP.
- For every branch inside the enclave, a branch record is pushed on the LBR stack.

Figure 42-3 shows an example of LBR stack manipulation after an opt-in entry. Every arrow in this picture indicates a branch record pushed on the LBR stack. The "From IP" of the branch record contains the linear address of the instruction located at the start of the arrow, while the "To IP" of the branch record contains the linear address of the instruction at the end of the arrow.

Figure 42-3. LBR Stack Interaction with Opt-in Entry

### 42.5.2.2 LBR Stack on Opt-out Entry

An opt-out entry into an enclave suppresses last branch recording facilities, and enclave exit after an opt-out entry un-suppresses last branch recording facilities.

Opt-out entry into an enclave does not push any record on LBR stack.

If last branch recording facilities were enabled at the time of enclave entry, then EEXIT following such an enclave entry pushes one record on LBR stack. The MSR\_LASTBRANCH\_n\_FROM\_IP of such record holds the linear address of the instruction (EENTER or ERESUME) that was used to enter the enclave, while the MSR\_LASTBRANCH\_n\_TO\_IP of such record holds linear address of the destination of EEXIT.

Additionally, if last branch recording facilities were enabled at the time of enclave entry, then an AEX after such an entry pushes one record on LBR stack, before pushing record for the event causing the AEX if the event pushes a record on LBR stack. The MSR\_LASTBRANCH\_n\_FROM\_IP of the new record holds linear address of the instruction (EENTER or ERESUME) that was used to enter the enclave, while MSR\_LASTBRANCH\_n\_TO\_IP of the new record holds linear address of the AEP. If the event causing AEX pushes a record on LBR stack, then the MSR\_LASTBRANCH\_n\_FROM\_IP for that record holds linear address of the AEP.

Figure 42-4 shows an example of LBR stack manipulation after an opt-out entry. Every arrow in this picture indicates a branch record pushed on the LBR stack. The “From IP” of the branch record contains the linear address of the instruction located at the start of the arrow, while the “To IP” of the branch record contains the linear address of the instruction at the end of the arrow.

Figure 42-4. LBR Stack Interaction with Opt-out Entry

### 42.5.2.3 Mispredict Bit, Record Type, and Filtering

All branch records resulting from Intel SGX instructions/AEXs are reported as predicted branches, and consequently, bit 63 of MSR\_LASTBRANCH\_n\_FROM\_IP for such records is set. Branch records due to these Intel SGX operations are always non-HLE/non-RTM records.

EENTER, ERESUME, EEXIT, and AEX are considered to be far branches. Consequently, bit 8 in MSR\_LBR\_SELECT controls filtering of the new records introduced by Intel SGX.

## 42.6 INTERACTION WITH PERFORMANCE MONITORING

### 42.6.1 IA32\_PERF\_GLOBAL\_STATUS Enhancement

On processors supporting Intel SGX, the IA32\_PERF\_GLOBAL\_STATUS MSR provides a bit indicator, known as “Anti Side-channel Interference” (ASCI) at bit position 60. If this bit is 0, the performance monitoring data in various performance monitoring counters are accumulated normally as defined by relevant architectural/microarchitectural conditions. If the ASCI bit is set, the contents in various performance monitoring counters can be affected by the direct or indirect consequence of Intel SGX protection of enclave code executing in the processor.

### 42.6.2 Performance Monitoring with Opt-in Entry

An opt-in enclave entry allow performance monitoring logic to observe the contribution of enclave code executing in the processor. Thus the contents of performance monitoring counters does not distinguish between contribution originating from enclave code or otherwise. All counters, events, precise events, etc. continue to work as defined in the IA32/Intel 64 Software Developer Manual. Consequently, bit 60 of IA32\_PERF\_GLOBAL\_STATUS MSR is not set.

### 42.6.3 Performance Monitoring with Opt-out Entry

In general, performance monitoring activities are suppressed when entering an opt-out enclave. This applies to all thread-specific, configured performance monitoring, except for the cycle-counting fixed counter, IA32\_FIXED\_CTR1 and IA32\_FIXED\_CTR2. Upon entering an opt-out enclave, IA32\_FIXED\_CTR0, IA32\_PMCx will stop accumulating counts. Additionally, if PEBS is configured to capture PEBS record for this thread, PEBS record generation will also be suppressed. Consequently, bit 60 of IA32\_PERF\_GLOBAL\_STATUS MSR is set.

Performance monitoring on the sibling thread may also be affected. Any one of IA32\_FIXED\_CTRx or IA32\_PMCx on the sibling thread configured to monitor thread-specific eventing logic with AnyThread = 1 is demoted to count only MyThread while an opt-out enclave is executing on the other thread.

### 42.6.4 Enclave Exit and Performance Monitoring

When a logical processor exits an enclave, either via ENCLU[EEXIT] or via AEX, all performance monitoring activity (including PEBS) on that logical processor that was suppressed is unsuppressed.

Any counters that were demoted from AnyThread to MyThread on the sibling thread are promoted back to AnyThread.

### 42.6.5 PEBS Record Generation on Intel® SGX Instructions

All leaf functions of the ENCLS instruction report “Eventing RIP” of the ENCLS instruction if a PEBS record is generated at the end of the instruction execution. Additionally, the EGETKEY and EREPORT leaf functions of the ENCLU instruction report “Eventing RIP” of the ENCLU instruction if a PEBS record is generated at the end of the instruction execution.

If the EENTER and ERESUME leaf functions are performing an opt-in entry report “Eventing RIP” of the ENCLU instruction if a PEBS record is generated at the end of the instruction execution. On the other hand, if these leaf functions are performing an opt-out entry, then these leaf functions result in PEBS being suppressed, and no PEBS record is generated at the end of these instructions.

A PEBS record is generated if there is a PEBS event pending at the end of EEXIT (due to a counter overflowing during enclave execution or during EEXIT execution). This PEBS record contains the architectural state of the logical processor at the end of EEXIT. If the enclave was entered via an opt-in entry, then this record reports the “Eventing RIP” as the linear address of the ENCLU[EEXIT] instruction. If the enclave was entered via an opt-out entry, then the record reports the “Eventing RIP” as the linear address of the ENCLU[EENTER/ERESUME] instruction that performed the last enclave entry.

A PEBS record is generated after the AEX if there is a PEBS event pending at the end of AEX (due to a counter overflowing during enclave execution or during AEX execution). This PEBS record contains the synthetic state of the logical processor that is established at the end of AEX. For opt-in entry, this record has the EVENTING\_RIP set to the RIP saved in the SSA. For opt-out entry, the record has the EVENTING\_RIP set to the linear address of EENTER/ERESUME used for the last enclave entry.

If the enclave was entered via an opt-in entry, then this record reports the “Eventing RIP” as the linear address in the SSA of the enclave (a.k.a., the “Eventing LIP” inside the enclave). If the enclave was entered via an opt-out entry, then the record reports the “Eventing RIP” as the linear address of the ENCLU[EENTER/ERESUME] instruction that performed the last enclave entry.

A second PEBS event may be pending during the Enclave Exiting Event (EEE). If the PEBS event is taken at the end of delivery of the EEE then the “Eventing RIP” in this second PEBS record is the linear address of the AEP.

### 42.6.6 Exception-Handling on PEBS/BTS Loads/Stores after AEX

The operating system should allocate sections of the DS save area from a non-paged pool, and mark them as accessed and dirty. If the loads/stores to any section of the DS save area incur faults then such faults are reported to the OS/VMM immediately, and generation of the PEBS/BTS record is skipped and may leave the buffers in a state where they have a partial PEBS or BTS records.

However, any events that are detected during PEBS/BTS record generation at the end of AEX and before delivering the Enclave Exiting Event (EEE) cannot be reported immediately to the OS/VMM, as an event window is not open at

the end of AEX. Consequently, fault-like events such as page faults, EPT faults, EPT mis-configuration, and accesses to APIC-access page detected on stores to the PEBS/BTS buffer are not reported, and generation of the PEBS and/or BTS record at the end of AEX is aborted (this may leave the buffers in a state where they have partial PEBS or BTS records). Trap-like events detected on stores to the PEBS/BTS buffer (such as debug traps) are pended until the next instruction boundary, where they are handled according to the architecturally defined priority. The processor continues the handling of the Enclave Exiting Event (SMI, NMI, interrupt, exception delivery, VM exit, etc.) after aborting the PEBS/BTS record generation.

#### **42.6.6.1 Other Interactions with Performance Monitoring**

For opt-in entry, EENTER, ERESUME, EEXIT, and AEX are all treated as predicted far branches, and any counters that are counting such branches are incremented by 1 as a part of retirement of these instructions. Retirement of these instructions is also counted in any counters configured to count instructions retired.

For opt-out entry, execution inside an enclave is treated as a single predicted branch, and all branch-counting performance monitoring counters are incremented accordingly. Additionally, such execution is also counted as a single instruction, and all performance monitoring counters counting instructions are incremented accordingly.

Enclave entry does not affect any performance monitoring counters shared between cores.

# APPENDIX A

## VMX CAPABILITY REPORTING FACILITY

The ability of a processor to support VMX operation and related instructions is indicated by `CPUID.1:ECX.VMX[bit 5] = 1`. A value 1 in this bit indicates support for VMX features.

Support for specific features detailed in Chapter 26 and other VMX chapters is determined by reading values from a set of capability MSRs. These MSRs are indexed starting at MSR address 480H. VMX capability MSRs are read-only; an attempt to write them (with `WRMSR`) produces a general-protection exception (`#GP(0)`). They do not exist on processors that do not support VMX operation; an attempt to read them (with `RDMSR`) on such processors produces a general-protection exception (`#GP(0)`).

### A.1 BASIC VMX INFORMATION

The `IA32_VMX_BASIC` MSR (index 480H) consists of the following fields:

- Bits 30:0 contain the 31-bit VMCS revision identifier used by the processor. Processors that use the same VMCS revision identifier use the same size for VMCS regions (see subsequent item on bits 44:32).<sup>1</sup>
- Bit 31 is always 0.
- Bits 44:32 report the number of bytes that software should allocate for the VMXON region and any VMCS region. It is a value greater than 0 and at most 4096 (bit 44 is set if and only if bits 43:32 are clear).
- Bit 48 indicates the width of the physical addresses that may be used for the VMXON region, each VMCS, and data structures referenced by pointers in a VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions). If the bit is 0, these addresses are limited to the processor's physical-address width.<sup>2</sup> If the bit is 1, these addresses are limited to 32 bits. This bit is always 0 for processors that support Intel 64 architecture.
- If bit 49 is read as 1, the logical processor supports the dual-monitor treatment of system-management interrupts and system-management mode. See Section 34.15 for details of this treatment.
- Bits 53:50 report the memory type that should be used for the VMCS, for data structures referenced by pointers in the VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions), and for the MSEG header. If software needs to access these data structures (e.g., to modify the contents of the MSR bitmaps), it can configure the paging structures to map them into the linear-address space. If it does so, it should establish mappings that use the memory type reported bits 53:50 in this MSR.<sup>3</sup>

As of this writing, all processors that support VMX operation indicate the write-back type. The values used are given in Table A-1.

**Table A-1. Memory Types Recommended for VMCS and Related Data Structures**

Value(s)	Field
0	Uncacheable (UC)
1-5	Not used
6	Write Back (WB)
7-15	Not used

1. Earlier versions of this manual specified that the VMCS revision identifier was a 32-bit field in bits 31:0 of this MSR. For all processors produced prior to this change, bit 31 of this MSR was read as 0.
2. On processors that support Intel 64 architecture, the pointer must not set bits beyond the processor's physical address width.
3. Alternatively, software may map any of these regions or structures with the UC memory type. (This may be necessary for the MSEG header.) Doing so is discouraged unless necessary as it will cause the performance of software accesses to those structures to suffer.

- If bit 54 is read as 1, the processor reports information in the VM-exit instruction-information field on VM exits due to execution of the INS and OUTS instructions (see Section 27.2.4). This reporting is done only if this bit is read as 1.
- Bit 55 is read as 1 if any VMX controls that default to 1 may be cleared to 0. See Appendix A.2 for details. It also reports support for the VMX capability MSRs IA32\_VMX\_TRUE\_PINBASED\_CTLs, IA32\_VMX\_TRUE\_PROCBASED\_CTLs, IA32\_VMX\_TRUE\_EXIT\_CTLs, and IA32\_VMX\_TRUE\_ENTRY\_CTLs. See Appendix A.3.1, Appendix A.3.2, Appendix A.4, and Appendix A.5 for details.
- The values of bits 47:45 and bits 63:56 are reserved and are read as 0.

## A.2 RESERVED CONTROLS AND DEFAULT SETTINGS

As noted in Chapter 26, “VM Entries”, certain VMX controls are reserved and must be set to a specific value (0 or 1) determined by the processor. The specific value to which a reserved control must be set is its **default setting**. Software can discover the default setting of a reserved control by consulting the appropriate VMX capability MSR (see Appendix A.3 through Appendix A.5).

Future processors may define new functionality for one or more reserved controls. Such processors would allow each newly defined control to be set either to 0 or to 1. Software that does not desire a control’s new functionality should set the control to its default setting. For that reason, it is useful for software to know the default settings of the reserved controls.

Default settings partition the various controls into the following classes:

- **Always-flexible.** These have never been reserved.
- **Default0.** These are (or have been) reserved with a default setting of 0.
- **Default1.** They are (or have been) reserved with a default setting of 1.

As noted in Appendix A.1, a logical processor uses bit 55 of the IA32\_VMX\_BASIC MSR to indicate whether any of the default1 controls may be 0:

- If bit 55 of the IA32\_VMX\_BASIC MSR is read as 0, all the default1 controls are reserved and must be 1. VM entry will fail if any of these controls are 0 (see Section 26.2.1).
- If bit 55 of the IA32\_VMX\_BASIC MSR is read as 1, not all the default1 controls are reserved, and some (but not necessarily all) may be 0. The CPU supports four (4) new VMX capability MSRs: IA32\_VMX\_TRUE\_PINBASED\_CTLs, IA32\_VMX\_TRUE\_PROCBASED\_CTLs, IA32\_VMX\_TRUE\_EXIT\_CTLs, and IA32\_VMX\_TRUE\_ENTRY\_CTLs. See Appendix A.3 through Appendix A.5 for details. (These MSRs are not supported if bit 55 of the IA32\_VMX\_BASIC MSR is read as 0.)

See Section 31.5.1 for recommended software algorithms for proper capability detection of the default1 controls.

## A.3 VM-EXECUTION CONTROLS

There are separate capability MSRs for the pin-based VM-execution controls, the primary processor-based VM-execution controls, and the secondary processor-based VM-execution controls. These are described in Appendix A.3.1, Appendix A.3.2, and Appendix A.3.3, respectively.

### A.3.1 Pin-Based VM-Execution Controls

The IA32\_VMX\_PINBASED\_CTLs MSR (index 481H) reports on the allowed settings of most of the pin-based VM-execution controls (see Section 24.6.1):

- Bits 31:0 indicate the **allowed 0-settings** of these controls. VM entry allows control X (bit X of the pin-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the pin-based VM-execution controls in the default1 class (see Appendix A.2). These are bits 1, 2, and 4; the corresponding bits of the IA32\_VMX\_PINBASED\_CTLs MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any pin-based VM-execution control in the default1 class is 0.
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PINBASED\_CTLMS MSR (see below) reports which of the pin-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the **allowed 1-settings** of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PINBASED\_CTLMS MSR (index 48DH) reports on the allowed settings of **all** of the pin-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the pin-based VM-execution controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32\_VMX\_PINBASED\_CTLMS MSR. (The IA32\_VMX\_TRUE\_PINBASED\_CTLMS MSR is not supported.)
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32\_VMX\_TRUE\_PINBASED\_CTLMS MSR. Assuming that software knows that the default1 class of pin-based VM-execution controls contains bits 1, 2, and 4, there is no need for software to consult the IA32\_VMX\_PINBASED\_CTLMS MSR.

### A.3.2 Primary Processor-Based VM-Execution Controls

The IA32\_VMX\_PROCBASED\_CTLMS MSR (index 482H) reports on the allowed settings of most of the primary processor-based VM-execution controls (see Section 24.6.2):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the primary processor-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the primary processor-based VM-execution controls in the default1 class (see Appendix A.2). These are bits 1, 4–6, 8, 13–16, and 26; the corresponding bits of the IA32\_VMX\_PROCBASED\_CTLMS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any of the primary processor-based VM-execution controls in the default1 class is 0.
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PROCBASED\_CTLMS MSR (see below) reports which of the primary processor-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PROCBASED\_CTLMS MSR (index 48EH) reports on the allowed settings of **all** of the primary processor-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the primary processor-based VM-execution controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the primary processor-based VM-execution controls is contained in the IA32\_VMX\_PROCBASED\_CTLMS MSR. (The IA32\_VMX\_TRUE\_PROCBASED\_CTLMS MSR is not supported.)

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the processor-based VM-execution controls is contained in the IA32\_VMX\_TRUE\_PROCBASED\_CTLMSR. Assuming that software knows that the default1 class of processor-based VM-execution controls contains bits 1, 4–6, 8, 13–16, and 26, there is no need for software to consult the IA32\_VMX\_PROCBASED\_CTLMSR.

### A.3.3 Secondary Processor-Based VM-Execution Controls

The IA32\_VMX\_PROCBASED\_CTLMSR2 (index 48BH) reports on the allowed settings of the secondary processor-based VM-execution controls (see Section 24.6.2). VM entries perform the following checks:

- Bits 31:0 indicate the allowed 0-settings of these controls. These bits are always 0. This fact indicates that VM entry allows each bit of the secondary processor-based VM-execution controls to be 0 (reserved bits must be 0)
- Bits 63:32 indicate the allowed 1-settings of these controls; the 1-setting is not allowed for any reserved bit. VM entry allows control X (bit X of the secondary processor-based VM-execution controls) to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X and the “activate secondary controls” primary processor-based VM-execution control are both 1.

The IA32\_VMX\_PROCBASED\_CTLMSR2 MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32\_VMX\_PROCBASED\_CTLMSR is 1).

## A.4 VM-EXIT CONTROLS

The IA32\_VMX\_EXIT\_CTLMSR (index 483H) reports on the allowed settings of most of the VM-exit controls (see Section 24.7.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-exit controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. Exceptions are made for the VM-exit controls in the default1 class (see Appendix A.2). These are bits 0–8, 10, 11, 13, 14, 16, and 17; the corresponding bits of the IA32\_VMX\_EXIT\_CTLMSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any VM-exit control in the default1 class is 0.
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_EXIT\_CTLMSR (see below) reports which of the VM-exit controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_EXIT\_CTLMSR (index 48FH) reports on the allowed settings of all of the VM-exit controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-exit controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the VM-exit controls is contained in the IA32\_VMX\_EXIT\_CTLMSR. (The IA32\_VMX\_TRUE\_EXIT\_CTLMSR is not supported.)
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the VM-exit controls is contained in the IA32\_VMX\_TRUE\_EXIT\_CTLMSR. Assuming that software knows that the default1 class of VM-exit controls contains bits 0–8, 10, 11, 13, 14, 16, and 17, there is no need for software to consult the IA32\_VMX\_EXIT\_CTLMSR.

## A.5 VM-ENTRY CONTROLS

The IA32\_VMX\_ENTRY\_CTLMS MSR (index 484H) reports on the allowed settings of most of the VM-entry controls (see Section 24.8.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-entry controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. Exceptions are made for the VM-entry controls in the default1 class (see Appendix A.2). These are bits 0–8 and 12; the corresponding bits of the IA32\_VMX\_ENTRY\_CTLMS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any VM-entry control in the default1 class is 0.
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_ENTRY\_CTLMS MSR (see below) reports which of the VM-entry controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry fails if bit X is 1 in the VM-entry controls and bit 32+X is 0 in this MSR.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_ENTRY\_CTLMS MSR (index 490H) reports on the allowed settings of all of the VM-entry controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-entry controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the VM-entry controls is contained in the IA32\_VMX\_ENTRY\_CTLMS MSR. (The IA32\_VMX\_TRUE\_ENTRY\_CTLMS MSR is not supported.)
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the VM-entry controls is contained in the IA32\_VMX\_TRUE\_ENTRY\_CTLMS MSR. Assuming that software knows that the default1 class of VM-entry controls contains bits 0–8 and 12, there is no need for software to consult the IA32\_VMX\_ENTRY\_CTLMS MSR.

## A.6 MISCELLANEOUS DATA

The IA32\_VMX\_MISC MSR (index 485H) consists of the following fields:

- Bits 4:0 report a value X that specifies the relationship between the rate of the VMX-preemption timer and that of the timestamp counter (TSC). Specifically, the VMX-preemption timer (if it is active) counts down by 1 every time bit X in the TSC changes due to a TSC increment.
- If bit 5 is read as 1, VM exits store the value of IA32\_EFER.LMA into the “IA-32e mode guest” VM-entry control; see Section 27.2 for more details. This bit is read as 1 on any logical processor that supports the 1-setting of the “unrestricted guest” VM-execution control.
- Bits 8:6 report, as a bitmap, the activity states supported by the implementation:
  - Bit 6 reports (if set) the support for activity state 1 (HLT).
  - Bit 7 reports (if set) the support for activity state 2 (shutdown).
  - Bit 8 reports (if set) the support for activity state 3 (wait-for-SIPI).

If an activity state is not supported, the implementation causes a VM entry to fail if it attempts to establish that activity state. All implementations support VM entry to activity state 0 (active).

- If bit 14 is read as 1, Intel<sup>®</sup> Processor Trace (Intel PT) can be used in VMX operation. If the processor supports Intel PT but does not allow it to be used in VMX operation, execution of VMXON clears IA32\_RTIT\_CTL.TraceEn (see “VMXON—Enter VMX Operation” in Chapter 30); any attempt to write IA32\_RTIT\_CTL while in VMX operation (including VMX root operation) causes a general-protection exception.

- If bit 15 is read as 1, the RDMSR instruction can be used in system-management mode (SMM) to read the IA32\_SMBASE MSR (MSR address 9EH). See Section 34.15.6.3.
- Bits 24:16 indicate the number of CR3-target values supported by the processor. This number is a value between 0 and 256, inclusive (bit 24 is set if and only if bits 23:16 are clear).
- Bits 27:25 is used to compute the recommended maximum number of MSRs that should appear in the VM-exit MSR-store list, the VM-exit MSR-load list, or the VM-entry MSR-load list. Specifically, if the value bits 27:25 of IA32\_VMX\_MISC is N, then  $512 * (N + 1)$  is the recommended maximum number of MSRs to be included in each list. If the limit is exceeded, undefined processor behavior may result (including a machine check during the VMX transition).
- If bit 28 is read as 1, bit 2 of the IA32\_SMM\_MONITOR\_CTL can be set to 1. VMXOFF unblocks SMIs unless IA32\_SMM\_MONITOR\_CTL[bit 2] is 1 (see Section 34.14.4).
- If bit 29 is read as 1, software can use VMWRITE to write to any supported field in the VMCS; otherwise, VMWRITE cannot be used to modify VM-exit information fields.
- If bit 30 is read as 1, VM entry allows injection of a software interrupt, software exception, or privileged software exception with an instruction length of 0.
- Bits 63:32 report the 32-bit MSEG revision identifier used by the processor.
- Bits 13:9 and bit 31 are reserved and are read as 0.

## A.7 VMX-FIXED BITS IN CR0

The IA32\_VMX\_CR0\_FIXED0 MSR (index 486H) and IA32\_VMX\_CR0\_FIXED1 MSR (index 487H) indicate how bits in CR0 may be set in VMX operation. They report on bits in CR0 that are allowed to be 0 and to be 1, respectively, in VMX operation. If bit X is 1 in IA32\_VMX\_CR0\_FIXED0, then that bit of CR0 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in IA32\_VMX\_CR0\_FIXED1, then that bit of CR0 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in IA32\_VMX\_CR0\_FIXED0, then that bit is also 1 in IA32\_VMX\_CR0\_FIXED1; if bit X is 0 in IA32\_VMX\_CR0\_FIXED1, then that bit is also 0 in IA32\_VMX\_CR0\_FIXED0. Thus, each bit in CR0 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in IA32\_VMX\_CR0\_FIXED0 and 1 in IA32\_VMX\_CR0\_FIXED1).

## A.8 VMX-FIXED BITS IN CR4

The IA32\_VMX\_CR4\_FIXED0 MSR (index 488H) and IA32\_VMX\_CR4\_FIXED1 MSR (index 489H) indicate how bits in CR4 may be set in VMX operation. They report on bits in CR4 that are allowed to be 0 and 1, respectively, in VMX operation. If bit X is 1 in IA32\_VMX\_CR4\_FIXED0, then that bit of CR4 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in IA32\_VMX\_CR4\_FIXED1, then that bit of CR4 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in IA32\_VMX\_CR4\_FIXED0, then that bit is also 1 in IA32\_VMX\_CR4\_FIXED1; if bit X is 0 in IA32\_VMX\_CR4\_FIXED1, then that bit is also 0 in IA32\_VMX\_CR4\_FIXED0. Thus, each bit in CR4 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in IA32\_VMX\_CR4\_FIXED0 and 1 in IA32\_VMX\_CR4\_FIXED1).

## A.9 VMCS ENUMERATION

The IA32\_VMX\_VMCS\_ENUM MSR (index 48AH) provides information to assist software in enumerating fields in the VMCS.

As noted in Section 24.11.2, each field in the VMCS is associated with a 32-bit encoding which is structured as follows:

- Bits 31:15 are reserved (must be 0).
- Bits 14:13 indicate the field's width.
- Bit 12 is reserved (must be 0).
- Bits 11:10 indicate the field's type.

- Bits 9:1 is an index field that distinguishes different fields with the same width and type.
- Bit 0 indicates access type.

IA32\_VMX\_VMCS\_ENUM indicates to software the highest index value used in the encoding of any field supported by the processor:

- Bits 9:1 contain the highest index value used for any VMCS encoding.
- Bit 0 and bits 63:10 are reserved and are read as 0.

## A.10 VPID AND EPT CAPABILITIES

The IA32\_VMX\_EPT\_VPID\_CAP MSR (index 48CH) reports information about the capabilities of the logical processor with regard to virtual-processor identifiers (VPIDs, Section 28.1) and extended page tables (EPT, Section 28.2):

- If bit 0 is read as 1, the processor supports execute-only translations by EPT. This support allows software to configure EPT paging-structure entries in which bits 1:0 are clear (indicating that data accesses are not allowed) and bit 2 is set (indicating that instruction fetches are allowed).<sup>1</sup>
- Bit 6 indicates support for a page-walk length of 4.
- If bit 8 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be uncacheable (UC); see Section 24.6.11.
- If bit 14 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be write-back (WB).
- If bit 16 is read as 1, the logical processor allows software to configure a EPT PDE to map a 2-Mbyte page (by setting bit 7 in the EPT PDE).
- If bit 17 is read as 1, the logical processor allows software to configure a EPT PDPTE to map a 1-Gbyte page (by setting bit 7 in the EPT PDPTE).
- Support for the INVEPT instruction (see Chapter 30 and Section 28.3.3.1).
  - If bit 20 is read as 1, the INVEPT instruction is supported.
  - If bit 25 is read as 1, the single-context INVEPT type is supported.
  - If bit 26 is read as 1, the all-context INVEPT type is supported.
- If bit 21 is read as 1, accessed and dirty flags for EPT are supported (see Section 28.2.4).
- If bit 22 is read as 1, the processor reports advanced VM-exit information for EPT violations (see Section 27.2.1). This reporting is done only if this bit is read as 1.
- Support for the INVVPID instruction (see Chapter 30 and Section 28.3.3.1).
  - If bit 32 is read as 1, the INVVPID instruction is supported.
  - If bit 40 is read as 1, the individual-address INVVPID type is supported.
  - If bit 41 is read as 1, the single-context INVVPID type is supported.
  - If bit 42 is read as 1, the all-context INVVPID type is supported.
  - If bit 43 is read as 1, the single-context-retaining-globals INVVPID type is supported.
- Bits 5:1, bit 7, bits 13:9, bit 15, bits 19:18, bits 24:23, bits 31:27, bits 39:33, and bits 63:44 are reserved and are read as 0.

---

1. If the “mode-based execute control for EPT” VM-execution control is 1, setting bit 0 indicates also that software may also configure EPT paging-structure entries in which bits 1:0 are both clear and in which bit 10 is set (indicating a translation that can be used to fetch instructions from a supervisor-mode linear address or a user-mode linear address).

The IA32\_VMX\_EPT\_VPID\_CAP MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32\_VMX\_PROCBASED\_CTL5 MSR is 1) and that support either the 1-setting of the “enable EPT” VM-execution control (only if bit 33 of the IA32\_VMX\_PROCBASED\_CTL52 MSR is 1) or the 1-setting of the “enable VPID” VM-execution control (only if bit 37 of the IA32\_VMX\_PROCBASED\_CTL52 MSR is 1).

### A.11 VM FUNCTIONS

The IA32\_VMX\_VMFUNC MSR (index 491H) reports on the allowed settings of the VM-function controls (see Section 24.6.14). VM entry allows bit X of the VM-function controls to be 1 if bit X in the MSR is set to 1; if bit X in the MSR is cleared to 0, VM entry fails if bit X of the VM-function controls, the “activate secondary controls” primary processor-based VM-execution control, and the “enable VM functions” secondary processor-based VM-execution control are all 1.

The IA32\_VMX\_VMFUNC MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32\_VMX\_PROCBASED\_CTL5 MSR is 1) and the 1-setting of the “enable VM functions” secondary processor-based VM-execution control (only if bit 45 of the IA32\_VMX\_PROCBASED\_CTL52 MSR is 1).

Every component of the VMCS is encoded by a 32-bit field that can be used by VMREAD and VMWRITE. Section 24.11.2 describes the structure of the encoding space (the meanings of the bits in each 32-bit encoding).

This appendix enumerates all fields in the VMCS and their encodings. Fields are grouped by width (16-bit, 32-bit, etc.) and type (guest-state, host-state, etc.)

## B.1 16-BIT FIELDS

A value of 0 in bits 14:13 of an encoding indicates a 16-bit field. Only guest-state areas and the host-state area contain 16-bit fields. As noted in Section 24.11.2, each 16-bit field allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

### B.1.1 16-Bit Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table B-1 enumerates the 16-bit control fields.

**Table B-1. Encoding for 16-Bit Control Fields (0000\_00xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
Virtual-processor identifier (VPID) <sup>1</sup>	000000000B	00000000H
Posted-interrupt notification vector <sup>2</sup>	000000001B	00000002H
EPTP index <sup>3</sup>	000000010B	00000004H

**NOTES:**

1. This field exists only on processors that support the 1-setting of the “enable VPID” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “process posted interrupts” VM-execution control.
3. This field exists only on processors that support the 1-setting of the “EPT-violation #VE” VM-execution control.

### B.1.2 16-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table B-2 enumerates 16-bit guest-state fields.

**Table B-2. Encodings for 16-Bit Guest-State Fields (0000\_10xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
Guest ES selector	000000000B	00000800H
Guest CS selector	000000001B	00000802H
Guest SS selector	0000000010B	00000804H
Guest DS selector	0000000011B	00000806H
Guest FS selector	000000100B	00000808H
Guest GS selector	000000101B	0000080AH
Guest LDTR selector	000000110B	0000080CH
Guest TR selector	000000111B	0000080EH

**Table B-2. Encodings for 16-Bit Guest-State Fields (0000\_10xx\_xxxx\_xxx0B) (Contd.)**

Field Name	Index	Encoding
Guest interrupt status <sup>1</sup>	000001000B	00000810H
PML index <sup>2</sup>	000001001B	00000812H

**NOTES:**

1. This field exists only on processors that support the 1-setting of the “virtual-interrupt delivery” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “enable PML” VM-execution control.

**B.1.3 16-Bit Host-State Fields**

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table B-3 enumerates the 16-bit host-state fields.

**Table B-3. Encodings for 16-Bit Host-State Fields (0000\_11xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
Host ES selector	000000000B	00000C00H
Host CS selector	000000001B	00000C02H
Host SS selector	000000010B	00000C04H
Host DS selector	000000011B	00000C06H
Host FS selector	000000100B	00000C08H
Host GS selector	000000101B	00000C0AH
Host TR selector	000000110B	00000C0CH

**B.2 64-BIT FIELDS**

A value of 1 in bits 14:13 of an encoding indicates a 64-bit field. There are 64-bit fields only for controls and for guest state. As noted in Section 24.11.2, every 64-bit field has two encodings, which differ on bit 0, the access type. Thus, each such field has an even encoding for full access and an odd encoding for high access.

**B.2.1 64-Bit Control Fields**

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table B-4 enumerates the 64-bit control fields.

**Table B-4. Encodings for 64-Bit Control Fields (0010\_00xx\_xxxx\_xxxAb)**

Field Name	Index	Encoding
Address of I/O bitmap A (full)	000000000B	00002000H
Address of I/O bitmap A (high)		00002001H
Address of I/O bitmap B (full)	000000001B	00002002H
Address of I/O bitmap B (high)		00002003H

**NOTES:**

1. This field exists only on processors that support the 1-setting of the “use MSR bitmaps” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “enable PML” VM-execution control.
3. This field exists only on processors that support the 1-setting of the “use TPR shadow” VM-execution control.
4. This field exists only on processors that support the 1-setting of the “virtualize APIC accesses” VM-execution control.
5. This field exists only on processors that support the 1-setting of the “process posted interrupts” VM-execution control.
6. This field exists only on processors that support the 1-setting of the “enable VM functions” VM-execution control.
7. This field exists only on processors that support the 1-setting of the “enable EPT” VM-execution control.
8. This field exists only on processors that support the 1-setting of the “virtual-interrupt delivery” VM-execution control.
9. This field exists only on processors that support the 1-setting of the “EPTP switching” VM-function control.
10. This field exists only on processors that support the 1-setting of the “VMCS shadowing” VM-execution control.
11. This field exists only on processors that support the 1-setting of the “EPT-violation #VE” VM-execution control.
12. This field exists only on processors that support the 1-setting of the “enable XSAVES/XRSTORS” VM-execution control.
13. This field exists only on processors that support the 1-setting of the “enable ENCLS exiting” VM-execution control.
14. This field exists only on processors that support the 1-setting of the “use TSC scaling” VM-execution control.

**B.2.2 64-Bit Read-Only Data Field**

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. There is only one such 64-bit field as given in Table B-5. (As with other 64-bit fields, this one has two encodings.)

**Table B-5. Encodings for 64-Bit Read-Only Data Field (0010\_01xx\_xxxx\_xxxAb)**

Field Name	Index	Encoding
Guest-physical address (full) <sup>1</sup>	000000000B	00002400H

Guest IA32_BNDCFGS (high) <sup>5</sup>		00002813H

**NOTES:**

1. This field exists only on processors that support either the 1-setting of the "load IA32\_PAT" VM-entry control or that of the "save IA32\_PAT" VM-exit control.
2. This field exists only on processors that support either the 1-setting of the "load IA32\_EFER" VM-entry control or that of the "save IA32\_EFER" VM-exit control.
3. This field exists only on processors that support the 1-setting of the "load IA32\_PERF\_GLOBAL\_CTRL" VM-entry control.
4. This field exists only on processors that support the 1-setting of the "enable EPT" VM-execution control.
5. This field exists only on processors that support either the 1-setting of the "load IA32\_BNDCFGS" VM-entry control or that of the "clear IA32\_BNDCFGS" VM-exit control.

**B.2.4 64-Bit Host-State Fields**

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table B-7 enumerates the 64-bit control fields.

**Table B-7. Encodings for 64-Bit Host-State Fields (0010\_11xx\_xxxx\_xxxAb)**

Field Name	Index	Encoding
Host IA32_PAT (full) <sup>1</sup>	000000000B	00002C00H
Host IA32_PAT (high) <sup>1</sup>		00002C01H
Host IA32_EFER (full) <sup>2</sup>	000000001B	00002C02H

Host IA32_PERF_GLOBAL_CTRL (full) <sup>3</sup>	000000010B	00002C04H
Host IA32_PERF_GLOBAL_CTRL (high) <sup>3</sup>		00002C05H

**NOTES:**

1. This field exists only on processors that support the 1-setting of the "load IA32\_PAT" VM-exit control.
2. This field exists only on processors that support the 1-setting of the "load IA32\_EFER" VM-exit control.

3. This field exists only on processors that support the 1-setting of the “load IA32\_PERF\_GLOBAL\_CTRL” VM-exit control.

## B.3 32-BIT FIELDS

A value of 2 in bits 14:13 of an encoding indicates a 32-bit field. As noted in Section 24.11.2, each 32-bit field allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

### B.3.1 32-Bit Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table B-8 enumerates the 32-bit control fields.

**Table B-8. Encodings for 32-Bit Control Fields (0100\_00xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
Pin-based VM-execution controls	00000000B	00004000H
Primary processor-based VM-execution controls	00000001B	00004002H
Exception bitmap	00000010B	00004004H
Page-fault error-code mask	00000011B	00004006H
Page-fault error-code match	00000100B	00004008H
CR3-target count	00000101B	0000400AH
VM-exit controls	00000110B	0000400CH
VM-exit MSR-store count	00000111B	0000400EH
VM-exit MSR-load count	00001000B	00004010H
VM-entry controls	00001001B	00004012H
VM-entry MSR-load count	00001010B	00004014H
VM-entry interruption-information field	00001011B	00004016H
VM-entry exception error code	00001100B	00004018H
VM-entry instruction length	00001101B	0000401AH
TPR threshold <sup>1</sup>	00001110B	0000401CH
Secondary processor-based VM-execution controls <sup>2</sup>	00001111b	0000401EH
PLE_Gap <sup>3</sup>	00001000b	00004020H
PLE_Window <sup>3</sup>	00001001b	00004022H

**NOTES:**

1. This field exists only on processors that support the 1-setting of the “use TPR shadow” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control.
3. This field exists only on processors that support the 1-setting of the “PAUSE-loop exiting” VM-execution control.

### B.3.2 32-Bit Read-Only Data Fields

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. Table B-9 enumerates the 32-bit read-only data fields.

**Table B-9. Encodings for 32-Bit Read-Only Data Fields (0100\_01xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
VM-instruction error	00000000B	00004400H
Exit reason	00000001B	00004402H
VM-exit interruption information	00000010B	00004404H
VM-exit interruption error code	00000011B	00004406H
IDT-vectoring information field	00000100B	00004408H
IDT-vectoring error code	00000101B	0000440AH
VM-exit instruction length	00000110B	0000440CH
VM-exit instruction information	00000111B	0000440EH

### B.3.3 32-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table B-10 enumerates the 32-bit guest-state fields.

**Table B-10. Encodings for 32-Bit Guest-State Fields (0100\_10xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
Guest ES limit	00000000B	00004800H
Guest CS limit	00000001B	00004802H
Guest SS limit	00000010B	00004804H
Guest DS limit	00000011B	00004806H
Guest FS limit	00000100B	00004808H
Guest GS limit	00000101B	0000480AH
Guest LDTR limit	00000110B	0000480CH
Guest TR limit	00000111B	0000480EH
Guest GDTR limit	00001000B	00004810H
Guest IDTR limit	00001001B	00004812H
Guest ES access rights	00001010B	00004814H
Guest CS access rights	00001011B	00004816H
Guest SS access rights	00001100B	00004818H
Guest DS access rights	00001101B	0000481AH
Guest FS access rights	00001110B	0000481CH
Guest GS access rights	00001111B	0000481EH
Guest LDTR access rights	00010000B	00004820H
Guest TR access rights	00010001B	00004822H
Guest interruptibility state	00010010B	00004824H
Guest activity state	00010011B	00004826H

**Table B-10. Encodings for 32-Bit Guest-State Fields (0100\_10xx\_xxxx\_xxx0B) (Contd.)**

Field Name	Index	Encoding
Guest SMBASE	000010100B	00004828H
Guest IA32_SYSENTER_CS	000010101B	0000482AH
VMX-preemption timer value <sup>1</sup>	000010111B	0000482EH

**NOTES:**

1. This field exists only on processors that support the 1-setting of the “activate VMX-preemption timer” VM-execution control.

The limit fields for GDTR and IDTR are defined to be 32 bits in width even though these fields are only 16-bits wide in the Intel 64 and IA-32 architectures. VM entry ensures that the high 16 bits of both these fields are cleared to 0.

**B.3.4 32-Bit Host-State Field**

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. There is only one such 32-bit field as given in Table B-11.

**Table B-11. Encoding for 32-Bit Host-State Field (0100\_11xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
Host IA32_SYSENTER_CS	000000000B	00004C00H

**B.4 NATURAL-WIDTH FIELDS**

A value of 3 in bits 14:13 of an encoding indicates a natural-width field. As noted in Section 24.11.2, each of these fields allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

**B.4.1 Natural-Width Control Fields**

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table B-12 enumerates the natural-width control fields.

**Table B-12. Encodings for Natural-Width Control Fields (0110\_00xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
CR0 guest/host mask	000000000B	00006000H
CR4 guest/host mask	000000001B	00006002H
CR0 read shadow	000000010B	00006004H
CR4 read shadow	000000011B	00006006H
CR3-target value 0	000000100B	00006008H
CR3-target value 1	000000101B	0000600AH
CR3-target value 2	000000110B	0000600CH
CR3-target value 3 <sup>1</sup>	000000111B	0000600EH

**NOTES:**

1. If a future implementation supports more than 4 CR3-target values, they will be encoded consecutively following the 4 encodings given here.

## B.4.2 Natural-Width Read-Only Data Fields

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. Table B-13 enumerates the natural-width read-only data fields.

**Table B-13. Encodings for Natural-Width Read-Only Data Fields (0110\_01xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
Exit qualification	000000000B	00006400H
I/O RCX	000000001B	00006402H
I/O RSI	000000010B	00006404H
I/O RDI	000000011B	00006406H
I/O RIP	000000100B	00006408H
Guest-linear address	000000101B	0000640AH

## B.4.3 Natural-Width Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table B-14 enumerates the natural-width guest-state fields.

**Table B-14. Encodings for Natural-Width Guest-State Fields (0110\_10xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
Guest CR0	000000000B	00006800H
Guest CR3	000000001B	00006802H
Guest CR4	000000010B	00006804H
Guest ES base	000000011B	00006806H
Guest CS base	000000100B	00006808H
Guest SS base	000000101B	0000680AH
Guest DS base	000000110B	0000680CH
Guest FS base	000000111B	0000680EH
Guest GS base	000001000B	00006810H
Guest LDTR base	000001001B	00006812H
Guest TR base	000001010B	00006814H
Guest GDTR base	000001011B	00006816H
Guest IDTR base	000001100B	00006818H
Guest DR7	000001101B	0000681AH
Guest RSP	000001110B	0000681CH
Guest RIP	000001111B	0000681EH
Guest RFLAGS	000010000B	00006820H
Guest pending debug exceptions	000010001B	00006822H
Guest IA32_SYSENTER_ESP	000010010B	00006824H
Guest IA32_SYSENTER_EIP	000010011B	00006826H

The base-address fields for ES, CS, SS, and DS in the guest-state area are defined to be natural-width (with 64 bits on processors supporting Intel 64 architecture) even though these fields are only 32-bits wide in the Intel 64 architecture. VM entry ensures that the high 32 bits of these fields are cleared to 0.

## B.4.4 Natural-Width Host-State Fields

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table B-15 enumerates the natural-width host-state fields.

**Table B-15. Encodings for Natural-Width Host-State Fields (0110\_11xx\_xxxx\_xxx0B)**

Field Name	Index	Encoding
Host CR0	00000000B	00006C00H
Host CR3	00000001B	00006C02H
Host CR4	00000010B	00006C04H
Host FS base	00000011B	00006C06H
Host GS base	00000100B	00006C08H

Host IDTR base	00000111B	00006C0EH
Host IA32_SYSENTER_ESP	00001000B	00006C10H
Host IA32_SYSENTER_EIP	00001001B	00006C12H
Host RSP	00001010B	00006C14H
Host RIP	00001011B	00006C16H

## APPENDIX C VMX BASIC EXIT REASONS

Every VM exit writes a 32-bit exit reason to the VMCS (see Section 24.9.1). Certain VM-entry failures also do this (see Section 26.7). The low 16 bits of the exit-reason field form the basic exit reason which provides basic information about the cause of the VM exit or VM-entry failure.

Table C-1 lists values for basic exit reasons and explains their meaning. Entries apply to VM exits, unless otherwise noted.

**Table C-1. Basic Exit Reasons**

Basic Exit Reason	Description
0	<b>Exception or non-maskable interrupt (NMI).</b> Either: 1: Guest software caused an exception and the bit in the exception bitmap associated with exception's vector was 1. 2: An NMI was delivered to the logical processor and the "NMI exiting" VM-execution control was 1. This case includes executions of BOUND that cause #BR, executions of INT3 (they cause #BP), executions of INTO that cause #OF, and executions of UD (they cause #UD).
1	<b>External interrupt.</b> An external interrupt arrived and the "external-interrupt exiting" VM-execution control was 1.
2	<b>Triple fault.</b> The logical processor encountered an exception while attempting to call the double-fault handler and that exception did not itself cause a VM exit due to the exception bitmap.
3	<b>INIT signal.</b> An INIT signal arrived
4	<b>Start-up IPI (SIPI).</b> A SIPI arrived while the logical processor was in the "wait-for-SIPI" state.
5	<b>I/O system-management interrupt (SMI).</b> An SMI arrived immediately after retirement of an I/O instruction and caused an SMM VM exit (see Section 34.15.2).
6	<b>Other SMI.</b> An SMI arrived and caused an SMM VM exit (see Section 34.15.2) but not immediately after retirement of an I/O instruction.
7	<b>Interrupt window.</b> At the beginning of an instruction, RFLAGS.IF was 1; events were not blocked by STI or by MOV SS; and the "interrupt-window exiting" VM-execution control was 1.
8	<b>NMI window.</b> At the beginning of an instruction, there was no virtual-NMI blocking; events were not blocked by MOV SS; and the "NMI-window exiting" VM-execution control was 1.
9	<b>Task switch.</b> Guest software attempted a task switch.
10	<b>CPUID.</b> Guest software attempted to execute CPUID.
11	<b>GETSEC.</b> Guest software attempted to execute GETSEC.
12	<b>HLT.</b> Guest software attempted to execute HLT and the "HLT exiting" VM-execution control was 1.
13	<b>INVD.</b> Guest software attempted to execute INVD.
14	<b>INVLPG.</b> Guest software attempted to execute INVLPG and the "INVLPG exiting" VM-execution control was 1.
15	<b>RDPMC.</b> Guest software attempted to execute RDPMC and the "RDPMC exiting" VM-execution control was 1.
16	<b>RDTSC.</b> Guest software attempted to execute RDTSC and the "RDTSC exiting" VM-execution control was 1.
17	<b>RSM.</b> Guest software attempted to execute RSM in SMM.
18	<b>VMCALL.</b> VMCALL was executed either by guest software (causing an ordinary VM exit) or by the executive monitor (causing an SMM VM exit; see Section 34.15.2).
19	<b>VMCLEAR.</b> Guest software attempted to execute VMCLEAR.
20	<b>VMLAUNCH.</b> Guest software attempted to execute VMLAUNCH.
21	<b>VMPTRLD.</b> Guest software attempted to execute VMPTRLD.
22	<b>VMPTRST.</b> Guest software attempted to execute VMPTRST.
23	<b>VMREAD.</b> Guest software attempted to execute VMREAD.

**Table C-1. Basic Exit Reasons (Contd.)**

Basic Exit Reason	Description
24	<b>VMRESUME.</b> Guest software attempted to execute VMRESUME.
25	<b>VMWRITE.</b> Guest software attempted to execute VMWRITE.
26	<b>VMXOFF.</b> Guest software attempted to execute VMXOFF.
27	<b>VMXON.</b> Guest software attempted to execute VMXON.
28	<b>Control-register accesses.</b> Guest software attempted to access CR0, CR3, CR4, or CR8 using CLTS, LMSW, or MOV CR and the VM-execution control fields indicate that a VM exit should occur (see Section 25.1 for details). This basic exit reason is not used for trap-like VM exits following executions of the MOV to CR8 instruction when the “use TPR shadow” VM-execution control is 1. Such VM exits instead use basic exit reason 43.
29	<b>MOV DR.</b> Guest software attempted a MOV to or from a debug register and the “MOV-DR exiting” VM-execution control was 1.
30	<b>I/O instruction.</b> Guest software attempted to execute an I/O instruction and either: 1: The “use I/O bitmaps” VM-execution control was 0 and the “unconditional I/O exiting” VM-execution control was 1. 2: The “use I/O bitmaps” VM-execution control was 1 and a bit in the I/O bitmap associated with one of the ports accessed by the I/O instruction was 1.
31	<b>RDMSR.</b> Guest software attempted to execute RDMSR and either: 1: The “use MSR bitmaps” VM-execution control was 0. 2: The value of RCX is neither in the range 00000000H - 00001FFFH nor in the range C0000000H - C0001FFFH. 3: The value of RCX was in the range 00000000H - 00001FFFH and the $n^{\text{th}}$ bit in read bitmap for low MSRs is 1, where $n$ was the value of RCX. 4: The value of RCX is in the range C0000000H - C0001FFFH and the $n^{\text{th}}$ bit in read bitmap for high MSRs is 1, where $n$ is the value of RCX & 00001FFFH.
32	<b>WRMSR.</b> Guest software attempted to execute WRMSR and either: 1: The “use MSR bitmaps” VM-execution control was 0. 2: The value of RCX is neither in the range 00000000H - 00001FFFH nor in the range C0000000H - C0001FFFH. 3: The value of RCX was in the range 00000000H - 00001FFFH and the $n^{\text{th}}$ bit in write bitmap for low MSRs is 1, where $n$ was the value of RCX. 4: The value of RCX is in the range C0000000H - C0001FFFH and the $n^{\text{th}}$ bit in write bitmap for high MSRs is 1, where $n$ is the value of RCX & 00001FFFH.
33	<b>VM-entry failure due to invalid guest state.</b> A VM entry failed one of the checks identified in Section 26.3.1.
34	<b>VM-entry failure due to MSR loading.</b> A VM entry failed in an attempt to load MSRs. See Section 26.4.
36	<b>MWAIT.</b> Guest software attempted to execute MWAIT and the “MWAIT exiting” VM-execution control was 1.
37	<b>Monitor trap flag.</b> A VM entry occurred due to the 1-setting of the “monitor trap flag” VM-execution control and injection of an MTF VM exit as part of VM entry. See Section 25.5.2.
39	<b>MONITOR.</b> Guest software attempted to execute MONITOR and the “MONITOR exiting” VM-execution control was 1.
40	<b>PAUSE.</b> Either guest software attempted to execute PAUSE and the “PAUSE exiting” VM-execution control was 1 or the “PAUSE-loop exiting” VM-execution control was 1 and guest software executed a PAUSE loop with execution time exceeding PLE_Window (see Section 25.1.3).
41	<b>VM-entry failure due to machine-check event.</b> A machine-check event occurred during VM entry (see Section 26.8).
43	<b>TPR below threshold.</b> The logical processor determined that the value of bits 7:4 of the byte at offset 080H on the virtual-APIC page was below that of the TPR threshold VM-execution control field while the “use TPR shadow” VM-execution control was 1 either as part of TPR virtualization (Section 29.1.2) or VM entry (Section 26.6.7).
44	<b>APIC access.</b> Guest software attempted to access memory at a physical address on the APIC-access page and the “virtualize APIC accesses” VM-execution control was 1 (see Section 29.4).
45	<b>Virtualized EOI.</b> EOI virtualization was performed for a virtual interrupt whose vector indexed a bit set in the EOI-exit bitmap.

Table C-1. Basic Exit Reasons (Contd.)

Basic Exit Reason	Description
46	<b>Access to GDTR or IDTR.</b> Guest software attempted to execute LGDT, LIDT, SGDT, or SIDT and the “descriptor-table exiting” VM-execution control was 1.
47	<b>Access to LDTR or TR.</b> Guest software attempted to execute LLDT, LTR, SLDT, or STR and the “descriptor-table exiting” VM-execution control was 1.
48	<b>EPT violation.</b> An attempt to access memory with a guest-physical address was disallowed by the configuration of the EPT paging structures.
49	<b>EPT misconfiguration.</b> An attempt to access memory with a guest-physical address encountered a misconfigured EPT paging-structure entry.
50	<b>INVEPT.</b> Guest software attempted to execute INVEPT.
51	<b>RDTSCP.</b> Guest software attempted to execute RDTSCP and the “enable RDTSCP” and “RDTSC exiting” VM-execution controls were both 1.
52	<b>VMX-preemption timer expired.</b> The preemption timer counted down to zero.
53	<b>INVPID.</b> Guest software attempted to execute INVVPID.
54	<b>WBINVD.</b> Guest software attempted to execute WBINVD and the “WBINVD exiting” VM-execution control was 1.
55	<b>XSETBV.</b> Guest software attempted to execute XSETBV.
56	<b>APIC write.</b> Guest software completed a write to the virtual-APIC page that must be virtualized by VMM software (see Section 29.4.3.3).
57	<b>RDRAND.</b> Guest software attempted to execute RDRAND and the “RDRAND exiting” VM-execution control was 1.
58	<b>INVPCID.</b> Guest software attempted to execute INVPCID and the “enable INVPCID” and “INVLPG exiting” VM-execution controls were both 1.
59	<b>VMFUNC.</b> Guest software invoked a VM function with the VMFUNC instruction and the VM function either was not enabled or generated a function-specific condition causing a VM exit.
60	<b>ENCLS.</b> Guest software attempted to execute ENCLS and “enable ENCLS exiting” VM-execution control was 1 and either (1) EAX < 63 and the corresponding bit in the ENCLS-exiting bitmap is 1; or (2) EAX ≥ 63 and bit 63 in the ENCLS-exiting bitmap is 1.
61	<b>RDSEED.</b> Guest software attempted to execute RDSEED and the “RDSEED exiting” VM-execution control was 1.
62	<b>Page-modification log full.</b> The processor attempted to create a page-modification log entry and the value of the PML index was not in the range 0-511.
63	<b>XSAVES.</b> Guest software attempted to execute XSAVES, the “enable XSAVES/XRSTORS” was 1, and a bit was set in the logical-AND of the following three values: EDX:EAX, the IA32_XSS MSR, and the XSS-exiting bitmap.
64	<b>XRSTORS.</b> Guest software attempted to execute XRSTORS, the “enable XSAVES/XRSTORS” was 1, and a bit was set in the logical-AND of the following three values: EDX:EAX, the IA32_XSS MSR, and the XSS-exiting bitmap.

# Intel® 64 and IA-32 Architectures Software Developer's Manual

## Volume 4: Model-Specific Registers

**NOTE:** The *Intel® 64 and IA-32 Architectures Software Developer's Manual* consists of ten volumes: *Basic Architecture*, Order Number 253665; *Instruction Set Reference A-L*, Order Number 253666; *Instruction Set Reference M-U*, Order Number 253667; *Instruction Set Reference V-Z*, Order Number 326018; *Instruction Set Reference*, Order Number 334569; *System Programming Guide, Part 1*, Order Number 253668; *System Programming Guide, Part 2*, Order Number 253669; *System Programming Guide, Part 3*, Order Number 326019; *System Programming Guide, Part 4*, Order Number 332831; *Model-Specific Registers*, Order Number 335592. Refer to all ten volumes when evaluating your design needs.

Order Number: 335592-066US  
March 2018

Intel technologies features and benefits depend on system configuration and may require enabled hardware, software, or service activation. Learn more at [intel.com](http://intel.com), or from the OEM or retailer.

## CHAPTER 1

### ABOUT THIS MANUAL

1.1	INTEL® 64 AND IA-32 PROCESSORS COVERED IN THIS MANUAL .....	1-1
1.2	OVERVIEW OF THE SYSTEM PROGRAMMING GUIDE .....	1-4
1.3	NOTATIONAL CONVENTIONS .....	1-4
1.3.1	Bit and Byte Order .....	1-4
1.3.2	Reserved Bits and Software Compatibility .....	1-4
1.3.3	Instruction Operands .....	1-5
1.3.4	Hexadecimal and Binary Numbers .....	1-5
1.3.5	Segmented Addressing .....	1-5
1.3.6	Syntax for CPUID, CR, and MSR Values .....	1-6
1.3.7	Exceptions .....	1-7
1.4	RELATED LITERATURE .....	1-7

## CHAPTER 2

### MODEL-SPECIFIC REGISTERS (MSRS)

2.1	ARCHITECTURAL MSRS .....	2-2
2.2	MSRS IN THE INTEL® CORE™ 2 PROCESSOR FAMILY .....	2-44
2.3	MSRS IN THE 45 NM AND 32 NM INTEL® ATOM™ PROCESSOR FAMILY .....	2-58
2.4	MSRS IN INTEL PROCESSORS BASED ON SILVERMONT MICROARCHITECTURE .....	2-69
2.4.1	MSRs with Model-Specific Behavior in the Silvermont Microarchitecture .....	2-82
2.4.2	MSRs In Intel Atom Processors Based on Airmont Microarchitecture .....	2-85
2.5	MSRS IN INTEL ATOM PROCESSORS BASED ON GOLDMONT MICROARCHITECTURE .....	2-88
2.6	MSRS IN INTEL ATOM PROCESSORS BASED ON GOLDMONT PLUS MICROARCHITECTURE .....	2-111
2.7	MSRS IN THE INTEL® MICROARCHITECTURE CODE NAME NEHALEM .....	2-115
2.7.1	Additional MSRs in the Intel® Xeon® Processor 5500 and 3400 Series .....	2-134
2.7.2	Additional MSRs in the Intel® Xeon® Processor 7500 Series .....	2-135
2.8	MSRS IN THE INTEL® XEON® PROCESSOR 5600 SERIES (BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE) .....	2-149
2.9	MSRS IN THE INTEL® XEON® PROCESSOR E7 FAMILY (BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE) .....	2-150
2.10	MSRS IN INTEL® PROCESSOR FAMILY BASED ON INTEL® MICROARCHITECTURE CODE NAME SANDY BRIDGE .....	2-152
2.10.1	MSRs In 2nd Generation Intel® Core™ Processor Family (Based on Intel® Microarchitecture Code Name Sandy Bridge) .....	2-172
2.10.2	MSRs In Intel® Xeon® Processor E5 Family (Based on Intel® Microarchitecture Code Name Sandy Bridge) .....	2-176
2.10.3	Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 Family .....	2-180
2.11	MSRS IN THE 3RD GENERATION INTEL® CORE™ PROCESSOR FAMILY (BASED ON INTEL® MICROARCHITECTURE CODE NAME IVY BRIDGE) .....	2-184
2.11.1	MSRs In Intel® Xeon® Processor E5 v2 Product Family (Based on Ivy Bridge-E Microarchitecture) .....	2-187
2.11.2	Additional MSRs Supported by Intel® Xeon® Processor E7 v2 Family .....	2-195
2.11.3	Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v2 and E7 v2 Families .....	2-197
2.12	MSRS IN THE 4TH GENERATION INTEL® CORE™ PROCESSORS (BASED ON HASWELL MICROARCHITECTURE) .....	2-201
2.12.1	MSRs in 4th Generation Intel® Core™ Processor Family (based on Haswell Microarchitecture) .....	2-206
2.12.2	Additional Residency MSRs Supported in 4th Generation Intel® Core™ Processors .....	2-218
2.13	MSRS IN INTEL® XEON® PROCESSOR E5 V3 AND E7 V3 PRODUCT FAMILY .....	2-220
2.13.1	Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v3 Family .....	2-230
2.14	MSRS IN INTEL® CORE™ M PROCESSORS AND 5TH GENERATION INTEL® CORE™ PROCESSORS .....	2-240
2.15	MSRS IN INTEL® XEON® PROCESSORS E5 V4 FAMILY .....	2-244
2.15.1	Additional MSRs Supported in the Intel® Xeon® Processor D Product Family .....	2-255
2.15.2	Additional MSRs Supported in Intel® Xeon® Processors E5 v4 and E7 v4 Families .....	2-256
2.16	MSRS IN THE 6TH GENERATION, 7TH GENERATION AND 8TH GENERATION INTEL® CORE™ PROCESSORS, INTEL® XEON® PROCESSOR SCALABLE FAMILY, AND FUTURE INTEL® CORE™ PROCESSORS .....	2-260
2.16.1	MSRs Specific to 7th Generation and 8th Generation Intel® Core™ Processors based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture .....	2-282
2.16.2	MSRs Specific to Future Intel® Core™ Processors .....	2-284
2.16.3	MSRs Specific to Intel® Xeon® Processor Scalable Family .....	2-288
2.17	MSRS IN INTEL® XEON PHI™ PROCESSOR 3200/5200/7200 SERIES AND INTEL® XEON PHI™ PROCESSOR 7215/7285/7295 SERIES .....	2-300
2.18	MSRS IN THE PENTIUM® 4 AND INTEL® XEON® PROCESSORS .....	2-317

## CONTENTS

	PAGE
2.18.1 MSRs Unique to Intel® Xeon® Processor MP with L3 Cache.....	2-342
2.19 MSRS IN INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS.....	2-343
2.20 MSRS IN THE PENTIUM M PROCESSOR.....	2-352
2.21 MSRS IN THE P6 FAMILY PROCESSORS.....	2-359
2.22 MSRS IN PENTIUM PROCESSORS.....	2-368
2.23 MSR INDEX.....	2-369

# CHAPTER 1 ABOUT THIS MANUAL

---

The *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4: Model-Specific Registers* (order number 335592) is part of a set that describes the architecture and programming environment of Intel® 64 and IA-32 architecture processors. Other volumes in this set are:

- *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1: Basic Architecture* (order number 253665).
- *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 2A, 2B, 2C & 2D: Instruction Set Reference* (order numbers 253666, 253667, 326018 and 334569).
- The *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 3A, 3B, 3C & 3D: System Programming Guide* (order numbers 253668, 253669, 326019 and 332831).

The *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1*, describes the basic architecture and programming environment of Intel 64 and IA-32 processors. The *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 2A, 2B, 2C & 2D*, describe the instruction set of the processor and the opcode structure. These volumes apply to application programmers and to programmers who write operating systems or executives. The *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volumes 3A, 3B, 3C & 3D*, describe the operating-system support environment of Intel 64 and IA-32 processors. These volumes target operating-system and BIOS designers. In addition, *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B*, and *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C* address the programming environment for classes of software that host operating systems. The *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4*, describes the model-specific registers of Intel 64 and IA-32 processors.

## 1.1 INTEL® 64 AND IA-32 PROCESSORS COVERED IN THIS MANUAL

This manual set includes information pertaining primarily to the most recent Intel 64 and IA-32 processors, which include:

- Pentium® processors
- P6 family processors
- Pentium® 4 processors
- Pentium® M processors
- Intel® Xeon® processors
- Pentium® D processors
- Pentium® processor Extreme Editions
- 64-bit Intel® Xeon® processors
- Intel® Core™ Duo processor
- Intel® Core™ Solo processor
- Dual-Core Intel® Xeon® processor LV
- Intel® Core™2 Duo processor
- Intel® Core™2 Quad processor Q6000 series
- Intel® Xeon® processor 3000, 3200 series
- Intel® Xeon® processor 5000 series
- Intel® Xeon® processor 5100, 5300 series
- Intel® Core™2 Extreme processor X7000 and X6800 series
- Intel® Core™2 Extreme QX6000 series
- Intel® Xeon® processor 7100 series

## ABOUT THIS MANUAL

- Intel® Pentium® Dual-Core processor
- Intel® Xeon® processor 7200, 7300 series
- Intel® Core™2 Extreme QX9000 series
- Intel® Xeon® processor 5200, 5400, 7400 series
- Intel® Core™2 Extreme processor QX9000 and X9000 series
- Intel® Core™2 Quad processor Q9000 series
- Intel® Core™2 Duo processor E8000, T9000 series
- Intel® Atom™ processors 200, 300, D400, D500, D2000, N200, N400, N2000, E2000, Z500, Z600, Z2000, C1000 series are built from 45 nm and 32 nm processes.
- Intel® Core™ i7 processor
- Intel® Core™ i5 processor
- Intel® Xeon® processor E7-8800/4800/2800 product families
- Intel® Core™ i7-3930K processor
- 2nd generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx processor series
- Intel® Xeon® processor E3-1200 product family
- Intel® Xeon® processor E5-2400/1400 product family
- Intel® Xeon® processor E5-4600/2600/1600 product family
- 3rd generation Intel® Core™ processors
- Intel® Xeon® processor E3-1200 v2 product family
- Intel® Xeon® processor E5-2400/1400 v2 product families
- Intel® Xeon® processor E5-4600/2600/1600 v2 product families
- Intel® Xeon® processor E7-8800/4800/2800 v2 product families
- 4th generation Intel® Core™ processors
- The Intel® Core™ M processor family
- Intel® Core™ i7-59xx Processor Extreme Edition
- Intel® Core™ i7-49xx Processor Extreme Edition
- Intel® Xeon® processor E3-1200 v3 product family
- Intel® Xeon® processor E5-2600/1600 v3 product families
- 5th generation Intel® Core™ processors
- Intel® Xeon® processor D-1500 product family
- Intel® Xeon® processor E5 v4 family
- Intel® Atom™ processor X7-Z8000 and X5-Z8000 series
- Intel® Atom™ processor Z3400 series
- Intel® Atom™ processor Z3500 series
- 6th generation Intel® Core™ processors
- Intel® Xeon® processor E3-1500m v5 product family
- 7th generation Intel® Core™ processors
- Intel® Xeon Phi™ Processor 3200, 5200, 7200 Series
- Intel® Xeon® Processor Scalable Family
- 8th generation Intel® Core™ processors
- Intel® Xeon Phi™ Processor 7215, 7285, 7295 Series

P6 family processors are IA-32 processors based on the P6 family microarchitecture. This includes the Pentium® Pro, Pentium® II, Pentium® III, and Pentium® III Xeon® processors.

The Pentium® 4, Pentium® D, and Pentium® processor Extreme Editions are based on the Intel NetBurst® microarchitecture. Most early Intel® Xeon® processors are based on the Intel NetBurst® microarchitecture. Intel Xeon processor 5000, 7100 series are based on the Intel NetBurst® microarchitecture.

The Intel® Core™ Duo, Intel® Core™ Solo and dual-core Intel® Xeon® processor LV are based on an improved Pentium® M processor microarchitecture.

The Intel® Xeon® processor 3000, 3200, 5100, 5300, 7200, and 7300 series, Intel® Pentium® dual-core, Intel® Core™2 Duo, Intel® Core™2 Quad, and Intel® Core™2 Extreme processors are based on Intel® Core™ microarchitecture.

The Intel® Xeon® processor 5200, 5400, 7400 series, Intel® Core™2 Quad processor Q9000 series, and Intel® Core™2 Extreme processors QX9000, X9000 series, Intel® Core™2 processor E8000 series are based on Enhanced Intel® Core™ microarchitecture.

The Intel® Atom™ processors 200, 300, D400, D500, D2000, N200, N400, N2000, E2000, Z500, Z600, Z2000, C1000 series are based on the Intel® Atom™ microarchitecture and supports Intel 64 architecture.

P6 family, Pentium® M, Intel® Core™ Solo, Intel® Core™ Duo processors, dual-core Intel® Xeon® processor LV, and early generations of Pentium 4 and Intel Xeon processors support IA-32 architecture. The Intel® Atom™ processor Z5xx series support IA-32 architecture.

The Intel® Xeon® processor 3000, 3200, 5000, 5100, 5200, 5300, 5400, 7100, 7200, 7300, 7400 series, Intel® Core™2 Duo, Intel® Core™2 Extreme, Intel® Core™2 Quad processors, Pentium® D processors, Pentium® Dual-Core processor, newer generations of Pentium 4 and Intel Xeon processor family support Intel® 64 architecture.

The Intel® Core™ i7 processor and Intel® Xeon® processor 3400, 5500, 7500 series are based on 45 nm Intel® microarchitecture code name Nehalem. Intel® microarchitecture code name Westmere is a 32 nm version of Intel® microarchitecture code name Nehalem. Intel® Xeon® processor 5600 series, Intel Xeon processor E7 and various Intel Core i7, i5, i3 processors are based on Intel® microarchitecture code name Westmere. These processors support Intel 64 architecture.

The Intel® Xeon® processor E5 family, Intel® Xeon® processor E3-1200 family, Intel® Xeon® processor E7-8800/4800/2800 product families, Intel® Core™ i7-3930K processor, and 2nd generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx processor series are based on the Intel® microarchitecture code name Sandy Bridge and support Intel 64 architecture.

The Intel® Xeon® processor E7-8800/4800/2800 v2 product families, Intel® Xeon® processor E3-1200 v2 product family and 3rd generation Intel® Core™ processors are based on the Intel® microarchitecture code name Ivy Bridge and support Intel 64 architecture.

The Intel® Xeon® processor E5-4600/2600/1600 v2 product families, Intel® Xeon® processor E5-2400/1400 v2 product families and Intel® Core™ i7-49xx Processor Extreme Edition are based on the Intel® microarchitecture code name Ivy Bridge-E and support Intel 64 architecture.

The Intel® Xeon® processor E3-1200 v3 product family and 4th Generation Intel® Core™ processors are based on the Intel® microarchitecture code name Haswell and support Intel 64 architecture.

The Intel® Xeon® processor E5-2600/1600 v3 product families and the Intel® Core™ i7-59xx Processor Extreme Edition are based on the Intel® microarchitecture code name Haswell-E and support Intel 64 architecture.

The Intel® Atom™ processor Z8000 series is based on the Intel microarchitecture code name Airmont.

The Intel® Atom™ processor Z3400 series and the Intel® Atom™ processor Z3500 series are based on the Intel microarchitecture code name Silvermont.

The Intel® Core™ M processor family, 5th generation Intel® Core™ processors, Intel® Xeon® processor D-1500 product family and the Intel® Xeon® processor E5 v4 family are based on the Intel® microarchitecture code name Broadwell and support Intel 64 architecture.

The Intel® Xeon® Processor Scalable Family, Intel® Xeon® processor E3-1500m v5 product family and 6th generation Intel® Core™ processors are based on the Intel® microarchitecture code name Skylake and support Intel 64 architecture.

The 7th generation Intel® Core™ processors are based on the Intel® microarchitecture code name Kaby Lake and support Intel 64 architecture.

The Intel® Xeon Phi™ Processor 3200, 5200, 7200 Series is based on the Intel® microarchitecture code name Knights Landing and supports Intel 64 architecture.

The 8th generation Intel® Core™ processors are based on the Intel® microarchitecture code name Coffee Lake and support Intel 64 architecture.

The Intel® Xeon Phi™ Processor 7215, 7285, 7295 Series is based on the Intel® microarchitecture code name Knights Mill and supports Intel 64 architecture.

IA-32 architecture is the instruction set architecture and programming environment for Intel's 32-bit microprocessors. Intel® 64 architecture is the instruction set architecture and programming environment which is the superset of Intel's 32-bit and 64-bit architectures. It is compatible with the IA-32 architecture.

## 1.2 OVERVIEW OF THE SYSTEM PROGRAMMING GUIDE

A description of this manual's content follows:

**Chapter 1 — About This Manual.** Gives an overview of all eight volumes of the *Intel® 64 and IA-32 Architectures Software Developer's Manual*. It also describes the notational conventions in these manuals and lists related Intel manuals and documentation of interest to programmers and hardware designers.

**Chapter 2 — Model-Specific Registers (MSRs).** Lists the MSRs available in the Pentium processors, the P6 family processors, the Pentium 4, Intel Xeon, Intel Core Solo, Intel Core Duo processors, Intel Core 2 processor family, and Intel Atom processors, and describes their functions.

## 1.3 NOTATIONAL CONVENTIONS

This manual uses specific notation for data-structure formats, for symbolic representation of instructions, and for hexadecimal and binary numbers. A review of this notation makes the manual easier to read.

### 1.3.1 Bit and Byte Order

In illustrations of data structures in memory, smaller addresses appear toward the bottom of the figure; addresses increase toward the top. Bit positions are numbered from right to left. The numerical value of a set bit is equal to two raised to the power of the bit position. Intel 64 and IA-32 processors are "little endian" machines; this means the bytes of a word are numbered starting from the least significant byte. Figure 1-1 illustrates these conventions.

### 1.3.2 Reserved Bits and Software Compatibility

In many register and memory layout descriptions, certain bits are marked as reserved. When bits are marked as reserved, it is essential for compatibility with future processors that software treat these bits as having a future, though unknown, effect. The behavior of reserved bits should be regarded as not only undefined, but unpredictable. Software should follow these guidelines in dealing with reserved bits:

- Do not depend on the states of any reserved bits when testing the values of registers which contain such bits. Mask out the reserved bits before testing.
- Do not depend on the states of any reserved bits when storing to memory or to a register.
- Do not depend on the ability to retain information written into any reserved bits.
- When loading a register, always load the reserved bits with the values indicated in the documentation, if any, or reload them with values previously read from the same register.

#### NOTE

Avoid any software dependence upon the state of reserved bits in Intel 64 and IA-32 registers. Depending upon the values of reserved register bits will make software dependent upon the unspecified manner in which the processor handles these bits. Programs that depend upon reserved values risk incompatibility with future processors.

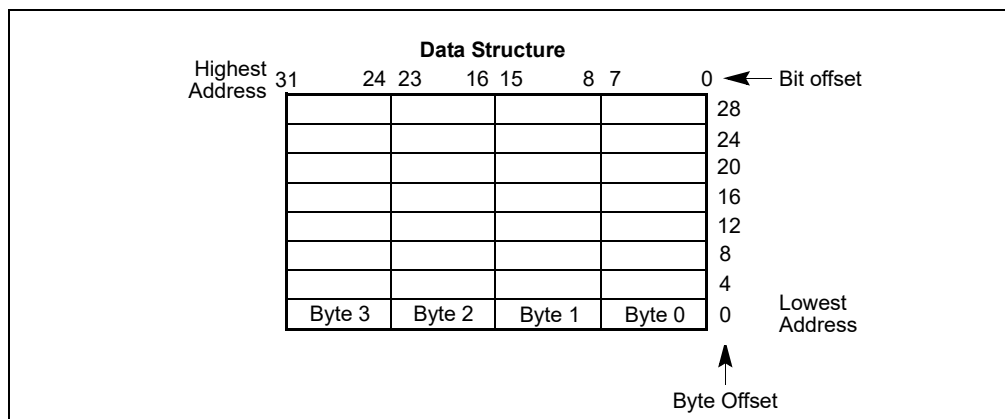

Figure 1-1. Bit and Byte Order

### 1.3.3 Instruction Operands

When instructions are represented symbolically, a subset of assembly language is used. In this subset, an instruction has the following format:

```
label: mnemonic argument1, argument2, argument3
```

where:

- A **label** is an identifier which is followed by a colon.
- A **mnemonic** is a reserved name for a class of instruction opcodes which have the same function.
- The operands **argument1**, **argument2**, and **argument3** are optional. There may be from zero to three operands, depending on the opcode. When present, they take the form of either literals or identifiers for data items. Operand identifiers are either reserved names of registers or are assumed to be assigned to data items declared in another part of the program (which may not be shown in the example).

When two operands are present in an arithmetic or logical instruction, the right operand is the source and the left operand is the destination.

For example:

```
LOADREG: MOV EAX, SUBTOTAL
```

In this example LOADREG is a label, MOV is the mnemonic identifier of an opcode, EAX is the destination operand, and SUBTOTAL is the source operand. Some assembly languages put the source and destination in reverse order.

### 1.3.4 Hexadecimal and Binary Numbers

Base 16 (hexadecimal) numbers are represented by a string of hexadecimal digits followed by the character H (for example, F82EH). A hexadecimal digit is a character from the following set: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, and F.

Base 2 (binary) numbers are represented by a string of 1s and 0s, sometimes followed by the character B (for example, 1010B). The "B" designation is only used in situations where confusion as to the type of number might arise.

### 1.3.5 Segmented Addressing

The processor uses byte addressing. This means memory is organized and accessed as a sequence of bytes. Whether one or more bytes are being accessed, a byte address is used to locate the byte or bytes memory. The range of memory that can be addressed is called an **address space**.

The processor also supports segmented addressing. This is a form of addressing where a program may have many independent address spaces, called **segments**. For example, a program can keep its code (instructions) and stack in separate segments. Code addresses would always refer to the code space, and stack addresses would always refer to the stack space. The following notation is used to specify a byte address within a segment:

Segment-register:Byte-address

For example, the following segment address identifies the byte at address FF79H in the segment pointed to by the DS register:

DS:FF79H

The following segment address identifies an instruction address in the code segment. The CS register points to the code segment and the EIP register contains the address of the instruction.

CS:EIP

### 1.3.6 Syntax for CPUID, CR, and MSR Values

Obtain feature flags, status, and system information by using the CPUID instruction, by checking control register bits, and by reading model-specific registers. We are moving toward a single syntax to represent this type of information. See Figure 1-2.

Figure 1-2. Syntax for CPUID, CR, and MSR Data Presentation

### 1.3.7 Exceptions

An exception is an event that typically occurs when an instruction causes an error. For example, an attempt to divide by zero generates an exception. However, some exceptions, such as breakpoints, occur under other conditions. Some types of exceptions may provide error codes. An error code reports additional information about the error. An example of the notation used to show an exception and error code is shown below:

```
#PF(fault code)
```

This example refers to a page-fault exception under conditions where an error code naming a type of fault is reported. Under some conditions, exceptions which produce error codes may not be able to report an accurate code. In this case, the error code is zero, as shown below for a general-protection exception:

```
#GP(0)
```

## CHAPTER 2

# MODEL-SPECIFIC REGISTERS (MSRS)

This chapter lists MSRs across Intel processor families. All MSRs listed can be read with the RDMSR and written with the WRMSR instructions.

Register addresses are given in both hexadecimal and decimal. The register name is the mnemonic register name and the bit description describes individual bits in registers.

Model specific registers and its bit-fields may be supported for a finite range of processor families/models. To distinguish between different processor family and/or models, software must use CPUID.01H leaf function to query the combination of DisplayFamily and DisplayModel to determine model-specific availability of MSRs (see CPUID instruction in Chapter 3, "Instruction Set Reference, A-L" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A*). Table 2-1 lists the signature values of DisplayFamily and DisplayModel for various processor families or processor number series.

**Table 2-1. CPUID Signature Values of DisplayFamily\_DisplayModel**

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_85H	Intel® Xeon Phi™ Processor 7215, 7285, 7295 Series based on Knights Mill microarchitecture
06_57H	Intel® Xeon Phi™ Processor 3200, 5200, 7200 Series based on Knights Landing microarchitecture
06_66H	Future Intel® Core™ processors based on Cannon Lake microarchitecture
06_8EH, 06_9EH	7th generation Intel® Core™ processors based on Kaby Lake microarchitecture and 8th generation Intel® Core™ processors based on Coffee Lake microarchitecture
06_55H	Intel® Xeon® Processor Scalable Family based on Skylake microarchitecture
06_4EH, 06_5EH	6th generation Intel Core processors and Intel Xeon processor E3-1500m v5 product family and E3-1200 v5 product family based on Skylake microarchitecture
06_56H	Intel Xeon processor D-1500 product family based on Broadwell microarchitecture
06_4FH	Intel Xeon processor E5 v4 Family based on Broadwell microarchitecture, Intel Xeon processor E7 v4 Family, Intel Core i7-69xx Processor Extreme Edition
06_47H	5th generation Intel Core processors, Intel Xeon processor E3-1200 v4 product family based on Broadwell microarchitecture
06_3DH	Intel Core M-5xxx Processor, 5th generation Intel Core processors based on Broadwell microarchitecture
06_3FH	Intel Xeon processor E5-4600/2600/1600 v3 product families, Intel Xeon processor E7 v3 product families based on Haswell-E microarchitecture, Intel Core i7-59xx Processor Extreme Edition
06_3CH, 06_45H, 06_46H	4th Generation Intel Core processor and Intel Xeon processor E3-1200 v3 product family based on Haswell microarchitecture
06_3EH	Intel Xeon processor E7-8800/4800/2800 v2 product families based on Ivy Bridge-E microarchitecture
06_3EH	Intel Xeon processor E5-2600/1600 v2 product families and Intel Xeon processor E5-2400 v2 product family based on Ivy Bridge-E microarchitecture, Intel Core i7-49xx Processor Extreme Edition
06_3AH	3rd Generation Intel Core Processor and Intel Xeon processor E3-1200 v2 product family based on Ivy Bridge microarchitecture
06_2DH	Intel Xeon processor E5 Family based on Intel microarchitecture code name Sandy Bridge, Intel Core i7-39xx Processor Extreme Edition
06_2FH	Intel Xeon Processor E7 Family
06_2AH	Intel Xeon processor E3-1200 product family; 2nd Generation Intel Core i7, i5, i3 Processors 2xxx Series
06_2EH	Intel Xeon processor 7500, 6500 series

**Table 2-1. CPUID Signature (Contd.)Values of DisplayFamily\_DisplayModel (Contd.)**

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_25H, 06_2CH	Intel Xeon processors 3600, 5600 series, Intel Core i7, i5 and i3 Processors
06_1EH, 06_1FH	Intel Core i7 and i5 Processors
06_1AH	Intel Core i7 Processor, Intel Xeon processor 3400, 3500, 5500 series
06_1DH	Intel Xeon processor MP 7400 series
06_17H	Intel Xeon processor 3100, 3300, 5200, 5400 series, Intel Core 2 Quad processors 8000, 9000 series
06_0FH	Intel Xeon processor 3000, 3200, 5100, 5300, 7300 series, Intel Core 2 Quad processor 6000 series, Intel Core 2 Extreme 6000 series, Intel Core 2 Duo 4000, 5000, 6000, 7000 series processors, Intel Pentium dual-core processors
06_0EH	Intel Core Duo, Intel Core Solo processors
06_0DH	Intel Pentium M processor
06_7AH	Intel® Atom™ processors based on Goldmont Plus Microarchitecture
06_5FH	Intel Atom processors based on Goldmont Microarchitecture (code name Denverton)
06_5CH	Intel Atom processors based on Goldmont Microarchitecture
06_4CH	Intel Atom processor X7-Z8000 and X5-Z8000 series based on Airmont Microarchitecture
06_5DH	Intel Atom processor X3-C3000 based on Silvermont Microarchitecture
06_5AH	Intel Atom processor Z3500 series
06_4AH	Intel Atom processor Z3400 series
06_37H	Intel Atom processor E3000 series, Z3600 series, Z3700 series
06_4DH	Intel Atom processor C2000 series
06_36H	Intel Atom processor S1000 Series
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	Intel Atom processor family, Intel Atom processor D2000, N2000, E2000, Z2000, C1000 series
0F_06H	Intel Xeon processor 7100, 5000 Series, Intel Xeon Processor MP, Intel Pentium 4, Pentium D processors
0F_03H, 0F_04H	Intel Xeon processor, Intel Xeon processor MP, Intel Pentium 4, Pentium D processors
06_09H	Intel Pentium M processor
0F_02H	Intel Xeon Processor, Intel Xeon processor MP, Intel Pentium 4 processors
0F_0H, 0F_01H	Intel Xeon Processor, Intel Xeon processor MP, Intel Pentium 4 processors
06_7H, 06_08H, 06_0AH, 06_0BH	Intel Pentium III Xeon processor, Intel Pentium III processor
06_03H, 06_05H	Intel Pentium II Xeon processor, Intel Pentium II processor
06_01H	Intel Pentium Pro processor
05_01H, 05_02H, 05_04H	Intel Pentium processor, Intel Pentium processor with MMX Technology

The Intel® Quark™ SoC X1000 processor can be identified by the signature of DisplayFamily\_DisplayModel = 05\_09H and SteppingID = 0

## 2.1 ARCHITECTURAL MSRS

Many MSRs have carried over from one generation of IA-32 processors to the next and to Intel 64 processors. A subset of MSRs and associated bit fields, which do not change on future processor generations, are now considered architectural MSRs. For historical reasons (beginning with the Pentium 4 processor), these “architectural MSRs” were given the prefix “IA32\_”. Table 2-2 lists the architectural MSRs, their addresses, their current names, their names in previous IA-32 processors, and bit fields that are considered architectural. MSR addresses outside Table 2-2 and certain bit fields in an MSR address that may overlap with architectural MSR addresses are model-specific.

Code that accesses a machine specified MSR and that is executed on a processor that does not support that MSR will generate an exception.

Architectural MSR or individual bit fields in an architectural MSR may be introduced or transitioned at the granularity of certain processor family/model or the presence of certain CPUID feature flags. The right-most column of Table 2-2 provides information on the introduction of each architectural MSR or its individual fields. This information is expressed either as signature values of "DF\_DM" (see Table 2-1) or via CPUID flags.

Certain bit field position may be related to the maximum physical address width, the value of which is expressed as "MAXPHYADDR" in Table 2-2. "MAXPHYADDR" is reported by CPUID.8000\_0008H leaf.

MSR address range between 40000000H - 400000FFH is marked as a specially reserved range. All existing and future processors will not implement any features using any MSR in this range.

**Table 2-2. IA-32 Architectural MSRs**

Register Address		Architectural MSR Name / Bit Fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
0H	0	IA32_P5_MC_ADDR (P5_MC_ADDR)	See Section 2.22, "MSRs in Pentium Processors."	Pentium Processor (05_01H)
1H	1	IA32_P5_MC_TYPE (P5_MC_TYPE)	See Section 2.22, "MSRs in Pentium Processors."	DF_DM = 05_01H
6H	6	IA32_MONITOR_FILTER_SIZE	See Section 8.10.5, "Monitor/Mwait Address Range Determination."	0F_03H
10H	16	IA32_TIME_STAMP_COUNTER (TSC)	See Section 17.17, "Time-Stamp Counter."	05_01H
17H	23	IA32_PLATFORM_ID (MSR_PLATFORM_ID)	Platform ID (RO) The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.	06_01H
		49:0	Reserved	
		52:50	Platform Id (RO) Contains information concerning the intended platform for the processor. 52 51 50 0 0 0 Processor Flag 0 0 0 1 Processor Flag 1 0 1 0 Processor Flag 2 0 1 1 Processor Flag 3 1 0 0 Processor Flag 4 1 0 1 Processor Flag 5 1 1 0 Processor Flag 6 1 1 1 Processor Flag 7	
		63:53	Reserved	
1BH	27	IA32_APIC_BASE (APIC_BASE)	This register holds the APIC base address, permitting the relocation of the APIC memory map. See Section 10.4.4, "Local APIC Status and Location" and Section 10.4.5, "Relocating the Local APIC Registers".	06_01H
		7:0	Reserved	
		8	BSP flag (R/W)	

**Table 2-2. IA-32 Architectural MSRs (Contd.)**

Register Address		Architectural MSR Name / Bit Fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
		9	Reserved	
		10	Enable x2APIC mode.	06_1AH
		11	APIC Global Enable (R/W)	
		(MAXPHYADDR - 1):12	APIC Base (R/W)	
		63: MAXPHYADDR	Reserved	
3AH	58	IA32_FEATURE_CONTROL	Control Features in Intel 64 Processor (R/W)	If any one enumeration condition for defined bit field holds.
		0	Lock bit (R/WO): (1 = locked). When set, locks this MSR from being written; writes to this bit will result in GP(0).  Note: Once the Lock bit is set, the contents of this register cannot be modified. Therefore the lock bit must be set after configuring support for Intel Virtualization Technology and prior to transferring control to an option ROM or the OS. Hence, once the Lock bit is set, the entire IA32_FEATURE_CONTROL contents are preserved across RESET when PWRGOOD is not deasserted.	If any one enumeration condition for defined bit field position greater than bit 0 holds.
		1	Enable VMX inside SMX operation (R/WL): This bit enables a system executive to use VMX in conjunction with SMX to support Intel® Trusted Execution Technology.  BIOS must set this bit only when the CPUID function 1 returns VMX feature flag and SMX feature flag set (ECX bits 5 and 6 respectively).	If CPUID.01H:ECX[5] = 1 && CPUID.01H:ECX[6] = 1
		2	Enable VMX outside SMX operation (R/WL): This bit enables VMX for a system executive that does not require SMX.  BIOS must set this bit only when the CPUID function 1 returns the VMX feature flag set (ECX bit 5).	If CPUID.01H:ECX[5] = 1
		7:3	Reserved	
		14:8	SENTER Local Function Enables (R/WL): When set, each bit in the field represents an enable control for a corresponding SENTER function. This bit is supported only if CPUID.1:ECX.[bit 6] is set.	If CPUID.01H:ECX[6] = 1
		15	SENTER Global Enable (R/WL): This bit must be set to enable SENTER leaf functions. This bit is supported only if CPUID.1:ECX.[bit 6] is set.	If CPUID.01H:ECX[6] = 1
		16	Reserved	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name / Bit Fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
		17	SGX Launch Control Enable (R/WL): This bit must be set to enable runtime reconfiguration of SGX Launch Control via the IA32_SGXLEPUBKEYHASHn MSR.	If CPUID.(EAX=07H, ECX=0H): ECX[30] = 1
		18	SGX Global Enable (R/WL): This bit must be set to enable SGX leaf functions.	If CPUID.(EAX=07H, ECX=0H): EBX[2] = 1
		19	Reserved	
		20	LMCE On (R/WL): When set, system software can program the MSRs associated with LMCE to configure delivery of some machine check exceptions to a single logical processor.	If IA32_MCG_CAP[27] = 1
		63:21	Reserved	
3BH	59	IA32_TSC_ADJUST	Per Logical Processor TSC Adjust (R/Write to clear)	If CPUID.(EAX=07H, ECX=0H): EBX[1] = 1
		63:0	THREAD_ADJUST: Local offset value of the IA32_TSC for a logical processor. Reset value is zero. A write to IA32_TSC will modify the local offset in IA32_TSC_ADJUST and the content of IA32_TSC, but does not affect the internal invariant TSC hardware.	
79H	121	IA32_BIOS_UPDT_TRIG (BIOS_UPDT_TRIG)	BIOS Update Trigger (W) Executing a WRMSR instruction to this MSR causes a microcode update to be loaded into the processor. See Section 9.11.6, "Microcode Update Loader." A processor may prevent writing to this MSR when loading guest states on VM entries or saving guest states on VM exits.	06_01H
8BH	139	IA32_BIOS_SIGN_ID (BIOS_SIGN/BBL_CR_D3)	BIOS Update Signature (RO) Returns the microcode update signature following the execution of CPUID.01H. A processor may prevent writing to this MSR when loading guest states on VM entries or saving guest states on VM exits.	06_01H
		31:0	Reserved	
		63:32	It is recommended that this field be pre-loaded with zero prior to executing CPUID. If the field remains zero following the execution of CPUID, this indicates that no microcode update is loaded. Any non-zero value is the microcode update signature.	

**Table 2-2. IA-32 Architectural MSRs (Contd.)**

Register Address		Architectural MSR Name / Bit Fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
8CH	140	IA32_SGXLEPUBKEYHASH0	IA32_SGXLEPUBKEYHASH[63:0] (R/W) Bits 63:0 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.	Read permitted If CPUID.(EAX=12H,ECX=0H): EAX[0]=1 && CPUID.(EAX=07H, ECX=0H):ECX[30]=1. D90H	3472	IA32_BNDCFGS	Supervisor State of MPX Configuration (R/W)	If (CPUID.(EAX=07H, ECX=0H):EBX[14] = 1)
		0	EN: Enable Intel MPX in supervisor mode.	
		1	BNDPRESERVE: Preserve the bounds registers for near branch instructions in the absence of the BND prefix.	
		11:2	Reserved, must be zero.	
		63:12	Base Address of Bound Directory.	
DA0H	3488	IA32_XSS	Extended Supervisor State Mask (R/W)	If (CPUID.(0DH, 1):EAX.[3] = 1)
		7:0	Reserved	
		8	Trace Packet Configuration State (R/W)	
		63:9	Reserved.	
DB0H	3504	IA32_PKG_HDC_CTL	Package Level Enable/disable HDC (R/W)	If CPUID.06H:EAX.[13] = 1
		0	HDC_Pkg_Enable (R/W) Force HDC idling or wake up HDC-idled logical processors in the package. See Section 14.5.2, "Package level Enabling HDC".	If CPUID.06H:EAX.[13] = 1
		63:1	Reserved	
DB1H	3505	IA32_PM_CTL1	Enable/disable HWP (R/W)	If CPUID.06H:EAX.[13] = 1
		0	HDC_Allow_Block (R/W) Allow/Block this logical processor for package level HDC control. See Section 14.5.3.	If CPUID.06H:EAX.[13] = 1
		63:1	Reserved	
DB2H	3506	IA32_THREAD_STALL	Per-Logical_Processor HDC Idle Residency (R/O)	If CPUID.06H:EAX.[13] = 1
		63:0	Stall_Cycle_Cnt (R/W) Stalled cycles due to HDC forced idle on this logical processor. See Section 14.5.4.1.	If CPUID.06H:EAX.[13] = 1
4000_0000H - 4000_00FFH		Reserved MSR Address Space	All existing and future processors will not implement MSRs in this range.	
C000_0080H		IA32_EFER	Extended Feature Enables	If (CPUID.80000001H:EDX.[20]    CPUID.80000001H:EDX.[29])
		0	SYSCALL Enable: IA32_EFER.SCE (R/W) Enables SYSCALL/SYSRET instructions in 64-bit mode.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address		Architectural MSR Name / Bit Fields (Former MSR Name)	MSR/Bit Description	Comment
Hex	Decimal			
		7:1	Reserved	
		8	IA-32e Mode Enable: IA32_EFER.LME (R/W) Enables IA-32e mode operation.	
		9	Reserved	
		10	IA-32e Mode Active: IA32_EFER.LMA (R) Indicates IA-32e mode is active when set.	
		11	Execute Disable Bit Enable: IA32_EFER.NXE (R/W)	
		63:12	Reserved	
C000_0081H		IA32_STAR	System Call Target Address (R/W)	If CPUID.80000001:EDX.[29] = 1
C000_0082H		IA32_LSTAR	IA-32e Mode System Call Target Address (R/W) Target RIP for the called procedure when SYSCALL is executed in 64-bit mode.	If CPUID.80000001:EDX.[29] = 1
C000_0083H		IA32_CSTAR	IA-32e Mode System Call Target Address (R/W) Not used, as the SYSCALL instruction is not recognized in compatibility mode.	If CPUID.80000001:EDX.[29] = 1
C000_0084H		IA32_FMASK	System Call Flag Mask (R/W)	If CPUID.80000001:EDX.[29] = 1
C000_0100H		IA32_FS_BASE	Map of BASE Address of FS (R/W)	If CPUID.80000001:EDX.[29] = 1
C000_0101H		IA32_GS_BASE	Map of BASE Address of GS (R/W)	If CPUID.80000001:EDX.[29] = 1
C000_0102H		IA32_KERNEL_GS_BASE	Swap Target of BASE Address of GS (R/W)	If CPUID.80000001:EDX.[29] = 1
C000_0103H		IA32_TSC_AUX	Auxiliary TSC (RW)	If CPUID.80000001H: EDX[27] = 1 or CPUID.(EAX=7,ECX=0):ECX [bit 22] = 1
		31:0	AUX: Auxiliary signature of TSC.	
		63:32	Reserved	

**NOTES:**

1. In processors based on Intel NetBurst® microarchitecture, MSR addresses 180H-197H are supported, software must treat them as model-specific. Starting with Intel Core Duo processors, MSR addresses 180H-185H, 188H-197H are reserved.
2. The \*\_ADDR MSRs may or may not be present; this depends on flag settings in IA32\_MCi\_STATUS. See Section 15.3.2.3 and Section 15.3.2.4 for more information.
3. MAXPHYADDR is reported by CPUID.80000008H:EAX[7:0].

## 2.2 MSRS IN THE INTEL® CORE™ 2 PROCESSOR FAMILY

Table 2-3 lists model-specific registers (MSRs) for Intel Core 2 processor family and for Intel Xeon processors based on Intel Core microarchitecture, architectural MSR addresses are also included in Table 2-3. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_0FH, see Table 2-1.

MSRs listed in Table 2-2 and Table 2-3 are also supported by processors based on the Enhanced Intel Core microarchitecture. Processors based on the Enhanced Intel Core microarchitecture have the CPUID signature DisplayFamily\_DisplayModel of 06\_17H.

The column “Shared/Unique” applies to multi-core processors based on Intel Core microarchitecture. “Unique” means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. “Shared” means the MSR or the bit field in an MSR address governs the operation of both processor cores.

**Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture**

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Unique	See Section 2.22, “MSRs in Pentium Processors.”
1H	1	IA32_P5_MC_TYPE	Unique	See Section 2.22, “MSRs in Pentium Processors.”
6H	6	IA32_MONITOR_FILTER_SIZE	Unique	See Section 8.10.5, “Monitor/Mwait Address Range Determination.” and Table 2-2.
10H	16	IA32_TIME_STAMP_COUNTER	Unique	See Section 17.17, “Time-Stamp Counter,” and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Shared	Platform ID (R) See Table 2-2.
17H	23	MSR_PLATFORM_ID	Shared	Model Specific Platform ID (R)
		7:0		Reserved
		12:8		Maximum Qualified Ratio (R) The maximum allowed bus ratio.
		49:13		Reserved
		52:50		See Table 2-2.
		63:53		Reserved
1BH	27	IA32_APIC_BASE	Unique	See Section 10.4.4, “Local APIC Status and Location” and Table 2-2.
2AH	42	MSR_EBL_CR_POWERON	Shared	Processor Hard Power-On Configuration (R/W) Enables and disables processor features; (R) indicates current processor configuration.
		0		Reserved
		1		Data Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled Note: Not all processors implement R/W.
		2		Response Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description

		3		MCERR# Drive Enable (R/W) 1 = Enabled; 0 = Disabled Note: Not all processors implement R/W.
		4		Address Parity Enable (R/W) 1 = Enabled; 0 = Disabled Note: Not all processors implement R/W.
		5		Reserved
		6		Reserved
		7		BINIT# Driver Enable (R/W) 1 = Enabled; 0 = Disabled Note: Not all processors implement R/W.
		8		Output Tri-state Enabled (R/O) 1 = Enabled; 0 = Disabled
		9		Execute BIST (R/O) 1 = Enabled; 0 = Disabled
		10		MCERR# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled
		11		Intel TXT Capable Chipset. (R/O) 1 = Present; 0 = Not Present
		12		BINIT# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled
		13		Reserved
		14		1 MByte Power on Reset Vector (R/O) 1 = 1 MByte; 0 = 4 GBytes
		15		Reserved
		17:16		APIC Cluster ID (R/O)
		18		N/2 Non-Integer Bus Ratio (R/O) 0 = Integer ratio; 1 = Non-integer ratio
		19		Reserved
		21:20		Symmetric Arbitration ID (R/O)
		26:22		Integer Bus Frequency Ratio (R/O)
3AH	58	MSR_FEATURE_CONTROL	Unique	Control Features in Intel 64 Processor (R/W) See Table 2-2.
		3	Unique	SMRR Enable (R/WL) When this bit is set and the lock bit is set, this makes the SMRR_PHYS_BASE and SMRR_PHYS_MASK registers read visible and writeable while in SMM.

**Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description
Hex	Dec			
40H	64	MSR_LASTBRANCH_0_FROM_IP	Unique	Last Branch Record 0 From IP (R/W) One of four pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction. See also: <ul style="list-style-type: none"> <li>▪ Last Branch Record Stack TOS at 1C9H.</li> <li>▪ Section 17.5.</li> </ul>
41H	65	MSR_LASTBRANCH_1_FROM_IP	Unique	Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
42H	66	MSR_LASTBRANCH_2_FROM_IP	Unique	Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
43H	67	MSR_LASTBRANCH_3_FROM_IP	Unique	Last Branch Record 3 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
60H	96	MSR_LASTBRANCH_0_TO_IP	Unique	Last Branch Record 0 To IP (R/W) One of four pairs of last branch record registers on the last branch record stack. This To_IP part of the stack contains pointers to the destination instruction.
61H	97	MSR_LASTBRANCH_1_TO_IP	Unique	Last Branch Record 1 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
62H	98	MSR_LASTBRANCH_2_TO_IP	Unique	Last Branch Record 2 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
63H	99	MSR_LASTBRANCH_3_TO_IP	Unique	Last Branch Record 3 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
79H	121	IA32_BIOS_UPDT_TRIG	Unique	BIOS Update Trigger Register (w) See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Unique	BIOS Update Signature ID (RO) See Table 2-2.
A0H	160	MSR_SMRR_PHYSBASE	Unique	System Management Mode Base Address register (wO in SMM) Model-specific implementation of SMRR-like interface, read visible and write only in SMM.
		11:0		Reserved
		31:12		PhysBase: SMRR physical Base Address.
		63:32		Reserved
A1H	161	MSR_SMRR_PHYSMASK	Unique	System Management Mode Physical Address Mask register (wO in SMM) Model-specific implementation of SMRR-like interface, read visible and write only in SMM.
		10:0		Reserved
		11		Valid: Physical address base and range mask are valid.
		31:12		PhysMask: SMRR physical address range mask.

198H	408	MSR_PERF_STATUS	Shared	Current performance status. See Section 14.1.1, "Software Interface For Initiating Performance State Transitions".
		15:0		Current Performance State Value
		30:16		Reserved
		31		XE Operation (R/O). If set, XE operation is enabled. Default is cleared.
		39:32		Reserved

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description
Hex	Dec			
		44:40		Maximum Bus Ratio (R/O) Indicates maximum bus ratio configured for the processor.
		45		Reserved
		46		Non-Integer Bus Ratio (R/O) Indicates non-integer bus ratio is enabled. Applies processors based on Enhanced Intel Core microarchitecture.
		63:47		Reserved
199H	409	IA32_PERF_CTL	Unique	See Table 2-2.
19AH	410	IA32_CLOCK_MODULATION	Unique	Clock Modulation (R/W) See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.
19BH	411	IA32_THERM_INTERRUPT	Unique	Thermal Interrupt Control (R/W) See Table 2-2.
19CH	412	IA32_THERM_STATUS	Unique	Thermal Monitor Status (R/W) See Table 2-2.
19DH	413	MSR_THERM2_CTL	Unique	Thermal Monitor 2 Control
		15:0		Reserved
		16		TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle). 1 = Thermal Monitor 2 (thermally-initiated frequency transitions). If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 are enabled.
		63:16		Reserved
1A0H	416	IA32_MISC_ENABLE		Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.
		0		Fast-Strings Enable See Table 2-2.
		2:1		Reserved
		3	Unique	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2.
		6:4		Reserved
		7	Shared	Performance Monitoring Available (R) See Table 2-2.

**Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description
Hex	Dec			
		8		Reserved
		9		Hardware Prefetcher Disable (R/W) When set, disables the hardware prefetcher operation on streams of data. When clear (default), enables the prefetch queue. Disabling of the hardware prefetcher may impact processor performance.
		10	Shared	FERR# Multiplexing Enable (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor. 0 = Indicates compatible FERR# signaling behavior. This bit must be set to 1 to support XAPIC interrupt model usage.
		11	Shared	Branch Trace Storage Unavailable (RO) See Table 2-2.
		12	Shared	Processor Event Based Sampling Unavailable (RO) See Table 2-2.
		13	Shared	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0.
				When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state. The BIOS must enable this feature if the TM2 feature flag (CPUID.1:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location. The processor is operating out of specification if both this bit and the TM1 bit are set to 0.
		15:14		Reserved
		16	Shared	Enhanced Intel SpeedStep Technology Enable (R/W) See Table 2-2.
		18	Shared	ENABLE MONITOR FSM (R/W) See Table 2-2.

390H	912	MSR_PERF_GLOBAL_OVF_CTRL	Unique	See Section 18.6.2.2, "Global Counter Control Facilities."
3F1H	1009	MSR_PEBES_ENABLE	Unique	See Table 2-2. See Section 18.6.2.4, "Processor Event Based Sampling (PEBS)."
		0		Enable PEBS on IA32_PMC0. (R/W)
400H	1024	IA32_MCO_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MCO_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MCO_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDRv flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
406H	1030	IA32_MC1_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRv flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description
Hex	Dec			
409H	1033	IA32_MC2_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40AH	1034	IA32_MC2_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	IA32_MC4_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC4_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40EH	1038	IA32_MC4_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	IA32_MC3_CTL		See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC3_STATUS		See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
412H	1042	IA32_MC3_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	IA32_MC3_MISC	Unique	Machine Check Error Reporting Register: Contains additional information describing the machine-check error if the MISC_V flag in the IA32_MCi_STATUS register is set.
414H	1044	IA32_MC5_CTL	Unique	Machine Check Error Reporting Register: Controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).
415H	1045	IA32_MC5_STATUS	Unique	Machine Check Error Reporting Register: Contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.
416H	1046	IA32_MC5_ADDR	Unique	Machine Check Error Reporting Register: Contains the address of the code or data memory location that produced the machine-check error if the ADDR_V flag in the IA32_MCi_STATUS register is set.
417H	1047	IA32_MC5_MISC	Unique	Machine Check Error Reporting Register: Contains additional information describing the machine-check error if the MISC_V flag in the IA32_MCi_STATUS register is set.

C000_0100H		IA32_FS_BASE	Unique	Map of BASE Address of FS (R/W) See Table 2-2.
C000_0101H		IA32_GS_BASE	Unique	Map of BASE Address of GS (R/W) See Table 2-2.
C000_0102H		IA32_KERNEL_GS_BASE	Unique	Swap Target of BASE Address of GS (R/W) See Table 2-2.

## 2.3 MSRS IN THE 45 NM AND 32 NM INTEL® ATOM™ PROCESSOR FAMILY

Table 2-4 lists model-specific registers (MSRs) for 45 nm and 32 nm Intel Atom processors, architectural MSR addresses are also included in Table 2-4. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_1CH, 06\_26H, 06\_27H, 06\_35H and 06\_36H; see Table 2-1.

The column “Shared/Unique” applies to logical processors sharing the same core in processors based on the Intel Atom microarchitecture. “Unique” means each logical processor has a separate MSR, or a bit field in an MSR governs only a logical processor. “Shared” means the MSR or the bit field in an MSR address governs the operation of both logical processors in the same core.

**Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family**

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Shared	See Section 2.22, “MSRs in Pentium Processors.”
1H	1	IA32_P5_MC_TYPE	Shared	See Section 2.22, “MSRs in Pentium Processors.”
6H	6	IA32_MONITOR_FILTER_SIZE	Unique	See Section 8.10.5, “Monitor/Mwait Address Range Determination.” and Table 2-2.
10H	16	IA32_TIME_STAMP_COUNTER	Unique	See Section 17.17, “Time-Stamp Counter,” and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Shared	Platform ID (R) See Table 2-2.
17H	23	MSR_PLATFORM_ID	Shared	Model Specific Platform ID (R)
		7:0		Reserved
		12:8		Maximum Qualified Ratio (R) The maximum allowed bus ratio.
		63:13		Reserved
1BH	27	IA32_APIC_BASE	Unique	See Section 10.4.4, “Local APIC Status and Location” and Table 2-2.

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description
Hex	Dec			
2AH	42	MSR_EBL_CR_POWERON	Shared	Processor Hard Power-On Configuration (R/W) Enables and disables processor features; (R) indicates current processor configuration.
		0		Reserved
		1		Data Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled Always 0.
		2		Response Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled Always 0.
		3		AERR# Drive Enable (R/W) 1 = Enabled; 0 = Disabled Always 0.
		4		BERR# Enable for initiator bus requests (R/W) 1 = Enabled; 0 = Disabled Always 0.
		5		Reserved
		6		Reserved
		7		BINIT# Driver Enable (R/W) 1 = Enabled; 0 = Disabled Always 0.
		8		Reserved
		9		Execute BIST (R/O) 1 = Enabled; 0 = Disabled
		10		AERR# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled Always 0.

		12		BINIT# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled Always 0.
		13		Reserved
		14		1 MByte Power on Reset Vector (R/O) 1 = 1 MByte; 0 = 4 GBytes
		15		Reserved
		17:16		APIC Cluster ID (R/O) Always 00B.
19:18	Reserved			
21:20	Symmetric Arbitration ID (R/O) Always 00B.			

**Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)**

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description
Hex	Dec			
		26:22		Integer Bus Frequency Ratio (R/O)
3AH	58	IA32_FEATURE_CONTROL	Unique	Control Features in Intel 64Processor (R/W) See Table 2-2.
40H	64	MSR_LASTBRANCH_0_FROM_IP	Unique	Last Branch Record 0 From IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction . See also: <ul style="list-style-type: none"> <li>▪ Last Branch Record Stack TOS at 1C9H.</li> <li>▪ Section 17.5.</li> </ul>
41H	65	MSR_LASTBRANCH_1_FROM_IP	Unique	Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
42H	66	MSR_LASTBRANCH_2_FROM_IP	Unique	Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
43H	67	MSR_LASTBRANCH_3_FROM_IP	Unique	Last Branch Record 3 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
44H	68	MSR_LASTBRANCH_4_FROM_IP	Unique	Last Branch Record 4 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
45H	69	MSR_LASTBRANCH_5_FROM_IP	Unique	Last Branch Record 5 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
46H	70	MSR_LASTBRANCH_6_FROM_IP	Unique	Last Branch Record 6 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
47H	71	MSR_LASTBRANCH_7_FROM_IP	Unique	Last Branch Record 7 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
60H	96	MSR_LASTBRANCH_0_TO_IP	Unique	Last Branch Record 0 To IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The To_IP part of the stack contains pointers to the destination instruction.
61H	97	MSR_LASTBRANCH_1_TO_IP	Unique	Last Branch Record 1 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
62H	98	MSR_LASTBRANCH_2_TO_IP	Unique	Last Branch Record 2 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
63H	99	MSR_LASTBRANCH_3_TO_IP	Unique	Last Branch Record 3 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
64H	100	MSR_LASTBRANCH_4_TO_IP	Unique	Last Branch Record 4 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
65H	101	MSR_LASTBRANCH_5_TO_IP	Unique	Last Branch Record 5 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
66H	102	MSR_LASTBRANCH_6_TO_IP	Unique	Last Branch Record 6 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
67H	103	MSR_LASTBRANCH_7_TO_IP	Unique	Last Branch Record 7 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description
Hex	Dec			
79H	121	IA32_BIOS_UPDT_TRIG	Shared	BIOS Update Trigger Register (W) See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Unique	BIOS Update Signature ID (RO) See Table 2-2.
C1H	193	IA32_PMC0	Unique	Performance counter register See Table 2-2.
C2H	194	IA32_PMC1	Unique	Performance Counter Register See Table 2-2.
CDH	205	MSR_FSB_FREQ	Shared	Scaleable Bus Speed(RO) This field indicates the intended scaleable bus clock speed for processors based on Intel Atom microarchitecture.
		2:0		<ul style="list-style-type: none"> <li>▪ 111B: 083 MHz (FSB 333)</li> <li>▪ 101B: 100 MHz (FSB 400)</li> <li>▪ 001B: 133 MHz (FSB 533)</li> <li>▪ 011B: 167 MHz (FSB 667)</li> </ul> 133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.
		63:3		Reserved
E7H	231	IA32_MPERF	Unique	Maximum Performance Frequency Clock Count (RW) See Table 2-2.
E8H	232	IA32_APERF	Unique	Actual Performance Frequency Clock Count (RW) See Table 2-2.
FEH	254	IA32_MTRRCAP	Shared	Memory Type Range Register (R) See Table 2-2.
11EH	281	MSR_BBL_CR_CTL3	Shared	Control Register 3 Used to configure the L2 Cache.
		0		L2 Hardware Enabled (RO) 1 = Indicates the L2 is hardware-enabled. 0 = Indicates the L2 is hardware-disabled.
		7:1		Reserved
		8		L2 Enabled (R/W) 1 = L2 cache has been initialized. 0 = Disabled (default). Until this bit is set, the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9		Reserved
		23		L2 Not Present (RO) 0 = L2 Present 1 = L2 Not Present
		63:24		Reserved

Register Address		Register Name / Bit Fields	Shared/ Unique	Bit Description
Hex	Dec			
174H	372	IA32_SYSENTER_CS	Unique	See Table 2-2.
175H	373	IA32_SYSENTER_ESP	Unique	See Table 2-2.
176H	374	IA32_SYSENTER_EIP	Unique	See Table 2-2.
179H	377	IA32_MCG_CAP	Unique	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Unique	Global Machine Check Status
		0		RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.
		1		EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved
186H	390	IA32_PERFEVTSELO	Unique	See Table 2-2.
187H	391	IA32_PERFEVTSEL1	Unique	See Table 2-2.
198H	408	IA32_PERF_STATUS	Shared	See Table 2-2.
198H	408	MSR_PERF_STATUS	Shared	Performance Status
		15:0		Current Performance State Value
		39:16		Reserved
		44:40		Maximum Bus Ratio (R/O) Indicates maximum bus ratio configured for the processor.
		63:45		Reserved

		63:0	Package	Package C4 Residency Counter. (R/O) Time that this package is in processor-specific C4 states since last reset. Counts at 1 Mhz frequency.
3FAH	1018	MSR_PKG_C6_RESIDENCY	Package	Package C6 Residency Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0	Package	Package C6 Residency Counter. (R/O) Time that this package is in processor-specific C6 states since last reset. Counts at 1 Mhz frequency.

## 2.4 MSRS IN INTEL PROCESSORS BASED ON SILVERMONT MICROARCHITECTURE

Table 2-6 lists model-specific registers (MSRs) common to Intel processors based on the Silvermont microarchitecture. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_37H, 06\_4AH, 06\_4DH, 06\_5AH, and 06\_5DH; see Table 2-1. The MSRs listed in Table 2-6 are also common to processors based on the Airmont microarchitecture and newer microarchitectures for next generation Intel Atom processors.

Table 2-7 lists MSRs common to processors based on the Silvermont and Airmont microarchitectures, but not newer microarchitectures.

Table 2-8, Table 2-9, and Table 2-10 lists MSRs that are model-specific across processors based on the Silvermont microarchitecture.

In the Silvermont microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a pair of processor cores in the physical package. "Package" means all processor cores in the physical package share the same MSR or bit interface.

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Module	See Section 2.22, "MSRs in Pentium Processors."
1H	1	IA32_P5_MC_TYPE	Module	See Section 2.22, "MSRs in Pentium Processors."
6H	6	IA32_MONITOR_FILTER_SIZE	Core	See Section 8.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.
10H	16	IA32_TIME_STAMP_COUNTER	Core	See Section 17.17, "Time-Stamp Counter," and Table 2-2.
1BH	27	IA32_APIC_BASE	Core	See Section 10.4.4, "Local APIC Status and Location," and Table 2-2.

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
2AH	42	MSR_EBL_CR_POWERON	Module	Processor Hard Power-On Configuration (R/W) Writes ignored.
		63:0		Reserved
34H	52	MSR_SMI_COUNT	Core	SMI Counter (R/O)
		31:0		SMI Count (R/O) Running count of SMI events since last RESET.
		63:32		Reserved
79H	121	IA32_BIOS_UPDT_TRIG	Core	BIOS Update Trigger Register (W) See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Core	BIOS Update Signature ID (RO) See Table 2-2.
C1H	193	IA32_PMC0	Core	Performance counter register See Table 2-2.
C2H	194	IA32_PMC1	Core	Performance Counter Register See Table 2-2.
E4H	228	MSR_PMG_IO_CAPTURE_BASE	Module	Power Management IO Redirection in C-state (R/W) See <a href="http://biosbits.org">http://biosbits.org</a> .
		15:0		LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.
		18:16		C-state Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 100b - C4 is the max C-State to include 110b - C6 is the max C-State to include 111b - C7 is the max C-State to include
		63:19		Reserved

179H	377	IA32_MCG_CAP	Core	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Core	Global Machine Check Status
		0		RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.
		1		EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved
186H	390	IA32_PERFVTSELO	Core	See Table 2-2.

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
277H	631	IA32_PAT	Core	See Table 2-2.
2FFH	767	IA32_MTRR_DEF_TYPE	Core	Default Memory Types (R/W) See Table 2-2.
309H	777	IA32_FIXED_CTR0	Core	Fixed-Function Performance Counter Register 0 (R/W) See Table 2-2.
30AH	778	IA32_FIXED_CTR1	Core	Fixed-Function Performance Counter Register 1 (R/W) See Table 2-2.
30BH	779	IA32_FIXED_CTR2	Core	Fixed-Function Performance Counter Register 2 (R/W) See Table 2-2.
345H	837	IA32_PERF_CAPABILITIES	Core	See Table 2-2. See Section 17.4.1, "IA32_DEBUGCTL MSR."
38DH	909	IA32_FIXED_CTR_CTRL	Core	Fixed-Function-Counter Control Register (R/W) See Table 2-2.
38FH	911	IA32_PERF_GLOBAL_CTRL	Core	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
3FDH	1021	MSR_CORE_C6_RESIDENCY	Core	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		CORE C6 Residency Counter (R/O) Value since last reset that this core is in processor-specific C6 states. Counts at the TSC Frequency.
400H	1024	IA32_MCO_CTL	Module	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MCO_STATUS	Module	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MCO_ADDR	Module	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	Module	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Module	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
408H	1032	IA32_MC2_CTL	Module	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Module	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR	Module	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
40CH	1036	IA32_MC3_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC3_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40EH	1038	IA32_MC3_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	IA32_MC4_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC4_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
412H	1042	IA32_MC4_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
414H	1044	IA32_MC5_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
415H	1045	IA32_MC5_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
416H	1046	IA32_MC5_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
480H	1152	IA32_VMX_BASIC	Core	Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2. See Appendix A.1, "Basic VMX Information."
481H	1153	IA32_VMX_PINBASED_CTL	Core	Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Table 2-2. See Appendix A.3, "VM-Execution Controls."
482H	1154	IA32_VMX_PROCBASED_CTL	Core	Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."
483H	1155	IA32_VMX_EXIT_CTL	Core	Capability Reporting Register of VM-Exit Controls (R/O) See Table 2-2. See Appendix A.4, "VM-Exit Controls."

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
484H	1156	IA32_VMX_ENTRY_CTL5	Core	Capability Reporting Register of VM-Entry Controls (R/O) See Table 2-2. See Appendix A.5, "VM-Entry Controls."
485H	1157	IA32_VMX_MISC	Core	Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2. See Appendix A.6, "Miscellaneous Data."
486H	1158	IA32_VMX_CR0_FIXED0	Core	Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."
487H	1159	IA32_VMX_CR0_FIXED1	Core	Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."
488H	1160	IA32_VMX_CR4_FIXED0	Core	Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."
489H	1161	IA32_VMX_CR4_FIXED1	Core	Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."
48AH	1162	IA32_VMX_VMCS_ENUM	Core	Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2. See Appendix A.9, "VMCS Enumeration."
48BH	1163	IA32_VMX_PROCBASED_CTL52	Core	Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."
48CH	1164	IA32_VMX_EPT_VPID_ENUM	Core	Capability Reporting Register of EPT and VPID (R/O) See Table 2-2
48DH	1165	IA32_VMX_TRUE_PINBASED_CTL5	Core	Capability Reporting Register of Pin-Based VM-Execution Flex Controls (R/O) See Table 2-2
48EH	1166	IA32_VMX_TRUE_PROCBASED_CTL5	Core	Capability Reporting Register of Primary Processor-based VM-Execution Flex Controls (R/O) See Table 2-2
48FH	1167	IA32_VMX_TRUE_EXIT_CTL5	Core	Capability Reporting Register of VM-Exit Flex Controls (R/O) See Table 2-2

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
490H	1168	IA32_VMX_TRUE_ENTRY_CTL5	Core	Capability Reporting Register of VM-Entry Flex Controls (R/O) See Table 2-2
491H	1169	IA32_VMX_FMFUNC	Core	Capability Reporting Register of VM-Function Controls (R/O) See Table 2-2
4C1H	1217	IA32_A_PMC0	Core	See Table 2-2.
4C2H	1218	IA32_A_PMC1	Core	See Table 2-2.
600H	1536	IA32_DS_AREA	Core	DS Save Area (R/W) See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
660H	1632	MSR_CORE_C1_RESIDENCY	Core	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		CORE C1 Residency Counter. (R/O) Value since last reset that this core is in processor-specific C1 states. Counts at the TSC frequency.
6E0H	1760	IA32_TSC_DEADLINE	Core	TSC Target of Local APIC's TSC Deadline Mode (R/W) See Table 2-2.
C000_0080H		IA32_EFER	Core	Extended Feature Enables See Table 2-2.
C000_0081H		IA32_STAR	Core	System Call Target Address (R/W) See Table 2-2.
C000_0082H		IA32_LSTAR	Core	IA-32e Mode System Call Target Address (R/W) See Table 2-2.
C000_0084H		IA32_FMASK	Core	System Call Flag Mask (R/W) See Table 2-2.
C000_0100H		IA32_FS_BASE	Core	Map of BASE Address of FS (R/W) See Table 2-2.
C000_0101H		IA32_GS_BASE	Core	Map of BASE Address of GS (R/W) See Table 2-2.
C000_0102H		IA32_KERNEL_GS_BASE	Core	Swap Target of BASE Address of GS (R/W) See Table 2-2.
C000_0103H		IA32_TSC_AUX	Core	AUXILIARY TSC Signature (R/W) See Table 2-2

Table 2-7 lists model-specific registers (MSRs) that are common to Intel® Atom™ processors based on the Silvermont and Airmont microarchitectures but not newer microarchitectures.

**Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
17H	23	MSR_PLATFORM_ID	Module	Model Specific Platform ID (R)
		7:0		Reserved
		13:8		Maximum Qualified Ratio (R) The maximum allowed bus ratio.
		49:13		Reserved
		52:50		See Table 2-2.
		63:33		Reserved
3AH	58	IA32_FEATURE_CONTROL	Core	Control Features in Intel 64Processor (R/W) See Table 2-2.
		0		Lock (R/WL)
		1		Reserved
		2		Enable VMX outside SMX operation (R/WL)
40H	64	MSR_LASTBRANCH_0_FROM_IP	Core	Last Branch Record 0 From IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction. See also: <ul style="list-style-type: none"> <li>▪ Last Branch Record Stack TOS at 1C9H.</li> <li>▪ Section 17.5 and record format in Section 17.4.8.1.</li> </ul>
41H	65	MSR_LASTBRANCH_1_FROM_IP	Core	Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
42H	66	MSR_LASTBRANCH_2_FROM_IP	Core	Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
43H	67	MSR_LASTBRANCH_3_FROM_IP	Core	Last Branch Record 3 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
44H	68	MSR_LASTBRANCH_4_FROM_IP	Core	Last Branch Record 4 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
45H	69	MSR_LASTBRANCH_5_FROM_IP	Core	Last Branch Record 5 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
46H	70	MSR_LASTBRANCH_6_FROM_IP	Core	Last Branch Record 6 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
47H	71	MSR_LASTBRANCH_7_FROM_IP	Core	Last Branch Record 7 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
60H	96	MSR_LASTBRANCH_0_TO_IP	Core	Last Branch Record 0 To IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The To_IP part of the stack contains pointers to the destination instruction.
61H	97	MSR_LASTBRANCH_1_TO_IP	Core	Last Branch Record 1 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
62H	98	MSR_LASTBRANCH_2_TO_IP	Core	Last Branch Record 2 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
63H	99	MSR_LASTBRANCH_3_TO_IP	Core	Last Branch Record 3 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
64H	100	MSR_LASTBRANCH_4_TO_IP	Core	Last Branch Record 4 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
65H	101	MSR_LASTBRANCH_5_TO_IP	Core	Last Branch Record 5 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
66H	102	MSR_LASTBRANCH_6_TO_IP	Core	Last Branch Record 6 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
67H	103	MSR_LASTBRANCH_7_TO_IP	Core	Last Branch Record 7 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Module	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See <a href="http://biosbits.org">http://biosbits.org</a> .
		2:0		Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0 (no package C-state support) 001b: C1 (Behavior is the same as 000b) 100b: C4 110b: C6 111b: C7 (Silvermont only).
		9:3		Reserved
		10		I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.
		14:11		Reserved
		15		CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.
		63:16		Reserved
11EH	281	MSR_BBL_CR_CTL3	Module	Control Register 3 Used to configure the L2 Cache.
		0		L2 Hardware Enabled (RO) 1 = If the L2 is hardware-enabled. 0 = Indicates if the L2 is hardware-disabled.

**Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		7:1		Reserved
		8		L2 Enabled (R/W) 1 = L2 cache has been initialized. 0 = Disabled (default). Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9		Reserved
		23		L2 Not Present (RO) 0 = L2 Present. 1 = L2 Not Present.
		63:24		Reserved
1A0H	416	IA32_MISC_ENABLE		Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.
		0	Core	Fast-Strings Enable See Table 2-2.
		2:1		Reserved
		3	Module	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2. Default value is 0.
		6:4		Reserved
		7	Core	Performance Monitoring Available (R) See Table 2-2.
		10:8		Reserved
		11	Core	Branch Trace Storage Unavailable (RO) See Table 2-2.
		12	Core	Processor Event Based Sampling Unavailable (RO) See Table 2-2.
		15:13		Reserved
		16	Module	Enhanced Intel SpeedStep Technology Enable (R/W) See Table 2-2.
		18	Core	ENABLE MONITOR FSM (R/W) See Table 2-2.
		21:19		Reserved
		22	Core	Limit CPUID Maxval (R/W) See Table 2-2.
23	Module	xTPR Message Disable (R/W) See Table 2-2.		
33:24		Reserved		

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		34	Core	XD Bit Disable (R/W) See Table 2-2.
		37:35		Reserved
		38	Module	Turbo Mode Disable (R/W) When set to 1 on processors that support Intel Turbo Boost Technology, the turbo mode feature is disabled and the IDA_Enable feature flag will be cleared (CPUID.06H: EAX[1]=0). When set to a 0 on processors that support IDA, CPUID.06H: EAX[1] reports the processor's support of turbo mode is enabled. Note: The power-on default value is used by BIOS to detect hardware support of turbo mode. If the power-on default value is 1, turbo mode is available in the processor. If the power-on default value is 0, turbo mode is not available.
		63:39		Reserved
1C8H	456	MSR_LBR_SELECT	Core	Last Branch Record Filtering Select Register (R/W) See Section 17.9.2, "Filtering of Last Branch Records."
		0		CPL_EQ_0
		1		CPL_NEQ_0
		2		JCC
		3		NEAR_REL_CALL
		4		NEAR_IND_CALL
		5		NEAR_RET
		6		NEAR_IND_JMP
		7		NEAR_REL_JMP
		8		FAR_BRANCH
	63:9		Reserved	
1C9H	457	MSR_LASTBRANCH_TOS	Core	Last Branch Record Stack TOS (R/W) Contains an index (bits 0-2) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP.
38EH	910	IA32_PERF_GLOBAL_STATUS	Core	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
390H	912	IA32_PERF_GLOBAL_OVF_CTRL	Core	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
3F1H	1009	MSR_PEBS_ENABLE	Core	See Table 2-2. See Section 18.6.2.4, "Processor Event Based Sampling (PEBS)."
		0		Enable PEBS for precise event on IA32_PMC0 (R/W)

### 2.4.1 MSRs with Model-Specific Behavior in the Silvermont Microarchitecture

Table 2-8 lists model-specific registers (MSRs) that are specific to Intel® Atom™ processor E3000 Series (CPUID signature with DisplayFamily\_DisplayModel of 06\_37H) and Intel Atom processors (CPUID signatures with DisplayFamily\_DisplayModel of 06\_4AH, 06\_5AH, 06\_5DH).

**Table 2-8. Specific MSRs Supported by Intel® Atom™ Processors with CPUID Signatures 06\_37H, 06\_4AH, 06\_5AH, 06\_5DH**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
606H	1542	MSR_RAPL_POWER_UNIT	Package	Unit Multipliers used in RAPL Interfaces (R/O) See Section 14.9.1, "RAPL Interfaces."
		3:0		Power Units Power related information (in milliwatts) is based on the multiplier, $2^{PU}$ ; where PU is an unsigned integer represented by bits 3:0. Default value is 0101b, indicating power unit is in 32 milliwatts increment.
		7:4		Reserved

**Table 2-8. Specific MSRs Supported by Intel® Atom™ Processors with CPUID Signatures 06\_37H, 06\_4AH, 06\_5AH, 06\_5DH**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		12:8		Energy Status Units Energy related information (in microJoules) is based on the multiplier, 2 <sup>^</sup> ESU; where ESU is an unsigned integer represented by bits 12:8. Default value is 00101b, indicating energy unit is in 32 microJoules increment.
		15:13		Reserved
		19:16		Time Unit The value is 0000b, indicating time unit is in one second.
		63:20		Reserved
610H	1552	MSR_PKG_POWER_LIMIT	Package	PKG RAPL Power Limit Control (R/W)
		14:0		Package Power Limit #1 (R/W) See Section 14.9.3, "Package RAPL Domain." and MSR_RAPL_POWER_UNIT in Table 2-8.
		15		Enable Power Limit #1 (R/W) See Section 14.9.3, "Package RAPL Domain."
		16		Package Clamping Limitation #1 (R/W) See Section 14.9.3, "Package RAPL Domain."
		23:17		Time Window for Power Limit #1 (R/W) In unit of second. If 0 is specified in bits [23:17], defaults to 1 second window.
		63:24		Reserved
611H	1553	MSR_PKG_ENERGY_STATUS	Package	PKG Energy Status (R/O) See Section 14.9.3, "Package RAPL Domain." and MSR_RAPL_POWER_UNIT in Table 2-8.
639H	1593	MSR_PPO_ENERGY_STATUS	Package	PPO Energy Status (R/O) See Section 14.9.4, "PPO/PP1 RAPL Domains." and MSR_RAPL_POWER_UNIT in Table 2-8.
CDH	205	MSR_FSB_FREQ	Module	Scaleable Bus Speed(RO) This field indicates the intended scaleable bus clock speed for processors based on Silvermont microarchitecture.
		2:0		<ul style="list-style-type: none"> <li>▪ 100B: 080.0 MHz</li> <li>▪ 000B: 083.3 MHz</li> <li>▪ 001B: 100.0 MHz</li> <li>▪ 010B: 133.3 MHz</li> <li>▪ 011B: 116.7 MHz</li> </ul>

## 2.4.2 MSRs In Intel Atom Processors Based on Airmont Microarchitecture

Intel Atom processor X7-Z8000 and X5-Z8000 series are based on the Airmont microarchitecture. These processors support MSRs listed in Table 2-6, Table 2-7, Table 2-8, and Table 2-11. These processors have a CPUID signature with DisplayFamily\_DisplayModel including 06\_4CH; see Table 2-1.

**Table 2-11. MSRs in Intel Atom Processors Based on the Airmont Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
CDH	205	MSR_FSB_FREQ	Module	Scaleable Bus Speed(RO) This field indicates the intended scaleable bus clock speed for processors based on Airmont microarchitecture.
		3:0		<ul style="list-style-type: none"> <li>▪ 0000B: 083.3 MHz</li> <li>▪ 0001B: 100.0 MHz</li> <li>▪ 0010B: 133.3 MHz</li> <li>▪ 0011B: 116.7 MHz</li> <li>▪ 0100B: 080.0 MHz</li> <li>▪ 0101B: 093.3 MHz</li> <li>▪ 0110B: 090.0 MHz</li> <li>▪ 0111B: 088.9 MHz</li> <li>▪ 1000B: 087.5 MHz</li> </ul>
		63:5		Reserved
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Module	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See <a href="http://biosbits.org">http://biosbits.org</a> .
		2:0		Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: No limit 001b: C1 010b: C2 110b: C6 111b: C7
		9:3		Reserved
		10		I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.
		14:11		Reserved
		15		CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.
		63:16		Reserved
E4H	228	MSR_PMG_IO_CAPTURE_BASE	Module	Power Management IO Redirection in C-state (R/W) See <a href="http://biosbits.org">http://biosbits.org</a> .

Table 2-11. MSRs in Intel Atom Processors Based on the Airmont Microarchitecture (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		15:0		LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.
		18:16		C-state Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 000b - C3 is the max C-State to include. 001b - Deep Power Down Technology is the max C-State. 010b - C7 is the max C-State to include.
		63:19		Reserved
638H	1592	MSR_PPO_POWER_LIMIT	Package	PPO RAPL Power Limit Control (R/W)
		14:0		PPO Power Limit #1 (R/W) See Section 14.9.4, "PPO/PP1 RAPL Domains" and MSR_RAPL_POWER_UNIT in Table 2-8.
		15		Enable Power Limit #1 (R/W) See Section 14.9.4, "PPO/PP1 RAPL Domains."
		16		Reserved
		23:17		Time Window for Power Limit #1 (R/W) Specifies the time duration over which the average power must remain below PPO_POWER_LIMIT #1(14:0). Supported Encodings: 0x0: 1 second time duration. 0x1: 5 second time duration (Default). 0x2: 10 second time duration. 0x3: 15 second time duration. 0x4: 20 second time duration. 0x5: 25 second time duration. 0x6: 30 second time duration. 0x7: 35 second time duration. 0x8: 40 second time duration. 0x9: 45 second time duration. 0xA: 50 second time duration. 0xB-0x7F - reserved.
		63:24		Reserved

## 2.5 MSRS IN INTEL ATOM PROCESSORS BASED ON GOLDMONT MICROARCHITECTURE

Intel Atom processors based on the Goldmont microarchitecture support MSRs listed in Table 2-6 and Table 2-12. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_5CH; see Table 2-1.

In the Goldmont microarchitecture, the scope column indicates the following: “Core” means each processor core has a separate MSR, or a bit field not shared with another processor core. “Module” means the MSR or the bit field is shared by a pair of processor cores in the physical package. “Package” means all processor cores in the physical package share the same MSR or bit interface.

**Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
17H	23	MSR_PLATFORM_ID	Module	Model Specific Platform ID (R)
		49:0		Reserved
		52:50		See Table 2-2.
		63:33		Reserved
3AH	58	IA32_FEATURE_CONTROL	Core	Control Features in Intel 64 Processor (R/W) See Table 2-2.
		0		Lock (R/WL)
		1		Enable VMX inside SMX operation (R/WL)
		2		Enable VMX outside SMX operation (R/WL)
		14:8		SENTER local functions enables (R/WL)
		15		SENTER global functions enable (R/WL)
		18		SGX global functions enable (R/WL)
		63:19		Reserved
3BH	59	IA32_TSC_ADJUST	Core	Per-Core TSC ADJUST (R/W) See Table 2-2.
C3H	195	IA32_PMC2	Core	Performance Counter Register See Table 2-2.
C4H	196	IA32_PMC3	Core	Performance Counter Register See Table 2-2.

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		22		Thermal Interrupt Coordination Enable (R/W) If set, then thermal interrupt on one core is routed to all cores.
		63:23		Reserved
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	Maximum Ratio Limit of Turbo Mode by Core Groups (RW) Specifies Maximum Ratio Limit for each Core Group. Max ratio for groups with more cores must decrease monotonically. For groups with less than 4 cores, the max ratio must be 32 or less. For groups with 4-5 cores, the max ratio must be 22 or less. For groups with more than 5 cores, the max ratio must be 16 or less.
		7:0	Package	Maximum Ratio Limit for Active Cores in Group 0 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 0 threshold.
		15:8	Package	Maximum Ratio Limit for Active Cores in Group 1 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 1 threshold, and greater than the Group 0 threshold.
		23:16	Package	Maximum Ratio Limit for Active Cores in Group 2 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 2 threshold, and greater than the Group 1 threshold.
		31:24	Package	Maximum Ratio Limit for Active Cores in Group 3 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 3 threshold, and greater than the Group 2 threshold.
		39:32	Package	Maximum Ratio Limit for Active Cores in Group 4 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 4 threshold, and greater than the Group 3 threshold.
		47:40	Package	Maximum Ratio Limit for Active Cores in Group 5 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 5 threshold, and greater than the Group 4 threshold.
		55:48	Package	Maximum Ratio Limit for Active Cores in Group 6 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 6 threshold, and greater than the Group 5 threshold.
		63:56	Package	Maximum Ratio Limit for Active Cores in Group 7 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 7 threshold, and greater than the Group 6 threshold.

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
1AEH	430	MSR_TURBO_GROUP_CORECNT	Package	Group Size of Active Cores for Turbo Mode Operation (R/W) Writes of 0 threshold is ignored.
		7:0	Package	Group 0 Core Count Threshold Maximum number of active cores to operate under the Group 0 Max Turbo Ratio limit.
		15:8	Package	Group 1 Core Count Threshold Maximum number of active cores to operate under the Group 1 Max Turbo Ratio limit. Must be greater than the Group 0 Core Count.
		23:16	Package	Group 2 Core Count Threshold Maximum number of active cores to operate under the Group 2 Max Turbo Ratio limit. Must be greater than the Group 1 Core Count.
		31:24	Package	Group 3 Core Count Threshold Maximum number of active cores to operate under the Group 3 Max Turbo Ratio limit. Must be greater than the Group 2 Core Count.
		39:32	Package	Group 4 Core Count Threshold Maximum number of active cores to operate under the Group 4 Max Turbo Ratio limit. Must be greater than the Group 3 Core Count.
		47:40	Package	Group 5 Core Count Threshold Maximum number of active cores to operate under the Group 5 Max Turbo Ratio limit. Must be greater than the Group 4 Core Count.
		55:48	Package	Group 6 Core Count Threshold Maximum number of active cores to operate under the Group 6 Max Turbo Ratio limit. Must be greater than the Group 5 Core Count.
		63:56	Package	Group 7 Core Count Threshold Maximum number of active cores to operate under the Group 7 Max Turbo Ratio limit. Must be greater than the Group 6 Core Count, and not less than the total number of processor cores in the package. E.g., specify 255.

3F1H	1009	MSR_PEBS_ENABLE	Core	See Table 2-2. See Section 18.6.2.4, "Processor Event Based Sampling (PEBS)."
		0		Enable PEBS trigger and recording for the programmed event (precise or otherwise) on IA32_PMC0. (R/W)
3F8H	1016	MSR_PKG_C3_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		Package C3 Residency Counter (R/O) Value since last reset that this package is in processor-specific C3 states. Count at the same frequency as the TSC.
3F9H	1017	MSR_PKG_C6_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		Package C6 Residency Counter (R/O) Value since last reset that this package is in processor-specific C6 states. Count at the same frequency as the TSC.

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
3FCH	1020	MSR_CORE_C3_RESIDENCY	Core	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		CORE C3 Residency Counter (R/O) Value since last reset that this core is in processor-specific C3 states. Count at the same frequency as the TSC.
406H	1030	IA32_MC1_ADDR	Module	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
418H	1048	IA32_MC6_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
419H	1049	IA32_MC6_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS" and Chapter 16.
41AH	1050	IA32_MC6_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
4C3H	1219	IA32_A_PMC2	Core	See Table 2-2.
4C4H	1220	IA32_A_PMC3	Core	See Table 2-2.
4E0H	1248	MSR_SMM_FEATURE_CONTROL	Package	Enhanced SMM Feature Control (SMM-RW) Reports SMM capability Enhancement. Accessible only while in SMM.
		0		Lock (SMM-RW0) When set to '1' locks this register from further changes.
		1		Reserved
		2		SMM_Code_Chk_En (SMM-RW) This control bit is available only if MSR_SMM_MCA_CAP[58] == 1. When set to '0' (default) none of the logical processors are prevented from executing SMM code outside the ranges defined by the SMRR. When set to '1' any logical processor in the package that attempts to execute SMM code not within the ranges defined by the SMRR will assert an unrecoverable MCE.
		63:3		Reserved
4E2H	1250	MSR_SMM_DELAYED	Package	SMM Delayed (SMM-RO) Reports the interruptible state of all logical processors in the package. Available only while in SMM and MSR_SMM_MCA_CAP[LONG_FLOW_INDICATION] == 1.

**Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		N-1:0		LOG_PROC_STATE (SMM-RO) Each bit represents a processor core of its state in a long flow of internal operation which delays servicing an interrupt. The corresponding bit will be set at the start of long events such as: Microcode Update Load, C6, WBINVD, Ratio Change, Throttle. The bit is automatically cleared at the end of each long event. The reset value of this field is 0. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.
		63:N		Reserved
4E3H	1251	MSR_SMM_BLOCKED	Package	SMM Blocked (SMM-RO) Reports the blocked state of all logical processors in the package. Available only while in SMM.
		N-1:0		LOG_PROC_STATE (SMM-RO) Each bit represents a processor core of its blocked state to service an SMI. The corresponding bit will be set if the logical processor is in one of the following states: Wait For SIPI or SENTER Sleep. The reset value of this field is OFFFH. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.
		63:N		Reserved
500H	1280	IA32_SGX_SVN_STATUS	Core	Status and SVN Threshold of SGX Support for ACM (RO)

583H	1411	IA32_RTIT_ADDR1_B	Core	Region 1 End Address (R/W)
		63:0		See Table 2-2.
606H	1542	MSR_RAPL_POWER_UNIT	Package	Unit Multipliers used in RAPL Interfaces (R/O) See Section 14.9.1, "RAPL Interfaces."
		3:0		Power Units Power related information (in Watts) is in unit of $1W/2^{PU}$ ; where PU is an unsigned integer represented by bits 3:0. Default value is 1000b, indicating power unit is in 3.9 milliWatts increment.
		7:4		Reserved
		12:8		Energy Status Units Energy related information (in Joules) is in unit of $1Joule/2^{ESU}$ ; where ESU is an unsigned integer represented by bits 12:8. Default value is 01110b, indicating energy unit is in 61 microJoules.
		15:13		Reserved
		19:16		Time Unit Time related information (in seconds) is in unit of $1S/2^{TU}$ ; where TU is an unsigned integer represented by bits 19:16. Default value is 1010b, indicating power unit is in 0.977 millisecond.
		63:20		Reserved
60AH	1546	MSR_PKGC3_IRTL	Package	Package C3 Interrupt Response Limit (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C3 state.
		12:10		Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-19 for supported time unit encodings.
		14:13		Reserved
		15		Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.
		63:16		Reserved

Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
60BH	1547	MSR_PKG_C6_C7S_IRT_L1	Package	Package C6/C7S Interrupt Response Limit 1 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C6 or C7S state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.
		9:0		Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 or C7S state.
		12:10		Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-19 for supported time unit encodings.

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
639H	1593	MSR_PP0_ENERGY_STATUS	Package	PP0 Energy Status (R/O) See Section 14.9.4, "PP0/PP1 RAPL Domains."
641H	1601	MSR_PP1_ENERGY_STATUS	Package	PP1 Energy Status (R/O) See Section 14.9.4, "PP0/PP1 RAPL Domains."
64CH	1612	MSR_TURBO_ACTIVATION_RATIO	Package	ConfigTDP Control (R/W)
		7:0		MAX_NON_TURBO_RATIO (R/W/L) System BIOS can program this field.
		30:8		Reserved
		31		TURBO_ACTIVATION_RATIO_Lock (R/W/L) When this bit is set, the content of this register is locked until a reset.
		63:32		Reserved
64FH	1615	MSR_CORE_PERF_LIMIT_REASONS	Package	Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)
		0		PROCHOT Status (R0) When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.
		1		Thermal Status (R0) When set, frequency is reduced below the operating system request due to a thermal event.
		2		Package-Level Power Limiting PL1 Status (R0) When set, frequency is reduced below the operating system request due to package-level power limiting PL1.
		3		Package-Level PL2 Power Limiting Status (R0) When set, frequency is reduced below the operating system request due to package-level power limiting PL2.
		8:4		Reserved
		9		Core Power Limiting Status (R0) When set, frequency is reduced below the operating system request due to domain-level power limiting.
		10		VR Therm Alert Status (R0) When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.
11		Max Turbo Limit Status (R0) When set, frequency is reduced below the operating system request due to multi-core turbo limits.		

**Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		12		Electrical Design Point Status (R0) When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).
		13		Turbo Transition Attenuation Status (R0) When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.
		14		Maximum Efficiency Frequency Status (R0) When set, frequency is reduced below the maximum efficiency frequency.
		15		Reserved
		16		PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		17		Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		18		Package-Level PL1 Power Limiting Log When set, indicates that the Package Level PL1 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		19		Package-Level PL2 Power Limiting Log When set, indicates that the Package Level PL2 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		24:20		Reserved
		25		Core Power Limiting Log When set, indicates that the Core Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.

See Table 2-6, and Table 2-12 for MSR definitions applicable to processors with CPUID signature 06\_5CH.

## 2.6 MSRS IN INTEL ATOM PROCESSORS BASED ON GOLDMONT PLUS MICROARCHITECTURE

Intel Atom processors based on the Goldmont Plus microarchitecture support MSRs listed in Table 2-6, Table 2-12 and Table 2-13. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_7AH; see Table 2-1. For an MSR listed in Table 2-13 that also appears in the model-specific tables of prior generations, Table 2-13 supercede prior generation tables.

In the Goldmont Plus microarchitecture, the scope column indicates the following: “Core” means each processor core has a separate MSR, or a bit field not shared with another processor core. “Module” means the MSR or the bit field is shared by a pair of processor cores in the physical package. “Package” means all processor cores in the physical package share the same MSR or bit interface.

**Table 2-13. MSRs in Intel Atom Processors Based on the Goldmont Plus Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
3AH	58	IA32_FEATURE_CONTROL	Core	Control Features in Intel 64Processor (R/W) See Table 2-2.
		0		Lock (R/WL)
		1		Enable VMX inside SMX operation (R/WL)
		2		Enable VMX outside SMX operation (R/WL)
		14:8		SENTER local functions enables (R/WL)
		15		SENTER global functions enable (R/WL)
		17		SGX Launch Control Enable (R/WL) This bit must be set to enable runtime reconfiguration of SGX Launch Control via IA32_SGXLEPUBKEYHASHn MSR. Valid if CPUID.(EAX=07H, ECX=0H): ECX[30] = 1.
		18		SGX global functions enable (R/WL)
		63:19		Reserved
8CH	140	IA32_SGXLEPUBKEYHASH0	Core	See Table 2-2.

See Table 2-6, Table 2-12 and Table 2-13 for MSR definitions applicable to processors with CPUID signature 06\_7AH.

## 2.7 MSRS IN THE INTEL® MICROARCHITECTURE CODE NAME NEHALEM

Table 2-14 lists model-specific registers (MSRs) that are common for Intel® microarchitecture code name Nehalem. These include Intel Core i7 and i5 processor family. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_1AH, 06\_1EH, 06\_1FH, 06\_2EH, see Table 2-1. Additional MSRs specific to 06\_1AH, 06\_1EH, 06\_1FH are listed in Table 2-15. Some MSRs listed in these tables are used by BIOS. More information about these MSR can be found at <http://biosbits.org>.

The column “Scope” represents the package/core/thread scope of individual bit field of an MSR. “Thread” means this bit field must be programmed on each logical processor independently. “Core” means the bit field must be programmed on each processor core independently, logical processors in the same core will be affected by change of this bit on the other logical processor in the same core. “Package” means the bit field must be programmed once for each physical package. Change of a bit filed with a package scope will affect all logical processors in that physical package.

**Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Thread	See Section 2.22, “MSRs in Pentium Processors.”
1H	1	IA32_P5_MC_TYPE	Thread	See Section 2.22, “MSRs in Pentium Processors.”

**Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
6H	6	IA32_MONITOR_FILTER_SIZE	Thread	See Section 8.10.5, "Monitor/Mwait Address Range Determination" and Table 2-2.
10H	16	IA32_TIME_STAMP_COUNTER	Thread	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Package	Platform ID (R) See Table 2-2.
17H	23	MSR_PLATFORM_ID	Package	Model Specific Platform ID (R)
		49:0		Reserved
		52:50		See Table 2-2.
		63:53		Reserved
1BH	27	IA32_APIC_BASE	Thread	See Section 10.4.4, "Local APIC Status and Location," and Table 2-2.
34H	52	MSR_SMI_COUNT	Thread	SMI Counter (R/O)
		31:0		SMI Count (R/O) Running count of SMI events since last RESET.
		63:32		Reserved
3AH	58	IA32_FEATURE_CONTROL	Thread	Control Features in Intel 64Processor (R/W) See Table 2-2.
79H	121	IA32_BIOS_UPDT_TRIG	Core	BIOS Update Trigger Register (W) See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Thread	BIOS Update Signature ID (RO) See Table 2-2.
C1H	193	IA32_PMC0	Thread	Performance Counter Register See Table 2-2.
C2H	194	IA32_PMC1	Thread	Performance Counter Register See Table 2-2.
C3H	195	IA32_PMC2	Thread	Performance Counter Register See Table 2-2.
C4H	196	IA32_PMC3	Thread	Performance Counter Register See Table 2-2.
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information Contains power management and other model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a> .
		7:0		Reserved
		15:8	Package	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. The invariant TSC frequency can be computed by multiplying this ratio by 133.33 MHz.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		27:16		Reserved
		28	Package	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.
		29	Package	Programmable TDC-TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDC and TDP Limits for Turbo mode are programmable. When set to 0, indicates TDC and TDP Limits for Turbo mode are not programmable.
		39:30		Reserved
		47:40	Package	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 133.33MHz.
		63:48		Reserved
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Core	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See <a href="http://biosbits.org">http://biosbits.org</a> .
		2:0		Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0 (no package C-state support) 001b: C1 (Behavior is the same as 000b) 010b: C3 011b: C6 100b: C7 101b and 110b: Reserved 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.
		9:3		Reserved
		10		I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.
		14:11		Reserved

**Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		15		CFG Lock (R/W) When set, locks bits 15:0 of this register until next reset.
		23:16		Reserved
		24		Interrupt filtering enable (R/W) When set, processor cores in a deep C-State will wake only when the event message is destined for that core. When 0, all processor cores in a deep C-State will wake for an event message.
		25		C3 state auto demotion enable (R/W) When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.
		26		C1 state auto demotion enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.
		27		Enable C3 Undemotion (R/W)
		28		Enable C1 Undemotion (R/W)
		29		Package C State Demotion Enable (R/W)
		30		Package C State UnDemotion Enable (R/W)
		63:31		Reserved
		E4H	228	MSR_PMG_IO_CAPTURE_BASE
15:0				LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.
18:16				C-state Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 000b - C3 is the max C-State to include. 001b - C6 is the max C-State to include. 010b - C7 is the max C-State to include.
63:19				Reserved
E7H	231	IA32_MPERF	Thread	Maximum Performance Frequency Clock Count (RW) See Table 2-2.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
E8H	232	IA32_APERF	Thread	Actual Performance Frequency Clock Count (RW) See Table 2-2.
FEH	254	IA32_MTRRCAP	Thread	See Table 2-2.
174H	372	IA32_SYSENTER_CS	Thread	See Table 2-2.
175H	373	IA32_SYSENTER_ESP	Thread	See Table 2-2.
176H	374	IA32_SYSENTER_EIP	Thread	See Table 2-2.
179H	377	IA32_MCG_CAP	Thread	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Thread	Global Machine Check Status
		0		RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.
		1		EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		21:19		Reserved
		22	Thread	Limit CPUID Maxval (R/W) See Table 2-2.
		23	Thread	xTPR Message Disable (R/W) See Table 2-2.
		33:24		Reserved
		34	Thread	XD Bit Disable (R/W) See Table 2-2.
		37:35		Reserved
		38	Package	Turbo Mode Disable (R/W) When set to 1 on processors that support Intel Turbo Boost Technology, the turbo mode feature is disabled and the IDA_Enable feature flag will be clear (CPUID.06H: EAX[1]=0). When set to a 0 on processors that support IDA, CPUID.06H: EAX[1] reports the processor's support of turbo mode is enabled. Note: The power-on default value is used by BIOS to detect hardware support of turbo mode. If the power-on default value is 1, turbo mode is available in the processor. If the power-on default value is 0, turbo mode is not available.
		63:39		Reserved
1A2H	418	MSR_TEMPERATURE_TARGET	Thread	Temperature Target
		15:0		Reserved
		23:16		Temperature Target (R) The minimum temperature at which PROCHOT# will be asserted. The value is degrees C.
		63:24		Reserved
1A4H	420	MSR_MISC_FEATURE_CONTROL		Miscellaneous Feature Control (R/W)
		0	Core	L2 Hardware Prefetcher Disable (R/W) If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.
		1	Core	L2 Adjacent Cache Line Prefetcher Disable (R/W) If 1, disables the adjacent cache line prefetcher, which fetches the cache line that comprises a cache line pair (128 bytes).
		2	Core	DCU Hardware Prefetcher Disable (R/W) If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.

**Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		3	Core	DCU IP Prefetcher Disable (R/W) If 1, disables the L1 data cache IP prefetcher, which uses sequential load history (based on instruction pointer of previous loads) to determine whether to prefetch additional lines.
		63:4		Reserved
1A6H	422	MSR_OFFCORE_RSP_0	Thread	Offcore Response Event Select Register (R/W)
1AAH	426	MSR_MISC_PWR_MGMT		Miscellaneous Power Management Control Various model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a> .
		0	Package	EIST Hardware Coordination Disable (R/W) When 0, enables hardware coordination of Enhanced Intel Speedstep Technology request from processor cores. When 1, disables hardware coordination of Enhanced Intel Speedstep Technology requests.
		1	Thread	Energy/Performance Bias Enable (R/W) This bit makes the IA32_ENERGY_PERF_BIAS register (MSR 1B0h) visible to software with Ring 0 privileges. This bit's status (1 or 0) is also reflected by CPUID.(EAX=06h):ECX[3].
		63:2		Reserved
1ACH	428	MSR_TURBO_POWER_CURRENT_LIMIT		See <a href="http://biosbits.org">http://biosbits.org</a> .
		14:0	Package	TDP Limit (R/W) TDP limit in 1/8 Watt granularity.
		15	Package	TDP Limit Override Enable (R/W) A value = 0 indicates override is not active; a value = 1 indicates override is active.
		30:16	Package	TDC Limit (R/W) TDC limit in 1/8 Amp granularity.
		31	Package	TDC Limit Override Enable (R/W) A value = 0 indicates override is not active; a value = 1 indicates override is active.
		63:32		Reserved

		61		UNC_Ovf Uncore overflowed if 1.
38FH	911	IA32_PERF_GLOBAL_CTRL	Thread	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."
390H	912	IA32_PERF_GLOBAL_OVF_CTRL	Thread	See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities." Allows software to clear counter overflow conditions on any combination of fixed-function PMCs (MSR_PERF_FIXED_CTRx) or general-purpose PMCs via a single WRMSR.
390H	912	MSR_PERF_GLOBAL_OVF_CTRL	Thread	(R/W)
		61		CLR_UNC_Ovf Set 1 to clear UNC_Ovf.
3F1H	1009	MSR_PEBS_ENABLE	Thread	See Section 18.3.1.1.1, "Processor Event Based Sampling (PEBS)."
		0		Enable PEBS on IA32_PMC0 (R/W)
		1		Enable PEBS on IA32_PMC1 (R/W)
		2		Enable PEBS on IA32_PMC2 (R/W)
		3		Enable PEBS on IA32_PMC3 (R/W)
		31:4		Reserved
		32		Enable Load Latency on IA32_PMC0 (R/W)
		33		Enable Load Latency on IA32_PMC1 (R/W)
		34		Enable Load Latency on IA32_PMC2 (R/W)
		35		Enable Load Latency on IA32_PMC3 (R/W)
		63:36		Reserved
3F6H	1014	MSR_PEBS_LD_LAT	Thread	See Section 18.3.1.1.2, "Load Latency Performance Monitoring Facility."
		15:0		Minimum threshold latency value of tagged load operation that will be counted. (R/W)
		63:36		Reserved
3F8H	1016	MSR_PKG_C3_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		Package C3 Residency Counter (R/O) Value since last reset that this package is in processor-specific C3 states. Count at the same frequency as the TSC.
3F9H	1017	MSR_PKG_C6_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		63:0		Package C6 Residency Counter (R/O) Value since last reset that this package is in processor-specific C6 states. Count at the same frequency as the TSC.
3FAH	1018	MSR_PKG_C7_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		Package C7 Residency Counter (R/O) Value since last reset that this package is in processor-specific C7 states. Count at the same frequency as the TSC.
3FCH	1020	MSR_CORE_C3_RESIDENCY	Core	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		CORE C3 Residency Counter (R/O) Value since last reset that this core is in processor-specific C3 states. Count at the same frequency as the TSC.
3FDH	1021	MSR_CORE_C6_RESIDENCY	Core	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		63:0		CORE C6 Residency Counter (R/O) Value since last reset that this core is in processor-specific C6 states. Count at the same frequency as the TSC.
400H	1024	IA32_MCO_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
401H	1025	IA32_MCO_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."
402H	1026	IA32_MCO_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
403H	1027	IA32_MCO_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
404H	1028	IA32_MC1_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS."
406H	1030	IA32_MC1_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
407H	1031	IA32_MC1_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
408H	1032	IA32_MC2_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40AH	1034	IA32_MC2_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40BH	1035	IA32_MC2_MISC	Core	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
40CH	1036	IA32_MC3_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC3_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40EH	1038	IA32_MC3_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40FH	1039	IA32_MC3_MISC	Core	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
410H	1040	IA32_MC4_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC4_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
412H	1042	IA32_MC4_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	IA32_MC4_MISC	Core	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
414H	1044	IA32_MC5_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
415H	1045	IA32_MC5_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
416H	1046	IA32_MC5_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
417H	1047	IA32_MC5_MISC	Core	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
418H	1048	IA32_MC6_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
419H	1049	IA32_MC6_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs" and Chapter 16.
41AH	1050	IA32_MC6_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
41BH	1051	IA32_MC6_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
41CH	1052	IA32_MC7_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
41DH	1053	IA32_MC7_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS" and Chapter 16.
41EH	1054	IA32_MC7_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
41FH	1055	IA32_MC7_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
420H	1056	IA32_MC8_CTL	Package	See Section 15.3.2.1, "IA32_MCI_CTL MSRs."
421H	1057	IA32_MC8_STATUS	Package	See Section 15.3.2.2, "IA32_MCI_STATUS MSRS" and Chapter 16.
422H	1058	IA32_MC8_ADDR	Package	See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."
423H	1059	IA32_MC8_MISC	Package	See Section 15.3.2.4, "IA32_MCI_MISC MSRs."
480H	1152	IA32_VMX_BASIC	Thread	Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2. See Appendix A.1, "Basic VMX Information."
481H	1153	IA32_VMX_PINBASED_CTL	Thread	Capability Reporting Register of Pin-based VM-execution Controls (R/O) See Table 2-2. See Appendix A.3, "VM-Execution Controls."
482H	1154	IA32_VMX_PROCBASED_CTL	Thread	Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."
483H	1155	IA32_VMX_EXIT_CTL	Thread	Capability Reporting Register of VM-Exit Controls (R/O) See Table 2-2. See Appendix A.4, "VM-Exit Controls."
484H	1156	IA32_VMX_ENTRY_CTL	Thread	Capability Reporting Register of VM-Entry Controls (R/O) See Table 2-2. See Appendix A.5, "VM-Entry Controls."
485H	1157	IA32_VMX_MISC	Thread	Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2. See Appendix A.6, "Miscellaneous Data."
486H	1158	IA32_VMX_CRO_FIXED0	Thread	Capability Reporting Register of CRO Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CRO."
487H	1159	IA32_VMX_CRO_FIXED1	Thread	Capability Reporting Register of CRO Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CRO."

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
488H	1160	IA32_VMX_CR4_FIXED0	Thread	Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."
489H	1161	IA32_VMX_CR4_FIXED1	Thread	Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."
48AH	1162	IA32_VMX_VMCS_ENUM	Thread	Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2. See Appendix A.9, "VMCS Enumeration."
48BH	1163	IA32_VMX_PROCBASED_CTL2	Thread	Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."
600H	1536	IA32_DS_AREA	Thread	DS Save Area (R/W) See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
680H	1664	MSR_LASTBRANCH_0_FROM_IP	Thread	Last Branch Record 0 From IP (R/W) One of sixteen pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction. See also: <ul style="list-style-type: none"> <li>▪ Last Branch Record Stack TOS at 1C9H.</li> <li>▪ Section 17.9.1 and record format in Section 17.4.8.1.</li> </ul>
681H	1665	MSR_LASTBRANCH_1_FROM_IP	Thread	Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
682H	1666	MSR_LASTBRANCH_2_FROM_IP	Thread	Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
683H	1667	MSR_LASTBRANCH_3_FROM_IP	Thread	Last Branch Record 3 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
684H	1668	MSR_LASTBRANCH_4_FROM_IP	Thread	Last Branch Record 4 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
685H	1669	MSR_LASTBRANCH_5_FROM_IP	Thread	Last Branch Record 5 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
686H	1670	MSR_LASTBRANCH_6_FROM_IP	Thread	Last Branch Record 6 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
687H	1671	MSR_LASTBRANCH_7_FROM_IP	Thread	Last Branch Record 7 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
688H	1672	MSR_LASTBRANCH_8_FROM_IP	Thread	Last Branch Record 8 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
689H	1673	MSR_LASTBRANCH_9_FROM_IP	Thread	Last Branch Record 9 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68AH	1674	MSR_LASTBRANCH_10_FROM_IP	Thread	Last Branch Record 10 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68BH	1675	MSR_LASTBRANCH_11_FROM_IP	Thread	Last Branch Record 11 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68CH	1676	MSR_LASTBRANCH_12_FROM_IP	Thread	Last Branch Record 12 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68DH	1677	MSR_LASTBRANCH_13_FROM_IP	Thread	Last Branch Record 13 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68EH	1678	MSR_LASTBRANCH_14_FROM_IP	Thread	Last Branch Record 14 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
68FH	1679	MSR_LASTBRANCH_15_FROM_IP	Thread	Last Branch Record 15 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.
6C0H	1728	MSR_LASTBRANCH_0_TO_IP	Thread	Last Branch Record 0 To IP (R/W) One of sixteen pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the destination instruction.
6C1H	1729	MSR_LASTBRANCH_1_TO_IP	Thread	Last Branch Record 1 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6C2H	1730	MSR_LASTBRANCH_2_TO_IP	Thread	Last Branch Record 2 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6C3H	1731	MSR_LASTBRANCH_3_TO_IP	Thread	Last Branch Record 3 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6C4H	1732	MSR_LASTBRANCH_4_TO_IP	Thread	Last Branch Record 4 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6C5H	1733	MSR_LASTBRANCH_5_TO_IP	Thread	Last Branch Record 5 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6C6H	1734	MSR_LASTBRANCH_6_TO_IP	Thread	Last Branch Record 6 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6C7H	1735	MSR_LASTBRANCH_7_TO_IP	Thread	Last Branch Record 7 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6C8H	1736	MSR_LASTBRANCH_8_TO_IP	Thread	Last Branch Record 8 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6C9H	1737	MSR_LASTBRANCH_9_TO_IP	Thread	Last Branch Record 9 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6CAH	1738	MSR_LASTBRANCH_10_TO_IP	Thread	Last Branch Record 10 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
6CBH	1739	MSR_LASTBRANCH_11_TO_IP	Thread	Last Branch Record 11 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6CCH	1740	MSR_LASTBRANCH_12_TO_IP	Thread	Last Branch Record 12 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6CDH	1741	MSR_LASTBRANCH_13_TO_IP	Thread	Last Branch Record 13 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6CEH	1742	MSR_LASTBRANCH_14_TO_IP	Thread	Last Branch Record 14 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
6CFH	1743	MSR_LASTBRANCH_15_TO_IP	Thread	Last Branch Record 15 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.
802H	2050	IA32_X2APIC_APICID	Thread	x2APIC ID Register (R/O)
803H	2051	IA32_X2APIC_VERSION	Thread	x2APIC Version Register (R/O)
808H	2056	IA32_X2APIC_TPR	Thread	x2APIC Task Priority Register (R/W)
80AH	2058	IA32_X2APIC_PPR	Thread	x2APIC Processor Priority Register (R/O)
80BH	2059	IA32_X2APIC_EOI	Thread	x2APIC EOI Register (W/O)
80DH	2061	IA32_X2APIC_LDR	Thread	x2APIC Logical Destination Register (R/O)
80FH	2063	IA32_X2APIC_SIVR	Thread	x2APIC Spurious Interrupt Vector Register (R/W)
810H	2064	IA32_X2APIC_ISR0	Thread	x2APIC In-Service Register Bits [31:0] (R/O)
811H	2065	IA32_X2APIC_ISR1	Thread	x2APIC In-Service Register Bits [63:32] (R/O)
812H	2066	IA32_X2APIC_ISR2	Thread	x2APIC In-Service Register Bits [95:64] (R/O)
813H	2067	IA32_X2APIC_ISR3	Thread	x2APIC In-Service Register Bits [127:96] (R/O)
814H	2068	IA32_X2APIC_ISR4	Thread	x2APIC In-Service Register Bits [159:128] (R/O)
815H	2069	IA32_X2APIC_ISR5	Thread	x2APIC In-Service Register Bits [191:160] (R/O)
816H	2070	IA32_X2APIC_ISR6	Thread	x2APIC In-Service Register Bits [223:192] (R/O)
817H	2071	IA32_X2APIC_ISR7	Thread	x2APIC In-Service Register Bits [255:224] (R/O)
818H	2072	IA32_X2APIC_TMR0	Thread	x2APIC Trigger Mode Register Bits [31:0] (R/O)
819H	2073	IA32_X2APIC_TMR1	Thread	x2APIC Trigger Mode Register Bits [63:32] (R/O)
81AH	2074	IA32_X2APIC_TMR2	Thread	x2APIC Trigger Mode Register Bits [95:64] (R/O)
81BH	2075	IA32_X2APIC_TMR3	Thread	x2APIC Trigger Mode Register Bits [127:96] (R/O)
81CH	2076	IA32_X2APIC_TMR4	Thread	x2APIC Trigger Mode Register Bits [159:128] (R/O)
81DH	2077	IA32_X2APIC_TMR5	Thread	x2APIC Trigger Mode Register Bits [191:160] (R/O)
81EH	2078	IA32_X2APIC_TMR6	Thread	x2APIC Trigger Mode Register Bits [223:192] (R/O)
81FH	2079	IA32_X2APIC_TMR7	Thread	x2APIC Trigger Mode Register Bits [255:224] (R/O)
820H	2080	IA32_X2APIC_IRR0	Thread	x2APIC Interrupt Request Register Bits [31:0] (R/O)
821H	2081	IA32_X2APIC_IRR1	Thread	x2APIC Interrupt Request Register Bits [63:32] (R/O)
822H	2082	IA32_X2APIC_IRR2	Thread	x2APIC Interrupt Request Register Bits [95:64] (R/O)

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
823H	2083	IA32_X2APIC_IRR3	Thread	x2APIC Interrupt Request Register Bits [127:96] (R/O)
824H	2084	IA32_X2APIC_IRR4	Thread	x2APIC Interrupt Request Register Bits [159:128] (R/O)
825H	2085	IA32_X2APIC_IRR5	Thread	x2APIC Interrupt Request Register Bits [191:160] (R/O)
826H	2086	IA32_X2APIC_IRR6	Thread	x2APIC Interrupt Request Register Bits [223:192] (R/O)
827H	2087	IA32_X2APIC_IRR7	Thread	x2APIC Interrupt Request Register Bits [255:224] (R/O)
828H	2088	IA32_X2APIC_ESR	Thread	x2APIC Error Status Register (R/W)
82FH	2095	IA32_X2APIC_LVT_CMCI	Thread	x2APIC LVT Corrected Machine Check Interrupt Register (R/W)
830H	2096	IA32_X2APIC_ICR	Thread	x2APIC Interrupt Command Register (R/W)
832H	2098	IA32_X2APIC_LVT_TIMER	Thread	x2APIC LVT Timer Interrupt Register (R/W)
833H	2099	IA32_X2APIC_LVT_THERMAL	Thread	x2APIC LVT Thermal Sensor Interrupt Register (R/W)
834H	2100	IA32_X2APIC_LVT_PMI	Thread	x2APIC LVT Performance Monitor Register (R/W)
835H	2101	IA32_X2APIC_LVT_LINT0	Thread	x2APIC LVT LINT0 Register (R/W)
836H	2102	IA32_X2APIC_LVT_LINT1	Thread	x2APIC LVT LINT1 Register (R/W)
837H	2103	IA32_X2APIC_LVT_ERROR	Thread	x2APIC LVT Error Register (R/W)
838H	2104	IA32_X2APIC_INIT_COUNT	Thread	x2APIC Initial Count Register (R/W)
839H	2105	IA32_X2APIC_CUR_COUNT	Thread	x2APIC Current Count Register (R/O)
83EH	2110	IA32_X2APIC_DIV_CONF	Thread	x2APIC Divide Configuration Register (R/W)
83FH	2111	IA32_X2APIC_SELF_IPI	Thread	x2APIC Self IPI Register (W/O)
C000_0080H		IA32_EFER	Thread	Extended Feature Enables See Table 2-2.
C000_0081H		IA32_STAR	Thread	System Call Target Address (R/W) See Table 2-2.
C000_0082H		IA32_LSTAR	Thread	IA-32e Mode System Call Target Address (R/W) See Table 2-2.
C000_0084H		IA32_FMASK	Thread	System Call Flag Mask (R/W) See Table 2-2.
C000_0100H		IA32_FS_BASE	Thread	Map of BASE Address of FS (R/W) See Table 2-2.
C000_0101H		IA32_GS_BASE	Thread	Map of BASE Address of GS (R/W) See Table 2-2.
C000_0102H		IA32_KERNEL_GS_BASE	Thread	Swap Target of BASE Address of GS (R/W) See Table 2-2.
C000_0103H		IA32_TSC_AUX	Thread	AUXILIARY TSC Signature (R/W) See Table 2-2 and Section 17.17.2, "IA32_TSC_AUX Register and RDTSCP Support."

### 2.7.1 Additional MSRs in the Intel® Xeon® Processor 5500 and 3400 Series

Intel Xeon Processor 5500 and 3400 series support additional model-specific registers listed in Table 2-15. These MSRs also apply to Intel Core i7 and i5 processor family CPUID signature with DisplayFamily\_DisplayModel of 06\_1AH, 06\_1EH and 06\_1FH, see Table 2-1.

**Table 2-15. Additional MSRs in Intel® Xeon® Processor 5500 and 3400 Series**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	Actual maximum turbo frequency is multiplied by 133.33MHz. (Not available in model 06_2EH.)
		7:0		Maximum Turbo Ratio Limit 1C (R/O) Maximum Turbo mode ratio limit with 1 core active.
		15:8		Maximum Turbo Ratio Limit 2C (R/O) Maximum Turbo mode ratio limit with 2 cores active.
		23:16		Maximum Turbo Ratio Limit 3C (R/O) Maximum Turbo mode ratio limit with 3 cores active.
		31:24		Maximum Turbo Ratio Limit 4C (R/O) Maximum Turbo mode ratio limit with 4 cores active.
		63:32		Reserved
301H	769	MSR_GQ_SNOOP_MESF	Package	
		0		From M to S (R/W)
		1		From E to S (R/W)
		2		From S to S (R/W)
		3		From F to S (R/W)
		4		From M to I (R/W)
		5		From E to I (R/W)
		6		From S to I (R/W)
		7		From F to I (R/W)
63:8	Reserved			
391H	913	MSR_UNCORE_PERF_GLOBAL_CTRL	Package	See Section 18.3.1.2.1, "Uncore Performance Monitoring Management Facility."
392H	914	MSR_UNCORE_PERF_GLOBAL_STATUS	Package	See Section 18.3.1.2.1, "Uncore Performance Monitoring Management Facility."
393H	915	MSR_UNCORE_PERF_GLOBAL_OVF_CTRL	Package	See Section 18.3.1.2.1, "Uncore Performance Monitoring Management Facility."

3C1H	945	MSR_UNCORE_PERFEVTSEL1	Package	See Section 18.3.1.2.2, “Uncore Performance Event Configuration Facility.”
3C2H	946	MSR_UNCORE_PERFEVTSEL2	Package	See Section 18.3.1.2.2, “Uncore Performance Event Configuration Facility.”
3C3H	947	MSR_UNCORE_PERFEVTSEL3	Package	See Section 18.3.1.2.2, “Uncore Performance Event Configuration Facility.”
3C4H	948	MSR_UNCORE_PERFEVTSEL4	Package	See Section 18.3.1.2.2, “Uncore Performance Event Configuration Facility.”
3C5H	949	MSR_UNCORE_PERFEVTSEL5	Package	See Section 18.3.1.2.2, “Uncore Performance Event Configuration Facility.”
3C6H	950	MSR_UNCORE_PERFEVTSEL6	Package	See Section 18.3.1.2.2, “Uncore Performance Event Configuration Facility.”
3C7H	951	MSR_UNCORE_PERFEVTSEL7	Package	See Section 18.3.1.2.2, “Uncore Performance Event Configuration Facility.”

## 2.7.2 Additional MSRs in the Intel® Xeon® Processor 7500 Series

Intel Xeon Processor 7500 series support MSRs listed in Table 2-14 (except MSR address 1ADH) and additional model-specific registers listed in Table 2-16. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2EH.

**Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	Reserved Attempt to read/write will cause #UD.

**Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
289H	649	IA32_MC9_CTL2	Package	See Table 2-2.
28AH	650	IA32_MC10_CTL2	Package	See Table 2-2.
28BH	651	IA32_MC11_CTL2	Package	See Table 2-2.
28CH	652	IA32_MC12_CTL2	Package	See Table 2-2.
28DH	653	IA32_MC13_CTL2	Package	See Table 2-2.
28EH	654	IA32_MC14_CTL2	Package	See Table 2-2.
28FH	655	IA32_MC15_CTL2	Package	See Table 2-2.
290H	656	IA32_MC16_CTL2	Package	See Table 2-2.
291H	657	IA32_MC17_CTL2	Package	See Table 2-2.
292H	658	IA32_MC18_CTL2	Package	See Table 2-2.
293H	659	IA32_MC19_CTL2	Package	See Table 2-2.
294H	660	IA32_MC20_CTL2	Package	See Table 2-2.
295H	661	IA32_MC21_CTL2	Package	See Table 2-2.
394H	816	MSR_W_PMON_FIXED_CTR	Package	Uncore W-box perfmon fixed counter.
395H	817	MSR_W_PMON_FIXED_CTR_CTL	Package	Uncore U-box perfmon fixed counter control MSR.
424H	1060	IA32_MC9_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
425H	1061	IA32_MC9_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS" and Chapter 16.
426H	1062	IA32_MC9_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
427H	1063	IA32_MC9_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
428H	1064	IA32_MC10_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
429H	1065	IA32_MC10_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS" and Chapter 16.
42AH	1066	IA32_MC10_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
42BH	1067	IA32_MC10_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
42CH	1068	IA32_MC11_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
42DH	1069	IA32_MC11_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS" and Chapter 16.
42EH	1070	IA32_MC11_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
42FH	1071	IA32_MC11_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
430H	1072	IA32_MC12_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
431H	1073	IA32_MC12_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS" and Chapter 16.
432H	1074	IA32_MC12_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
433H	1075	IA32_MC12_MISC	Package	See Section 15.3.2.4, "IA32_MCi_MISC MSRs."
434H	1076	IA32_MC13_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
435H	1077	IA32_MC13_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS" and Chapter 16.

E2EH	3630	MSR_R1_PMON_QLX_P6	Package	Uncore R-box 1 perfmon QLX unit Port 6 select MSR.
E2FH	3631	MSR_R1_PMON_QLX_P7	Package	Uncore R-box 1 perfmon QLX unit Port 7 select MSR.
E30H	3632	MSR_R1_PMON_EVNT_SEL8	Package	Uncore R-box 1 perfmon event select MSR.
E31H	3633	MSR_R1_PMON_CTR8	Package	Uncore R-box 1 perfmon counter MSR.
E32H	3634	MSR_R1_PMON_EVNT_SEL9	Package	Uncore R-box 1 perfmon event select MSR.
E33H	3635	MSR_R1_PMON_CTR9	Package	Uncore R-box 1 perfmon counter MSR.
E34H	3636	MSR_R1_PMON_EVNT_SEL10	Package	Uncore R-box 1 perfmon event select MSR.
E35H	3637	MSR_R1_PMON_CTR10	Package	Uncore R-box 1 perfmon counter MSR.
E36H	3638	MSR_R1_PMON_EVNT_SEL11	Package	Uncore R-box 1 perfmon event select MSR.
E37H	3639	MSR_R1_PMON_CTR11	Package	Uncore R-box 1 perfmon counter MSR.
E38H	3640	MSR_R1_PMON_EVNT_SEL12	Package	Uncore R-box 1 perfmon event select MSR.
E39H	3641	MSR_R1_PMON_CTR12	Package	Uncore R-box 1 perfmon counter MSR.

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
E3AH	3642	MSR_R1_PMON_EVNT_SEL13	Package	Uncore R-box 1 perfmon event select MSR.
E3BH	3643	MSR_R1_PMON_CTR13	Package	Uncore R-box 1 perfmon counter MSR.
E3CH	3644	MSR_R1_PMON_EVNT_SEL14	Package	Uncore R-box 1 perfmon event select MSR.
E3DH	3645	MSR_R1_PMON_CTR14	Package	Uncore R-box 1 perfmon counter MSR.
E3EH	3646	MSR_R1_PMON_EVNT_SEL15	Package	Uncore R-box 1 perfmon event select MSR.
E3FH	3647	MSR_R1_PMON_CTR15	Package	Uncore R-box 1 perfmon counter MSR.
E45H	3653	MSR_B0_PMON_MATCH	Package	Uncore B-box 0 perfmon local box match MSR.
E46H	3654	MSR_B0_PMON_MASK	Package	Uncore B-box 0 perfmon local box mask MSR.
E49H	3657	MSR_S0_PMON_MATCH	Package	Uncore S-box 0 perfmon local box match MSR.
E4AH	3658	MSR_S0_PMON_MASK	Package	Uncore S-box 0 perfmon local box mask MSR.
E4DH	3661	MSR_B1_PMON_MATCH	Package	Uncore B-box 1 perfmon local box match MSR.
E4EH	3662	MSR_B1_PMON_MASK	Package	Uncore B-box 1 perfmon local box mask MSR.
E54H	3668	MSR_M0_PMON_MM_CONFIG	Package	Uncore M-box 0 perfmon local box address match/mask config MSR.
E55H	3669	MSR_M0_PMON_ADDR_MATCH	Package	Uncore M-box 0 perfmon local box address match MSR.
E56H	3670	MSR_M0_PMON_ADDR_MASK	Package	Uncore M-box 0 perfmon local box address mask MSR.
E59H	3673	MSR_S1_PMON_MATCH	Package	Uncore S-box 1 perfmon local box match MSR.
E5AH	3674	MSR_S1_PMON_MASK	Package	Uncore S-box 1 perfmon local box mask MSR.
E5CH	3676	MSR_M1_PMON_MM_CONFIG	Package	Uncore M-box 1 perfmon local box address match/mask config MSR.
E5DH	3677	MSR_M1_PMON_ADDR_MATCH	Package	Uncore M-box 1 perfmon local box address match MSR.
E5EH	3678	MSR_M1_PMON_ADDR_MASK	Package	Uncore M-box 1 perfmon local box address mask MSR.
3B5H	965	MSR_UNCORE_PMC5	Package	See Section 18.3.1.2.2, "Uncore Performance Event Configuration Facility."

## 2.8 MSRS IN THE INTEL® XEON® PROCESSOR 5600 SERIES (BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE)

Intel® Xeon® Processor 5600 Series (based on Intel® microarchitecture code name Westmere) supports the MSR interfaces listed in Table 2-14, Table 2-15, plus additional MSR listed in Table 2-17. These MSRs apply to Intel Core i7, i5 and i3 processor family with CPUID signature DisplayFamily\_DisplayModel of 06\_25H and 06\_2CH, see Table 2-1.

**Table 2-17. Additional MSRs Supported by Intel Processors  
(Based on Intel® Microarchitecture Code Name Westmere)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
13CH	52	MSR_FEATURE_CONFIG	Core	AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.
		1:0		AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.
		63:2		Reserved
1A7H	423	MSR_OFFCORE_RSP_1	Thread	Offcore Response Event Select Register (R/W)
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	Maximum Ratio Limit of Turbo Mode RO if MSR_PLATFORM_INFO.[28] = 0. RW if MSR_PLATFORM_INFO.[28] = 1.
		7:0	Package	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.
		15:8	Package	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 core active.
		23:16	Package	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 core active.
		31:24	Package	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 core active.
		39:32	Package	Maximum Ratio Limit for 5C Maximum turbo ratio limit of 5 core active.
		47:40	Package	Maximum Ratio Limit for 6C Maximum turbo ratio limit of 6 core active.
		63:48		Reserved
1B0H	432	IA32_ENERGY_PERF_BIAS	Package	See Table 2-2.

## 2.9 MSRS IN THE INTEL® XEON® PROCESSOR E7 FAMILY (BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE)

Intel® Xeon® Processor E7 Family (based on Intel® microarchitecture code name Westmere) supports the MSR interfaces listed in Table 2-14 (except MSR address 1ADH), Table 2-15, plus additional MSR listed in Table 2-18. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2FH.

Table 2-18. Additional MSRs Supported by Intel® Xeon® Processor E7 Family

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
13CH	52	MSR_FEATURE_CONFIG	Core	AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.
		1:0		AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.
		63:2		Reserved
1A7H	423	MSR_OFFCORE_RSP_1	Thread	Offcore Response Event Select Register (R/W)
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	Reserved Attempt to read/write will cause #UD.
1B0H	432	IA32_ENERGY_PERF_BIAS	Package	See Table 2-2.
F40H	3904	MSR_C8_PMON_BOX_CTRL	Package	Uncore C-box 8 perfmon local box control MSR.
F41H	3905	MSR_C8_PMON_BOX_STATUS	Package	Uncore C-box 8 perfmon local box status MSR.
F42H	3906	MSR_C8_PMON_BOX_OVF_CTRL	Package	Uncore C-box 8 perfmon local box overflow control MSR.
F50H	3920	MSR_C8_PMON_EVNT_SELO	Package	Uncore C-box 8 perfmon event select MSR.
F51H	3921	MSR_C8_PMON_CTR0	Package	Uncore C-box 8 perfmon counter MSR.
F52H	3922	MSR_C8_PMON_EVNT_SEL1	Package	Uncore C-box 8 perfmon event select MSR.
F53H	3923	MSR_C8_PMON_CTR1	Package	Uncore C-box 8 perfmon counter MSR.
F54H	3924	MSR_C8_PMON_EVNT_SEL2	Package	Uncore C-box 8 perfmon event select MSR.
F55H	3925	MSR_C8_PMON_CTR2	Package	Uncore C-box 8 perfmon counter MSR.
F56H	3926	MSR_C8_PMON_EVNT_SEL3	Package	Uncore C-box 8 perfmon event select MSR.
F57H	3927	MSR_C8_PMON_CTR3	Package	Uncore C-box 8 perfmon counter MSR.
F58H	3928	MSR_C8_PMON_EVNT_SEL4	Package	Uncore C-box 8 perfmon event select MSR.
F59H	3929	MSR_C8_PMON_CTR4	Package	Uncore C-box 8 perfmon counter MSR.
F5AH	3930	MSR_C8_PMON_EVNT_SEL5	Package	Uncore C-box 8 perfmon event select MSR.
F5BH	3931	MSR_C8_PMON_CTR5	Package	Uncore C-box 8 perfmon counter MSR.

**Table 2-18. Additional MSRs Supported by Intel® Xeon® Processor E7 Family (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
FC0H	4032	MSR_C9_PMON_BOX_CTRL	Package	Uncore C-box 9 perfmon local box control MSR.
FC1H	4033	MSR_C9_PMON_BOX_STATUS	Package	Uncore C-box 9 perfmon local box status MSR.
FC2H	4034	MSR_C9_PMON_BOX_OVF_CTRL	Package	Uncore C-box 9 perfmon local box overflow control MSR.
FD0H	4048	MSR_C9_PMON_EVNT_SELO	Package	Uncore C-box 9 perfmon event select MSR.
FD1H	4049	MSR_C9_PMON_CTRL0	Package	Uncore C-box 9 perfmon counter MSR.
FD2H	4050	MSR_C9_PMON_EVNT_SEL1	Package	Uncore C-box 9 perfmon event select MSR.
FD3H	4051	MSR_C9_PMON_CTRL1	Package	Uncore C-box 9 perfmon counter MSR.
FD4H	4052	MSR_C9_PMON_EVNT_SEL2	Package	Uncore C-box 9 perfmon event select MSR.
FD5H	4053	MSR_C9_PMON_CTRL2	Package	Uncore C-box 9 perfmon counter MSR.
FD6H	4054	MSR_C9_PMON_EVNT_SEL3	Package	Uncore C-box 9 perfmon event select MSR.
FD7H	4055	MSR_C9_PMON_CTRL3	Package	Uncore C-box 9 perfmon counter MSR.
FD8H	4056	MSR_C9_PMON_EVNT_SEL4	Package	Uncore C-box 9 perfmon event select MSR.
FD9H	4057	MSR_C9_PMON_CTRL4	Package	Uncore C-box 9 perfmon counter MSR.
FDAH	4058	MSR_C9_PMON_EVNT_SEL5	Package	Uncore C-box 9 perfmon event select MSR.
FDBH	4059	MSR_C9_PMON_CTRL5	Package	Uncore C-box 9 perfmon counter MSR.

## 2.10 MSRS IN INTEL® PROCESSOR FAMILY BASED ON INTEL® MICROARCHITECTURE CODE NAME SANDY BRIDGE

Table 2-19 lists model-specific registers (MSRs) that are common to Intel® processor family based on Intel micro-architecture code name Sandy Bridge. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2AH, 06\_2DH, see Table 2-1. Additional MSRs specific to 06\_2AH are listed in Table 2-20.

**Table 2-19. MSRs Supported by Intel® Processors based on Intel® microarchitecture code name Sandy Bridge**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
0H	0	IA32_P5_MC_ADDR	Thread	See Section 2.22, “MSRs in Pentium Processors.”
1H	1	IA32_P5_MC_TYPE	Thread	See Section 2.22, “MSRs in Pentium Processors.”
6H	6	IA32_MONITOR_FILTER_SIZE	Thread	See Section 8.10.5, “Monitor/Mwait Address Range Determination” and Table 2-2.

**Table 2-19. MSRs Supported by Intel® Processors  
based on Intel® microarchitecture code name Sandy Bridge (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
10H	16	IA32_TIME_STAMP_COUNTER	Thread	See Section 17.17, "Time-Stamp Counter" and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Package	Platform ID (R) See Table 2-2.
1BH	27	IA32_APIC_BASE	Thread	See Section 10.4.4, "Local APIC Status and Location" and Table 2-2.
34H	52	MSR_SMI_COUNT	Thread	SMI Counter (R/O)
		31:0		SMI Count (R/O) Count SMIs.
		63:32		Reserved.
3AH	58	IA32_FEATURE_CONTROL	Thread	Control Features in Intel 64 Processor (R/W) See Table 2-2.
		0		Lock (R/WL)
		1		Enable VMX Inside SMX Operation (R/WL)
		2		Enable VMX Outside SMX Operation (R/WL)
		14:8		SENTER Local Functions Enables (R/WL)
15		SENTER Global Functions Enable (R/WL)		
79H	121	IA32_BIOS_UPDT_TRIG	Core	BIOS Update Trigger Register (W) See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Thread	BIOS Update Signature ID (RO) See Table 2-2.
C1H	193	IA32_PMC0	Thread	Performance Counter Register See Table 2-2.
C2H	194	IA32_PMC1	Thread	Performance Counter Register See Table 2-2.
C3H	195	IA32_PMC2	Thread	Performance Counter Register See Table 2-2.
C4H	196	IA32_PMC3	Thread	Performance Counter Register See Table 2-2.
C5H	197	IA32_PMC4	Core	Performance Counter Register (if core not shared by threads)
C6H	198	IA32_PMC5	Core	Performance Counter Register (if core not shared by threads)
C7H	199	IA32_PMC6	Core	Performance Counter Register (if core not shared by threads)
C8H	200	IA32_PMC7	Core	Performance Counter Register (if core not shared by threads)

**Table 2-19. MSRs Supported by Intel® Processors  
based on Intel® microarchitecture code name Sandy Bridge (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information Contains power management and other model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a> .
		7:0		Reserved
		15:8	Package	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.
		27:16		Reserved
		28	Package	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.
		29	Package	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.
		39:30		Reserved
		47:40	Package	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.
		63:48		Reserved
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Core	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See <a href="http://biosbits.org">http://biosbits.org</a> .
		2:0		Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit.  The following C-state code name encodings are supported: 000b: C0/C1 (no package C-sate support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit Note: This field cannot be used to limit package C-state to C3.
		9:3		Reserved

**Table 2-19. MSRs Supported by Intel® Processors  
based on Intel® microarchitecture code name Sandy Bridge (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		10		I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.
		14:11		Reserved
		15		CFG Lock (R/W0) When set, locks bits 15:0 of this register until next reset.
		24:16		Reserved
		25		C3 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.
		26		C1 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.
		27		Enable C3 Undemotion (R/W) When set, enables undemotion from demoted C3.
		28		Enable C1 Undemotion (R/W) When set, enables undemotion from demoted C1.
		63:29		Reserved
E4H	228	MSR_PMG_IO_CAPTURE_BASE	Core	Power Management IO Redirection in C-state (R/W) See <a href="http://biosbits.org">http://biosbits.org</a> .
		15:0		LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.
		18:16		C-State Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 000b - C3 is the max C-State to include. 001b - C6 is the max C-State to include. 010b - C7 is the max C-State to include.
		63:19		Reserved
E7H	231	IA32_MPERF	Thread	Maximum Performance Frequency Clock Count (RW) See Table 2-2.

**Table 2-19. MSRs Supported by Intel® Processors  
based on Intel® microarchitecture code name Sandy Bridge (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
E8H	232	IA32_APERF	Thread	Actual Performance Frequency Clock Count (RW) See Table 2-2.
FEH	254	IA32_MTRRCAP	Thread	See Table 2-2.
13CH	52	MSR_FEATURE_CONFIG	Core	AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.
		1:0		AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.
		63:2		Reserved
174H	372	IA32_SYSENTER_CS	Thread	See Table 2-2.
175H	373	IA32_SYSENTER_ESP	Thread	See Table 2-2.
176H	374	IA32_SYSENTER_EIP	Thread	See Table 2-2.
179H	377	IA32_MCG_CAP	Thread	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Thread	Global Machine Check Status
		0		RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.
		1		EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
		2		MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
63:3		Reserved		
186H	390	IA32_PERFEVTSELO	Thread	See Table 2-2.
187H	391	IA32_PERFEVTSEL1	Thread	See Table 2-2.

60AH	1546	MSR_PKGC3_IRTL	Package	Package C3 Interrupt Response Limit (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C3 state.

**Table 2-19. MSRs Supported by Intel® Processors  
based on Intel® microarchitecture code name Sandy Bridge (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		12:10		Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns
		14:13		Reserved
		15		Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.
		63:16		Reserved
60BH	1547	MSR_PKGC6_IRTL	Package	Package C6 Interrupt Response Limit (R/W) This MSR defines the budget allocated for the package to exit from a C6 to a C0 state, where an interrupt request can be delivered to the core and serviced. Additional core-exit latency may be applicable depending on the actual C-state the core is in. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.
		9:0		Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 state.
		12:10		Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns
		14:13		Reserved
		15		Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.

C000_0102H		IA32_KERNEL_GS_BASE	Thread	Swap Target of BASE Address of GS (R/W) See Table 2-2.
C000_0103H		IA32_TSC_AUX	Thread	AUXILIARY TSC Signature (R/W) See Table 2-2 and Section 17.17.2, "IA32_TSC_AUX Register and RDTSCP Support."

### 2.10.1 MSRs In 2nd Generation Intel® Core™ Processor Family (Based on Intel® Microarchitecture Code Name Sandy Bridge)

Table 2-20 and Table 2-21 list model-specific registers (MSRs) that are specific to the 2nd generation Intel® Core™ processor family (based on Intel microarchitecture code name Sandy Bridge). These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2AH; see Table 2-1.

**Table 2-20. MSRs Supported by 2nd Generation Intel® Core™ Processors  
(Intel® microarchitecture code name Sandy Bridge)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	Maximum Ratio Limit of Turbo Mode RO if MSR_PLATFORM_INFO.[28] = 0. RW if MSR_PLATFORM_INFO.[28] = 1.
		7:0	Package	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.
		15:8	Package	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 core active.
		23:16	Package	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 core active.
		31:24	Package	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 core active.
		63:32		Reserved
60CH	1548	MSR_PKGC7_IRTL	Package	Package C7 Interrupt Response Limit (R/W) This MSR defines the budget allocated for the package to exit from a C7 to a C0 state, where interrupt request can be delivered to the core and serviced. Additional core-exit latency may be applicable depending on the actual C-state the core is in. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.
		9:0		Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C7 state.
		12:10		Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns
		14:13		Reserved
		15		Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.
		63:16		Reserved

### 2.10.2 MSRs In Intel® Xeon® Processor E5 Family (Based on Intel® Microarchitecture Code Name Sandy Bridge)

Table 2-22 lists additional model-specific registers (MSRs) that are specific to the Intel® Xeon® Processor E5 Family (based on Intel® microarchitecture code name Sandy Bridge). These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2DH, and also supports MSRs listed in Table 2-19 and Table 2-23.

**Table 2-22. Selected MSRs Supported by Intel® Xeon® Processors E5 Family (based on Sandy Bridge microarchitecture)**

Register Address		Register Name / Bit Fields	Scope	Bit Description

### 2.10.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 Family

Intel Xeon Processor E5 family is based on the Sandy Bridge microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-23. For complete detail of the uncore PMU, refer to Intel Xeon Processor E5 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2DH

## 2.11 MSRS IN THE 3RD GENERATION INTEL® CORE™ PROCESSOR FAMILY (BASED ON INTEL® MICROARCHITECTURE CODE NAME IVY BRIDGE)

The 3rd generation Intel® Core™ processor family and the Intel® Xeon® processor E3-1200v2 product family (based on Intel microarchitecture code name Ivy Bridge) support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-21, and Table 2-24. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_3AH.

**Table 2-24. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors (based on Intel® microarchitecture code name Ivy Bridge)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information Contains power management and other model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a> .
		7:0		Reserved
		15:8	Package	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.
		27:16		Reserved
		28	Package	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.
		29	Package	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates that TDP Limit for Turbo mode is not programmable.
		31:30		Reserved
		32	Package	Low Power Mode Support (LPM) (R/O) When set to 1, indicates that LPM is supported. When set to 0, indicates LPM is not supported.
		34:33	Package	Number of ConfigTDP Levels (R/O) 00: Only Base TDP level available. 01: One additional TDP level available. 02: Two additional TDP level available. 11: Reserved
		39:35		Reserved
		47:40	Package	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.
		55:48	Package	Minimum Operating Ratio (R/O) Contains the minimum supported operating ratio in units of 100 MHz.
63:56		Reserved

(based on Intel® microarchitecture code name Ivy Bridge) (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Core	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See <a href="http://biosbits.org">http://biosbits.org</a> .
		2:0		Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-state support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.
		9:3		Reserved
		10		I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.
		14:11		Reserved
		15		CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.
		24:16		Reserved
		25		C3 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.
		26		C1 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.
		27		Enable C3 Undemotion (R/W) When set, enables undemotion from demoted C3.
28		Enable C1 Undemotion (R/W) When set, enables undemotion from demoted C1.

		1:0		TDP_LEVEL (RW/L) System BIOS can program this field.
		30:2		Reserved.
		31		Config_TDP_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.
		63:32		Reserved
64CH	1612	MSR_TURBO_ACTIVATION_RATIO	Package	ConfigTDP Control (R/W)
		7:0		MAX_NON_TURBO_RATIO (RW/L) System BIOS can program this field.
		30:8		Reserved
		31		TURBO_ACTIVATION_RATIO_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.
		63:32		Reserved

See Table 2-19, Table 2-20 and Table 2-21 for other MSR definitions applicable to processors with CPUID signature 06\_3AH.

### 2.11.1 MSRs In Intel® Xeon® Processor E5 v2 Product Family (Based on Ivy Bridge-E Microarchitecture)

Table 2-25 lists model-specific registers (MSRs) that are specific to the Intel® Xeon® Processor E5 v2 Product Family (based on Ivy Bridge-E microarchitecture). These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_3EH, see Table 2-1. These processors supports the MSR interfaces listed in Table 2-19, and Table 2-25.

**Table 2-25. MSRs Supported by Intel® Xeon® Processors E5 v2 Product Family (based on Ivy Bridge-E microarchitecture)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
4EH	78	MSR_PPIN_CTL	Package	Protected Processor Inventory Number Enable Control (R/W)

**Table 2-25. MSRs Supported by Intel® Xeon® Processors E5 v2 Product Family (based on Ivy Bridge-E microarchitecture) (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		0		<p>LockOut (R/WO)</p> <p>Set 1 to prevent further writes to MSR_PPIN_CTL. Writing 1 to MSR_PPIN_CTL[bit 0] is permitted only if MSR_PPIN_CTL[bit 1] is clear. Default is 0.</p> <p>BIOS should provide an opt-in menu to enable the user to turn on MSR_PPIN_CTL[bit 1] for privileged inventory initialization agent to access MSR_PPIN. After reading MSR_PPIN, the privileged inventory initialization agent should write '01b' to MSR_PPIN_CTL to disable further access to MSR_PPIN and prevent unauthorized modification to MSR_PPIN_CTL.</p>
		1		<p>Enable_PPIN (R/W)</p> <p>If 1, enables MSR_PPIN to be accessible using RDMSR. Once set, attempt to write 1 to MSR_PPIN_CTL[bit 0] will cause #GP.</p> <p>If 0, an attempt to read MSR_PPIN will cause #GP. Default is 0.</p>
		63:2		Reserved
4FH	79	MSR_PPIN	Package	Protected Processor Inventory Number (R/O)
		63:0		<p>Protected Processor Inventory Number (R/O)</p> <p>A unique value within a given CPUID family/model/stepping signature that a privileged inventory initialization agent can access to identify each physical processor, when access to MSR_PPIN is enabled. Access to MSR_PPIN is permitted only if MSR_PPIN_CTL[bits 1:0] = '10b'.</p>
CEH	206	MSR_PLATFORM_INFO	Package	<p>Platform Information</p> <p>Contains power management and other model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a>.</p>
		7:0		Reserved
		15:8	Package	<p>Maximum Non-Turbo Ratio (R/O)</p> <p>This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.</p>
		22:16		Reserved
		23	Package	<p>PPIN_CAP (R/O)</p> <p>When set to 1, indicates that Protected Processor Inventory Number (PPIN) capability can be enabled for a privileged system inventory agent to read PPIN from MSR_PPIN.</p> <p>When set to 0, PPIN capability is not supported. An attempt to access MSR_PPIN_CTL or MSR_PPIN will cause #GP.</p>
27:24		Reserved		

**Table 2-25. MSRs Supported by Intel® Xeon® Processors E5 v2 Product Family (based on Ivy Bridge-E microarchitecture) (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		28	Package	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.
		29	Package	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.
		30	Package	Programmable TJ OFFSET (R/O) When set to 1, indicates that MSR_TEMPERATURE_TARGET,[27:24] is valid and writable to specify a temperature offset.
		39:31		Reserved
		47:40	Package	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.
		63:48		Reserved
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Core	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states. See <a href="http://biosbits.org">http://biosbits.org</a> .
		2:0		Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-sate support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.
		9:3		Reserved
		10		I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.

See Table 2-19, Table 2-25 for other MSR definitions applicable to Intel Xeon processor E7 v2 with CPUID signature 06\_3AH.

**NOTES:**

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

**2.11.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v2 and E7 v2 Families**

Intel Xeon Processor E5 v2 and E7 v2 families are based on the Ivy Bridge-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-23 and Table 2-27. For complete detail of the uncore PMU, refer to Intel Xeon Processor E5 v2 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_3EH.

## 2.12 MSRS IN THE 4TH GENERATION INTEL® CORE™ PROCESSORS (BASED ON HASWELL MICROARCHITECTURE)

The 4th generation Intel® Core™ processor family and Intel® Xeon® processor E3-1200v3 product family (based on Haswell microarchitecture), with CPUID DisplayFamily\_DisplayModel signature 06\_3CH/06\_45H/06\_46H, support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-21, and Table 2-28. For an MSR listed in Table 2-19 that also appears in Table 2-28, Table 2-28 supercede Table 2-19.

The MSRs listed in Table 2-28 also apply to processors based on Haswell-E microarchitecture (see Section 2.13).

**Table 2-28. Additional MSRs Supported by Processors based on the Haswell or Haswell-E microarchitectures**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
3BH	59	IA32_TSC_ADJUST	Thread	Per-Logical-Processor TSC ADJUST (R/W) See Table 2-2.
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information Contains power management and other model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a> .
		7:0		Reserved
		15:8	Package	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.
		27:16		Reserved
		28	Package	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.
		29	Package	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.
		31:30		Reserved
		32	Package	Low Power Mode Support (LPM) (R/O) When set to 1, indicates that LPM is supported. When set to 0, indicates LPM is not supported.
		34:33	Package	Number of ConfigTDP Levels (R/O) 00: Only Base TDP level available. 01: One additional TDP level available. 02: Two additional TDP level available. 11: Reserved
		39:35		Reserved
	47:40	Package	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	

**Table 2-28. Additional MSRs Supported by Processors based on the Haswell or Haswell-E microarchitectures**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		55:48	Package	Minimum Operating Ratio (R/O) Contains the minimum supported operating ratio in units of 100 MHz.
		63:56		Reserved
186H	390	IA32_PERFEVTSELO	Thread	Performance Event Select for Counter 0 (R/W) Supports all fields described in Table 2-2 and the fields below.
		32		IN_TX: See Section 18.3.6.5.1. When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.
187H	391	IA32_PERFEVTSEL1	Thread	Performance Event Select for Counter 1 (R/W) Supports all fields described in Table 2-2 and the fields below.
		32		IN_TX: See Section 18.3.6.5.1. When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.
188H	392	IA32_PERFEVTSEL2	Thread	Performance Event Select for Counter 2 (R/W) Supports all fields described in Table 2-2 and the fields below.
		32		IN_TX: See Section 18.3.6.5.1. When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.
		33		IN_TXCP: See Section 18.3.6.5.1. When IN_TXCP=1 & IN_TX=1 and in sampling, a spurious PMI may occur and transactions may continuously abort near overflow conditions. Software should favor using IN_TXCP for counting over sampling. If sampling, software should use large "sample-after" value after clearing the counter configured to use IN_TXCP and also always reset the counter even when no overflow condition was reported.
189H	393	IA32_PERFEVTSEL3	Thread	Performance Event Select for Counter 3 (R/W) Supports all fields described in Table 2-2 and the fields below.
		32		IN_TX: See Section 18.3.6.5.1 When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.

491H	1169	IA32_VMX_VMFUNC	Thread	Capability Reporting Register of VM-Function Controls (R/O) See Table 2-2.
60BH	1548	MSR_PKG_C7_IRT_L1	Package	Package C6/C7 Interrupt Response Limit 1 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C6 or C7 state. The latency programmed in this register is for the shorter-latency sub C-states used by an MWAIT hint to a C6 or C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 or C7 state.

**Table 2-28. Additional MSRs Supported by Processors based on the Haswell or Haswell-E microarchitectures**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		12:10		Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-19 for supported time unit encodings.
		14:13		Reserved
		15		Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.
		63:16		Reserved
60CH	1548	MSR_PKG_C7_IRT2	Package	Package C6/C7 Interrupt Response Limit 2 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C6 or C7 state. The latency programmed in this register is for the longer-latency sub C-states used by an MWAIT hint to a C6 or C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.
		9:0		Interrupt response time limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 or C7 state.
		12:10		Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-19 for supported time unit encodings.
		14:13		Reserved
		15		Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.
		63:16		Reserved

### 2.12.1 MSRs in 4th Generation Intel® Core™ Processor Family (based on Haswell Microarchitecture)

Table 2-29 lists model-specific registers (MSRs) that are specific to 4th generation Intel® Core™ processor family and Intel® Xeon® processor E3-1200 v3 product family (based on Haswell microarchitecture). These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_3CH/06\_45H/06\_46H, see Table 2-1.

**Table 2-29. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Core	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states. See <a href="http://biosbits.org">http://biosbits.org</a> .
		3:0		Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 0000b: C0/C1 (no package C-state support) 0001b: C2 0010b: C3 0011b: C6 0100b: C7 0101b: C7s Package C states C7 are not available to processors with a signature of 06_3CH.
		9:4		Reserved
		10		I/O MWAIT Redirection Enable (R/W)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		29		Enable all uncore counters.
		30		Enable wake on PMI.
		31		Enable Freezing counter when overflow.
		63:32		Reserved
392H	914	MSR_UNC_PERF_GLOBAL_STATUS	Package	Uncore PMU Main Status
		0		Fixed counter overflowed.
		1		An ARB counter overflowed.
		2		Reserved
		3		A CBox counter overflowed (on any slice).
		63:4		Reserved
394H	916	MSR_UNC_PERF_FIXED_CTRL	Package	Uncore Fixed Counter Control (R/W)
		19:0		Reserved
		20		Enable overflow propagation.
		21		Reserved
		22		Enable counting.
		63:23		Reserved
395H	917	MSR_UNC_PERF_FIXED_CTR	Package	Uncore Fixed Counter
		47:0		Current count.
		63:48		Reserved
396H	918	MSR_UNC_CBO_CONFIG	Package	Uncore C-Box Configuration Information (R/O)
		3:0		Encoded number of C-Box, derive value by "-1".
		63:4		Reserved
3B0H	946	MSR_UNC_ARB_PERFCTR0	Package	Uncore Arb Unit, Performance Counter 0
3B1H	947	MSR_UNC_ARB_PERFCTR1	Package	Uncore Arb Unit, Performance Counter 1
3B2H	944	MSR_UNC_ARB_PERFEVTSELO	Package	Uncore Arb Unit, Counter 0 Event Select MSR
3B3H	945	MSR_UNC_ARB_PERFEVTSEL1	Package	Uncore Arb Unit, Counter 1 Event Select MSR
391H	913	MSR_UNC_PERF_GLOBAL_CTRL	Package	Uncore PMU Global Control
		0		Core 0 select.
		1		Core 1 select.
		2		Core 2 select.
		3		Core 3 select.
		18:4		Reserved
		29		Enable all uncore counters.
		30		Enable wake on PMI.
		31		Enable Freezing counter when overflow.
63:32		Reserved		

Table 2-29. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
395H	917	MSR_UNC_PERF_FIXED_CTR	Package	Uncore Fixed Counter
		47:0		Current count.
		63:48		Reserved
3B3H	945	MSR_UNC_ARB_PERFEVTSEL1	Package	Uncore Arb Unit, Counter 1 Event Select MSR
4E0H	1248	MSR_SMM_FEATURE_CONTROL	Package	Enhanced SMM Feature Control (SMM-RW) Reports SMM capability Enhancement. Accessible only while in SMM.
		0		Lock (SMM-RWO) When set to '1' locks this register from further changes.
		1		Reserved
		2		SMM_Code_Chk_En (SMM-RW) This control bit is available only if MSR_SMM_MCA_CAP[58] == 1. When set to '0' (default) none of the logical processors are prevented from executing SMM code outside the ranges defined by the SMRR. When set to '1' any logical processor in the package that attempts to execute SMM code not within the ranges defined by the SMRR will assert an unrecoverable MCE.
		63:3		Reserved
4E2H	1250	MSR_SMM_DELAYED	Package	SMM Delayed (SMM-RO) Reports the interruptible state of all logical processors in the package. Available only while in SMM and MSR_SMM_MCA_CAP[LONG_FLOW_INDICATION] == 1.
		N-1:0		LOG_PROC_STATE (SMM-RO) Each bit represents a logical processor of its state in a long flow of internal operation which delays servicing an interrupt. The corresponding bit will be set at the start of long events such as: Microcode Update Load, C6, WBINVD, Ratio Change, Throttle. The bit is automatically cleared at the end of each long event. The reset value of this field is 0. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.
		63:N		Reserved
4E3H	1251	MSR_SMM_BLOCKED	Package	SMM Blocked (SMM-RO) Reports the blocked state of all logical processors in the package. Available only while in SMM.

**Table 2-29. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		N-1:0		LOG_PROC_STATE (SMM-RO) Each bit represents a logical processor of its blocked state to service an SMI. The corresponding bit will be set if the logical processor is in one of the following states: Wait For SIPI or SENTER Sleep. The reset value of this field is 0FFFH. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.
		63:N		Reserved
606H	1542	MSR_RAPL_POWER_UNIT	Package	Unit Multipliers Used in RAPL Interfaces (R/O)
		3:0	Package	Power Units See Section 14.9.1, "RAPL Interfaces."
		7:4	Package	Reserved
		12:8	Package	Energy Status Units Energy related information (in Joules) is based on the multiplier, $1/2^{\text{ESU}}$ ; where ESU is an unsigned integer represented by bits 12:8. Default value is 0EH (or 61 micro-joules).
		15:13	Package	Reserved
		19:16	Package	Time Units See Section 14.9.1, "RAPL Interfaces."
		63:20		Reserved
639H	1593	MSR_PPO_ENERGY_STATUS	Package	PPO Energy Status (R/O) See Section 14.9.4, "PPO/PP1 RAPL Domains."
640H	1600	MSR_PP1_POWER_LIMIT	Package	PP1 RAPL Power Limit Control (R/W) See Section 14.9.4, "PPO/PP1 RAPL Domains."
641H	1601	MSR_PP1_ENERGY_STATUS	Package	PP1 Energy Status (R/O) See Section 14.9.4, "PPO/PP1 RAPL Domains."
642H	1602	MSR_PP1_POLICY	Package	PP1 Balance Policy (R/W) See Section 14.9.4, "PPO/PP1 RAPL Domains."
690H	1680	MSR_CORE_PERF_LIMIT_REASONS	Package	Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)
		0		PROCHOT Status (RO) When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.
		1		Thermal Status (RO) When set, frequency is reduced below the operating system request due to a thermal event.
		3:2		Reserved

Table 2-29. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		4		Graphics Driver Status (RO) When set, frequency is reduced below the operating system request due to Processor Graphics driver override.
		5		Autonomous Utilization-Based Frequency Control Status (RO) When set, frequency is reduced below the operating system request because the processor has detected that utilization is low.
		6		VR Therm Alert Status (RO) When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.
		7		Reserved
		8		Electrical Design Point Status (RO) When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).
		9		Core Power Limiting Status (RO) When set, frequency is reduced below the operating system request due to domain-level power limiting.
		10		Package-Level Power Limiting PL1 Status (RO) When set, frequency is reduced below the operating system request due to package-level power limiting PL1.
		11		Package-Level PL2 Power Limiting Status (RO) When set, frequency is reduced below the operating system request due to package-level power limiting PL2.
		12		Max Turbo Limit Status (RO) When set, frequency is reduced below the operating system request due to multi-core turbo limits.
		13		Turbo Transition Attenuation Status (RO) When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.
		15:14		Reserved
		16		PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.

See Table 2-19, Table 2-20, Table 2-21, Table 2-28, Table 2-29 for other MSR definitions applicable to processors with CPUID signature 06\_45H.

## 2.13 MSRS IN INTEL® XEON® PROCESSOR E5 V3 AND E7 V3 PRODUCT FAMILY

Intel® Xeon® processor E5 v3 family and Intel® Xeon® processor E7 v3 family are based on Haswell-E microarchitecture (CPUID DisplayFamily\_DisplayModel = 06\_3F). These processors supports the MSR interfaces listed in Table 2-19, Table 2-28, and Table 2-31.

**Table 2-31. Additional MSRs Supported by Intel® Xeon® Processor E5 v3 Family**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
35H	53	MSR_CORE_THREAD_COUNT	Package	Configured State of Enabled Processor Core Count and Logical Processor Count (RO) <ul style="list-style-type: none"> <li>After a Power-On RESET, enumerates factory configuration of the number of processor cores and logical processors in the physical package.</li> <li>Following the sequence of (i) BIOS modified a Configuration Mask which selects a subset of processor cores to be active post RESET and (ii) a RESET event after the modification, enumerates the current configuration of enabled processor core count and logical processor count in the physical package.</li> </ul>
		15:0		Core_COUNT (RO) The number of processor cores that are currently enabled (by either factory configuration or BIOS configuration) in the physical package.

Table 2-31. Additional MSRs Supported by Intel® Xeon® Processor E5 v3 Family

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		31:16		THREAD_COUNT (RO) The number of logical processors that are currently enabled (by either factory configuration or BIOS configuration) in the physical package.
		63:32		Reserved
53H	83	MSR_THREAD_ID_INFO	Thread	A Hardware Assigned ID for the Logical Processor (RO)
		7:0		Logical_Processor_ID (RO) An implementation-specific numerical value physically assigned to each logical processor. This ID is not related to Initial APIC ID or x2APIC ID, it is unique within a physical package.
		63:8		Reserved
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Core	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states. See <a href="http://biosbits.org">http://biosbits.org</a> .
		2:0		Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-state support) 001b: C2 010b: C6 (non-retention) 011b: C6 (retention) 111b: No Package C state limits. All C states supported by the processor are available.
		9:3		Reserved
		10		I/O MWAIT Redirection Enable (R/W)
		14:11		Reserved
		15		CFG Lock (R/W0)
		24:16		Reserved
		25		C3 State Auto Demotion Enable (R/W)
		26		C1 State Auto Demotion Enable (R/W)
		27		Enable C3 Undemotion (R/W)
		28		Enable C1 Undemotion (R/W)
		29		Package C State Demotion Enable (R/W)
		30		Package C State UnDemotion Enable (R/W)
63:31		Reserved

Hex	Dec			
620H	1568	MSR_UNCORE_RATIO_LIMIT	Package	Uncore Ratio Limit (R/W) Out of reset, the min_ratio and max_ratio fields represent the widest possible range of uncore frequencies. Writing to these fields allows software to control the minimum and the maximum frequency that hardware will select.
		63:15		Reserved
		14:8		MIN_RATIO Writing to this field controls the minimum possible ratio of the LLC/Ring.
		7		Reserved
		6:0		MAX_RATIO This field is used to limit the max ratio of the LLC/Ring.
639H	1593	MSR_PPO_ENERGY_STATUS	Package	Reserved (R/O) Reads return 0.
690H	1680	MSR_CORE_PERF_LIMIT_REASONS	Package	Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)
		0		PROCHOT Status (R0) When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.
		1		Thermal Status (R0) When set, frequency is reduced below the operating system request due to a thermal event.
		2		Power Budget Management Status (R0) When set, frequency is reduced below the operating system request due to PBM limit
		3		Platform Configuration Services Status (R0) When set, frequency is reduced below the operating system request due to PCS limit
		4		Reserved
		5		Autonomous Utilization-Based Frequency Control Status (R0) When set, frequency is reduced below the operating system request because the processor has detected that utilization is low.
		6		VR Therm Alert Status (R0) When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.
		7		Reserved

**Table 2-31. Additional MSRs Supported by Intel® Xeon® Processor E5 v3 Family**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		8		Electrical Design Point Status (R0) When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).
		9		Reserved
		10		Multi-Core Turbo Status (R0) When set, frequency is reduced below the operating system request due to Multi-Core Turbo limits.
		12:11		Reserved
		13		Core Frequency P1 Status (R0) When set, frequency is reduced below max non-turbo P1.
		14		Core Max N-Core Turbo Frequency Limiting Status (R0) When set, frequency is reduced below max n-core turbo frequency.
		15		Core Frequency Limiting Status (R0) When set, frequency is reduced below the operating system request.
		16		PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		17		Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		18		Power Budget Management Log When set, indicates that the PBM Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		19		Platform Configuration Services Log When set, indicates that the PCS Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		20		Reserved

Table 2-31. Additional MSRs Supported by Intel® Xeon® Processor E5 v3 Family

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		21		Autonomous Utilization-Based Frequency Control Log When set, indicates that the AUBFC Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		22		VR Therm Alert Log When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		23		Reserved
		24		Electrical Design Point Log When set, indicates that the EDP Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		25		Reserved
		26		Multi-Core Turbo Log When set, indicates that the Multi-Core Turbo Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		28:27		Reserved
		29		Core Frequency P1 Log When set, indicates that the Core Frequency P1 Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		30		Core Max N-Core Turbo Frequency Limiting Log When set, indicates that the Core Max n-core Turbo Frequency Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		31		Core Frequency Limiting Log When set, indicates that the Core Frequency Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.
		63:32		Reserved
C8DH	3213	IA32_QM_EVTSEL	THREAD	Monitoring Event Select Register (R/W) If CPUID.(EAX=07H, ECX=0):EBX.RDT-M[bit 12] = 1.

**Table 2-31. Additional MSRs Supported by Intel® Xeon® Processor E5 v3 Family**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		7:0		EventID (Rw) Event encoding: 0x0: No monitoring. 0x1: L3 occupancy monitoring. All other encoding reserved.
		31:8		Reserved
		41:32		RMID (Rw)
		63:42		Reserved
C8EH	3214	IA32_QM_CTR	THREAD	Monitoring Counter Register (R/O) If CPUID.(EAX=07H, ECX=0):EBX.RDT-M[bit 12] = 1.
		61:0		Resource Monitored Data
		62		Unavailable: If 1, indicates data for this RMID is not available or not monitored for this resource or RMID.
		63		Error: If 1, indicates and unsupported RMID or event type was written to IA32_PQR_QM_EVTSEL.
C8FH	3215	IA32_PQR_ASSOC	THREAD	Resource Association Register (R/W)
		9:0		RMID
		63: 10		Reserved

See Table 2-19, Table 2-28 for other MSR definitions applicable to processors with CPUID signature 06\_3FH.

**NOTES:**

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

**2.13.1 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v3 Family**

Intel Xeon Processor E5 v3 and E7 v3 family are based on the Haswell-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-32. For complete detail of the uncore PMU, refer to Intel Xeon Processor E5 v3 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_3FH.

**Table 2-32. Uncore PMU MSRs in Intel® Xeon® Processor E5 v3 Family**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
700H		MSR_PMON_GLOBAL_CTL	Package	Uncore Perfmon Per-Socket Global Control
701H		MSR_PMON_GLOBAL_STATUS	Package	Uncore Perfmon Per-Socket Global Status
702H		MSR_PMON_GLOBAL_CONFIG	Package	Uncore Perfmon Per-Socket Global Configuration
703H		MSR_U_PMON_UCLK_FIXED_CTL	Package	Uncore U-Box UCLK Fixed Counter Control
704H		MSR_U_PMON_UCLK_FIXED_CTR	Package	Uncore U-Box UCLK Fixed Counter
705H		MSR_U_PMON_EVNTSELO	Package	Uncore U-Box Perfmon Event Select for U-Box Counter 0

## 2.14 MSRS IN INTEL® CORE™ M PROCESSORS AND 5TH GENERATION INTEL CORE PROCESSORS

The Intel® Core™ M-5xxx processors and 5th generation Intel® Core™ Processors, and Intel® Xeon® Processor E3-1200 v4 family are based on the Broadwell microarchitecture. The Intel® Core™ M-5xxx processors and 5th generation Intel® Core™ Processors have CPUID DisplayFamily\_DisplayModel signature 06\_3DH. Intel® Xeon® Processor E3-1200 v4 family and the 5th generation Intel® Core™ Processors have CPUID DisplayFamily\_DisplayModel signature 06\_47H. Processors with signatures 06\_3DH and 06\_47H support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-21, Table 2-24, Table 2-28, Table 2-29, Table 2-33, and Table 2-34. For an MSR listed in Table 2-34 that also appears in the model-specific tables of prior generations, Table 2-34 supercede prior generation tables.

Table 2-33 lists MSRs that are common to processors based on the Broadwell microarchitectures (including CPUID signatures 06\_3DH, 06\_47H, 06\_4FH, and 06\_56H).

**Table 2-33. Additional MSRs Common to Processors Based the Broadwell Microarchitectures**

Register Address		Register Name / Bit Fields	Scope	Bit Description

		11		DisRETC
		12		Reserved, must be zero.
		13		Reserved; writing 0 will #GP if also setting TraceEn.
		63:14		Reserved, must be zero.
571H	1393	IA32_RTIT_STATUS	Thread	Tracing Status Register (R/W)
		0		Reserved, writes ignored.
		1		ContexEn, writes ignored.
		2		TriggerEn, writes ignored.
		3		Reserved

**Table 2-33. Additional MSRs Common to Processors Based the Broadwell Microarchitectures**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		4		Error (R/W)
		5		Stopped
		63:6		Reserved, must be zero.
572H	1394	IA32_RTIT_CR3_MATCH	THREAD	Trace Filter CR3 Match Register (R/W)
		4:0		Reserved
		63:5		CR3[63:5] value to match.
620H		MSR UNCORE_RATIO_LIMIT	Package	Uncore Ratio Limit (R/W) Out of reset, the min_ratio and max_ratio fields represent the widest possible range of uncore frequencies. Writing to these fields allows software to control the minimum and the maximum frequency that hardware will select.
		63:15		Reserved
		14:8		MIN_RATIO Writing to this field controls the minimum possible ratio of the LLC/Ring.
		7		Reserved
		6:0		MAX_RATIO This field is used to limit the max ratio of the LLC/Ring.

**NOTES:**

1. MAXPHYADDR is reported by CPUID.80000008H:EAX[7:0].

Table 2-34 lists MSRs that are specific to Intel Core M processors and 5th Generation Intel Core Processors.

**Table 2-34. Additional MSRs Supported by Intel® Core™ M Processors and 5th Generation Intel® Core™ Processors**

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Core	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states. See <a href="http://biosbits.org">http://biosbits.org</a> .

Table 2-34. Additional MSRs Supported by Intel® Core™ M Processors and 5th Generation Intel® Core™ Processors

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		3:0		Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 0000b: C0/C1 (no package C-state support) 0001b: C2 0010b: C3 0011b: C6 0100b: C7 0101b: C7s 0110b: C8 0111b: C9 1000b: C10

Register Address		Register Name	Scope	Bit Description
Hex	Dec			
		39:32	Package	Maximum Ratio Limit for 5C Maximum turbo ratio limit of 5core active.
		47:40	Package	Maximum Ratio Limit for 6C Maximum turbo ratio limit of 6core active.
		63:48		Reserved
639H	1593	MSR_PPO_ENERGY_STATUS	Package	PPO Energy Status (R/O) See Section 14.9.4, "PPO/PP1 RAPL Domains."

See Table 2-19, Table 2-20, Table 2-21, Table 2-24, Table 2-28, Table 2-29, Table 2-33 for other MSR definitions applicable to processors with CPUID signature 06\_3DH.

## 2.15 MSRS IN INTEL® XEON® PROCESSORS E5 V4 FAMILY

The MSRs listed in Table 2-35 are available and common to Intel® Xeon® Processor D product Family (CPUID DisplayFamily\_DisplayModel = 06\_56H) and to Intel Xeon processors E5 v4, E7 v4 families (CPUID DisplayFamily\_DisplayModel = 06\_4FH). They are based on the Broadwell microarchitecture.

See Section 2.15.1 for lists of tables of MSRs that are supported by Intel® Xeon® Processor D Family.

**Table 2-35. Additional MSRs Common to Intel® Xeon® Processor D and Intel Xeon Processors E5 v4 Family Based on the Broadwell Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
4EH	78	MSR_PPIN_CTL	Package	Protected Processor Inventory Number Enable Control (R/W)
		0		LockOut (R/W/O) See Table 2-25.
		1		Enable_PPIN (R/W) See Table 2-25.
		63:2		Reserved
4FH	79	MSR_PPIN	Package	Protected Processor Inventory Number (R/O)
		63:0		Protected Processor Inventory Number (R/O) See Table 2-25.
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information Contains power management and other model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a> .
		7:0		Reserved
		15:8	Package	Maximum Non-Turbo Ratio (R/O) See Table 2-25.
		22:16		Reserved.

### 2.15.1 Additional MSRs Supported in the Intel® Xeon® Processor D Product Family

The MSRs listed in Table 2-36 are available to Intel® Xeon® Processor D Product Family (CPUID DisplayFamily\_DisplayModel = 06\_56H). The Intel® Xeon® processor D product family is based on the Broadwell microarchitecture and supports the MSR interfaces listed in Table 2-19, Table 2-28, Table 2-33, Table 2-35, and Table 2-36.

**Table 2-36. Additional MSRs Supported by Intel® Xeon® Processor D with DisplayFamily\_DisplayModel 06\_56H**

44DH	1101	IA32_MC19_STATUS	Package	
44EH	1102	IA32_MC19_ADDR	Package	
44FH	1103	IA32_MC19_MISC	Package	
See Table 2-19, Table 2-28, Table 2-33, and Table 2-35 for other MSR definitions applicable to processors with CPUID signature 06_56H.				

**NOTES:**

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

**2.15.2 Additional MSRs Supported in Intel® Xeon® Processors E5 v4 and E7 v4 Families**

The MSRs listed in Table 2-36 are available to Intel® Xeon® Processor E5 v4 and E7 v4 Families (CPUID DisplayFamily\_DisplayModel = 06\_4FH). The Intel® Xeon® processor E5 v4 family is based on the Broadwell micro-

architecture and supports the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-28, Table 2-33, Table 2-35, and Table 2-37.

		63:1		Reserved

See Table 2-19, Table 2-20, Table 2-28, and Table 2-29 for other MSR definitions applicable to processors with CPUID signature 06\_45H.

**NOTES:**

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

## 2.16 MSRS IN THE 6TH GENERATION, 7TH GENERATION AND 8TH GENERATION INTEL® CORE™ PROCESSORS, INTEL® XEON® PROCESSOR SCALABLE FAMILY, AND FUTURE INTEL® CORE™ PROCESSORS

6th generation Intel® Core™ processors and the Intel® Xeon® Processor Scalable Family are based on the Skylake microarchitecture and have CPUID DisplayFamily\_DisplayModel signatures of 06\_4EH, 06\_5EH, and 06\_55H. 7th generation Intel® Core™ processors are based on the Kaby Lake microarchitecture and 8th generation Intel® Core™ processors are based on the Coffee Lake microarchitecture; these processors have CPUID DisplayFamily\_DisplayModel signatures of 06\_8EH and 06\_9EH. Future Intel® Core™ processors are based on Cannon Lake microarchitecture and have a CPUID DisplayFamily\_DisplayModel signature of 06\_66H. These processors support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-24, Table 2-28, Table 2-34, Table 2-38, and Table 2-39. For an MSR listed in Table 2-38 that also appears in the model-specific tables of prior generations, Table 2-38 supercede prior generation tables.

The notation of “Platform” in the Scope column (with respect to MSR\_PLATFORM\_ENERGY\_COUNTER and MSR\_PLATFORM\_POWER\_LIMIT) is limited to the power-delivery domain and the specifics of the power delivery integration may vary by platform vendor’s implementation.

**Table 2-38. Additional MSRs Supported by 6th Generation Intel® Core™ Processors and the Intel® Xeon® Processor Scalable Family Based on Skylake Microarchitecture, 7th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture, 8th Generation Intel® Core™ Processors Based on Coffee Lake Microarchitecture, and Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
1C9H	457	MSR_LASTBRANCH_TOS	Thread	Last Branch Record Stack TOS (R/W) Contains an index (bits 0-4) that points to the MSR containing the most recent branch record.
1FCH	508	MSR_POWER_CTL	Core	Power Control Register See <a href="http://biosbits.org">http://biosbits.org</a> .
		0		Reserved
		1	Package	C1E Enable (R/W) When set to '1', will enable the CPU to switch to the Minimum Enhanced Intel SpeedStep Technology operating point when all execution cores enter MWAIT (C1).
		18:2		Reserved
		19		Disable Race to Halt Optimization (R/W) Setting this bit disables the Race to Halt optimization and avoids this optimization limitation to execute below the most efficient frequency ratio. Default value is 0 for processors that support Race to Halt optimization. Default value is 1 for processors that do not support Race to Halt optimization.
		20		Disable Energy Efficiency Optimization (R/W) Setting this bit disables the P-States energy efficiency optimization. Default value is 0. Disable/enable the energy efficiency optimization in P-State legacy mode (when IA32_PM_ENABLE[HWP_ENABLE] = 0), has an effect only in the turbo range or into PERF_MIN_CTL value if it is not zero set. In HWP mode (IA32_PM_ENABLE[HWP_ENABLE] == 1), has an effect between the OS desired or OS maximize to the OS minimize performance setting.
300H	768	MSR_SGXOWNEREPOCH0	Package	Lower 64 Bit CR_SGXOWNEREPOCH (W) Writes do not update CR_SGXOWNEREPOCH if CPUID.(EAX=12H, ECX=0):EAX.SGX1 is 1 on any thread in the package.
		63:0		Lower 64 bits of an 128-bit external entropy value for key derivation of an enclave.
301H	768	MSR_SGXOWNEREPOCH1	Package	Upper 64 Bit CR_SGXOWNEREPOCH (W) Writes do not update CR_SGXOWNEREPOCH if CPUID.(EAX=12H, ECX=0):EAX.SGX1 is 1 on any thread in the package.
		63:0		Upper 64 bits of an 128-bit external entropy value for key derivation of an enclave.

64DH	1613	MSR_PLATFORM_ENERGY_COUNTER	Platform*	Platform Energy Counter (R/O) This MSR is valid only if both platform vendor hardware implementation and BIOS enablement support it. This MSR will read 0 if not valid.
		31:0		Total energy consumed by all devices in the platform that receive power from integrated power delivery mechanism, included platform devices are processor cores, SOC, memory, add-on or peripheral devices that get powered directly from the platform power delivery means. The energy units are specified in the MSR_RAPL_POWER_UNIT.Energy_Status_Unit.
		63:32		Reserved
64EH	1614	MSR_PPERF	Thread	Productive Performance Count (R/O)
		63:0		Hardware's view of workload scalability. See Section 14.4.5.1.
64FH	1615	MSR_CORE_PERF_LIMIT_REASONS	Package	Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)
		0		PROCHOT Status (R0) When set, frequency is reduced below the operating system request due to assertion of external PROCHOT.
		1		Thermal Status (R0) When set, frequency is reduced below the operating system request due to a thermal event.
		3:2		Reserved
		4		Residency State Regulation Status (R0) When set, frequency is reduced below the operating system request due to residency state regulation limit.
		5		Running Average Thermal Limit Status (R0) When set, frequency is reduced below the operating system request due to Running Average Thermal Limit (RATL).
		6		VR Therm Alert Status (R0) When set, frequency is reduced below the operating system request due to a thermal alert from a processor Voltage Regulator (VR).
		7		VR Therm Design Current Status (R0) When set, frequency is reduced below the operating system request due to VR thermal design current limit.
		8		Other Status (R0) When set, frequency is reduced below the operating system request due to electrical or other constraints.

**Table 2-38. 		63:0		Core_Cx_Duty_Cycle_Cnt
655H	1621	MSR_PKG_HDC_SHALLOW_RESIDENCY	Package	Accumulate the cycles the package was in C2 state and at least one logical processor was in forced idle (R/O)
		63:0		Pkg_C2_Duty_Cycle_Cnt
656H	1622	MSR_PKG_HDC_DEEP_RESIDENCY	Package	Package Cx HDC Idle Residency (R/O)
		63:0		Pkg_Cx_Duty_Cycle_Cnt
658H	1624	MSR_WEIGHTED_CORE_CO	Package	Core-count Weighted C0 Residency (R/O)
		63:0		Increment at the same rate as the TSC. The increment each cycle is weighted by the number of processor cores in the package that reside in C0. If N cores are simultaneously in C0, then each cycle the counter increments by N.
659H	1625	MSR_ANY_CORE_CO	Package	Any Core C0 Residency (R/O)
		63:0		Increment at the same rate as the TSC. The increment each cycle is one if any processor core in the package is in C0.
65AH	1626	MSR_ANY_GFXE_CO	Package	Any Graphics Engine C0 Residency (R/O)
		63:0		Increment at the same rate as the TSC. The increment each cycle is one if any processor graphic device's compute engines are in C0.
65BH	1627	MSR_CORE_GFXE_OVERLAP_CO	Package	Core and Graphics Engine Overlapped C0 Residency (R/O)
		63:0		Increment at the same rate as the TSC. The increment each cycle is one if at least one compute engine of the processor graphics is in C0 and at least one processor core in the package is also in C0.
65CH	1628	MSR_PLATFORM_POWER_LIMIT	Platform*	Platform Power Limit Control (R/W-L) Allows platform BIOS to limit power consumption of the platform devices to the specified values. The Long Duration power consumption is specified via Platform_Power_Limit_1 and Platform_Power_Limit_1_Time. The Short Duration power consumption limit is specified via the Platform_Power_Limit_2 with duration chosen by the processor. The processor implements an exponential-weighted algorithm in the placement of the time windows.

**Table 2-38. 		14:0		Platform Power Limit #1 Average Power limit value which the platform must not exceed over a time window as specified by Power_Limit_1_TIME field. The default value is the Thermal Design Power (TDP) and varies with product skus. The unit is specified in MSR_RAPLPOWER_UNIT.
		15		Enable Platform Power Limit #1 When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit #1 over the time window specified by Power Limit #1 Time Window.
		16		Platform Clamping Limitation #1 When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit #1 value. This bit is writeable only when CPUID (EAX=6):EAX[4] is set.
		23:17		Time Window for Platform Power Limit #1 Specifies the duration of the time window over which Platform Power Limit 1 value should be maintained for sustained long duration. This field is made up of two numbers from the following equation: Time Window = (float) ((1+(X/4))*(2^Y)), where: X = POWER_LIMIT_1_TIME[23:22] Y = POWER_LIMIT_1_TIME[21:17] The maximum allowed value in this field is defined in MSR_PKG_POWER_INFO[PKG_MAX_WIN]. The default value is 0DH, The unit is specified in MSR_RAPLPOWER_UNIT[Time Unit].
		31:24		Reserved
		46:32		Platform Power Limit #2 Average Power limit value which the platform must not exceed over the Short Duration time window chosen by the processor. The recommended default value is 1.25 times the Long Duration Power Limit (i.e., Platform Power Limit # 1).
		47		Enable Platform Power Limit #2 When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit #2 over the Short Duration time window.

### 2.16.1 MSRs Specific to 7th Generation and 8th Generation Intel® Core™ Processors based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture

Table 2-41 lists additional MSRs for 7th generation and 8th generation Intel Core processors with a CPUID DisplayFamily\_DisplayModel signatures of 06\_8EH and 06\_9EH. For an MSR listed in Table 2-41 that also appears in the model-specific tables of prior generations, Table 2-41 supersedes prior generation tables.

**Table 2-40. Additional MSRs Supported by 7th Generation and 8th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
80H	128	MSR_TRACE_HUB_STH ACPIBAR_BASE	Package	NPK Address Used by AET Messages (R/W)
		0		Lock Bit If set, this MSR cannot be re-written anymore. Lock bit has to be set in order for the AET packets to be directed to NPK MMIO.
		17:1		Reserved
		63:18		ACPIBAR_BASE_ADDRESS AET target address in NPK MMIO space.
1F4H	500	MSR_PRMRR_PHYS_BASE	Core	Processor Reserved Memory Range Register - Physical Base Control Register (R/W)
		2:0		MemType PRMRR BASE MemType.
		11:3		Reserved
		45:12		Base PRMRR Base Address.
		63:46		Reserved

**Table 2-40. Additional MSRs Supported by 7th Generation and 8th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
1F5H	501	MSR_PLMRR_PHYS_MASK	Core	Processor Reserved Memory Range Register - Physical Mask Control Register (R/W)
		9:0		Reserved
		10		Lock Lock bit for the PLMRR.
		11		VLD Enable bit for the PLMRR.
		45:12		Mask PLMRR MASK bits.
		63:46		Reserved
1FBH	507	MSR_PLMRR_VALID_CONFIG	Core	Valid PLMRR Configurations (R/W)
		0		1M supported MEE size.
		4:1		Reserved
		5		32M supported MEE size.
		6		64M supported MEE size.
		7		128M supported MEE size.
		31:8		Reserved
2F4H	756	MSR_UNCORE_PLMRR_PHYS_BASE	Package	(R/W) The PLMRR range is used to protect Xucode memory from unauthorized reads and writes. Any IO access to this range is aborted. This register controls the location of the PLMRR range by indicating its starting address. It functions in tandem with the PLMRR mask register.
		11:0		Reserved
		38:12		Range Base This field corresponds to bits 38:12 of the base address memory range which is allocated to PLMRR memory.
		63:39		Reserved
2F5H	757	MSR_UNCORE_PLMRR_PHYS_MASK	Package	(R/W) This register controls the size of the PLMRR range by indicating which address bits must match the PLMRR base register value.
		9:0		Reserved
		10		Lock Setting this bit locks all writeable settings in this register, including itself.
		11		Range_En Indicates whether the PLMRR range is enabled and valid.

**Table 2-40. Additional MSRs Supported by 7th Generation and 8th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		38:12		Range_Mask This field indicates which address bits must match PRMRR base in order to qualify as an PRMRR access.
		63:39		Reserved
620H	1568	MSR_RING_RATIO_LIMIT	Package	Ring Ratio Limit (R/W) This register provides Min/Max Ratio Limits for the LLC and Ring.
		6:0		MAX_Ratio This field is used to limit the max ratio of the LLC/Ring.
		7		Reserved
		14:8		MIN_Ratio Writing to this field controls the minimum possible ratio of the LLC/Ring.
		63:15		Reserved

### 2.16.2 MSRs Specific to Future Intel® Core™ Processors

Table 2-41 lists additional MSRs for Future Intel Core processors with a CPUID DisplayFamily\_DisplayModel signature of 06\_66H. For an MSR listed in Table 2-41 that also appears in the model-specific tables of prior generations, Table 2-41 supersedes prior generation tables.

**Table 2-41. Additional MSRs Supported by Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
3AH	58	IA32_FEATURE_CONTROL	Thread	Control Features in Intel 64 Processor (R/W) See Table 2-2.
		0		Lock (R/WL)
		1		Enable VMX Inside SMX Operation (R/WL)
		2		Enable VMX Outside SMX Operation (R/WL)
		14:8		SENTER Local Functions Enables (R/WL)
		15		SENTER Global Functions Enable (R/WL)
		17		SGX Launch Control Enable (R/WL) This bit must be set to enable runtime reconfiguration of SGX Launch Control via IA32_SGXLEPUBKEYHASHn MSR. Available only if CPUID.(EAX=07H, ECX=0H): ECX[30] = 1.
		18		SGX Global Functions Enable (R/WL)
		63:21		Reserved

Table 2-41. Additional MSRs Supported by Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
350H	848	MSR_BR_DETECT_CTRL		Branch Monitoring Global Control (R/W)
		0		EnMonitoring Global enable for branch monitoring.
		1		EnExcept Enable branch monitoring event signaling on threshold trip. The branch monitoring event handler is signaled via the existing PMI signaling mechanism as programmed from the corresponding local APIC LVT entry.
		2		EnLBRFrz Enable LBR freeze on threshold trip. This will cause the LBR frozen bit 58 to be set in IA32_PERF_GLOBAL_STATUS when a triggering condition occurs and this bit is enabled.
		3		DisableInGuest When set to '1', branch monitoring, event triggering and LBR freeze actions are disabled when operating at VMX non-root operation.
		7:4		Reserved
		17:8		WindowSize Window size defined by WindowCntSel. Values 0 - 1023 are supported. Once the Window counter reaches the WindowSize count both the Window Counter and all Branch Monitoring Counters are cleared.
		23:18		Reserved
		25:24		WindowCntSel Window event count select: '00 = Instructions retired. '01 = Branch instructions retired '10 = Return instructions retired. '11 = Indirect branch instructions retired.
		26		CntAndMode When set to '1', the overall branch monitoring event triggering condition is true only if all enabled counters' threshold conditions are true. When '0', the threshold tripping condition is true if any enabled counters' threshold is true.
63:27		Reserved		
351H	849	MSR_BR_DETECT_STATUS		Branch Monitoring Global Status (R/W)
		0		Branch Monitoring Event Signaled When set to '1', Branch Monitoring event signaling is blocked until this bit is cleared by software.

**Table 2-41. Additional MSRs Supported by Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		1		LBRsValid This status bit is set to '1' if the LBR state is considered valid for sampling by branch monitoring software.
		7:2		Reserved
		8		CntrHit0 Branch monitoring counter #0 threshold hit. This status bit is sticky and once set requires clearing by software. Counter operation continues independent of the state of the bit.
		9		CntrHit1 Branch monitoring counter #1 threshold hit. This status bit is sticky and once set requires clearing by software. Counter operation continues independent of the state of the bit.
		15:10		Reserved Reserved for additional branch monitoring counters threshold hit status.
		25:16		CountWindow The current value of the window counter. The count value is frozen on a valid branch monitoring triggering condition. This is a 10-bit unsigned value.
		31:26		Reserved Reserved for future extension of CountWindow.
		39:32		Count0 The current value of counter 0 updated after each occurrence of the event being counted. The count value is frozen on a valid branch monitoring triggering condition (in which case CntrHit0 will also be set). This is an 8-bit signed value (2's complement). Heuristic events which only increment will saturate and freeze at maximum value 0xFF (256). RET-CALL event counter saturate at maximum value 0x7F (+127) and minimum value 0x80 (-128).
		47:40		Count1 The current value of counter 1 updated after each occurrence of the event being counted. The count value is frozen on a valid branch monitoring triggering condition (in which case CntrHit1 will also be set). This is an 8-bit signed value (2's complement). Heuristic events which only increment will saturate and freeze at maximum value 0xFF (256). RET-CALL event counter saturate at maximum value 0x7F (+127) and minimum value 0x80 (-128).
		63:48		Reserved

Table 2-41. Additional MSRs Supported by Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
354H - 355H	852 - 853	MSR_BR_DETECT_COUNTER_CONFIG_i		Branch Monitoring Detect Counter Configuration (R/W)
		0		CntrEn Enable counter.
		7:1		CntrEvSel Event select (other values #GP) '0000000 = RETs. '0000001 = RET-CALL bias. '0000010 = RET mispredicts. '0000011 = Branch (all) mispredicts. '0000100 = Indirect branch mispredicts. '0000101 = Far branch instructions.
		14:8		CntrThreshold Threshold (an unsigned value of 0 to 127 supported). The value 0 of counter threshold will result in event signaled after every instruction. #GP if threshold is < 2.
		15		MispredEventCnt Mispredict events counting behavior: '0 = Mispredict events are counted in a window. '1 = Mispredict events are counted based on a consecutive occurrence. CntrThreshold is treated as # of consecutive mispredicts. This control bit only applies to events specified by CntrEvSel that involve a prediction (0000010, 0000011, 0000100). Setting this bit for other events is ignored.
		63:16		Reserved
3F8H	1016	MSR_PKG_C3_RESIDENCY	Package	Package C3 Residency Counter (R/O)
		63:0		Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.
620H	1568	MSR_RING_RATIO_LIMIT	Package	Ring Ratio Limit (R/W) This register provides Min/Max Ratio Limits for the LLC and Ring.
		6:0		MAX_Ratio This field is used to limit the max ratio of the LLC/Ring.
		7		Reserved
		14:8		MIN_Ratio Writing to this field controls the minimum possible ratio of the LLC/Ring.
		63:15		Reserved

**Table 2-41. Additional MSRs Supported by Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
660H	1632	MSR_CORE_C1_RESIDENCY	Core	Core C1 Residency Counter (R/O)
		63:0		Value since last reset for the Core C1 residency. Counter rate is the Max Non-Turbo frequency (same as TSC). This counter counts in case both of the core's threads are in an idle state and at least one of the core's thread residency is in a C1 state or in one of its sub states. The counter is updated only after a core C state exit. Note: Always reads 0 if core C1 is unsupported. A value of zero indicates that this processor does not support core C1 or never entered core C1 level state.
662H	1634	MSR_CORE_C3_RESIDENCY	Core	Core C3 Residency Counter (R/O)
		63:0		Will always return 0.

### 2.16.3 MSRs Specific to Intel® Xeon® Processor Scalable Family

Intel® Xeon® Processor Scalable Family (CPUID DisplayFamily\_DisplayModel = 06\_55H) support the MSRs listed in Table 2-42.

**Table 2-42. MSRs Supported by Intel® Xeon® Processor Scalable Family with DisplayFamily\_DisplayModel 06\_55H**

1ADH	429	MSR_TURBO_RATIO_LIMIT	Package	This register defines the ratio limits. $RATIO[0:7]$ must be populated in ascending order. $RATIO[i+1]$ must be less than or equal to $RATIO[i]$ . Entries with $RATIO[i]$ will be ignored. If any of the rules above are broken, the configuration is silently rejected. If the programmed ratio is: <ul style="list-style-type: none"> <li>▪ Above the fused ratio for that core count, it will be clipped to the fuse limits (assuming !OC).</li> <li>▪ Below the min supported ratio, it will be clipped.</li> </ul>
		7:0		RATIO_0 Defines ratio limits.
		15:8		RATIO_1 Defines ratio limits.
		23:16		RATIO_2 Defines ratio limits.
		31:24		RATIO_3 Defines ratio limits.
		39:32		RATIO_4 Defines ratio limits.
		47:40		RATIO_5 Defines ratio limits.
		55:48		RATIO_6 Defines ratio limits.
		63:56		RATIO_7 Defines ratio limits.
		1AEH	430	MSR_TURBO_RATIO_LIMIT_CORES

## 2.17 MSRS IN INTEL® XEON PHI™ PROCESSOR 3200/5200/7200 SERIES AND INTEL® XEON PHI™ PROCESSOR 7215/7285/7295 SERIES

Intel® Xeon Phi™ processor 3200, 5200, 7200 series, with CPUID DisplayFamily\_DisplayModel signature 06\_57H, supports the MSR interfaces listed in Table 2-43. These processors are based on the Knights Landing microarchitecture. Intel® Xeon Phi™ processor 7215, 7285, 7295 series, with CPUID DisplayFamily\_DisplayModel signature 06\_85H, supports the MSR interfaces listed in Table 2-43 and Table 2-44. These processors are based on the Knights Mill microarchitecture. Some MSRs are shared between a pair of processor cores, the scope is marked as module.

**Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily\_DisplayModel Signatures 06\_57H and 06\_85H**

6H	6	IA32_MONITOR_FILTER_SIZE	Thread	See Section 8.10.5, "Monitor/Mwait Address Range Determination." See Table 2-2.
10H	16	IA32_TIME_STAMP_COUNTER	Thread	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Package	Platform ID (R) See Table 2-2.
1BH	27	IA32_APIC_BASE	Thread	See Section 10.4.4, "Local APIC Status and Location," and Table 2-2.
34H	52	MSR_SMI_COUNT	Thread	SMI Counter (R/O)
		31:0		SMI Count (R/O)
		63:32		Reserved
3AH	58	IA32_FEATURE_CONTROL	Thread	Control Features in Intel 64Processor (R/W) See Table 2-2.
		0		Lock (R/WL)
		1		Reserved
		2		Enable VMX outside SMX operation (R/WL)
3BH	59	IA32_TSC_ADJUST	THREAD	Per-Logical-Processor TSC ADJUST (R/W) See Table 2-2.
4EH	78	MSR_PPIN_CTL	Package	Protected Processor Inventory Number Enable Control (R/W)
		0		LockOut (R/WO) Set 1 to prevent further writes to MSR_PPIN_CTL. Writing 1 to MSR_PPIN_CTL[bit 0] is permitted only if MSR_PPIN_CTL[bit 1] is clear. Default is 0. BIOS should provide an opt-in menu to enable the user to turn on MSR_PPIN_CTL[bit 1] for a privileged inventory initialization agent to access MSR_PPIN. After reading MSR_PPIN, the privileged inventory initialization agent should write '01b' to MSR_PPIN_CTL to disable further access to MSR_PPIN and prevent unauthorized modification to MSR_PPIN_CTL.

**Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily\_DisplayModel Signatures 06\_57H and 06\_85H**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		1		Enable_PPIN (R/W) If 1, enables MSR_PPIN to be accessible using RDMSR. Once set, an attempt to write 1 to MSR_PPIN_CTL[bit 0] will cause #GP. If 0, an attempt to read MSR_PPIN will cause #GP. Default is 0.
		63:2		Reserved
4FH	79	MSR_PPIN	Package	Protected Processor Inventory Number (R/O)
		63:0		Protected Processor Inventory Number (R/O) A unique value within a given CUID family/model/stepping signature that a privileged inventory initialization agent can access to identify each physical processor, when access to MSR_PPIN is enabled. Access to MSR_PPIN is permitted only if MSR_PPIN_CTL[bits 1:0] = '10b'.
79H	121	IA32_BIOS_UPDT_TRIG	Core	BIOS Update Trigger Register (W) See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	THREAD	BIOS Update Signature ID (RO) See Table 2-2.
C1H	193	IA32_PMC0	THREAD	Performance Counter Register See Table 2-2.
C2H	194	IA32_PMC1	THREAD	Performance Counter Register See Table 2-2.
CEH	206	MSR_PLATFORM_INFO	Package	Platform Information Contains power management and other model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a> .
		7:0		Reserved
		15:8	Package	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.
		27:16		Reserved
		28	Package	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.
		29	Package	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.
		39:30		Reserved

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		47:40	Package	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.
		63:48		Reserved
E2H	226	MSR_PKG_CST_CONFIG_CONTROL	Package	C-State Configuration Control (R/W)
		2:0		Package C-State Limit (R/W) Specifies the lowest C-state for the package. This feature does not limit the processor core C-state. The power-on default value from bit[2:0] of this register reports the deepest package C-state the processor is capable to support when manufactured. It is recommended that BIOS always read the power-on default value reported from this bit field to determine the supported deepest C-state on the processor and leave it as default without changing it. 000b - C0/C1 (No package C-state support) 001b - C2 010b - C6 (non retention)* 011b - C6 (Retention)* 100b - Reserved 101b - Reserved 110b - Reserved 111b - No package C-state limit. All C-States supported by the processor are available. Note: C6 retention mode provides more power saving than C6 non-retention mode. Limiting the package to C6 non retention mode does prevent the MSR_PKG_C6_RESIDENCY counter (MSR 3F9h) from being incremented.
		9:3		Reserved
		10		I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO registers at MSR_PMG_IO_CAPTURE_BASE[15:0] to MWAIT instructions.
		14:11		Reserved
		15		CFG Lock (RO) When set, locks bits [15:0] of this register for further writes until the next reset occurs.
		25		Reserved
		26		C1 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.
		27		Reserved

405H	1029	IA32_MC1_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
408H	1032	IA32_MC2_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
40CH	1036	IA32_MC3_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC3_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40EH	1038	IA32_MC3_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
410H	1040	IA32_MC4_CTL	Core	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC4_STATUS	Core	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
412H	1042	IA32_MC4_ADDR	Core	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
414H	1044	IA32_MC5_CTL	Package	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
415H	1045	IA32_MC5_STATUS	Package	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
416H	1046	IA32_MC5_ADDR	Package	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."
4C1H	1217	IA32_A_PMC0	Thread	See Table 2-2.
4C2H	1218	IA32_A_PMC1	Thread	See Table 2-2.
600H	1536	IA32_DS_AREA	Thread	DS Save Area (R/W) See Table 2-2.
606H	1542	MSR_RAPL_POWER_UNIT	Package	Unit Multipliers Used in RAPL Interfaces (R/O)

**Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily\_DisplayModel Signatures 06\_57H and 06\_85H**

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
		3:0	Package	Power Units See Section 14.9.1, "RAPL Interfaces."
		7:4	Package	Reserved
		12:8	Package	Energy Status Units Energy related information (in Joules) is based on the multiplier, $1/2^{\wedge}ESU$ ; where ESU is an unsigned integer represented by bits 12:8. Default value is 0EH (or 61 micro-joules).
		15:13	Package	Reserved
		19:16	Package	Time Units See Section 14.9.1, "RAPL Interfaces."
		63:20		Reserved
60DH	1549	MSR_PKG_C2_RESIDENCY	Package	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.
		63:0		Package C2 Residency Counter (R/O)
610H	1552	MSR_PKG_POWER_LIMIT	Package	PKG RAPL Power Limit Control (R/W) See Section 14.9.3, "Package RAPL Domain."
611H	1553	MSR_PKG_ENERGY_STATUS	Package	PKG Energy Status (R/O) See Section 14.9.3, "Package RAPL Domain."
613H	1555	MSR_PKG_PERF_STATUS	Package	PKG Perf Status (R/O) See Section 14.9.3, "Package RAPL Domain."
614H	1556	MSR_PKG_POWER_INFO	Package	PKG RAPL Parameters (R/W) See Section 14.9.3, "Package RAPL Domain."
618H	1560	MSR_DRAM_POWER_LIMIT	Package	DRAM RAPL Power Limit Control (R/W) See Section 14.9.5, "DRAM RAPL Domain."
619H	1561	MSR_DRAM_ENERGY_STATUS	Package	DRAM Energy Status (R/O) See Section 14.9.5, "DRAM RAPL Domain."
61BH	1563	MSR_DRAM_PERF_STATUS	Package	DRAM Performance Throttling Status (R/O) See Section 14.9.5, "DRAM RAPL Domain."
61CH	1564	MSR_DRAM_POWER_INFO	Package	DRAM RAPL Parameters (R/W) See Section 14.9.5, "DRAM RAPL Domain."
620H	1568	MSR_UNCORE_RATIO_LIMIT	Package	Uncore Ratio Limit (R/W) Out of reset, the min_ratio and max_ratio fields represent the widest possible range of uncore frequencies. Writing to these fields allows software to control the minimum and the maximum frequency that hardware will select.
		63:15		Reserved

**Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily\_DisplayModel Signatures 06\_57H and 06\_85H**

Register Address		Register Name / Bit Fields	Scope	Bit Description

Register Address		Register Name / Bit Fields	Scope	Bit Description
Hex	Dec			
484H	1156	IA32_VMX_ENTRY_CTL5	Core	Capability Reporting Register of VM-entry Controls (R/O) See Table 2-2.
485H	1157	IA32_VMX_MISC	Core	Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2.
486H	1158	IA32_VMX_CRO_FIXED0	Core	Capability Reporting Register of CRO Bits Fixed to 0 (R/O) See Table 2-2.
487H	1159	IA32_VMX_CRO_FIXED1	Core	Capability Reporting Register of CRO Bits Fixed to 1 (R/O) See Table 2-2.
488H	1160	IA32_VMX_CR4_FIXED0	Core	Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2.
489H	1161	IA32_VMX_CR4_FIXED1	Core	Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2.
48AH	1162	IA32_VMX_VMCS_ENUM	Core	Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2.
48BH	1163	IA32_VMX_PROCBASED_CTL52	Core	Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Table 2-2.
48CH	1164	IA32_VMX_EPT_VPID_ENUM	Core	Capability Reporting Register of EPT and VPID (R/O) See Table 2-2.
48DH	1165	IA32_VMX_TRUE_PINBASE D_CTL5	Core	Capability Reporting Register of Pin-Based VM-Execution Flex Controls (R/O) See Table 2-2.
48EH	1166	IA32_VMX_TRUE_PROCBASED_CTL5	Core	Capability Reporting Register of Primary Processor-Based VM-Execution Flex Controls (R/O) See Table 2-2.
48FH	1167	IA32_VMX_TRUE_EXIT_CTL5	Core	Capability Reporting Register of VM-Exit Flex Controls (R/O) See Table 2-2.
490H	1168	IA32_VMX_TRUE_ENTRY_CTL5	Core	Capability Reporting Register of VM-Entry Flex Controls (R/O) See Table 2-2.
491H	1169	IA32_VMX_FMFUNC	Core	Capability Reporting Register of VM-Function Controls (R/O) See Table 2-2.

## 2.18 MSRS IN THE PENTIUM® 4 AND INTEL® XEON® PROCESSORS

Table 2-45 lists MSRs (architectural and model-specific) that are defined across processor generations based on Intel NetBurst microarchitecture. The processor can be identified by its CPUID signatures of DisplayFamily encoding of 0FH, see Table 2-1.

- MSRs with an “IA32\_” prefix are designated as “architectural.” This means that the functions of these MSRs and their addresses remain the same for succeeding families of IA-32 processors.
- MSRs with an “MSR\_” prefix are model specific with respect to address functionalities. The column “Model Availability” lists the model encoding value(s) within the Pentium 4 and Intel Xeon processor family at the specified register address. The model encoding value of a processor can be queried using CPUID. See “CPUID—CPU Identification” in Chapter 3 of the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2A*.

**Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors**

Register Address		Register Name Fields and Flags	Model Avail- ability	Shared/ Unique <sup>1</sup>	Bit Description
Hex	Dec				
0H	0	IA32_P5_MC_ADDR	0, 1, 2, 3, 4, 6	Shared	See Section 2.22, “MSRs in Pentium Processors.”
1H	1	IA32_P5_MC_TYPE	0, 1, 2, 3, 4, 6	Shared	See Section 2.22, “MSRs in Pentium Processors.”
6H	6	IA32_MONITOR_FILTER_LINE_SIZE	3, 4, 6	Shared	See Section 8.10.5, “Monitor/Mwait Address Range Determination.”
10H	16	IA32_TIME_STAMP_COUNTER	0, 1, 2, 3, 4, 6	Unique	Time Stamp Counter See Table 2-2.
					On earlier processors, only the lower 32 bits are writable. On any write to the lower 32 bits, the upper 32 bits are cleared. For processor family 0FH, models 3 and 4: all 64 bits are writable.
17H	23	IA32_PLATFORM_ID	0, 1, 2, 3, 4, 6	Shared	Platform ID (R) See Table 2-2.  The operating system can use this MSR to determine “slot” information for the processor and the proper microcode update to load.
1BH	27	IA32_APIC_BASE	0, 1, 2, 3, 4, 6	Unique	APIC Location and Status (R/W) See Table 2-2. See Section 10.4.4, “Local APIC Status and Location.”
2AH	42	MSR_EBC_HARD_POWERON	0, 1, 2, 3, 4, 6	Shared	Processor Hard Power-On Configuration (R/W) Enables and disables processor features. (R) Indicates current processor configuration.
		0			Output Tri-state Enabled (R) Indicates whether tri-state output is enabled (1) or disabled (0) as set by the strapping of SMI#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.

**Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)**

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique <sup>1</sup>	Bit Description
Hex	Dec				
		1			Execute BIST (R) Indicates whether the execution of the BIST is enabled (1) or disabled (0) as set by the strapping of INIT#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		2			In Order Queue Depth (R) Indicates whether the in order queue depth for the system bus is 1 (1) or up to 12 (0) as set by the strapping of A7#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		3			MCERR# Observation Disabled (R) Indicates whether MCERR# observation is enabled (0) or disabled (1) as determined by the strapping of A9#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		4			BINIT# Observation Enabled (R) Indicates whether BINIT# observation is enabled (0) or disabled (1) as determined by the strapping of A10#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		6:5			APIC Cluster ID (R) Contains the logical APIC cluster ID value as set by the strapping of A12# and A11#. The logical cluster ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.
		7			Bus Park Disable (R) Indicates whether bus park is enabled (0) or disabled (1) as set by the strapping of A15#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.
		11:8			Reserved
		13:12			Agent ID (R) Contains the logical agent ID value as set by the strapping of BR[3:0]. The logical ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.
		63:14			Reserved

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail- ability	Shared/ Unique <sup>7</sup>	Bit Description
Hex	Dec				
2BH	43	MSR_EBC_SOFT_POWERON	0, 1, 2, 3, 4, 6	Shared	Processor Soft Power-On Configuration (R/W) Enables and disables processor features.
		0			RCNT/SCNT On Request Encoding Enable (R/W) Controls the driving of RCNT/SCNT on the request encoding. Set to enable (1); clear to disabled (0, default).
		1			Data Error Checking Disable (R/W) Set to disable system data bus parity checking; clear to enable parity checking.
		2			Response Error Checking Disable (R/W) Set to disable (default); clear to enable.
		3			Address/Request Error Checking Disable (R/W) Set to disable (default); clear to enable.
		4			Initiator MCERR# Disable (R/W) Set to disable MCERR# driving for initiator bus requests (default); clear to enable.
		5			Internal MCERR# Disable (R/W) Set to disable MCERR# driving for initiator internal errors (default); clear to enable.
		6			BINIT# Driver Disable (R/W) Set to disable BINIT# driver (default); clear to enable driver.
		63:7			Reserved
2CH	44	MSR_EBC_FREQUENCY_ID	2,3, 4, 6	Shared	Processor Frequency Configuration The bit field layout of this MSR varies according to the MODEL value in the CPUID version information. The following bit field layout applies to Pentium 4 and Xeon Processors with MODEL encoding equal or greater than 2. (R) The field Indicates the current processor frequency configuration.
		15:0			Reserved
		18:16			Scalable Bus Speed (R/W) Indicates the intended scalable bus speed: <u>Encoding Scalable Bus Speed</u> 000B 100 MHz (Model 2) 000B 266 MHz (Model 3 or 4) 001B 133 MHz 010B 200 MHz 011B 166 MHz 100B 333 MHz (Model 6)

**Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)**

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique <sup>1</sup>	Bit Description
Hex	Dec				
					133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.
					266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 000B and model encoding = 3 or 4. 333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 100B and model encoding = 6. All other values are reserved.
		23:19			Reserved
		31:24			Core Clock Frequency to System Bus Frequency Ratio (R) The processor core clock frequency to system bus frequency ratio observed at the de-assertion of the reset pin.
		63:25			Reserved
2CH	44	MSR_EBC_FREQUENCY_ID	0, 1	Shared	Processor Frequency Configuration (R) The bit field layout of this MSR varies according to the MODEL value of the CPUID version information. This bit field layout applies to Pentium 4 and Xeon Processors with MODEL encoding less than 2. Indicates current processor frequency configuration.
		20:0			Reserved
		23:21			Scalable Bus Speed (R/W) Indicates the intended scalable bus speed: <u>Encoding Scalable Bus Speed</u> 000B 100 MHz  All others values reserved.

Hex	Dec				
194H	404	MSR_MCG_R12	0, 1, 2, 3, 4, 6	Unique	Machine Check R12 See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
195H	405	MSR_MCG_R13	0, 1, 2, 3, 4, 6	Unique	Machine Check R13 See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
196H	406	MSR_MCG_R14	0, 1, 2, 3, 4, 6	Unique	Machine Check R14 See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
197H	407	MSR_MCG_R15	0, 1, 2, 3, 4, 6	Unique	Machine Check R15 See Section 15.3.2.6, "IA32_MCG Extended Machine Check State MSRs."
		63:0			Registers R8-15 (and the associated state-save MSRs) exist only in Intel 64 processors. These registers contain valid information only when the processor is operating in 64-bit mode at the time of the error.
198H	408	IA32_PERF_STATUS	3, 4, 6	Unique	See Table 2-2. See Section 14.1, "Enhanced Intel Speedstep® Technology."
199H	409	IA32_PERF_CTL	3, 4, 6	Unique	See Table 2-2. See Section 14.1, "Enhanced Intel Speedstep® Technology."
19AH	410	IA32_CLOCK_MODULATION	0, 1, 2, 3, 4, 6	Unique	Thermal Monitor Control (R/W) See Table 2-2. See Section 14.7.3, "Software Controlled Clock Modulation."
19BH	411	IA32_THERM_INTERRUPT	0, 1, 2, 3, 4, 6	Unique	Thermal Interrupt Control (R/W) See Section 14.7.2, "Thermal Monitor," and see Table 2-2.
19CH	412	IA32_THERM_STATUS	0, 1, 2, 3, 4, 6	Shared	Thermal Monitor Status (R/W) See Section 14.7.2, "Thermal Monitor," and see Table 2-2.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail- ability	Shared/ Unique <sup>7</sup>	Bit Description
Hex	Dec				
19DH	413	MSR_THERM2_CTL			Thermal Monitor 2 Control
			3,	Shared	For Family F, Model 3 processors: When read, specifies the value of the target TM2 transition last written. When set, it sets the next target value for TM2 transition.
			4, 6	Shared	For Family F, Model 4 and Model 6 processors: When read, specifies the value of the target TM2 transition last written. Writes may cause #GP exceptions.
1A0H	416	IA32_MISC_ENABLE	0, 1, 2, 3, 4, 6	Shared	Enable Miscellaneous Processor Features (R/W)
		0			Fast-Strings Enable. See Table 2-2.
		1			Reserved
		2			x87 FPU Fopcode Compatibility Mode Enable
		3			Thermal Monitor 1 Enable See Section 14.7.2, "Thermal Monitor," and see Table 2-2.
		4			Split-Lock Disable When set, the bit causes an #AC exception to be issued instead of a split-lock cycle. Operating systems that set this bit must align system structures to avoid split-lock scenarios. When the bit is clear (default), normal split-locks are issued to the bus.
					This debug feature is specific to the Pentium 4 processor.
		5			Reserved
		6			Third-Level Cache Disable (R/W) When set, the third-level cache is disabled; when clear (default) the third-level cache is enabled. This flag is reserved for processors that do not have a third-level cache.  Note that the bit controls only the third-level cache; and only if overall caching is enabled through the CD flag of control register CR0, the page-level cache controls, and/or the MTRRs. See Section 11.5.4, "Disabling and Enabling the L3 Cache."
		7			Performance Monitoring Available (R) See Table 2-2.
8			Suppress Lock Enable When set, assertion of LOCK on the bus is suppressed during a Split Lock access. When clear (default), LOCK is not suppressed.		

**Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)**

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique <sup>1</sup>	Bit Description
Hex	Dec				
		9			Prefetch Queue Disable When set, disables the prefetch queue. When clear (default), enables the prefetch queue.
		10			FERR# Interrupt Reporting Enable (R/W) When set, interrupt reporting through the FERR# pin is enabled; when clear, this interrupt reporting function is disabled.
					When this flag is set and the processor is in the stop-clock state (STPCLK# is asserted), asserting the FERR# pin signals to the processor that an interrupt (such as, INIT#, BINIT#, INTR, NMI, SMI#, or RESET#) is pending and that the processor should return to normal operation to handle the interrupt.
					This flag does not affect the normal operation of the FERR# pin (to indicate an unmasked floating-point error) when the STPCLK# pin is not asserted.
		11			Branch Trace Storage Unavailable (BTS_UNAVILABLE) (R) See Table 2-2. When set, the processor does not support branch trace storage (BTS); when clear, BTS is supported.
		12			PEBS_UNAVILABLE: Processor Event Based Sampling Unavailable (R) See Table 2-2. When set, the processor does not support processor event-based sampling (PEBS); when clear, PEBS is supported.
		13	3		TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state. If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Availability	Shared/Unique <sup>7</sup>	Bit Description
Hex	Dec				
		17:14			Reserved
		18	3, 4, 6		ENABLE MONITOR FSM (R/W) See Table 2-2.
		19			Adjacent Cache Line Prefetch Disable (R/W) When set to 1, the processor fetches the cache line of the 128-byte sector containing currently required data. When set to 0, the processor fetches both cache lines in the sector.
					Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing. BIOS may contain a setup option that controls the setting of this bit.
		21:20			Reserved
		22	3, 4, 6		Limit CPUID MAXVAL (R/W) See Table 2-2. Setting this can cause unexpected behavior to software that depends on the availability of CPUID leaves greater than 3.
		23		Shared	xTPR Message Disable (R/W) See Table 2-2.
		24			L1 Data Cache Context Mode (R/W) When set, the L1 data cache is placed in shared mode; when clear (default), the cache is placed in adaptive mode. This bit is only enabled for IA-32 processors that support Intel Hyper-Threading Technology. See Section 11.5.6, "L1 Data Cache Context Mode." When L1 is running in adaptive mode and CR3s are identical, data in L1 is shared across logical processors. Otherwise, L1 is not shared and cache use is competitive. If the Context ID feature flag (ECX[10]) is set to 0 after executing CPUID with EAX = 1, the ability to switch modes is not supported. BIOS must not alter the contents of IA32_MISC_ENABLE[24].
		33:25			Reserved
		34		Unique	XD Bit Disable (R/W) See Table 2-2.
		63:35			Reserved

		18			PLATFORM Requirements When set to 1, indicates the processor has specific platform requirements. The details of the platform requirements are listed in the respective data sheets of the processor.
		63:19			Reserved
1D7H	471	MSR_LER_FROM_LIP	0, 1, 2, 3, 4, 6	Unique	Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 17.13.3, "Last Exception Records."
		31:0			From Linear IP Linear address of the last branch instruction.
		63:32			Reserved
1D7H	471	63:0		Unique	From Linear IP Linear address of the last branch instruction (If IA-32e mode is active).
1D8H	472	MSR_LER_TO_LIP	0, 1, 2, 3, 4, 6	Unique	Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 17.13.3, "Last Exception Records."
		31:0			From Linear IP Linear address of the target of the last branch instruction.
		63:32			Reserved
1D8H	472	63:0		Unique	From Linear IP Linear address of the target of the last branch instruction (If IA-32e mode is active).
1D9H	473	MSR_DEBUGCTLA	0, 1, 2, 3, 4, 6	Unique	Debug Control (R/W) Controls how several debug features are used. Bit definitions are discussed in the referenced section. See Section 17.13.1, "MSR_DEBUGCTLA MSR."
1DAH	474	MSR_LASTBRANCH_TOS	0, 1, 2, 3, 4, 6	Unique	Last Branch Record Stack TOS (R/O) Contains an index (0-3 or 0-15) that points to the top of the last branch record stack (that is, that points the index of the MSR containing the most recent branch record). See Section 17.13.2, "LBR Stack for Processors Based on Intel NetBurst® Microarchitecture"; and addresses 1DBH-1DEH and 680H-68FH.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail- ability	Shared/ Unique <sup>7</sup>	Bit Description
Hex	Dec				
1DBH	475	MSR_LASTBRANCH_0	0, 1, 2	Unique	Last Branch Record 0 (R/O) One of four last branch record registers on the last branch record stack. It contains pointers to the source and destination instruction for one of the last four branches, exceptions, or interrupts that the processor took. MSR_LASTBRANCH_0 through MSR_LASTBRANCH_3 at 1DBH-1DEH are available only on family 0FH, models 0H-02H. They have been replaced by the MSRs at 680H-68FH and 6C0H-6CFH.
					See Section 17.12, "Last Branch, Call Stack, Interrupt, and Exception Recording for Processors based on Skylake Microarchitecture."
1DCH	477	MSR_LASTBRANCH_1	0, 1, 2	Unique	Last Branch Record 1 See description of the MSR_LASTBRANCH_0 MSR at 1DBH.
1DDH	477	MSR_LASTBRANCH_2	0, 1, 2	Unique	Last Branch Record 2 See description of the MSR_LASTBRANCH_0 MSR at 1DBH.
1DEH	478	MSR_LASTBRANCH_3	0, 1, 2	Unique	Last Branch Record 3 See description of the MSR_LASTBRANCH_0 MSR at 1DBH.
200H	512	IA32_MTRR_PHYSBASE0	0, 1, 2, 3, 4, 6	Shared	Variable Range Base MTRR See Section 11.11.2.3, "Variable Range MTRRs."

3CCH	972	MSR_CRU_ESCR2	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3CDH	973	MSR_CRU_ESCR3	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3E0H	992	MSR_CRU_ESCR4	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3E1H	993	MSR_CRU_ESCR5	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3FOH	1008	MSR_TC_PRECISE_EVENT	0, 1, 2, 3, 4, 6	Shared	See Section 18.6.3.1, "ESCR MSRs."
3F1H	1009	MSR_PEBS_ENABLE	0, 1, 2, 3, 4, 6	Shared	Processor Event Based Sampling (PEBS) (R/W) Controls the enabling of processor event sampling and replay tagging.
		12:0			See Table 19-36.
		23:13			Reserved
		24			UOP Tag Enables replay tagging when set.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail- ability	Shared/ Unique <sup>7</sup>	Bit Description
Hex	Dec				
		25			ENABLE_PEBS_MY_THR (R/W) Enables PEBS for the target logical processor when set; disables PEBS when clear (default). See Section 18.6.4.3, "IA32_PEBS_ENABLE MSR," for an explanation of the target logical processor. This bit is called ENABLE_PEBS in IA-32 processors that do not support Intel Hyper-Threading Technology.
		26			ENABLE_PEBS_OTH_THR (R/W) Enables PEBS for the target logical processor when set; disables PEBS when clear (default). See Section 18.6.4.3, "IA32_PEBS_ENABLE MSR," for an explanation of the target logical processor. This bit is reserved for IA-32 processors that do not support Intel Hyper-Threading Technology.
		63:27			Reserved
3F2H	1010	MSR_PEBS_MATRIX_VERT	0, 1, 2, 3, 4, 6	Shared	See Table 19-36.
400H	1024	IA32_MCO_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MCO_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MCO_ADDR	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
403H	1027	IA32_MCO_MISC	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MCO_MISC MSR is either not implemented or does not contain additional information if the MISC_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail- ability	Shared/ Unique <sup>1</sup>	Bit Description
Hex	Dec				
406H	1030	IA32_MC1_ADDR	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
407H	1031	IA32_MC1_MISC		Shared	See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC1_MISC MSR is either not implemented or does not contain additional information if the MISC_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40AH	1034	IA32_MC2_ADDR			See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40BH	1035	IA32_MC2_MISC			See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC2_MISC MSR is either not implemented or does not contain additional information if the MISC_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	IA32_MC3_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	IA32_MC3_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
40EH	1038	IA32_MC3_ADDR	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail- ability	Shared/ Unique <sup>7</sup>	Bit Description
Hex	Dec				
40FH	1039	IA32_MC3_MISC	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC3_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	IA32_MC4_CTL	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC4_STATUS	0, 1, 2, 3, 4, 6	Shared	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
412H	1042	IA32_MC4_ADDR			See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRIV flag in the IA32_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
413H	1043	IA32_MC4_MISC			See Section 15.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC2_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
480H	1152	IA32_VMX_BASIC	3, 4, 6	Unique	Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2. See Appendix A.1, "Basic VMX Information."
481H	1153	IA32_VMX_PINBASED_CTL	3, 4, 6	Unique	Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Table 2-2. See Appendix A.3, "VM-Execution Controls."
482H	1154	IA32_VMX_PROCBASED_CTL	3, 4, 6	Unique	Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls," and see Table 2-2.
483H	1155	IA32_VMX_EXIT_CTL	3, 4, 6	Unique	Capability Reporting Register of VM-Exit Controls (R/O) See Appendix A.4, "VM-Exit Controls," and see Table 2-2.

**Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)**

Register Address		Register Name Fields and Flags	Model Availability	Shared/ Unique <sup>1</sup>	Bit Description
Hex	Dec				
484H	1156	IA32_VMX_ENTRY_CTL5	3, 4, 6	Unique	Capability Reporting Register of VM-Entry Controls (R/O) See Appendix A.5, "VM-Entry Controls," and see Table 2-2.
485H	1157	IA32_VMX_MISC	3, 4, 6	Unique	Reporting Register of Miscellaneous VMX Capabilities (R/O) See Appendix A.6, "Miscellaneous Data," and see Table 2-2.
486H	1158	IA32_VMX_CR0_FIXED0	3, 4, 6	Unique	Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0," and see Table 2-2.
487H	1159	IA32_VMX_CR0_FIXED1	3, 4, 6	Unique	Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0," and see Table 2-2.
488H	1160	IA32_VMX_CR4_FIXED0	3, 4, 6	Unique	Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4," and see Table 2-2.
489H	1161	IA32_VMX_CR4_FIXED1	3, 4, 6	Unique	Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4," and see Table 2-2.
48AH	1162	IA32_VMX_VMCS_ENUM	3, 4, 6	Unique	Capability Reporting Register of VMCS Field Enumeration (R/O) See Appendix A.9, "VMCS Enumeration," and see Table 2-2.
48BH	1163	IA32_VMX_PROCBASED_CTL52	3, 4, 6	Unique	Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls," and see Table 2-2.
600H	1536	IA32_DS_AREA	0, 1, 2, 3, 4, 6	Unique	DS Save Area (R/W) See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
680H	1664	MSR_LASTBRANCH_0_FROM_IP	3, 4, 6	Unique	Last Branch Record 0 (R/W) One of 16 pairs of last branch record registers on the last branch record stack (680H-68FH). This part of the stack contains pointers to the source instruction for one of the last 16 branches, exceptions, or interrupts taken by the processor.

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address		Register Name Fields and Flags	Model Avail- ability	Shared/ Unique <sup>7</sup>	Bit Description
Hex	Dec				
					The MSRs at 680H-68FH, 6C0H-6CfH are not available in processor releases before family 0FH, model 03H. These MSRs replace MSRs previously located at 1DBH-1DEH, which performed the same function for early releases.  See Section 17.12, "Last Branch, Call Stack, Interrupt, and Exception Recording for Processors based on Skylake Microarchitecture."
681H	1665	MSR_LASTBRANCH_1_FROM_IP	3, 4, 6	Unique	Last Branch Record 1 See description of MSR_LASTBRANCH_0 at 680H.
682H	1666	MSR_LASTBRANCH_2_FROM_IP	3, 4, 6	Unique	Last Branch Record 2 See description of MSR_LASTBRANCH_0 at 680H.
683H	1667	MSR_LASTBRANCH_3_FROM_IP	3, 4, 6	Unique	Last Branch Record 3 See description of MSR_LASTBRANCH_0 at 680H.
684H	1668	MSR_LASTBRANCH_4_FROM_IP	3, 4, 6	Unique	Last Branch Record 4 See description of MSR_LASTBRANCH_0 at 680H.
685H	1669	MSR_LASTBRANCH_5_FROM_IP	3, 4, 6	Unique	Last Branch Record 5 See description of MSR_LASTBRANCH_0 at 680H.
686H	1670	MSR_LASTBRANCH_6_FROM_IP	3, 4, 6	Unique	Last Branch Record 6 See description of MSR_LASTBRANCH_0 at 680H.
687H	1671	MSR_LASTBRANCH_7_FROM_IP	3, 4, 6	Unique	Last Branch Record 7 See description of MSR_LASTBRANCH_0 at 680H.
688H	1672	MSR_LASTBRANCH_8_FROM_IP	3, 4, 6	Unique	Last Branch Record 8 See description of MSR_LASTBRANCH_0 at 680H.
689H	1673	MSR_LASTBRANCH_9_FROM_IP	3, 4, 6	Unique	Last Branch Record 9 See description of MSR_LASTBRANCH_0 at 680H.
68AH	1674	MSR_LASTBRANCH_10_FROM_IP	3, 4, 6	Unique	Last Branch Record 10 See description of MSR_LASTBRANCH_0 at 680H.
68BH	1675	MSR_LASTBRANCH_11_FROM_IP	3, 4, 6	Unique	Last Branch Record 11 See description of MSR_LASTBRANCH_0 at 680H.
68CH	1676	MSR_LASTBRANCH_12_FROM_IP	3, 4, 6	Unique	Last Branch Record 12 See description of MSR_LASTBRANCH_0 at 680H.

6CBH	1739	MSR_LASTBRANCH_11_TO_IP	3, 4, 6	Unique	Last Branch Record 11 See description of MSR_LASTBRANCH_0 at 6COH.
6CCH	1740	MSR_LASTBRANCH_12_TO_IP	3, 4, 6	Unique	Last Branch Record 12 See description of MSR_LASTBRANCH_0 at 6COH.
6CDH	1741	MSR_LASTBRANCH_13_TO_IP	3, 4, 6	Unique	Last Branch Record 13 See description of MSR_LASTBRANCH_0 at 6COH.
6CEH	1742	MSR_LASTBRANCH_14_TO_IP	3, 4, 6	Unique	Last Branch Record 14 See description of MSR_LASTBRANCH_0 at 6COH.
6CFH	1743	MSR_LASTBRANCH_15_TO_IP	3, 4, 6	Unique	Last Branch Record 15 See description of MSR_LASTBRANCH_0 at 6COH.
C000_ 0080H		IA32_EFER	3, 4, 6	Unique	Extended Feature Enables See Table 2-2.
C000_ 0081H		IA32_STAR	3, 4, 6	Unique	System Call Target Address (R/W) See Table 2-2.
C000_ 0082H		IA32_LSTAR	3, 4, 6	Unique	IA-32e Mode System Call Target Address (R/W) See Table 2-2.
C000_ 0084H		IA32_FMASK	3, 4, 6	Unique	System Call Flag Mask (R/W) See Table 2-2.
C000_ 0100H		IA32_FS_BASE	3, 4, 6	Unique	Map of BASE Address of FS (R/W) See Table 2-2.
C000_ 0101H		IA32_GS_BASE	3, 4, 6	Unique	Map of BASE Address of GS (R/W) See Table 2-2.
C000_ 0102H		IA32_KERNEL_GS_BASE	3, 4, 6	Unique	Swap Target of BASE Address of GS (R/W) See Table 2-2.

**NOTES**

1. For HT-enabled processors, there may be more than one logical processors per physical unit. If an MSR is Shared, this means that one MSR is shared between logical processors. If an MSR is unique, this means that each logical processor has its own MSR.

## 2.18.1 MSRs Unique to Intel® Xeon® Processor MP with L3 Cache

The MSRs listed in Table 2-46 apply to Intel® Xeon® Processor MP with up to 8MB level three cache. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 3 or 4 (see CPUID instruction for more details).

**Table 2-46. MSRs Unique to 64-bit Intel® Xeon® Processor MP with Up to an 8 MB L3 Cache**

Register Address	Register Name Fields and Flags	Model Availability	Shared/Unique	Bit Description
107CCH	MSR_IFSB_BUSQ0	3, 4	Shared	IFSB BUSQ Event Control and Counter Register (R/W) See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107CDH	MSR_IFSB_BUSQ1	3, 4	Shared	IFSB BUSQ Event Control and Counter Register (R/W)
107CEH	MSR_IFSB_SNPQ0	3, 4	Shared	IFSB SNPQ Event Control and Counter Register (R/W) See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107CFH	MSR_IFSB_SNPQ1	3, 4	Shared	IFSB SNPQ Event Control and Counter Register (R/W)
107D0H	MSR_EFSB_DRDY0	3, 4	Shared	EFSB DRDY Event Control and Counter Register (R/W) See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107D1H	MSR_EFSB_DRDY1	3, 4	Shared	EFSB DRDY Event Control and Counter Register (R/W)
107D2H	MSR_IFSB_CTL6	3, 4	Shared	IFSB Latency Event Control Register (R/W) See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107D3H	MSR_IFSB_CNTR7	3, 4	Shared	IFSB Latency Event Counter Register (R/W) See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."

The MSRs listed in Table 2-47 apply to Intel® Xeon® Processor 7100 series. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 6 (See CPUID instruction for more details.). The performance monitoring MSRs listed in Table 2-47 are shared between logical processors in the same core, but are replicated for each core.

**Table 2-47. MSRs Unique to Intel® Xeon® Processor 7100 Series**

Register Address	Register Name Fields and Flags	Model Availability	Shared/Unique	Bit Description
107CCH	MSR_EMON_L3_CTR_CTL0	6	Shared	GBUSQ Event Control and Counter Register (R/W) See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."

**Table 2-47. MSRs Unique to Intel® Xeon® Processor 7100 Series (Contd.)**

Register Address		Register Name Fields and Flags	Model Avail- ability	Shared/ Unique	Bit Description
107CDH		MSR_EMON_L3_CTR_CTL1	6	Shared	GBUSQ Event Control and Counter Register (R/W)
107CEH		MSR_EMON_L3_CTR_CTL2	6	Shared	GSNPQ Event Control and Counter Register (R/W) See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107CFH		MSR_EMON_L3_CTR_CTL3	6	Shared	GSNPQ Event Control and Counter Register (R/W)
107D0H		MSR_EMON_L3_CTR_CTL4	6	Shared	FSB Event Control and Counter Register (R/W) See Section 18.6.6, "Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache."
107D1H		MSR_EMON_L3_CTR_CTL5	6	Shared	FSB Event Control and Counter Register (R/W)
107D2H		MSR_EMON_L3_CTR_CTL6	6	Shared	FSB Event Control and Counter Register (R/W)
107D3H		MSR_EMON_L3_CTR_CTL7	6	Shared	FSB Event Control and Counter Register (R/W)

## 2.19 MSRS IN INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Model-specific registers (MSRs) for Intel Core Solo, Intel Core Duo processors, and Dual-core Intel Xeon processor LV are listed in Table 2-48. The column "Shared/Unique" applies to Intel Core Duo processor. "Unique" means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. "Shared" means the MSR or the bit field in an MSR address governs the operation of both processor cores.

**Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV**

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
0H	0	P5_MC_ADDR	Unique	See Section 2.22, "MSRs in Pentium Processors," and see Table 2-2.
1H	1	P5_MC_TYPE	Unique	See Section 2.22, "MSRs in Pentium Processors," and see Table 2-2.
6H	6	IA32_MONITOR_FILTER_SIZE	Unique	See Section 8.10.5, "Monitor/Mwait Address Range Determination," and see Table 2-2.
10H	16	IA32_TIME_STAMP_COUNTER	Unique	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Shared	Platform ID (R) See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.
1BH	27	IA32_APIC_BASE	Unique	See Section 10.4.4, "Local APIC Status and Location," and see Table 2-2.

**Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV**

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
2AH	42	MSR_EBL_CR_POWERON	Shared	Processor Hard Power-On Configuration (R/W) Enables and disables processor features; (R) indicates current processor configuration.
		0		Reserved
		1		Data Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		2		Response Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		3		MCERR# Drive Enable (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		4		Address Parity Enable (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		6: 5		Reserved
		7		BINIT# Driver Enable (R/W) 1 = Enabled; 0 = Disabled Note: Not all processor implements R/W.
		8		Output Tri-state Enabled (R/O) 1 = Enabled; 0 = Disabled
		9		Execute BIST (R/O) 1 = Enabled; 0 = Disabled

		15		Reserved
		17:16		APIC Cluster ID (R/O)
		18		System Bus Frequency (R/O) 0 = 100 MHz 1 = Reserved
		19		Reserved
		21: 20		Symmetric Arbitration ID (R/O)
26:22	Clock Frequency Ratio (R/O)			

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
3AH	58	IA32_FEATURE_CONTROL	Unique	Control Features in IA-32 Processor (R/W) See Table 2-2.
40H	64	MSR_LASTBRANCH_0	Unique	Last Branch Record 0 (R/W) One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the 'to' address. See also: <ul style="list-style-type: none"> <li>▪ Last Branch Record Stack TOS at 1C9H</li> <li>▪ Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."</li> </ul>
41H	65	MSR_LASTBRANCH_1	Unique	Last Branch Record 1 (R/W) See description of MSR_LASTBRANCH_0.
42H	66	MSR_LASTBRANCH_2	Unique	Last Branch Record 2 (R/W) See description of MSR_LASTBRANCH_0.
43H	67	MSR_LASTBRANCH_3	Unique	Last Branch Record 3 (R/W) See description of MSR_LASTBRANCH_0.
44H	68	MSR_LASTBRANCH_4	Unique	Last Branch Record 4 (R/W) See description of MSR_LASTBRANCH_0.
45H	69	MSR_LASTBRANCH_5	Unique	Last Branch Record 5 (R/W) See description of MSR_LASTBRANCH_0.
46H	70	MSR_LASTBRANCH_6	Unique	Last Branch Record 6 (R/W) See description of MSR_LASTBRANCH_0.
47H	71	MSR_LASTBRANCH_7	Unique	Last Branch Record 7 (R/W) See description of MSR_LASTBRANCH_0.
79H	121	IA32_BIOS_UPDT_TRIG	Unique	BIOS Update Trigger Register (W) See Table 2-2.
8BH	139	IA32_BIOS_SIGN_ID	Unique	BIOS Update Signature ID (RO) See Table 2-2.
C1H	193	IA32_PMC0	Unique	Performance Counter Register See Table 2-2.
C2H	194	IA32_PMC1	Unique	Performance Counter Register See Table 2-2.
CDH	205	MSR_FSB_FREQ	Shared	Scaleable Bus Speed (RO) This field indicates the scaleable bus clock speed:
		2:0		<ul style="list-style-type: none"> <li>▪ 101B: 100 MHz (FSB 400)</li> <li>▪ 001B: 133 MHz (FSB 533)</li> <li>▪ 011B: 167 MHz (FSB 667)</li> </ul> 133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 101B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B.
		63:3		Reserved

**Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV**

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
E7H	231	IA32_MPERF	Unique	Maximum Performance Frequency Clock Count (RW) See Table 2-2.
E8H	232	IA32_APERF	Unique	Actual Performance Frequency Clock Count (RW) See Table 2-2.
FEH	254	IA32_MTRRCAP	Unique	See Table 2-2.
11EH	281	MSR_BBL_CR_CTL3	Shared	Control Register 3 Used to configure the L2 Cache.
		0		L2 Hardware Enabled (RO) 1 = If the L2 is hardware-enabled 0 = Indicates if the L2 is hardware-disabled
		7:1		Reserved
		8		L2 Enabled (R/W) 1 = L2 cache has been initialized 0 = Disabled (default) Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9		Reserved
		23		L2 Not Present (RO) 0 = L2 Present 1 = L2 Not Present
		63:24		Reserved
174H	372	IA32_SYSENTER_CS	Unique	See Table 2-2.
175H	373	IA32_SYSENTER_ESP	Unique	See Table 2-2.
176H	374	IA32_SYSENTER_EIP	Unique	See Table 2-2.
179H	377	IA32_MCG_CAP	Unique	See Table 2-2.
17AH	378	IA32_MCG_STATUS	Unique	Global Machine Check Status
		0		RIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted.
		1		EIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		2		MCIP When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3		Reserved
186H	390	IA32_PERFEVTSELO	Unique	See Table 2-2.
187H	391	IA32_PERFEVTSEL1	Unique	See Table 2-2.
198H	408	IA32_PERF_STATUS	Shared	See Table 2-2.
199H	409	IA32_PERF_CTL	Unique	See Table 2-2.
19AH	410	IA32_CLOCK_MODULATION	Unique	Clock Modulation (R/W) See Table 2-2.
19BH	411	IA32_THERM_INTERRUPT	Unique	Thermal Interrupt Control (R/W) See Table 2-2. See Section 14.7.2, "Thermal Monitor."
19CH	412	IA32_THERM_STATUS	Unique	Thermal Monitor Status (R/W) See Table 2-2. See Section 14.7.2, "Thermal Monitor".
19DH	413	MSR_THERM2_CTL	Unique	Thermal Monitor 2 Control
		15:0		Reserved
		16		TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.
		63:16		Reserved
1A0H	416	IA32_MISC_ENABLE		Enable Miscellaneous Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.
		2:0		Reserved
		3	Unique	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2.
		6:4		Reserved
		7	Shared	Performance Monitoring Available (R) See Table 2-2.

**Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV**

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
		9:8		Reserved
		10	Shared	FERR# Multiplexing Enable (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor 0 = Indicates compatible FERR# signaling behavior This bit must be set to 1 to support XAPIC interrupt model usage.
		11	Shared	Branch Trace Storage Unavailable (RO) See Table 2-2.
		12		Reserved
		13	Shared	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state. If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.
		15:14		Reserved
		16	Shared	Enhanced Intel SpeedStep Technology Enable (R/W) 1 = Enhanced Intel SpeedStep Technology enabled
		18	Shared	ENABLE MONITOR FSM (R/W) See Table 2-2.
		19		Reserved
		22	Shared	Limit CPUID Maxval (R/W) See Table 2-2. Setting this bit may cause behavior in software that depends on the availability of CPUID leaves greater than 2.
		33:23		Reserved
		34	Shared	XD Bit Disable (R/W) See Table 2-2.
		63:35		Reserved
1C9H	457	MSR_LASTBRANCH_TOS	Unique	Last Branch Record Stack TOS (R/W) Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
1D9H	473	IA32_DEBUGCTL	Unique	Debug Control (R/W) Controls how several debug features are used. Bit definitions are discussed in Table 2-2.
1DDH	477	MSR_LER_FROM_LIP	Unique	Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.
1DEH	478	MSR_LER_TO_LIP	Unique	Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.
200H	512	MTRRphysBase0	Unique	Memory Type Range Registers
201H	513	MTRRphysMask0	Unique	Memory Type Range Registers

**Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV**

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
2FFH	767	IA32_MTRR_DEF_TYPE	Unique	Default Memory Types (R/W) See Table 2-2. See Section 11.11.2.1, "IA32_MTRR_DEF_TYPE MSR."
400H	1024	IA32_MCO_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MCO_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
402H	1026	IA32_MCO_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
406H	1030	IA32_MC1_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40AH	1034	IA32_MC2_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	MSR_MC4_CTL	Unique	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	MSR_MC4_STATUS	Unique	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40EH	1038	MSR_MC4_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	IA32_MC3_CTL		See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	IA32_MC3_STATUS		See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
412H	1042	MSR_MC3_ADDR	Unique	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.

Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
413H	1043	MSR_MC3_MISC	Unique	Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCI_STATUS register is set.
414H	1044	MSR_MC5_CTL	Unique	Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).
415H	1045	MSR_MC5_STATUS	Unique	Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCI_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.
416H	1046	MSR_MC5_ADDR	Unique	Machine Check Error Reporting Register - contains the address of the code or data memory location that produced the machine-check error if the ADDRV flag in the IA32_MCI_STATUS register is set.
417H	1047	MSR_MC5_MISC	Unique	Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCI_STATUS register is set.
480H	1152	IA32_VMX_BASIC	Unique	Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2. See Appendix A.1, "Basic VMX Information". (If CPUID.01H:ECX.[bit 9])
481H	1153	IA32_VMX_PINBASED_CTL	Unique	Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls". (If CPUID.01H:ECX.[bit 9])
482H	1154	IA32_VMX_PROCBASED_CTL	Unique	Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls". (If CPUID.01H:ECX.[bit 9])
483H	1155	IA32_VMX_EXIT_CTL	Unique	Capability Reporting Register of VM-Exit Controls (R/O) See Appendix A.4, "VM-Exit Controls". (If CPUID.01H:ECX.[bit 9])
484H	1156	IA32_VMX_ENTRY_CTL	Unique	Capability Reporting Register of VM-Entry Controls (R/O) See Appendix A.5, "VM-Entry Controls". (If CPUID.01H:ECX.[bit 9])
485H	1157	IA32_VMX_MISC	Unique	Reporting Register of Miscellaneous VMX Capabilities (R/O) See Appendix A.6, "Miscellaneous Data". (If CPUID.01H:ECX.[bit 9])
486H	1158	IA32_VMX_CRO_FIXED0	Unique	Capability Reporting Register of CRO Bits Fixed to 0 (R/O) See Appendix A.7, "VMX-Fixed Bits in CRO". (If CPUID.01H:ECX.[bit 9])

**Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV**

Register Address		Register Name	Shared/ Unique	Bit Description
Hex	Dec			
487H	1159	IA32_VMX_CR0_FIXED1	Unique	Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0". (If CPUID.01H:ECX.[bit 9])
488H	1160	IA32_VMX_CR4_FIXED0	Unique	Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4". (If CPUID.01H:ECX.[bit 9])
489H	1161	IA32_VMX_CR4_FIXED1	Unique	Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4". (If CPUID.01H:ECX.[bit 9])
48AH	1162	IA32_VMX_VMCS_ENUM	Unique	Capability Reporting Register of VMCS Field Enumeration (R/O) See Appendix A.9, "VMCS Enumeration". (If CPUID.01H:ECX.[bit 9])
48BH	1163	IA32_VMX_PROCBASED_CTL2	Unique	Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls". (If CPUID.01H:ECX.[bit 9] and IA32_VMX_PROCBASED_CTL2[bit 63])
600H	1536	IA32_DS_AREA	Unique	DS Save Area (R/W) See Table 2-2. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
		31:0		DS Buffer Management Area Linear address of the first byte of the DS buffer management area.
		63:32		Reserved
C000_0080H		IA32_EFER	Unique	See Table 2-2.
		10:0		Reserved
		11		Execute Disable Bit Enable
		63:12		Reserved

## 2.20 MSRS IN THE PENTIUM M PROCESSOR

Model-specific registers (MSRs) for the Pentium M processor are similar to those described in Section 2.21 for P6 family processors. The following table describes new MSRs and MSRs whose behavior has changed on the Pentium M processor.

**Table 2-49. MSRs in Pentium M Processors**

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
0H	0	P5_MC_ADDR	See Section 2.22, "MSRs in Pentium Processors."

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
1H	1	P5_MC_TYPE	See Section 2.22, "MSRs in Pentium Processors."
10H	16	IA32_TIME_STAMP_COUNTER	See Section 17.17, "Time-Stamp Counter," and see Table 2-2.
17H	23	IA32_PLATFORM_ID	Platform ID (R) See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.
2AH	42	MSR_EBL_CR_POWERON	Processor Hard Power-On Configuration (R/W) Enables and disables processor features. (R) Indicates current processor configuration.
		0	Reserved
		1	Data Error Checking Enable (R) 0 = Disabled Always 0 on the Pentium M processor.
		2	Response Error Checking Enable (R) 0 = Disabled Always 0 on the Pentium M processor.
		3	MCERR# Drive Enable (R) 0 = Disabled Always 0 on the Pentium M processor.
		4	Address Parity Enable (R) 0 = Disabled Always 0 on the Pentium M processor.
		6:5	Reserved
		7	BINIT# Driver Enable (R) 1 = Enabled; 0 = Disabled Always 0 on the Pentium M processor.
		8	Output Tri-state Enabled (R/O) 1 = Enabled; 0 = Disabled
		9	Execute BIST (R/O) 1 = Enabled; 0 = Disabled
		10	MCERR# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled Always 0 on the Pentium M processor.
		11	Reserved
		12	BINIT# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled Always 0 on the Pentium M processor.
13	Reserved		

**Table 2-49. MSRs in Pentium M Processors (Contd.)**

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
		14	1 MByte Power on Reset Vector (R/O) 1 = 1 MByte; 0 = 4 GBytes Always 0 on the Pentium M processor.
		15	Reserved
		17:16	APIC Cluster ID (R/O) Always 00B on the Pentium M processor.
		18	System Bus Frequency (R/O) 0 = 100 MHz 1 = Reserved Always 0 on the Pentium M processor.
		19	Reserved
		21:20	Symmetric Arbitration ID (R/O) Always 00B on the Pentium M processor.
		26:22	Clock Frequency Ratio (R/O)
40H	64	MSR_LASTBRANCH_0	Last Branch Record 0 (R/W) One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the to address. See also: <ul style="list-style-type: none"> <li>▪ Last Branch Record Stack TOS at 1C9H.</li> <li>▪ Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)".</li> </ul>
41H	65	MSR_LASTBRANCH_1	Last Branch Record 1 (R/W) See description of MSR_LASTBRANCH_0.
42H	66	MSR_LASTBRANCH_2	Last Branch Record 2 (R/W) See description of MSR_LASTBRANCH_0.
43H	67	MSR_LASTBRANCH_3	Last Branch Record 3 (R/W) See description of MSR_LASTBRANCH_0.
44H	68	MSR_LASTBRANCH_4	Last Branch Record 4 (R/W) See description of MSR_LASTBRANCH_0.
45H	69	MSR_LASTBRANCH_5	Last Branch Record 5 (R/W) See description of MSR_LASTBRANCH_0.
46H	70	MSR_LASTBRANCH_6	Last Branch Record 6 (R/W) See description of MSR_LASTBRANCH_0.
47H	71	MSR_LASTBRANCH_7	Last Branch Record 7 (R/W) See description of MSR_LASTBRANCH_0.
119H	281	MSR_BBL_CR_CTL	Control Register Used to program L2 commands to be issued via cache configuration accesses mechanism. Also receives L2 lookup response.
		63:0	Reserved
11EH	281	MSR_BBL_CR_CTL3	Control register 3 Used to configure the L2 Cache.

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
		0	L2 Hardware Enabled (RO) 1 = If the L2 is hardware-enabled. 0 = Indicates if the L2 is hardware-disabled.
		4:1	Reserved
		5	ECC Check Enable (RO) This bit enables ECC checking on the cache data bus. ECC is always generated on write cycles. 0 = Disabled (default) 1 = Enabled For the Pentium M processor, ECC checking on the cache data bus is always enabled.
		7:6	Reserved
		8	L2 Enabled (R/W) 1 = L2 cache has been initialized 0 = Disabled (default) Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
		22:9	Reserved
		23	L2 Not Present (RO) 0 = L2 Present 1 = L2 Not Present
		63:24	Reserved
179H	377	IA32_MCG_CAP	Read-only register that provides information about the machine-check architecture of the processor.
		7:0	Count (RO) Indicates the number of hardware unit error reporting banks available in the processor.
		8	IA32_MCG_CTL Present (RO) 1 = Indicates that the processor implements the MSR_MCG_CTL register found at MSR 17BH. 0 = Not supported.
		63:9	Reserved
17AH	378	IA32_MCG_STATUS	Global Machine Check Status
		0	RIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted.
		1	EIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.

**Table 2-49. MSRs in Pentium M Processors (Contd.)**

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
		2	MCIP When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
		63:3	Reserved
198H	408	IA32_PERF_STATUS	See Table 2-2.
199H	409	IA32_PERF_CTL	See Table 2-2.
19AH	410	IA32_CLOCK_MODULATION	Clock Modulation (R/W). See Table 2-2. See Section 14.7.3, "Software Controlled Clock Modulation."
19BH	411	IA32_THERM_INTERRUPT	Thermal Interrupt Control (R/W) See Table 2-2. See Section 14.7.2, "Thermal Monitor."
19CH	412	IA32_THERM_STATUS	Thermal Monitor Status (R/W) See Table 2-2. See Section 14.7.2, "Thermal Monitor."
19DH	413	MSR_THERM2_CTL	Thermal Monitor 2 Control
		15:0	Reserved
		16	TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.
		63:16	Reserved
1A0H	416	IA32_MISC_ENABLE	Enable Miscellaneous Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.
		2:0	Reserved

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
		3	<p>Automatic Thermal Control Circuit Enable (R/W)</p> <p>1 = Setting this bit enables the thermal control circuit (TCC) portion of the Intel Thermal Monitor feature. This allows processor clocks to be automatically modulated based on the processor's thermal sensor operation.</p> <p>0 = Disabled (default).</p> <p>The automatic thermal control circuit enable bit determines if the thermal control circuit (TCC) will be activated when the processor's internal thermal sensor determines the processor is about to exceed its maximum operating temperature.</p> <p>When the TCC is activated and TM1 is enabled, the processors clocks will be forced to a 50% duty cycle. BIOS must enable this feature.</p> <p>The bit should not be confused with the on-demand thermal control circuit enable bit.</p>
		6:4	Reserved
		7	<p>Performance Monitoring Available (R)</p> <p>1 = Performance monitoring enabled.</p> <p>0 = Performance monitoring disabled.</p>
		9:8	Reserved
		10	<p>FERR# Multiplexing Enable (R/W)</p> <p>1 = FERR# asserted by the processor to indicate a pending break event within the processor.</p> <p>0 = Indicates compatible FERR# signaling behavior.</p> <p>This bit must be set to 1 to support XAPIC interrupt model usage.</p>
			<p>Branch Trace Storage Unavailable (RO)</p> <p>1 = Processor doesn't support branch trace storage (BTS)</p> <p>0 = BTS is supported</p>
		12	<p>Processor Event Based Sampling Unavailable (RO)</p> <p>1 = Processor does not support processor event based sampling (PEBS);</p> <p>0 = PEBS is supported.</p> <p>The Pentium M processor does not support PEBS.</p>
		15:13	Reserved
		16	<p>Enhanced Intel SpeedStep Technology Enable (R/W)</p> <p>1 = Enhanced Intel SpeedStep Technology enabled.</p> <p>On the Pentium M processor, this bit may be configured to be read-only.</p>
		22:17	Reserved
		23	<p>xTPR Message Disable (R/W)</p> <p>When set to 1, xTPR messages are disabled. xTPR messages are optional messages that allow the processor to inform the chipset of its priority. The default is processor specific.</p>
		63:24	Reserved

**Table 2-49. MSRs in Pentium M Processors (Contd.)**

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
1C9H	457	MSR_LASTBRANCH_TOS	Last Branch Record Stack TOS (R/W) Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See also: <ul style="list-style-type: none"> <li>▪ MSR_LASTBRANCH_0_FROM_IP (at 40H).</li> <li>▪ Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)".</li> </ul>
1D9H	473	MSR_DEBUGCTLB	Debug Control (R/W) Controls how several debug features are used. Bit definitions are discussed in the referenced section. See Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."
1DDH	477	MSR_LER_TO_LIP	Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)" and Section 17.16.2, "Last Branch and Last Exception MSRs."
1DEH	478	MSR_LER_FROM_LIP	Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)" and Section 17.16.2, "Last Branch and Last Exception MSRs."
2FFH	767	IA32_MTRR_DEF_TYPE	Default Memory Types (R/W) Sets the memory type for the regions of physical memory that are not mapped by the MTRRs. See Section 11.11.2.1, "IA32_MTRR_DEF_TYPE MSR."
400H	1024	IA32_MCO_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
401H	1025	IA32_MCO_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
402H	1026	IA32_MCO_ADDR	See Section 14.3.2.3, "IA32_MCi_ADDR MSRs". The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
404H	1028	IA32_MC1_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
405H	1029	IA32_MC1_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRS."
406H	1030	IA32_MC1_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs". The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
408H	1032	IA32_MC2_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
409H	1033	IA32_MC2_STATUS	See Chapter 15.3.2.2, "IA32_MCi_STATUS MSRS."

Table 2-49. MSRs in Pentium M Processors (Contd.)

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
40AH	1034	IA32_MC2_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
40CH	1036	MSR_MC4_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
40DH	1037	MSR_MC4_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
40EH	1038	MSR_MC4_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
410H	1040	MSR_MC3_CTL	See Section 15.3.2.1, "IA32_MCi_CTL MSRs."
411H	1041	MSR_MC3_STATUS	See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."
412H	1042	MSR_MC3_ADDR	See Section 15.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.
600H	1536	IA32_DS_AREA	DS Save Area (R/W) See Table 2-2. Points to the DS buffer management area, which is used to manage the BTS and PEBS buffers. See Section 18.6.3.4, "Debug Store (DS) Mechanism."
		31:0	DS Buffer Management Area Linear address of the first byte of the DS buffer management area.
		63:32	Reserved

## 2.21 MSRS IN THE P6 FAMILY PROCESSORS

The following MSRs are defined for the P6 family processors. The MSRs in this table that are shaded are available only in the Pentium II and Pentium III processors. Beginning with the Pentium 4 processor, some of the MSRs in this list have been designated as "architectural" and have had their names changed. See Table 2-2 for a list of the architectural MSRs.

Table 2-50. MSRs in the P6 Family Processors

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
0H	0	P5_MC_ADDR	See Section 2.22, "MSRs in Pentium Processors."
1H	1	P5_MC_TYPE	See Section 2.22, "MSRs in Pentium Processors."
10H	16	TSC	See Section 17.17, "Time-Stamp Counter."

**Table 2-50. MSRs in the P6 Family Processors (Contd.)**

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
17H	23	IA32_PLATFORM_ID	Platform ID (R) The operating system can use this MSR to determine “slot” information for the processor and the proper microcode update to load.
		49:0	Reserved
		52:50	Platform Id (R) Contains information concerning the intended platform for the processor. 52 51 50 0 0 0 Processor Flag 0 0 0 1 Processor Flag 1 0 1 0 Processor Flag 2 0 1 1 Processor Flag 3 1 0 0 Processor Flag 4 1 0 1 Processor Flag 5 1 1 0 Processor Flag 6 1 1 1 Processor Flag 7
		56:53	L2 Cache Latency Read.
		59:57	Reserved
		60	Clock Frequency Ratio Read.
		63:61	Reserved
		1BH	27
7:0	Reserved		
8	Boot Strap Processor Indicator Bit 1 = BSP		
10:9	Reserved		
11	APIC Global Enable Bit - Permanent till reset 1 = Enabled 0 = Disabled		
31:12	APIC Base Address.		
63:32	Reserved		
2AH	42	EBL_CR_POWERON	Processor Hard Power-On Configuration (R/W) Enables and disables processor features; (R) indicates current processor configuration.
		0	Reserved <sup>1</sup>
		1	Data Error Checking Enable (R/W) 1 = Enabled 0 = Disabled
		2	Response Error Checking Enable FRCERR Observation Enable (R/W) 1 = Enabled 0 = Disabled
		3	AERR# Drive Enable (R/W) 1 = Enabled 0 = Disabled

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
		4	BERR# Enable for Initiator Bus Requests (R/W) 1 = Enabled 0 = Disabled
		5	Reserved
		6	BERR# Driver Enable for Initiator Internal Errors (R/W) 1 = Enabled 0 = Disabled
		7	BINIT# Driver Enable (R/W) 1 = Enabled 0 = Disabled
		8	Output Tri-state Enabled (R) 1 = Enabled 0 = Disabled
		9	Execute BIST (R) 1 = Enabled 0 = Disabled
		10	AERR# Observation Enabled (R) 1 = Enabled 0 = Disabled
		11	Reserved
		12	BINIT# Observation Enabled (R) 1 = Enabled 0 = Disabled
		13	In Order Queue Depth (R) 1 = 1 0 = 8
		14	1-MByte Power on Reset Vector (R) 1 = 1MByte 0 = 4GBytes
		15	FRC Mode Enable (R) 1 = Enabled 0 = Disabled
		17:16	APIC Cluster ID (R)
		19:18	System Bus Frequency (R) 00 = 66MHz 10 = 100MHz 01 = 133MHz 11 = Reserved
		21: 20	Symmetric Arbitration ID (R)
		25:22	Clock Frequency Ratio (R)
		26	Low Power Mode Enable (R/W)

**Table 2-50. MSRs in the P6 Family Processors (Contd.)**

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
		27	Clock Frequency Ratio
		63:28	Reserved <sup>1</sup>
33H	51	TEST_CTL	Test Control Register
		29:0	Reserved
		30	Streaming Buffer Disable
		31	Disable LOCK# Assertion for split locked access.
79H	121	BIOS_UPDT_TRIG	BIOS Update Trigger Register.
88H	136	BBL_CR_D0[63:0]	Chunk 0 data register D[63:0]; used to write to and read from the L2
89H	137	BBL_CR_D1[63:0]	Chunk 1 data register D[63:0]; used to write to and read from the L2
8AH	138	BBL_CR_D2[63:0]	Chunk 2 data register D[63:0]; used to write to and read from the L2
8BH	139	BIOS_SIGN/BBL_CR_D3[63:0]	BIOS Update Signature Register or Chunk 3 data register D[63:0] Used to write to and read from the L2 depending on the usage model.
C1H	193	PerfCtr0 (PERFCTR0)	Performance Counter Register See Table 2-2.
C2H	194	PerfCtr1 (PERFCTR1)	Performance Counter Register See Table 2-2.
FEH	254	MTRRcap	Memory Type Range Registers
116H	278	BBL_CR_ADDR [63:0]	Address register: used to send specified address (A31-A3) to L2 during cache initialization accesses.
		BBL_CR_ADDR [63:32]	Reserved,
		BBL_CR_ADDR [31:3]	Address bits [35:3]
		BBL_CR_ADDR [2:0]	Reserved Set to 0.
118H	280	BBL_CR_DECC[63:0]	Data ECC register D[7:0]: used to write ECC and read ECC to/from L2
119H	281	BBL_CR_CTL	Control register: used to program L2 commands to be issued via cache configuration accesses mechanism. Also receives L2 lookup response
		BL_CR_CTL[63:22]	Reserved
		BBL_CR_CTL[21]	Processor number <sup>2</sup> Disable = 1 Enable = 0 Reserved

**Table 2-50. MSRs in the P6 Family Processors (Contd.)**

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
		BBL_CR_CTL3[17:13] 00001 00010 00100 01000 10000  BBL_CR_CTL3[12:11] BBL_CR_CTL3[10:9] 00 01 10 11  BBL_CR_CTL3[8] BBL_CR_CTL3[7] BBL_CR_CTL3[6] BBL_CR_CTL3[5] BBL_CR_CTL3[4:1] BBL_CR_CTL3[0]	Cache size per bank (read/write) 256KBytes 512KBytes 1MByte 2MByte 4MBytes  Number of L2 banks (read only) L2 Associativity (read only) Direct Mapped 2 Way 4 Way Reserved  L2 Enabled (read/write) CRTN Parity Check Enable (read/write) Address Parity Check Enable (read/write) ECC Check Enable (read/write) L2 Cache Latency (read/write) L2 Configured (read/write )
174H	372	SYSENTER_CS_MSR	CS register target for CPL 0 code
175H	373	SYSENTER_ESP_MSR	Stack pointer for CPL 0 stack
176H	374	SYSENTER_EIP_MSR	CPL 0 code entry point
179H	377	MCG_CAP	Machine Check Global Control Register
17AH	378	MCG_STATUS	Machine Check Error Reporting Register - contains information related to machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.
17BH	379	MCG_CTL	Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).
186H	390	PerfEvtSel0 (EVNTSEL0)	Performance Event Select Register 0 (R/W)
		7:0	Event Select Refer to Performance Counter section for a list of event encodings.
		15:8	UMASK (Unit Mask) Unit mask register set to 0 to enable all count options.
		16	USER Controls the counting of events at Privilege levels of 1, 2, and 3.
		17	OS Controls the counting of events at Privilege level of 0.

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
		18	E Occurrence/Duration Mode Select 1 = Occurrence 0 = Duration
		19	PC Enabled the signaling of performance counter overflow via BPO pin
		20	INT Enables the signaling of counter overflow via input to APIC 1 = Enable 0 = Disable
		22	ENABLE Enables the counting of performance events in both counters 1 = Enable 0 = Disable
		23	INV Inverts the result of the CMASK condition 1 = Inverted 0 = Non-Inverted
		31:24	CMASK (Counter Mask)
187H	391	PerfEvtSel1 (EVNTSEL1)	Performance Event Select for Counter 1 (R/W)
		7:0	Event Select Refer to Performance Counter section for a list of event encodings.
		15:8	UMASK (Unit Mask) Unit mask register set to 0 to enable all count options.
		16	USER Controls the counting of events at Privilege levels of 1, 2, and 3.
		17	OS Controls the counting of events at Privilege level of 0.
		18	E Occurrence/Duration Mode Select. 1 = Occurrence 0 = Duration
		19	PC Enabled the signaling of performance counter overflow via BPO pin.

**Table 2-50. MSRs in the P6 Family Processors (Contd.)**

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
		20	INT Enables the signaling of counter overflow via input to APIC. 1 = Enable 0 = Disable
		23	INV Inverts the result of the CMASK condition. 1 = Inverted 0 = Non-Inverted
		31:24	CMASK (Counter Mask)
1D9H	473	DEBUGCTLMR	Enables last branch, interrupt, and exception recording; taken branch breakpoints; the breakpoint reporting pins; and trace messages. This register can be written to using the WRMSR instruction, when operating at privilege level 0 or when in real-address mode.
		0	Enable/Disable Last Branch Records
		1	Branch Trap Flag
		2	Performance Monitoring/Break Point Pins
		3	Performance Monitoring/Break Point Pins
		4	Performance Monitoring/Break Point Pins
		5	Performance Monitoring/Break Point Pins
		6	Enable/Disable Execution Trace Messages
31:7	Reserved		
1DBH	475	LASTBRANCHFROMIP	32-bit register for recording the instruction pointers for the last branch, interrupt, or exception that the processor took prior to a debug exception being generated.
1DCH	476	LASTBRANCHTOIP	32-bit register for recording the instruction pointers for the last branch, interrupt, or exception that the processor took prior to a debug exception being generated.
1DDH	477	LASTINTFROMIP	Last INT from IP
1DEH	478	LASTINTTOIP	Last INT to IP
200H	512	MTRRphysBase0	Memory Type Range Registers
201H	513	MTRRphysMask0	Memory Type Range Registers
202H	514	MTRRphysBase1	Memory Type Range Registers
203H	515	MTRRphysMask1	Memory Type Range Registers
204H	516	MTRRphysBase2	Memory Type Range Registers
205H	517	MTRRphysMask2	Memory Type Range Registers
206H	518	MTRRphysBase3	Memory Type Range Registers
207H	519	MTRRphysMask3	Memory Type Range Registers
208H	520	MTRRphysBase4	Memory Type Range Registers
209H	521	MTRRphysMask4	Memory Type Range Registers
20AH	522	MTRRphysBase5	Memory Type Range Registers

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
20BH	523	MTRRphysMask5	Memory Type Range Registers
20CH	524	MTRRphysBase6	Memory Type Range Registers
20DH	525	MTRRphysMask6	Memory Type Range Registers
20EH	526	MTRRphysBase7	Memory Type Range Registers
20FH	527	MTRRphysMask7	Memory Type Range Registers
250H	592	MTRRfix64K_00000	Memory Type Range Registers
258H	600	MTRRfix16K_80000	Memory Type Range Registers
259H	601	MTRRfix16K_A0000	Memory Type Range Registers
268H	616	MTRRfix4K_C0000	Memory Type Range Registers

		2:0	Default memory type
		10	Fixed MTRR enable
		11	MTRR Enable
400H	1024	MCO_CTL	Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).
401H	1025	MCO_STATUS	Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCI_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.
		15:0	MC_STATUS_MCACOD
		31:16	MC_STATUS_MSCOD
		57	MC_STATUS_DAM
		58	MC_STATUS_ADDRV
		59	MC_STATUS_MISCV
		60	MC_STATUS_EN. (Note: For MCO_STATUS only, this bit is hardcoded to 1.)
		61	MC_STATUS_UC
		62	MC_STATUS_O
63	MC_STATUS_V		
402H	1026	MCO_ADDR	
403H	1027	MCO_MISC	Defined in MCA architecture but not implemented in the P6 family processors.

Table 2-50. MSRs in the P6 Family Processors (Contd.)

Register Address		Register Name / Bit Fields	Bit Description
Hex	Dec		
404H	1028	MC1_CTL	
405H	1029	MC1_STATUS	Bit definitions same as MCO_STATUS.
406H	1030	MC1_ADDR	
407H	1031	MC1_MISC	Defined in MCA architecture but not implemented in the P6 family processors.
408H	1032	MC2_CTL	
409H	1033	MC2_STATUS	Bit definitions same as MCO_STATUS.
40AH	1034	MC2_ADDR	
40BH	1035	MC2_MISC	Defined in MCA architecture but not implemented in the P6 family processors.
40CH	1036	MC4_CTL	
40DH	1037	MC4_STATUS	Bit definitions same as MCO_STATUS, except bits 0, 4, 57, and 61 are hardcoded to 1.
40EH	1038	MC4_ADDR	Defined in MCA architecture but not implemented in P6 Family processors.
40FH	1039	MC4_MISC	Defined in MCA architecture but not implemented in the P6 family processors.
410H	1040	MC3_CTL	
411H	1041	MC3_STATUS	Bit definitions same as MCO_STATUS.
412H	1042	MC3_ADDR	
413H	1043	MC3_MISC	Defined in MCA architecture but not implemented in the P6 family processors.

**NOTES**

1. Bit 0 of this register has been redefined several times, and is no longer used in P6 family processors.
2. The processor number feature may be disabled by setting bit 21 of the BBL\_CR\_CTL MSR (model-specific register address 119h) to "1". Once set, bit 21 of the BBL\_CR\_CTL may not be cleared. This bit is write-once. The processor number feature will be disabled until the processor is reset.
3. The Pentium III processor will prevent FSB frequency overclocking with a new shutdown mechanism. If the FSB frequency selected is greater than the internal FSB frequency the processor will shutdown. If the FSB selected is less than the internal FSB frequency the BIOS may choose to use bit 11 to implement its own shutdown policy.

## 2.22 MSRS IN PENTIUM PROCESSORS

The following MSRs are defined for the Pentium processors. The P5\_MC\_ADDR, P5\_MC\_TYPE, and TSC MSRs (named IA32\_P5\_MC\_ADDR, IA32\_P5\_MC\_TYPE, and IA32\_TIME\_STAMP\_COUNTER in the Pentium 4 processor) are architectural; that is, code that accesses these registers will run on Pentium 4 and P6 family processors without generating exceptions (see Section 2.1, "Architectural MSRs"). The CESR, CTR0, and CTR1 MSRs are unique to Pentium processors; code that accesses these registers will generate exceptions on Pentium 4 and P6 family processors.

Table 2-51. MSRs in the Pentium Processor

Register Address		Register Name	Bit Description
Hex	Dec		
0H	0	P5_MC_ADDR	See Section 15.10.2, "Pentium Processor Machine-Check Exception Handling."
1H	1	P5_MC_TYPE	See Section 15.10.2, "Pentium Processor Machine-Check Exception Handling."
10H	16	TSC	See Section 17.17, "Time-Stamp Counter."
11H	17	CESR	See Section 18.6.9.1, "Control and Event Select Register (CESR)."
12H	18	CTRO	Section 18.6.9.3, "Events Counted."
13H	19	CTR1	Section 18.6.9.3, "Events Counted."

## 2.23 MSR INDEX

MSRs of recent processors are indexed here for convenience. IA32 MSRs are excluded from this index.

MSR Name and CPUID DisplayFamily_DisplayModel	Location
MSR_ALF_ESCR0	
0FH .....	See Table 2-45

## INDEX

- Core Solo and Core Duo, Vol.1-2-4
- Cosine, x87 FPU operation, Vol.1-8-21, Vol.2-3-334, Vol.2-3-386
- Counter mask field
  - PerfEvtSel0 and PerfEvtSel1 MSRs (P6 family processors), Vol.3-18-5, Vol.3-18-123
- CPL, Vol.2-3-144, Vol.2-5-92
  - description of, Vol.3-5-7
  - field, CS segment selector, Vol.3-5-2
- CPUID instruction, Vol.2-3-191, Vol.2-3-212
  - 36-bit page size extension, Vol.2-3-212
  - APIC on-chip, Vol.2-3-212
  - availability, Vol.3-22-4
  - basic CPUID information, Vol.2-3-192
  - cache and TLB characteristics, Vol.2-3-192
  - CLFLUSH flag, Vol.1-11-12, Vol.2-3-212
  - CLFLUSH instruction cache line size, Vol.2-3-208
  - CMOVcc feature flag, Vol.1-7-3
  - CMPXCHG16B flag, Vol.2-3-210
  - CMPXCHG8B flag, Vol.2-3-212
  - control register flags, Vol.3-2-19
  - CPL qualified debug store, Vol.2-3-209
  - debug extensions, CR4.DE, Vol.2-3-212
  - debug store supported, Vol.2-3-213
  - detecting features, Vol.3-22-2
  - determine support for, Vol.1-3-17
  - deterministic cache parameters leaf, Vol.2-3-192, Vol.2-3-195, Vol.2-3-196, Vol.2-3-197, Vol.2-3-198, Vol.2-3-199, Vol.2-3-200, Vol.2-3-201
  - earlier processors, Vol.1-19-1
  - extended function information, Vol.2-3-204, Vol.2-3-205
  - feature information, Vol.2-3-211
  - FPU on-chip, Vol.2-3-212
  - FSAVE flag, Vol.2-3-213
  - FXRSTOR flag, Vol.2-3-213
  - FXSAVE-FXRSTOR flag, Vol.1-10-14
  - IA-32e mode available, Vol.2-3-205
  - input limits for EAX, Vol.2-3-206
  - L1 Context ID, Vol.2-3-210
  - local APIC physical ID, Vol.2-3-208
  - machine check architecture, Vol.2-3-212
  - machine check exception, Vol.2-3-212
  - memory type range registers, Vol.2-3-212
  - MMX feature flag, Vol.1-9-8
  - MONITOR feature information, Vol.2-3-217
  - MONITOR/MWAIT flag, Vol.2-3-209
  - MONITOR/MWAIT leaf, Vol.2-3-193, Vol.2-3-194, Vol.2-3-196, Vol.2-3-202
  - MWAIT feature information, Vol.2-3-217
  - page attribute table, Vol.2-3-212
  - page size extension, Vol.2-3-212

- introduction to, Vol.3-2-7
- I/O instruction restart, Vol.3-34-15
- I/O state implementation, Vol.3-34-12
- memory model used, Vol.1-3-9
- native 16-bit mode, Vol.3-21-1
- overview, Vol.1-3-1
- overview of, Vol.3-34-1
- revision identifier, Vol.3-34-13
- revision identifier field, Vol.3-34-13
- switching to, Vol.3-34-2
- switching to from other operating modes, Vol.3-34-2
- synchronous SMI, Vol.3-34-11
- VMX operation
  - default RSM treatment, Vol.3-34-17
  - default SMI delivery, Vol.3-34-16
  - dual-monitor treatment, Vol.3-34-19
  - overview, Vol.3-34-1
  - protecting CR4.VMXE, Vol.3-34-18
  - RSM instruction, Vol.3-34-18
  - SMM monitor, Vol.3-34-1
  - SMM VM exits, Vol.3-27-1, Vol.3-34-19
  - SMM-transfer VMCS, Vol.3-34-19
  - SMM-transfer VMCS pointer, Vol.3-34-19
  - VMCS pointer preservation, Vol.3-34-17
  - VMX-critical state, Vol.3-34-17
- SMRAM
  - caching, Vol.3-34-8
  - state save map, Vol.3-34-4
  - structure of, Vol.3-34-3
- SMSW instruction, Vol.2-4-626, Vol.3-2-23, Vol.3-25-9
- SNaNs
  - description of, Vol.1-4-15
  - effect on COMISD and UCOMISD, Vol.1-11-7
  - encodings, Vol.1-4-5
  - operating on, Vol.1-4-16
  - typical uses of, Vol.1-4-15
  - using in applications, Vol.1-4-16
- SNaN, compatibility, IA-32 processors, Vol.3-22-9, Vol.3-22-14
- Snooping mechanism, Vol.3-11-6
- Software compatibility, Vol.1-1-6
- Software controlled clock
  - modulation control bits, Vol.3-14-29
  - power consumption, Vol.3-14-25, Vol.3-14-29
- Software interrupts, Vol.3-6-4
- Software-controlled bus locking, Vol.3-8-3
- SP register, Vol.1-3-12
- Speculative execution, Vol.1-2-8, Vol.1-2-10
- SpeedStep technology, Vol.2-3-209
- Spin-wait loops
  - programming with PAUSE instruction, Vol.1-11-12
- Split pages, Vol.3-22-15
- Spurious interrupt, local APIC, Vol.3-10-32
- SQRTPD instruction, Vol.1-11-6
- SQRTPD- Square Root of Double-Precision Floating-Point Values, Vol.2-4-652
- SQRTPD—Square Root of Double-Precision Floating-Point Values, Vol.2-4-628
- SQRTPS instruction, Vol.1-10-8
- SQRTPS- Square Root of Single-Precision Floating-Point Values, Vol.2-4-631
- SQRTSD - Compute Square Root of Scalar Double-Precision Floating-Point Value, Vol.2-4-634, Vol.2-4-652
- SQRTSD instruction, Vol.1-11-6
- SQRTSS - Compute Square Root of Scalar Single-Precision Floating-Point Value, Vol.2-4-636
- SQRTSS instruction, Vol.1-10-8
- Square root, Fx87 PU operation, Vol.2-3-388
- SS register, Vol.1-3-13, Vol.1-3-14, Vol.1-6-1, Vol.2-3-525, Vol.2-4-36, Vol.2-4-385
- SSE extensions
  - 128-bit packed single-precision data type, Vol.1-10-5
  - 64-bit mode, Vol.1-10-3
  - 64-bit SIMD integer instructions, Vol.1-10-11
  - branching on arithmetic operations, Vol.1-11-24
  - cacheability control instructions, Vol.1-10-12
  - cacheability hint instructions, Vol.1-11-25
  - cacheability instruction encodings, Vol.1-B-49
  - caller-save requirement for procedure and function calls, Vol.1-11-24
  - checking for SSE and SSE2 support, Vol.1-11-19
  - checking for with CPUID, Vol.3-13-2
  - checking support for FXSAVE/FXRSTOR, Vol.3-13-2
  - comparison instructions, Vol.1-10-9
  - compatibility mode, Vol.1-10-3
  - compatibility of SIMD and x87 FPU floating-point data types, Vol.1-11-22
  - conversion instructions, Vol.1-10-11
  - CPUID feature flag, Vol.3-9-8
  - CPUID flag, Vol.2-3-213
  - data movement instructions, Vol.1-10-7
  - data types, Vol.1-10-5, Vol.1-12-1
  - denormal operand exception (#D), Vol.1-11-15
  - denormals-are-zeros mode, Vol.1-10-5
  - divide by zero exception (#Z), Vol.1-11-15
  - EM flag, Vol.3-2-16
  - emulation of, Vol.3-13-6
  - exceptions, Vol.1-11-13
  - facilities for automatic saving of state, Vol.3-13-6, Vol.3-13-7
  - floating-point encodings, Vol.1-B-43
  - floating-point format, Vol.1-4-11
  - flush-to-zero mode, Vol.1-10-4
  - generating SIMD FP exceptions, Vol.1-11-16
  - guidelines for using, Vol.1-11-19
  - handling combinations of masked and unmasked exceptions, Vol.1-11-18
  - handling masked exceptions, Vol.1-11-16
  - handling SIMD floating-point exceptions in software, Vol.1-11-18
  - handling unmasked exceptions, Vol.1-11-17, Vol.1-11-18
  - inexact result exception (#P), Vol.1-11-16
  - initialization, Vol.3-9-8
  - instruction encodings, Vol.1-B-43
  - instruction prefixes, effect on SSE and SSE2 instructions, Vol.1-11-25
  - instruction set, Vol.1-5-14, Vol.1-10-6
  - integer instruction encodings, Vol.1-B-47
  - interaction of SIMD and x87 FPU floating-point exceptions, Vol.1-11-18
  - interaction of SSE and SSE2 instructions with x87 FPU and MMX instructions, Vol.1-11-21
  - interfacing with SSE and SSE2 procedures and functions, Vol.1-11-23
  - intermixing packed and scalar floating-point and 128-bit SIMD integer instructions and data ....., Vol.1-11-22
  - introduction, Vol.1-2-3
  - introduction of into the IA-32 architecture, Vol.3-22-3
  - invalid operation exception (#I), Vol.1-11-14
  - logical instructions, Vol.1-10-9
  - masked responses to invalid arithmetic operations, Vol.1-11-14
  - memory ordering encodings, Vol.1-B-49
  - memory ordering instruction, Vol.1-10-14
  - MMX technology compatibility, Vol.1-10-5
  - MXCSR register, Vol.1-10-3
  - MXCSR state management instructions, Vol.1-10-12
  - non-temporal data, operating on, Vol.1-10-12
  - numeric overflow exception (#O), Vol.1-11-15
  - numeric underflow exception (#U), Vol.1-11-16
  - overview, Vol.1-10-1
  - packed 128-Bit SIMD data types, Vol.1-4-8
  - packed and scalar floating-point instructions, Vol.1-10-6
  - programming environment, Vol.1-10-2
  - providing exception handlers for, Vol.3-13-4, Vol.3-13-5
  - providing operating system support for, Vol.3-13-1
  - QNaN floating-point indefinite, Vol.1-4-17
  - restoring SSE and SSE2 state, Vol.1-11-20

- REX prefixes, Vol.1-10-3
- saving and restoring state, Vol.3-13-6
- saving SSE and SSE2 state, Vol.1-11-20
- saving state on task, context switches, Vol.3-13-6
- saving XMM register state on a procedure or function call, Vol.1-11-23
- shuffle instructions, Vol.1-10-9
- SIMD floating-point exception conditions, Vol.1-11-14
- SIMD floating-point exception cross reference, Vol.1-C-3
- SIMD Floating-point exception (#XM), Vol.3-6-47
- SIMD floating-point exception (#XM), Vol.1-11-17, Vol.1-11-18
- SIMD floating-point exceptions, Vol.1-11-13
- SIMD floating-point mask and flag bits, Vol.1-10-4
- SIMD floating-point rounding control field, Vol.1-10-4
- SSE and SSE2 conversion instruction chart, Vol.1-11-9
- SSE feature flag, CPUID instruction, Vol.1-11-19
- SSE2 compatibility, Vol.1-10-5
- system programming, Vol.1-13-18
- unpack instructions, Vol.1-10-9
- updating MMX technology routines
  - using 128-bit SIMD integer instructions, Vol.1-11-24
  - using TS flag to control saving of state, Vol.3-13-7
- x87 FPU compatibility, Vol.1-10-5
- XMM registers, Vol.1-10-3
- SSE feature flag
  - CPUID instruction, Vol.3-13-2
- SSE feature flag, CPUID instruction, Vol.1-11-19, Vol.1-12-5
- SSE instructions
  - descriptions of, Vol.1-10-6
  - SIMD floating-point exception cross-reference, Vol.1-C-3
  - summary of, Vol.1-5-14
- SSE2 extensions
  - 128-bit packed single-precision data type, Vol.1-11-3
  - 128-bit packed single-precision data type, Vol.1-12-1
  - 128-bit SIMD integer instruction extensions, Vol.1-11-11
  - 64-bit and 128-bit SIMD integer instructions, Vol.1-11-10
  - 64-bit mode, Vol.1-11-3
  - arithmetic instructions, Vol.1-11-6
  - branch hints, Vol.1-11-13
  - branching on arithmetic operations, Vol.1-11-24
  - cacheability control instructions, Vol.1-11-12
  - cacheability hint instructions, Vol.1-11-25
  - cacheability instruction encodings, Vol.1-B-59
  - caller-save requirement for procedure and function calls, Vol.1-11-24
  - checking for SSE and SSE2 support, Vol.1-11-19
  - checking for with CPUID, Vol.3-13-2
  - checking support for FXSAVE/FXRSTOR, Vol.3-13-2
  - comparison instructions, Vol.1-11-7
  - compatibility mode, Vol.1-11-3
  - compatibility of SIMD and x87 FPU floating-point data types, Vol.1-11-22
  - conversion instructions, Vol.1-11-9
  - CPUID feature flag, Vol.3-9-8
  - CPUID flag, Vol.2-3-213
  - data movement instructions, Vol.1-11-5
  - data types, Vol.1-11-3, Vol.1-12-1
  - denormal operand exception (#D), Vol.1-11-15
  - denormals-are-zero mode, Vol.1-11-3
  - divide by zero exception (#Z), Vol.1-11-15
  - EM flag, Vol.3-2-16
  - emulation of, Vol.3-13-6
  - exceptions, Vol.1-11-13
  - facilities for automatic saving of state, Vol.3-13-6, Vol.3-13-7
  - floating-point encodings, Vol.1-B-50
  - floating-point format, Vol.1-4-11
  - generating SIMD floating-point exceptions, Vol.1-11-16
  - guidelines for using, Vol.1-11-19
  - handling combinations of masked and unmasked exceptions, Vol.1-11-18
  - handling masked exceptions, Vol.1-11-16
  - handling SIMD floating-point exceptions in software, Vol.1-11-18
  - handling unmasked exceptions, Vol.1-11-17, Vol.1-11-18
  - inexact result exception (#P), Vol.1-11-16
  - initialization, Vol.3-9-8
  - initialization of, Vol.1-11-20
  - instruction prefixes, effect on SSE and SSE2 instructions, Vol.1-11-25
  - instruction set, Vol.1-5-17
  - instructions, Vol.1-11-4, Vol.1-12-2, Vol.1-12-6
  - integer instruction encodings, Vol.1-B-55
  - interaction of SIMD and x87 FPU floating-point exceptions, Vol.1-11-18
  - interaction of SSE and SSE2 instructions with x87 FPU and MMX instructions, Vol.1-11-21
  - interfacing with SSE and SSE2 procedures and functions, Vol.1-11-23
  - intermixing packed and scalar floating-point and 128-bit SIMD integer instructions and data, Vol.1-11-22
  - introduction of into the IA-32 architecture, Vol.3-22-3
  - invalid operation exception (#I), Vol.1-11-14
  - logical instructions, Vol.1-11-7
  - masked responses to invalid arithmetic operations, Vol.1-11-14
  - memory ordering instructions, Vol.1-11-12
  - MMX technology compatibility, Vol.1-11-3
  - numeric overflow exception (#O), Vol.1-11-15
  - numeric underflow exception (#U), Vol.1-11-16
  - overview of, Vol.1-11-1
  - packed 128-Bit SIMD data types, Vol.1-4-8
  - packed and scalar floating-point instructions, Vol.1-11-4
  - programming environment, Vol.1-11-2
  - providing exception handlers for, Vol.3-13-4, Vol.3-13-5
  - providing operating system support for, Vol.3-13-1
  - QNaN floating-point indefinite, Vol.1-4-17
  - restoring SSE and SSE2 state, Vol.1-11-20
  - REX prefixes, Vol.1-11-3
  - saving and restoring state, Vol.3-13-6
  - saving SSE and SSE2 state, Vol.1-11-20

  - SSE compatibility, Vol.1-11-3
  - SSE2 feature flag, CPUID instruction, Vol.1-11-19
  - system programming, Vol.1-13-18
  - unpack instructions, Vol.1-11-7
  - updating MMX technology routines using 128-bit SIMD integer instructions, Vol.1-11-24
  - using TS flag to control saving state, Vol.3-13-7
  - writing applications with, Vol.1-11-19
  - x87 FPU compatibility, Vol.1-11-3
  - SSE2 feature flag
    - CPUID instruction, Vol.3-13-2
  - SSE2 feature flag, CPUID instruction, Vol.1-11-19, Vol.1-12-5
  - SSE2 instructions
    - descriptions of, Vol.1-11-4, Vol.1-12-2, Vol.1-12-6
    - SIMD floating-point exception cross-reference, Vol.1-C-5
    - summary of, Vol.1-5-17
  - SSE3
    - CPUID flag, Vol.2-3-209
  - SSE3 extensions
    - 64-bit mode, Vol.1-12-1
    - asymmetric processing, Vol.1-12-1
    - checking for with CPUID, Vol.3-13-2
    - compatibility mode, Vol.1-12-1
    - CPUID feature flag, Vol.3-9-8
    - CPUID flag, Vol.2-3-209
    - DNA exceptions, Vol.1-12-9
    - EM flag, Vol.3-2-16
    - emulation, Vol.1-12-10
    - emulation of, Vol.3-13-6

## INDEX

- enabling support in a system executive, Vol.1-12-5, Vol.1-12-18
- event mgmt instruction encodings, Vol.1-B-60
- example verifying SS3 support, Vol.3-8-44, Vol.3-8-48, Vol.3-14-2
- exceptions, Vol.1-12-9
  - facilities for automatic saving of state, Vol.3-13-6, Vol.3-13-7
  - floating-point instruction encodings, Vol.1-B-60
  - guideline for packed addition/subtraction instructions, Vol.1-12-6
  - horizontal addition/subtraction instructions, Vol.1-12-4
  - horizontal processing, Vol.1-12-1
  - initialization, Vol.3-9-8
  - instruction that addresses cache line splits, Vol.1-5-20
  - instruction that improves X87-FP integer conversion, Vol.1-5-20
  - instructions for horizontal addition/subtraction, Vol.1-5-21
  - instructions for packed addition/subtraction, Vol.1-5-21
  - instructions that enhance LOAD/MOVE/DUPLICATE, Vol.1-5-21
  - instructions that improve synchronization between agents, Vol.1-5-21
  - integer instruction encodings, Vol.1-B-61
  - introduction of into the IA-32 architecture, Vol.3-22-3
  - LOAD/MOVE/DUPLICATE enhancement instructions, Vol.1-12-3
  - MMX technology compatibility, Vol.1-12-1
  - numeric error flag and IGNE#, Vol.1-12-9
  - packed addition/subtraction instructions, Vol.1-12-4
  - programming environment, Vol.1-12-1
  - providing exception handlers for, Vol.3-13-4, Vol.3-13-5
  - providing operating system support for, Vol.3-13-1
  - REX prefixes, Vol.1-12-1
  - saving and restoring state, Vol.3-13-6
  - saving state on task, context switches, Vol.3-13-6
  - SIMD floating-point exception cross reference, Vol.1-C-7, Vol.1-C-8
  - specialized 120-bit load instruction, Vol.1-12-3
  - SSE compatibility, Vol.1-12-1
  - SSE2 compatibility, Vol.1-12-1
  - system programming, Vol.1-13-18
  - using TS flag to control saving of state, Vol.3-13-7
  - x87 FPU compatibility, Vol.1-12-1
- SSE3 feature flag
  - CPUID instruction, Vol.3-13-2
- SSE3 instructions
  - descriptions of, Vol.1-12-2
  - SIMD floating-point exception
    - cross-reference, Vol.1-C-7, Vol.1-C-8
  - summary of, Vol.1-5-20
- SSSE3 extensions, Vol.1-B-61, Vol.1-B-67, Vol.1-B-74
  - 64-bit mode, Vol.1-12-1
  - asymmetric processing, Vol.1-12-1
  - checking for support, Vol.1-12-9
  - compatibility, Vol.1-12-1
  - compatibility mode, Vol.1-12-1
  - CPUID flag, Vol.2-3-209
  - data types, Vol.1-12-1
  - DNA exceptions, Vol.1-12-9
  - emulation, Vol.1-12-10
  - enabling support in a system executive, Vol.1-12-9
  - exceptions, Vol.1-12-9
  - horizontal add/subtract instructions, Vol.1-12-7
  - horizontal processing, Vol.1-12-1
  - MMX technology compatibility, Vol.1-12-1
  - multiply and add packed instructions, Vol.1-12-8
  - numeric error flag and IGNE#, Vol.1-12-9
  - packed absolute value instructions, Vol.1-12-7
  - packed align instruction, Vol.1-12-8
  - packed multiply high instructions, Vol.1-12-8
  - packed shuffle instruction, Vol.1-12-8
  - programming environment, Vol.1-12-1
  - SSSE2 compatibility, Vol.1-12-1
  - x87 FPU compatibility, Vol.1-12-1
- SSSE3 instructions
  - descriptions of, Vol.1-12-6
  - summary of, Vol.1-5-21
- Stack
  - 64-bit mode, Vol.1-3-5, Vol.1-6-4
  - 64-bit mode behavior, Vol.1-6-14
  - address-size attribute, Vol.1-6-3
  - alignment, Vol.1-6-2
  - alignment of stack pointer, Vol.1-6-2
  - current stack, Vol.1-6-1, Vol.1-6-3
  - description of, Vol.1-6-1
  - EIP register (return instruction pointer), Vol.1-6-3
  - maximum size, Vol.1-6-1
  - number allowed, Vol.1-6-1
  - overview of, Vol.1-3-4
  - passing parameters on, Vol.1-6-5
  - popping values from, Vol.1-6-1
  - procedure linking information, Vol.1-6-3
  - pushing values on, Vol.1-6-1
  - return instruction pointer, Vol.1-6-3
  - SS register, Vol.1-6-1
  - stack segment, Vol.1-3-14, Vol.1-6-1
  - stack-frame base pointer, EBP register, Vol.1-6-3
  - switching
    - on calls to interrupt and exception handlers, Vol.1-6-11
    - on inter-privilege level calls, Vol.1-6-8, Vol.1-6-12
    - privilege levels, Vol.1-6-7
  - width, Vol.1-6-2
- Stack fault exception (#SS), Vol.3-6-35
- Stack fault, x87 FPU, Vol.3-22-8, Vol.3-22-13

- Word, Vol.1-4-1

WP (write protected) memory type, Vol.3-11-7  
 WP (write protect) flag  
   CRO control register, Vol.3-2-15, Vol.3-5-28, Vol.3-22-18  
 Wraparound mode (MMX instructions), Vol.1-9-4  
 Write  
   hit, Vol.3-11-5  
 Write combining (WC) buffer, Vol.3-11-4, Vol.3-11-7  
 Write-back and invalidate caches, Vol.2-5-552  
 Write-back caching, Vol.3-11-6  
 WRMSR instruction, Vol.2-5-556, Vol.3-2-19, Vol.3-2-21, Vol.3-2-26,  
   Vol.3-5-24, Vol.3-8-17, Vol.3-17-34, Vol.3-17-39,  
   Vol.3-17-42, Vol.3-18-96, Vol.3-18-122, Vol.3-18-123,  
   Vol.3-18-124, Vol.3-22-4, Vol.3-22-36, Vol.3-25-9  
   CPUID flag, Vol.2-3-212  
 WT (write through) memory type, Vol.3-11-7, Vol.3-11-8  
 WT# (write-through) pin (Pentium processor), Vol.3-11-13

## X

x2APIC ID, Vol.3-10-40, Vol.3-10-41, Vol.3-10-44, Vol.3-10-46  
 x2APIC Mode, Vol.3-10-31, Vol.3-10-37, Vol.3-10-38, Vol.3-10-40,  
   Vol.3-10-41, Vol.3-10-44, Vol.3-10-45, Vol.3-10-46  
 x87 FPU  
   64-bit mode, Vol.1-8-1  
   checking for pending x87 FPU exceptions, Vol.2-5-551  
   compatibility mode, Vol.1-8-1  
   compatibility with IA-32 x87 FPUs and math coprocessors, Vol.3-22-7  
   configuring the x87 FPU environment, Vol.3-9-6  
   constants, Vol.2-3-358  
   control word, Vol.1-8-7  
   data pointer, Vol.1-8-9  
   data registers, Vol.1-8-1  
   device-not-available exception, Vol.3-6-27  
   effect of MMX instructions on pending x87 floating-point exceptions,  
     Vol.3-12-5  
   effects of MMX instructions on x87 FPU state, Vol.3-12-3  
   effects of MMX, x87 FPU, FXSAVE, and FXRSTOR instructions on x87  
     FPU tag word, Vol.3-12-3  
   error signals, Vol.3-22-11  
   execution environment, Vol.1-8-1  
   floating-point data types, Vol.1-8-13  
   floating-point format, Vol.1-4-11  
   fopcode compatibility mode, Vol.1-8-10  
   FXSAVE and FXRSTOR instructions, Vol.1-11-23  
   IEEE Standard 754, Vol.1-8-1  
   initialization, Vol.2-3-349, Vol.3-9-5  
   instruction opcodes, Vol.1-A-20  
   instruction pointer, Vol.1-8-9  
   instruction set, Vol.1-8-15  
   instruction synchronization, Vol.3-22-15  
   last instruction opcode, Vol.1-8-10  
   overview of registers, Vol.1-3-2  
   programming, Vol.1-8-1  
   QNaN floating-point indefinite, Vol.1-4-17  
   register stack, Vol.1-8-1  
   register stack, aliasing with MMX registers, Vol.3-12-2  
   register stack, parameter passing, Vol.1-8-3  
   registers, Vol.1-8-1  
   save and restore state instructions, Vol.1-5-12  
   saving registers, Vol.1-11-23  
   setting up for software emulation of x87 FPU functions, Vol.3-9-6  
   state, Vol.1-8-11  
   state, image, Vol.1-8-11, Vol.1-8-12  
   state, saving, Vol.1-8-11, Vol.1-8-12  
   status register, Vol.1-8-4  
   tag word, Vol.1-8-8  
   transcendental instruction accuracy, Vol.1-8-22  
   using TS flag to control saving of x87 FPU state, Vol.3-13-7  
   x87 floating-point error exception (#MF), Vol.3-6-42  
 x87 FPU control word  
   compatibility, IA-32 processors, Vol.3-22-8  
   description of, Vol.1-8-7  
   exception-flag mask bits, Vol.1-8-7  
   infinity control flag, Vol.1-8-8  
   loading, Vol.2-3-360, Vol.2-3-362  
   precision control (PC) field, Vol.1-8-7  
   RC field, Vol.2-3-351, Vol.2-3-358, Vol.2-3-390  
   restoring, Vol.2-3-377  
   rounding control (RC) field, Vol.1-4-18, Vol.1-8-8  
   saving, Vol.2-3-379, Vol.2-3-394  
   storing, Vol.2-3-392  
 x87 FPU data pointer, Vol.2-3-362, Vol.2-3-377, Vol.2-3-379,  
   Vol.2-3-394  
 x87 FPU exception handling  
   description of, Vol.1-8-32  
   floating-point exception summary, Vol.1-C-1  
   MS-DOS compatibility mode, Vol.1-8-33  
   native mode, Vol.1-8-32  
 x87 FPU floating-point error exception (#MF), Vol.3-6-42  
 x87 FPU floating-point exceptions  
   denormal operand exception, Vol.1-8-28  
   division-by-zero, Vol.1-8-29  
   exception conditions, Vol.1-8-26  
   exception summary, Vol.1-C-1  
   guidelines for writing exception handlers, Vol.1-D-1  
   inexact-result (precision), Vol.1-8-31  
   interaction of SIMD and x87 FPU floating-point exceptions,  
     Vol.1-11-18  
   invalid arithmetic operand, Vol.1-8-27  
   MS-DOS compatibility mode, Vol.1-D-1  
   numeric overflow, Vol.1-8-29  
   numeric underflow, Vol.1-8-30  
   software handling, Vol.1-8-32  
   stack overflow, Vol.1-8-4, Vol.1-8-27  
   stack underflow, Vol.1-8-4, Vol.1-8-27  
   summary of, Vol.1-8-25  
   synchronization, Vol.1-8-31  
 x87 FPU instruction pointer, Vol.2-3-362, Vol.2-3-377, Vol.2-3-379,  
   Vol.2-3-394  
 x87 FPU instructions  
   arithmetic vs. non-arithmetic instructions, Vol.1-8-25  
   basic arithmetic, Vol.1-8-18  
   comparison and classification, Vol.1-8-19  
   control, Vol.1-8-24  
   data transfer, Vol.1-8-16  
   exponential, Vol.1-8-22  
   instruction set, Vol.1-8-15  
   load constant, Vol.1-8-18  
   logarithmic, Vol.1-8-22  
   operands, Vol.1-8-15  
   overview, Vol.1-8-15  
   save and restore state, Vol.1-8-24  
   scale, Vol.1-8-22  
   transcendental, Vol.1-8-22  
   transitions between x87 FPU and MMX code, Vol.1-9-9  
   trigonometric, Vol.1-8-21  
   unsupported, Vol.1-8-25  
 x87 FPU last opcode, Vol.2-3-362, Vol.2-3-377, Vol.2-3-379,  
   Vol.2-3-394  
 x87 FPU status word  
   condition code flags, Vol.1-8-4, Vol.2-3-328, Vol.2-3-344,  
     Vol.2-3-404, Vol.2-3-406, Vol.2-3-409, Vol.3-22-8  
   DE flag, Vol.1-8-29  
   description of, Vol.1-8-4  
   exception flags, Vol.1-8-5  
   loading, Vol.2-3-362  
   OE flag, Vol.1-8-29  
   PE flag, Vol.1-8-4  
   restoring, Vol.2-3-377  
   saving, Vol.2-3-379, Vol.2-3-394, Vol.2-3-396  
   stack fault flag, Vol.1-8-6  
   TOP field, Vol.1-8-2, Vol.2-3-348  
   top of stack (TOP) pointer, Vol.1-8-4  
   x87 FPU flags affected by instructions, Vol.2-3-15
